THROTTLE BODY REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal and Installation

WARNING:

Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE:

- 📖 Where icon is shown for further information in the information below.
- If you are replacing the throttle body, do the all procedures.

- If you are removing the throttle body, do 3rd procedure (12 Volt Battery - Remove) through 10th procedure (Engine Coolant - Refill).

1

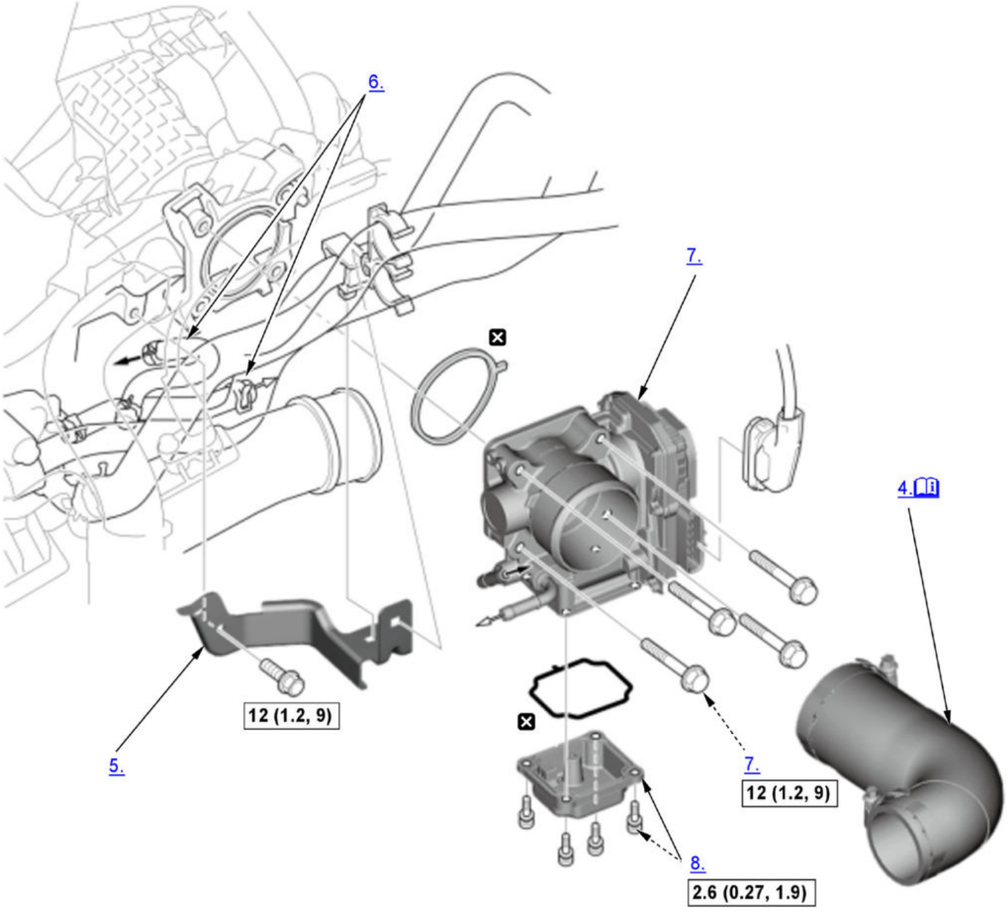

Fig. 57: Throttle Body Replacement Components With Torque Specifications (1.5 L Engine)

ℹ	Detailed information, notes and precautions
▭	Torque: N.m (kgf.m, lbf.ft)

☒	Replace

1. HDS - Connect
2. TP POSITION CHECK - Select

    1. Select the ETCS TEST in the INSPECTION MENU with the HDS.
    2. Select TP POSITION CHECK and clear the throttle position (TP) learned value.
    3. Turn the vehicle to the OFF (LOCK) mode.
    4. Turn the vehicle to the ON mode, and wait 2 seconds without pressing the accelerator pedal.

3. 12 Volt Battery - Remove
4. Throttle Body Duct - Remove

NOTE: **Make sure the end of hose band is aligned with the mark on the hose band after the throttle body duct is installed** .

5. Heater Hose Bracket - Remove
6. Water Bypass Hose - Disconnect and Plug
7. Throttle Body - Remove
8. Throttle Body Lower Case - Remove (If Necessary)
9. All Removed Parts - Install

1. Install the parts in the reverse order of removal with a new gasket and a new O-ring.
NOTE:
- Tighten the throttle body mounting bolts in a cross pattern in three steps;
-
    - Tighten the bolts until they sit on the throttle body.
    - Tighten the bolts until the gasket is compressed and both parts are contacted.
    - Tighten the bolts to specified torque.

10. **Engine Coolant - Refill**
11. **PCM - Reset**
12. **PCM - Idle Learn**

THROTTLE BODY REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

WARNING:

Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE:

- ℹ Where icon is shown for further information in the information below.
- If you are replacing the throttle body, do the all procedures.
- If you are removing the throttle body, do 3rd procedure (Intake Air Duct - Remove) through 8th procedure (Engine Coolant - Refill).

1

VALVE, SPRING, AND VALVE SEAL REMOVAL AND INSTALLATION (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	Valve Spring Compressor Attachment 070AE-5K0A100

Image	Description/Tool Number
	Stem Seal Driver 07PAD-0010000

Removal

WARNING:

Please carefully read "Precaution for Handling Sodium-Filled Valves" and follow the instructions as the exhaust valves contain metal sodium .

NOTE: Identify the valves and the valve springs as they are removed so that each item can be reinstalled in its original position.

1. Cylinder Head - Remove
2. Valve and Valve Spring - Remove

	1. Using an appropriate-sized socket (A) and a plastic mallet (B), lightly tap the spring retainer to loosen the valve cotters.

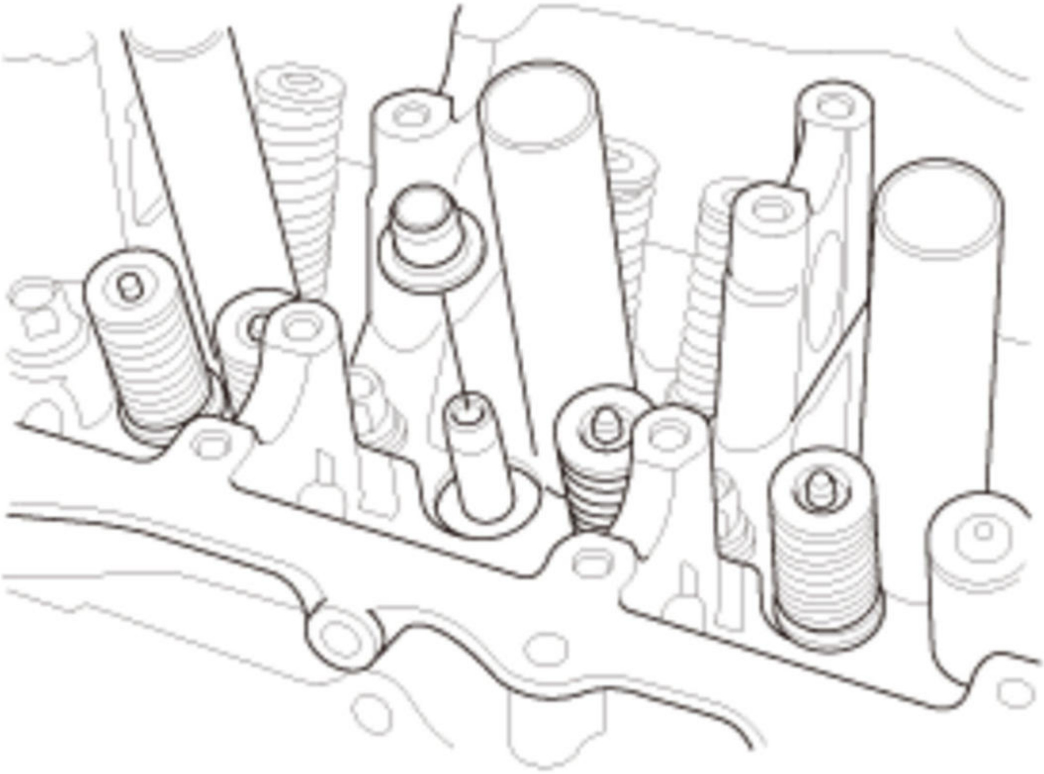
	2. Install the valve spring compressor attachment and the valve spring compressor. 3. Compress the valve spring and remove the valve cotters. 4. Remove the valve spring compressor and the valve spring compressor attachment. 5. Remove the spring retainer, the valve spring, and the valve.

3. Valve Seal - Remove

	1. Install the valve guide seal remover (A).

	2. Remove the valve seal.

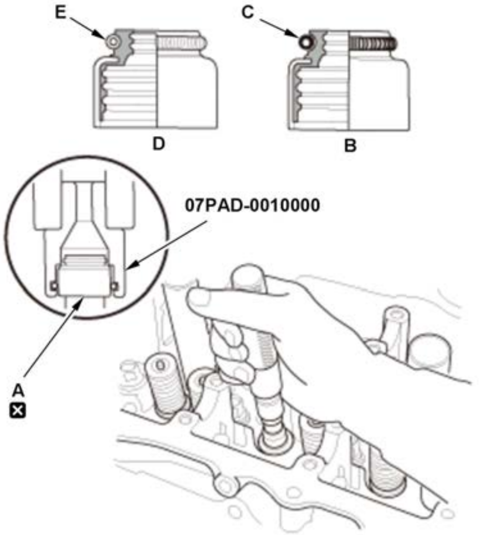
4. Valve Spring Seat - Remove



Installation

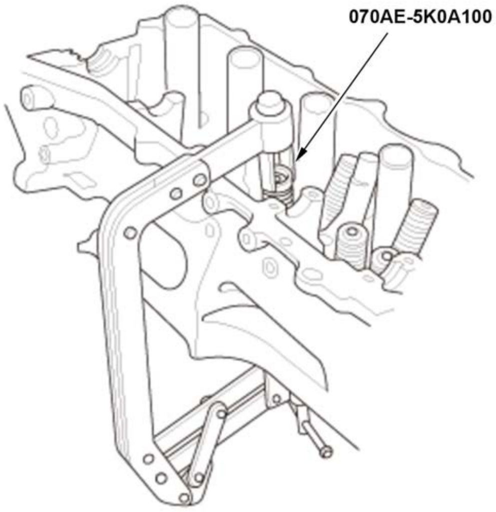
1. Valve Spring Seat and Valve Seal - Install

	1. Coat the valve stems with new engine oil. 2. Install the valves in the valve guides. 3. Check that the valves move up and down smoothly, then remove the valves.
	4. Install the valve spring seat (A).



5. Install the new valve seal (A) using the 5.5 mm side of the stem seal driver.
NOTE: The exhaust valve seal (B) has a black spring (C), and the intake valve seal (D) has a white or silver spring (E), they are not interchangeable.

2. Valve and Valve Spring - Install

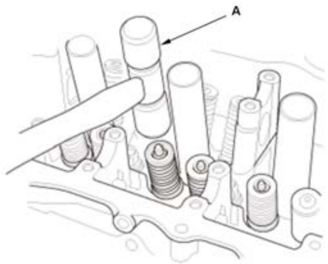


1. Install the valve, the valve spring, and the spring retainer. Place the end of the valve spring with the closely wound coils toward the cylinder head.

2. Install the valve spring compressor attachment and the valve spring compressor.

3. Compress the valve spring and install the valve cotters.

4. Remove the valve spring compressor and the valve spring compressor attachment.



5. Lightly tap the end of each valve stem two or three times with a plastic mallet (A) to ensure proper seating of the valve and the valve cotters. Tap the valve stem only along its axis so you do not bend the stem.**NOTE:** Be sure to raise the cylinder head off the work bench so the valve is not possibly damaged.

3. **Cylinder Head - Install**

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

AFTER WARMING UP, IDLE SPEED IS ABOVE SPECIFICATIONS WITHOUT LOAD (MIL WORKS OK, NO DTCS SET)

Diagnostic procedure

- Inspect the APP sensor.

Also check for

Intake air leaks

AFTER WARMING UP, IDLE SPEED IS BELOW SPECIFICATIONS WITHOUT LOAD (MIL WORKS OK, NO DTCS SET)

Diagnostic procedure

- Do the carbon accumulation check.

Also check for

Incorrect valve timing or clearance adjustment

COLD FAST IDLE TOO HIGH (MIL WORKS OK, NO DTCS SET)

Diagnostic procedure

- Check the idle speed.

Also check for

Intake air leaks

COLD FAST IDLE TOO LOW (MIL WORKS OK, NO DTCS SET)

Diagnostic procedure

- Check the idle speed.
- Do the carbon accumulation check.

Also check for

- Incorrect valve adjustment
- Intake air leaks

DIFFICULT TO REFUEL (MIL WORKS OK, NO DTCS SET)

Diagnostic procedure

- Check the fuel vent tube between the EVAP canister and the fuel tank unit.
- Check the fuel tank vapor recirculation tube between the fuel fill pipe and the fuel tank unit.
- Insert the emergency fuel funnel into the fuel filler neck, then check the operation of the shut-off valve flap.

NOTE: The emergency fuel funnel is stored in the trunk tool box.

- Replace the fuel tank .

Also check for

- Malfunctioning gas station filling nozzle
- Faulty fuel tank vapor control valve

ENGINE IS HARD TO START (MIL WORKS OK, NO DTCS SET)

Diagnostic procedure

- Test the 12 volt battery .
- Check the fuel pressure .
- Do the carbon accumulation check.

Also check for

- Low compression
- Intake air leaks
- Fuel contamination
- Weak spark

ENGINE STALLS (MIL WORKS OK, NO DTCS SET)

Diagnostic procedure

- Check the fuel pressure .
- Check the idle speed.

Also check for

- Intake air leaks
- Faulty harness and sensor connections
- Fuel contamination

ENGINE STARTS BUT STALLS IMMEDIATELY (MIL WORKS OK, NO DTCS SET, IMMOBILIZER INDICATOR STAYS ON OR FLASHES)

Diagnostic procedure

- Check the keyless access system .

Also check for

- Low compression
- Intake air leaks
- Weak spark
- Low fuel pressure

ENGINE WILL NOT START (MIL WORKS OK, NO DTCS SET, GENERATOR MOTOR WORKS OK)

Diagnostic procedure

- Test the 12 volt battery .

- Check the fuel pressure .
- Troubleshoot the fuel pump circuit .

Also check for

- Low compression
- No ignition spark
- Exhaust restriction
- Intake air leaks
- Locked up engine
- Broken cam chain
- Fuel contamination

ENGINE WILL NOT START, AND HDS DOES NOT COMMUNICATE WITH THE PCM (MIL COMES ON AND STAYS ON, NO DTCS SET)

Diagnostic procedure

- Do the DLC circuit troubleshooting .
- Do the PCM Power and Ground Circuit Troubleshooting.

HDS DOES NOT COMMUNICATE WITH THE PCM OR THE VEHICLE

Diagnostic procedure

- Troubleshoot the DLC circuit .

Also check for

Correct HDS software

IDLE SPEED FLUCTUATES (MIL WORKS OK, NO DTCS SET)

Diagnostic procedure

- Check the idle speed.
- Check the fuel pressure .
- Do the carbon accumulation check.

Also check for

- Incorrect valve adjustment
- Intake air leaks

LOW POWER (MIL WORKS OK, NO DTCS SET)

Diagnostic procedure

- Check the fuel pressure .
- Check the air cleaner element .

Also check for

- Low compression
- Incorrect camshaft timing
- Incorrect engine oil level

- Exhaust restriction
- Fuel contamination

MIL COMES ON AND STAYS ON, OR NEVER COMES ON AT ALL, NO DTCS SET

Diagnostic procedure

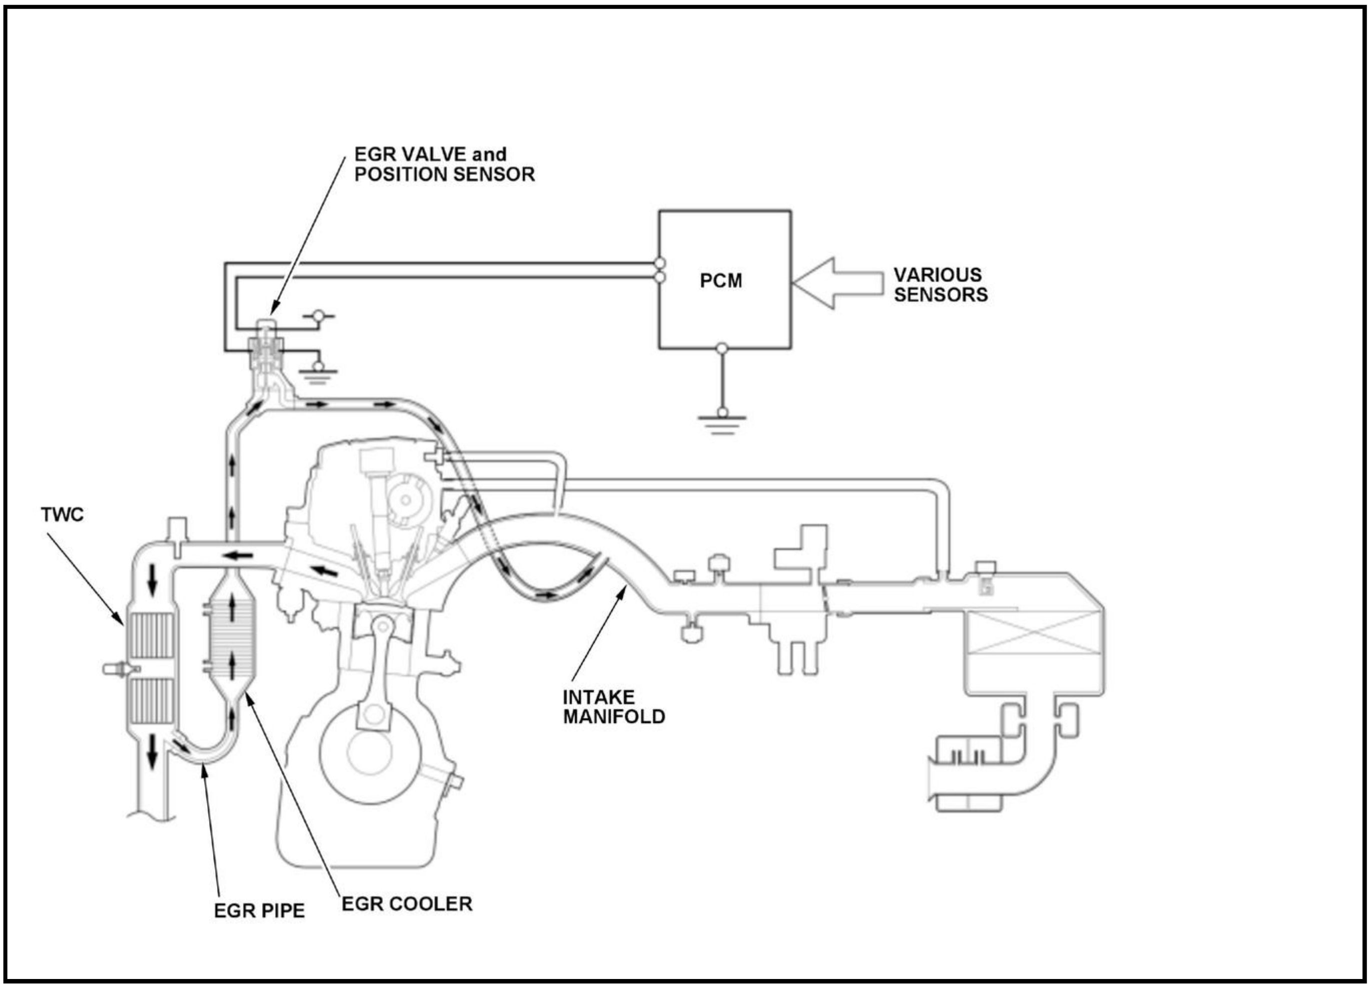
- **Troubleshoot the MIL circuit**.

DESCRIPTION & OPERATION

EGR SYSTEM DESCRIPTION

The exhaust gas recirculation (EGR) system lowers the combustion temperature and reduces oxides of nitrogen (NOx) emissions. Routing the exhaust gas through the EGR pipe helps to prevent carbon deposits from forming in the intake manifold and the throttle body. The powertrain control module (PCM) memory includes the ideal EGR valve position for varying operating conditions. The EGR valve position sensor detects the amount of EGR valve lift and sends it to the PCM. The PCM then compares it with the ideal lift in its memory (based on signals sent from other sensors). If there is any difference between the two, the PCM cuts power to the EGR valve.

For locations of each component on vehicle, refer to Component Location Index .



Exhaust Gas Recirculation (EGR) Cooler

A water-cooled type EGR cooler is installed between the three way catalytic converter (TWC) and the EGR valve to lower the exhaust gas temperature pass through the EGR valve more.

Because it has effects on to prevent knocking, to reduce pumping loss, and to reduce oxides of nitrogen (NOx) emissions more efficient.

Exhaust Gas Recirculation Flow

The exhaust gas downstream of the TWC flows through the EGR pipe, the EGR cooler, the passage in the cylinder head, and the EGR valve.

EVAP SYSTEM DESCRIPTION

For locations of each component on vehicle, refer to Component Location Index

Overview

The evaporative emission (EVAP) controls minimize the amount of fuel vapor escaping to the atmosphere. Vapor from the fuel tank is temporarily stored in the EVAP canister until it can be purged from the canister into the engine and burned.

The EVAP canister is purged by drawing fresh air through it and into a port on the intake manifold.

The purging vacuum is controlled by the EVAP canister purge valve(s).

With EVAP two way valve: When vapor pressure in the fuel tank is higher than the set value of the EVAP two way valve, the valve opens and regulates the flow of fuel vapor to the EVAP canister.

Operation

When fuel tank pressure increases because of heat and fuel vapor generation, evaporated fuel vapor is sent to the evaporative emission (EVAP) canister.

When the engine coolant is hot enough, the powertrain control module (PCM) opens the EVAP canister purge valves to draw the stored fuel vapor in the EVAP canister into the intake manifold to be burned.

To regulate the amount of fuel vapor drawn into the engine, the PCM varies the EVAP canister purge valves opening using duty cycle control.

The PCM commands one purge valve open, once the duty cycle is at 100%, the second purge valve will be commanded open to increase the flow of the fuel vapor.

When the outside air or other factor cools the fuel tank inside, the tank pressure decreases.

The canister change over valve in the EVAP leak check module is normally open when not energized, and allows outside air to flow in and out of the EVAP canister.

The PCM uses the EVAP leak check module to check for leaks in the system.

EVAP Leak Check Module

The EVAP leak check module (ELCM; mounted on a bracket to the side of the EVAP canister) is a small vacuum pump used to check the leakage of the EVAP system to create a vacuum in the system. The EVAP leak check module pressure sensor, the canister change over valve, and the EVAP leak check module vacuum pump are inside the ELCM.

The canister change over valve is normally open when not energized. When open the valve allows air to flow in and out of the EVAP canister. When energized the valve seals the EVAP canister side of the system from the atmosphere.

CANISTER CHANGE OVER VALVE
EVAP LEAK CHECK MODULE

ELECTRONIC THROTTLE CONTROL SYSTEM DESCRIPTION

For locations of each component on vehicle, refer to Component Location Index

Overview

The electronic throttle control system (ETCS) opens and closes the throttle valve by electronic control. This system consists of a throttle actuator built into the throttle body, throttle valve and throttle position (TP) sensor A/B, accelerator pedal position (APP) sensor A/B, ETCS driver built into the powertrain control module (PCM).

ETCS is a system that opens and closes the throttle valve electronically, it has various functions such as:

- Idle Control Function
- Accelerator Control Function
- Fail-Safe Function
- Relationship Action with Other Systems

Control

When the accelerator pedal is operated, APP sensors are driven and the accelerator pedal position is detected. The accelerator pedal position is delivered to the PCM, and the PCM drives the throttle actuator in the throttle body based on the delivered throttle pedal position to open or close the throttle valve.

Throttle position is detected by the TP sensors in the throttle body and delivered to the PCM.

The PCM drives the throttle actuator to control the throttle position during idling, during various system control, and when necessary, as well as based on the signals from the APP sensors.

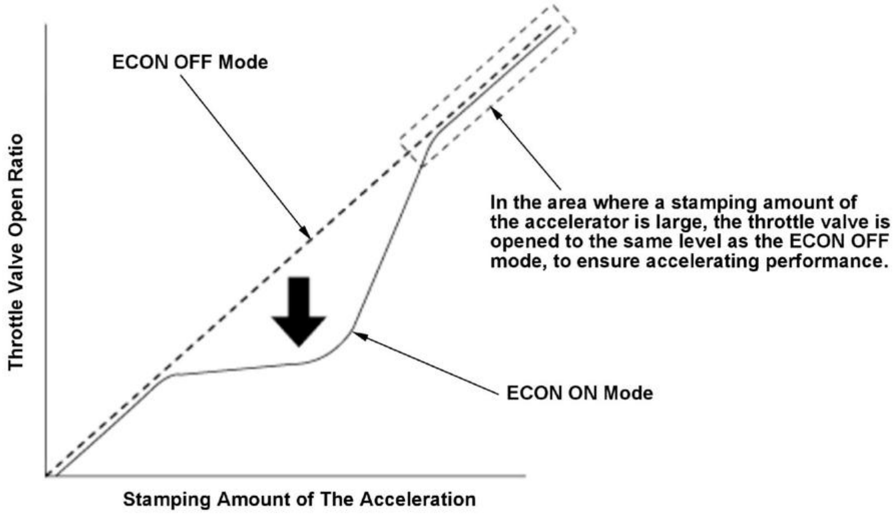
M
Throttle Valve

Change of ETCS system control

The ECON ON mode softens throttle valve control to reduce fuel consumption when the accelerator pedal is roughly depressed. Also, throttle opening becomes slow in comparison with the ECON OFF mode. However, if the accelerator pedal is depressed more than a certain level, control automatically becomes equivalent to the ECON OFF mode in order to ensure the acceleration.



PCV SYSTEM DESCRIPTION

Some of the unburned gases in the combustion chamber will leak past the gap between the pistons and cylinders into the crankcase. The blow-by gases that include the unburned gases are returned through the positive crankcase ventilation (PCV) valve and are burned. This prevents the blow-by gases from flowing into the atmosphere.

For locations of each component on vehicle, refer to Component Location Index .

Electronic Control

The powertrain control module (PCM) consists of a CPU memory (storage unit) and inputs/outputs that control the fuel injection, injection timing, and electronic throttle control system (ETCS).

Fail-Safe Function

When a malfunction occurs in the signal from a sensor or from another control unit, the PCM ignores that signal and substitutes a pre-programmed value that allows the engine to continue running. This causes a Confirmed DTC to be stored and the MIL to come on.

Updated Function

The PCM has a rewritable ROM. The ROM can acquire the latest software version.

MIL Bulb Check

When the vehicle is turned to the ON mode, the PCM turns on the MIL via the F-CAN circuit for about 15 to 20 seconds to check the bulb condition.

Self Shut Down (SSD) Mode

After the vehicle is turned to the OFF (LOCK) mode, the PCM stays on for up to an hour. If a PCM connector is disconnected during this time, the PCM may be damaged. To cancel the SSD, jump the SCS line with the HDS after the vehicle is turned to the OFF (LOCK) mode.

Two Drive Cycle Detection Method

The DTCs are detected with the one or two driving cycle method in the PCM. Specific DTCs which are considered as a not intermittent failure apply the two driving cycle method.

When a malfunction occurs in the signal from a sensor or from another control unit in the first drive cycle, the PCM stores a pending DTC. The MIL does not come on at this time. If the failure continues in the second drive cycle, the PCM stores a confirmed DTC and turns on the MIL.

Injection Control

Fuel injection controls include fuel injection amount control, fuel cut control, and fuel pump control. Adaptive PGM-FI (programmed-fuel injection) technology enables accurate fuel controls, which contributes to increasing engine power and decreasing fuel consumption.

Air fuel ratio control is part of fuel injection control and comprises the stops of:

- Calculating basic injection amount from intake air flow amount and engine speed
- Calculating air fuel ratio correction value from the oxygen density in the exhaust gas and reflecting the calculated values to the injection amount

Air fuel ratio control stops feedback under the following conditions in order to maintain operational performance and catalytic protection.

- When starting the engine or during fuel increase after the engine is started
- While the engine coolant is cold
- During fuel increase under high load
- During fuel increase at high engine speed
- During fuel cut-off at deceleration

Fuel Injection

The fuel injection duration is determined by adding correction values to a basic injection duration.

The powertrain control module (PCM) controls the amount of fuel injection by the length of time the injector is energized.

NOTE: This illustration shows an example only. Appearance and structure of the actual parts may vary depending on the model.

Fuel Injection Timing

The fuel injection timing is determined by the PCM, which calculates the injection time for each cylinder based on the signals from the crankshaft position (CKP) sensor and the camshaft position (CMP) sensor. The PCM then controls the time to energize the injector.

Ignition Timing Control

The powertrain control module (PCM) contains the memory for basic ignition timing at various engine speeds and manifold absolute pressures. It also adjusts the ignition timing according to engine coolant temperature and intake air temperature.

NOTE: This illustration shows an example only. Appearance and structure of the actual parts may vary depending on the model.

Fuel Cut-off Control

After warming up, during deceleration with the throttle valve slightly opened from the fully closed position, the PCM stops the fuel injection when the engine speed is over the specified value to improve fuel efficiency.

Fuel cut-off at high engine speed

To prevent the engine from damage, the PCM stops the fuel injection when the engine speed is in the limited area (red zone). PCM stops fuel injection while vehicle is driven and while at a stop.

Fuel cutoff at high engine speed	6500 RPM

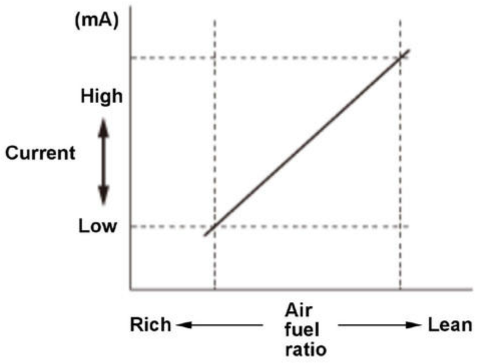
PGM-FI SYSTEM DESCRIPTION - COMPONENTS

Air Fuel Ratio (A/F) Sensor (Sensor 1)

Air fuel ratio control performs fuel injection control based on the oxygen density detected in exhaust gas in order to bring the intake mixture in the vicinity of a target air fuel ratio.

This high-precision air fuel ratio control is achieved by detecting a correction value with an A/F sensor (Sensor 1) and then applying further correction with a secondary heated oxygen sensor (secondary HO2S) (Sensor 2).

The sensor element and the heater inside the A/F sensor (Sensor 1) have a layered construction of a plate-shaped zirconia element whose inside and outside are coated with platinum and a built-in platinum heater. A ceramic coating diffusion layer on the platinum electrode on the outside of the element creates an atmospheric chamber between the platinum electrode inside the element and the heater.

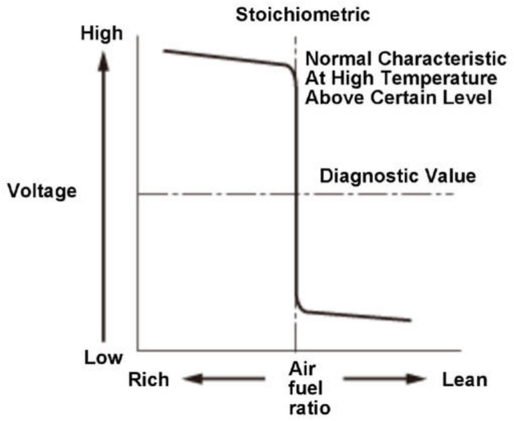


Secondary HO2S (Sensor 2)

It detects the oxygen density in the exhaust gas passing through the catalyst and outputs it to the powertrain control module (PCM) to enable the high-precision air fuel ratio control, which cannot be achieved only with an A/F sensor (Sensor 1).

Inside secondary HO2S (Sensor 2) is a test tube shaped zirconia element whose inside and outside surfaces are coated with platinum. The inside surface is exposed to the atmosphere, while the outside surface is within the exhaust gas.

A ceramic heater is equipped inside the element in order to shorten sensor reaction time and to enable output that is constantly stable.



CKP Sensor

Each of the teeth on the CKP pulse plate passes over it, the CKP sensor pulse signal is delivered to the PCM

CMP Sensor

Every time one of the protrusions of the CMP pulse plate passes over it, the camshaft position (CMP) sensor pulse signal is delivered.

MAF Sensor/IAT Sensor 1

The MAF sensor/IAT sensor 1 is attached to the air cleaner to detect the intake air amount and the intake air temperature.

PGM-FI SYSTEM DESCRIPTION - MAINTENANCE MODE

Outline

The maintenance mode enables the vehicle to start and run the engine to perform various tests, inspections, learning procedures and various adjustments.

When the vehicle is switched to the maintenance mode, some functions are stopped, and the multi-information display (MID) and related indicators in the gauge control module come on to indicate the activation of the maintenance mode.

The maintenance mode can be cancelled by turning the vehicle to the OFF (LOCK) mode.

SHUTTER GRILLE SYSTEM DESCRIPTION

For locations of each component on vehicle, refer to Component Location Index

The shutter grille system controls the heat dissipation by controlling the air flow to the engine room during engine warmed-up.

While vehicle running, improving the aerodynamic performance by controlling the opening and closing the shutter grille.

Improving the fuel efficiency by the improvement of the engine warm-up and the aerodynamic performances.

Operation

The powertrain control module (PCM) communicates with the shutter grille through the LIN communication line.

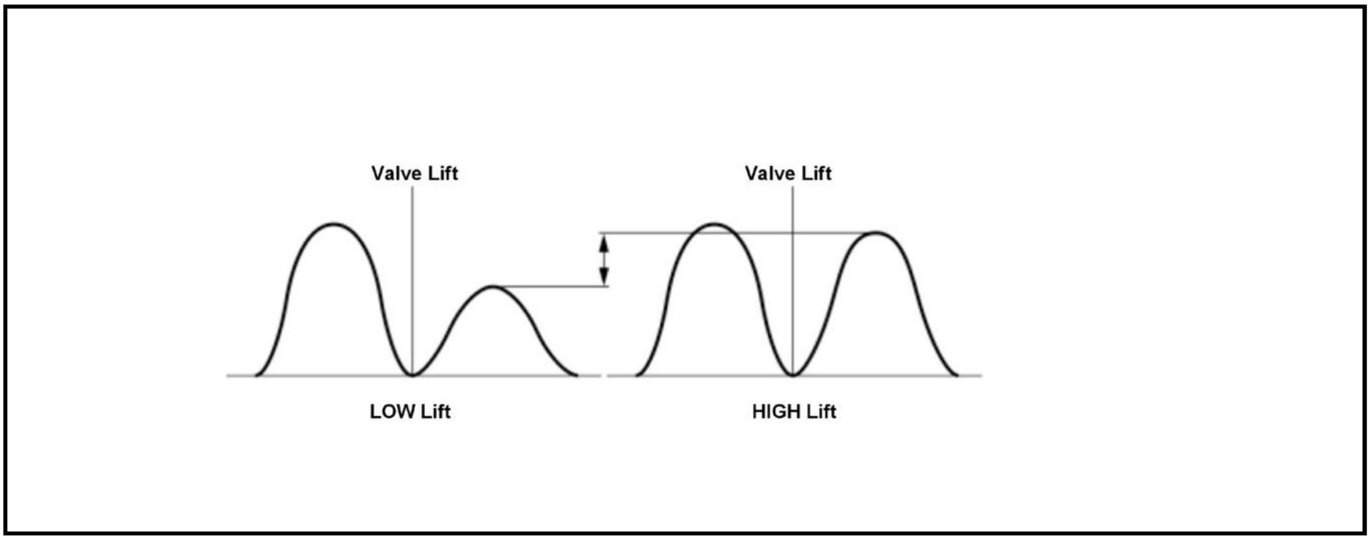
VTEC/VTC SYSTEM DESCRIPTION

VTEC

Overview

VTEC system changes the valve lift timing and lift height depending on the engine speed and load in order to optimize the fuel efficiency and the engine output.



Construction

VTEC is composed of the VTEC camshaft, VTEC rocker arm, and rocker arm oil control valve.

Control

Based on the signals sent from the various sensors, the powertrain control module (PCM) determines the lift amount and controls ON/OFF of the rocker arm oil control solenoid.

The PCM generates and determines the control amount based on signals from various sensors to subject the rocker arm oil control solenoid to a feedback control.

For locations of each component on the vehicle, refer to the Component Location Index

Operation

Rocker Arm Oil Control Solenoid

When the rocker arm oil control solenoid is turned off by the PCM, the spool valve is moved upward in the figure by the spring and the oil pressure from the oil pump enters the upper oil passage in the figure.

When the rocker arm oil control solenoid is turned on, the rocker arm oil control solenoid is moved upward in the figure and the spool valve is moved downward against the spring by the oil pressure, then the oil pressure from the oil pump enters the lower oil passage in the figure.

VTEC Rocker Arm (LOW Lift)

Oil pressure from the rocker arm oil control valve enters the primary rocker arm via the oil port. This oil pressure and the return spring tension push the stopper piston and the VTEC switching pistons to the left side in the figure. Thus the primary and the secondary rocker arms are separated from the middle rocker arm, and the primary and the secondary rocker arms are driven by the low lift cam.

VTEC Rocker Arm (HIGH Lift)

Oil pressure from the rocker arm oil control valve enters the secondary rocker arm via the oil port. This oil pressure moves the VTEC switching piston in the secondary rocker arm to the right side in the figure. This causes the VTEC switching piston to slide into the middle rocker arm and the primary rocker arm, locking the secondary, middle, and the primary rocker arms. Thus all rocker arms are driven by the high lift cam.

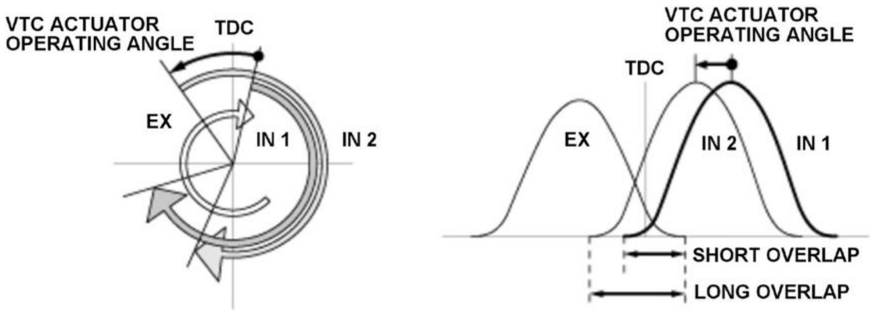
PRIMARY ROCKER ARM

VTC

Overview

The VTC system changes intake valve timing continuously depending on the engine operating conditions.

The electrical VTC is adjusted through electric control and it enables the phase of the intake camshaft to have non-step advances or retards the valve timing.



VTC ACTUATOR OPERATING ANGLE
TDC
EX
IN 1
IN 2
VTC ACTUATOR OPERATING ANGLE
TDC
EX
IN 2
IN 1
SHORT OVERLAP
LONG OVERLAP

Construction

The VTC consists of the electric VTC motor which is integrated with the control unit, and the VTC actuator. The electric VTC motor drives the VTC actuator, and advances or retards the valve timing by changing the phase.

The VTC motor in the VTC actuator has two gears that change phase. One is the gear assembly that is integrated with the timing sprocket, and the other is the gear that meshes with the planetary gear subassembly that is rotated by eccentricity, and the motor shaft rotated by the motor. The planetary gear subassembly is connected to the intake camshaft.

When the VTC actuator makes one rotation relative to the VTC motor, the planetary gear subassembly also moves by one gear tooth, and advances or retards the valve timing.

(integrated with the timing sprocket)
VTC ACTUATOR
ECCENTRIC SHAFT
ECCENTRIC SHAFT
PLANETARY GEAR SUBASSEMBLY
(connected to the intake camshaft)

The components pictured is an example and may not match your vehicle.

Control

The electric VTC system diagram is as follows.

The motor is controlled through the command from the powertrain control module (PCM). The PCM performs advances or retards the valve timing based on the data from various sensors, and performs feedback-control based on the data from CMP sensor A.

For locations of each component on the vehicle, refer to the Component Location Index

Operation

This VTC system liaises with the VTEC system. The VTEC + VTC operation uses the long duration cam and the VTC phase control to achieve the fuel-efficient Atkinson cycle for the hybrid drive, which uses both the engine and motor. For cruising, the engine is used directly. At engine start and during acceleration when high torque and high power output are required, the operation is switched to that of the short duration cam.

REMOVAL, INSTALLATION & INSPECTION

CATALYTIC CONVERTER REMOVAL, INSTALLATION, AND INSPECTION

Removal and Installation

NOTE:

- Due to the high temperatures of the exhaust system, the exhaust nut, studs and bolts may seize preventing easy removal. If you encounter a seized condition, do the following.
-
    - Apply rust penetrant to the nut/stud or bolt.
    - Allow the penetrant to sit. The amount of time may vary.
    - Lightly tap the nut/stud or bolt with a hammer.
    - Slowly loosen the nut or bolt.
    - If the nut or bolt still will not loosed, repeat steps ① to ④.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

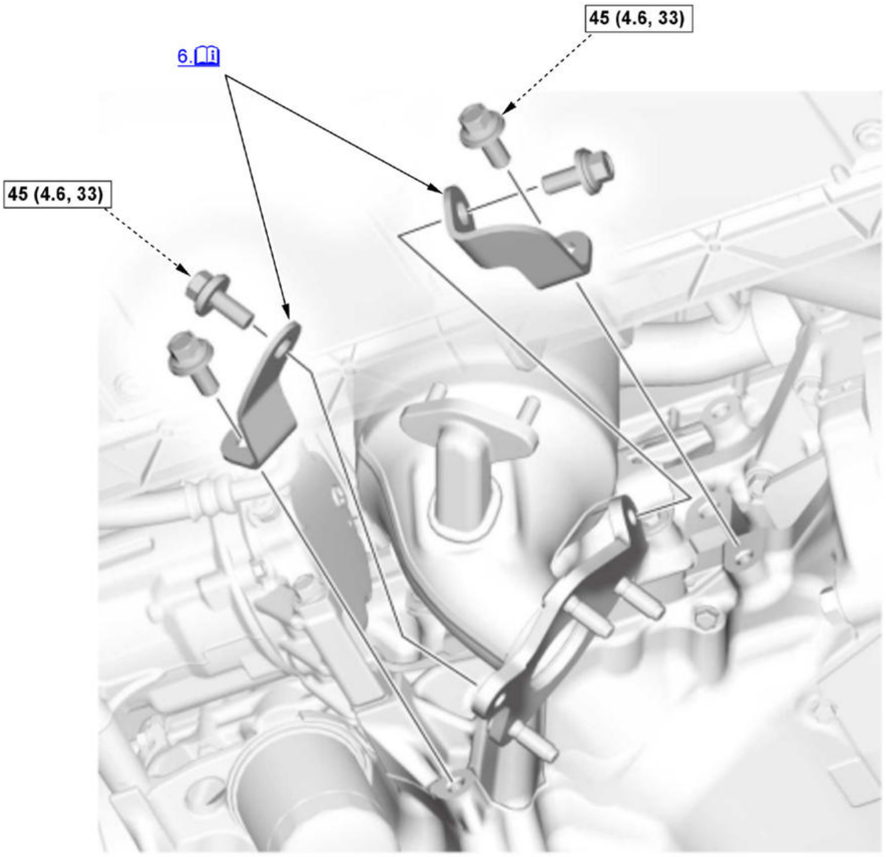

Fig. 1: Exploded View Of Catalytic Converter Replacement Components With Torque Specifications (1 Of 2)

Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

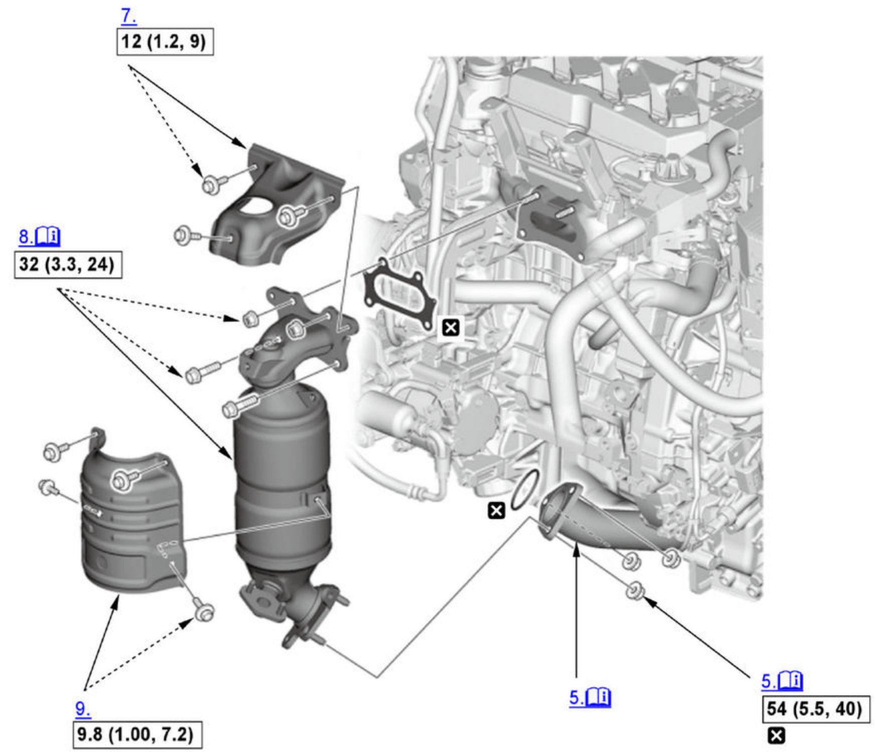

Fig. 2: Exploded View Of Catalytic Converter Replacement Components With Torque Specifications (2 Of 2)

Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Intake Air Resonator - Remove**
2. **A/F Sensor (Sensor 1) - Remove**
3. **Secondary HO2S (Sensor 2) - Remove**
4. **EGR Pipe - Remove**
5. Exhaust Pipe A - Remove

   NOTE: Remove the exhaust mounting rubber.

6. TWC Bracket - Remove

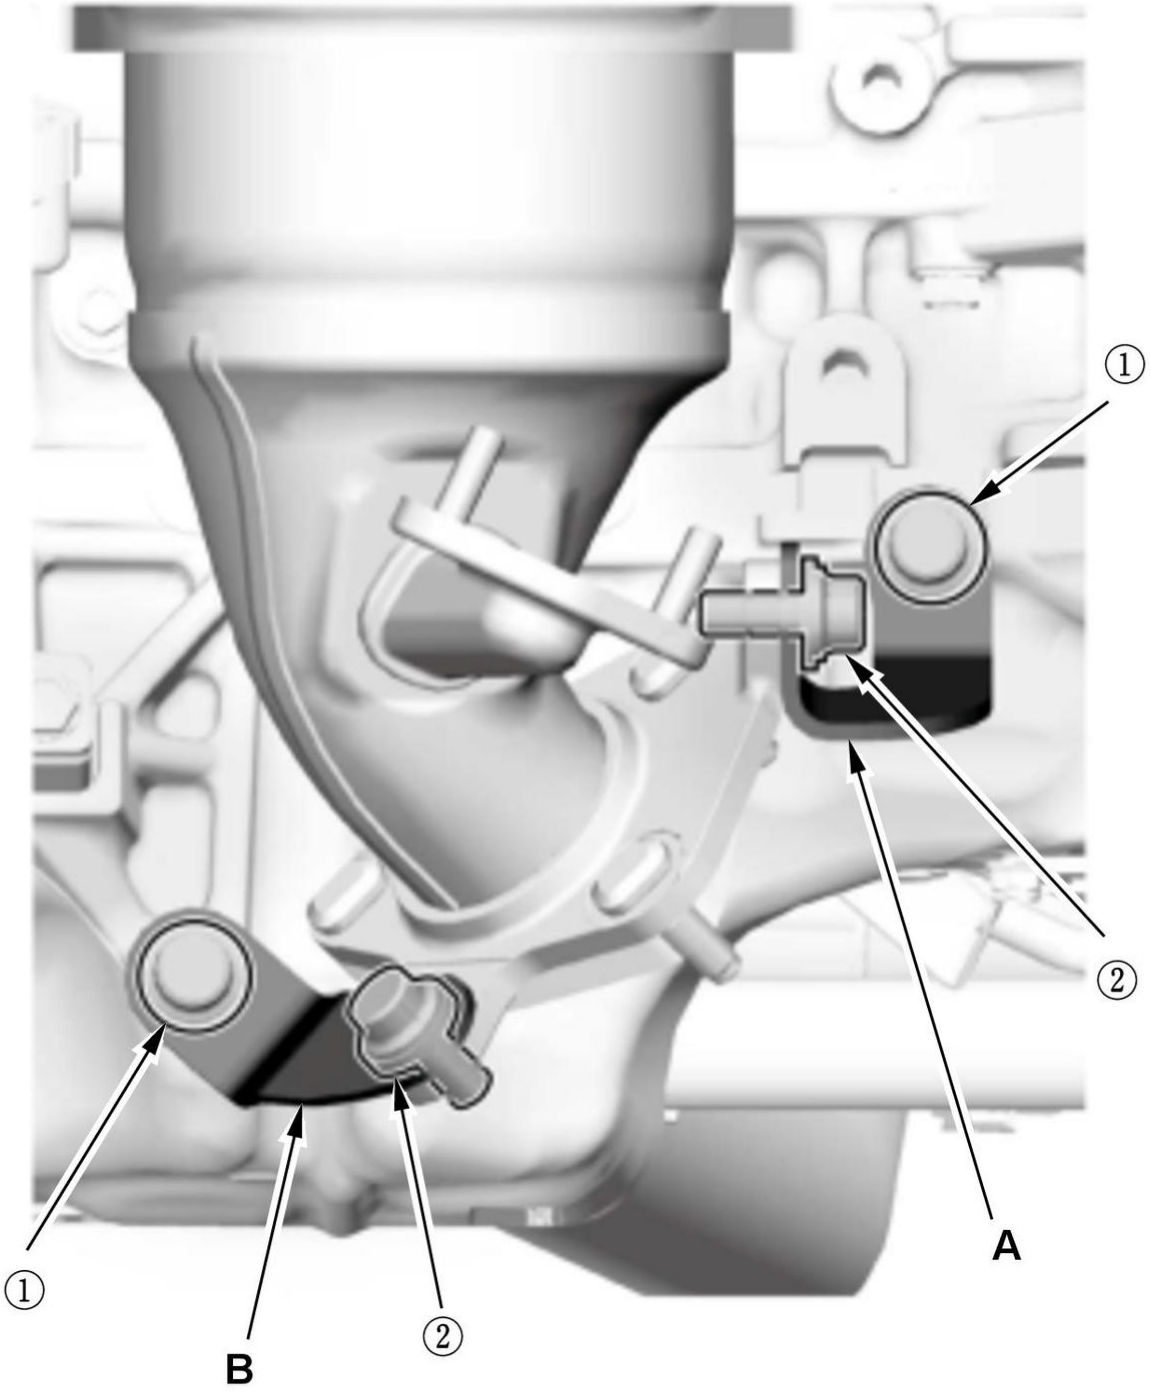

Fig. 3: TWC Brackets And Mounting Bolts With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

Note for installation

- Before installing the TWC brackets (A, B), confirm the bolts and nuts fixing the TWC to the cylinder head are tightened to the specified torque.
- Temporarily tighten all TWC bracket mounting bolts until the TWC bracket contacts to the surface of mating part, then tighten them to the specified torque in the numbered sequence shown.

7. Exhaust Chamber Cover - Remove
8. TWC Assembly - Remove

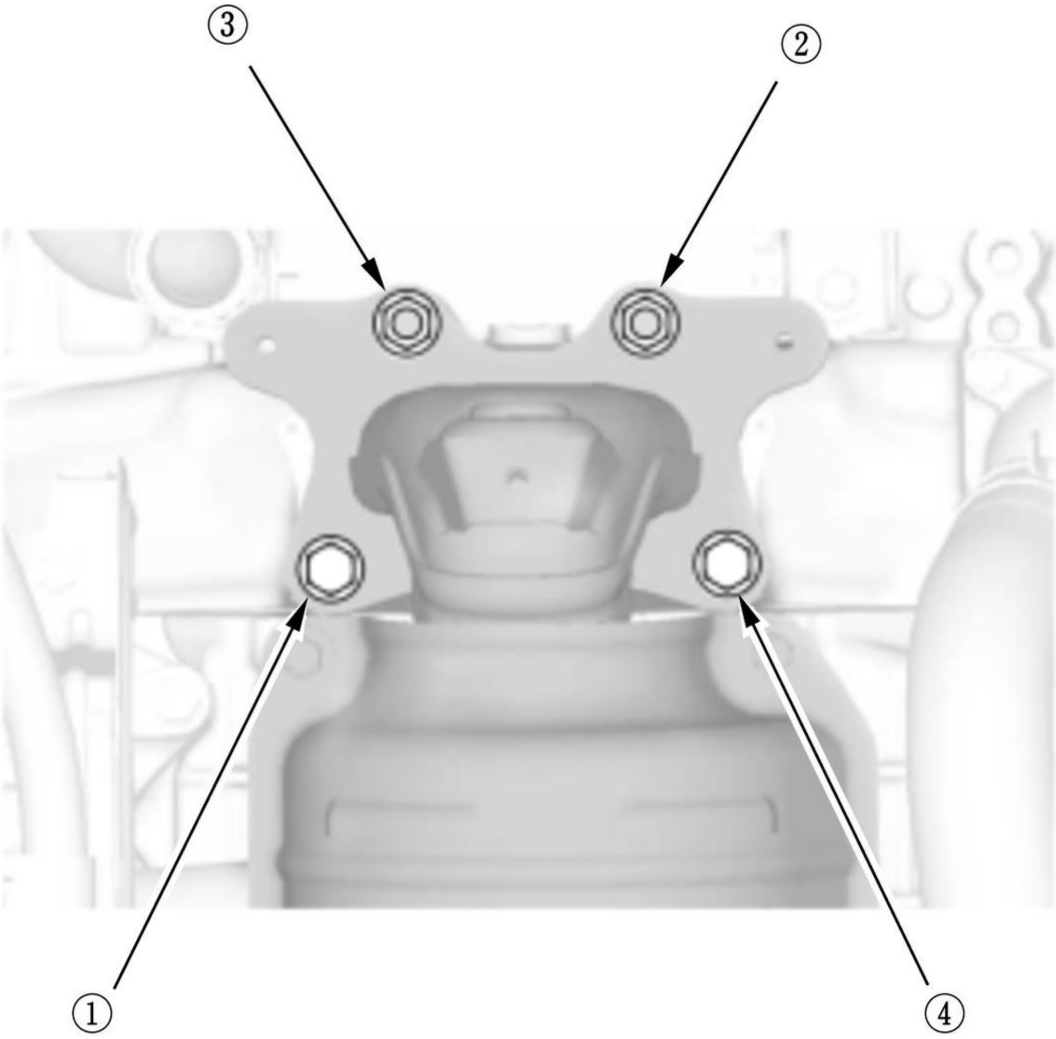

Fig. 4: TWC Assembly Mounting Bolts/Nuts With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

Note for installation

Loosely install all bolts and nuts by hand. Then tighten the warm up TWC mounting bolts and nuts in the numbered sequence shown.

9. TWC Cover - Remove (If Necessary)
10. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Inspection

1. TWC - Inspect

1. Plug up the hole(s) other than main exhaust gas route.

2. Using a flashlight visually check for plugging, melting, or cracking of the catalyst. Replace the TWC if any of the visible area is damaged or plugged.

ENGINE OIL JET AND BOLT REMOVAL, INSTALLATION, AND INSPECTION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

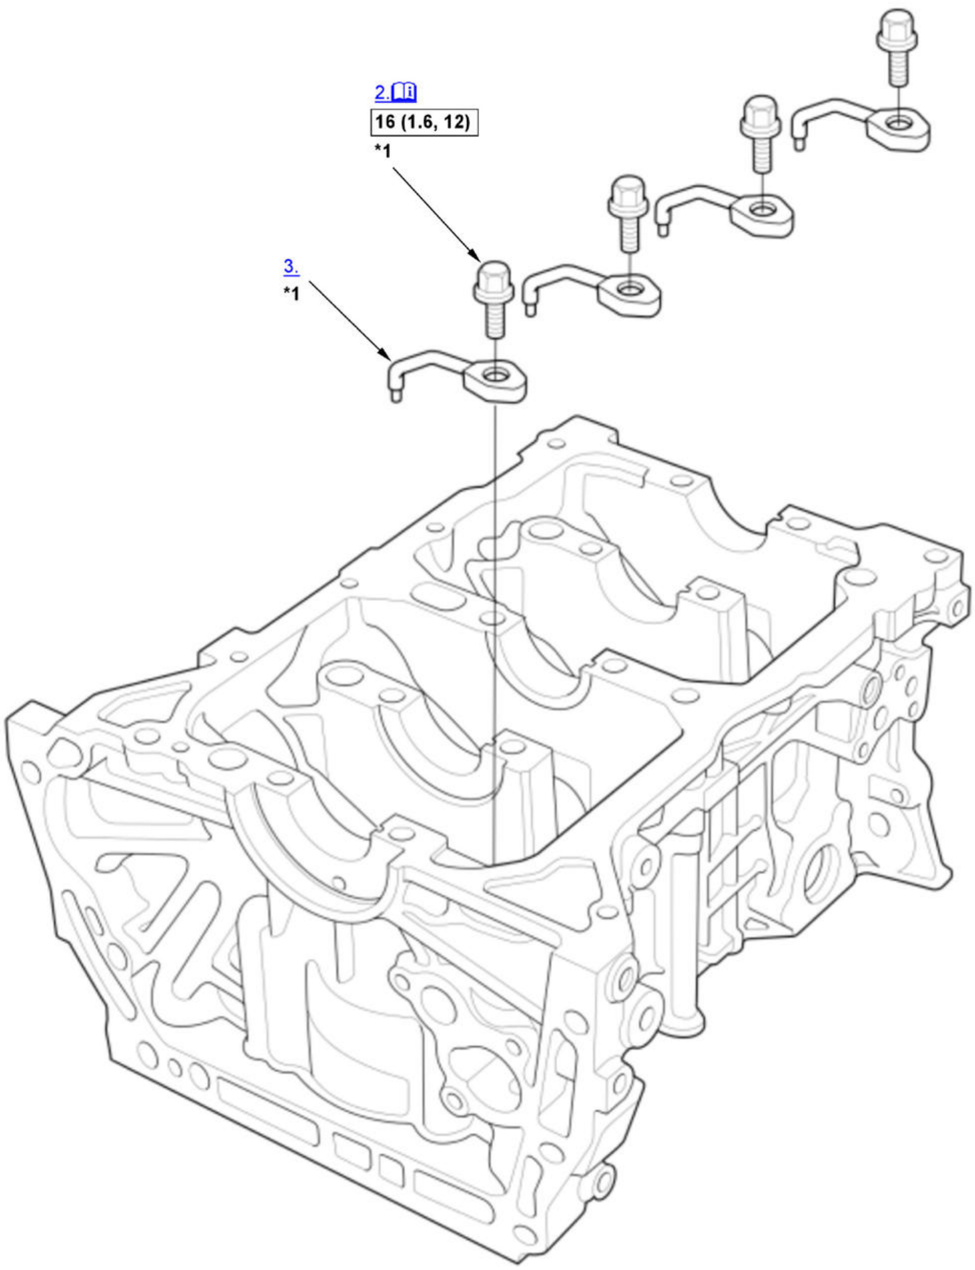

Fig. 5: Exploded View Of Engine Oil Jet And Bolt Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
*1	These parts have inspection items

1. Crankshaft - Remove
2. Oil Jet Bolt - Remove

Note for installation

Apply new engine oil to the threads and flange.

3. Oil Jet - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Inspection

1. Oil Jet and Oil Jet Bolt - Inspect

	1. Inspect the oil jet and the oil jet bolt as follows. • Make sure that a 0.7 mm (1/32 in) diameter drill bit will go through the nozzle hole (A) (0.9 mm (0.035 in) diameter). • Insert the other end of a 1.8 mm (1/16 in) drill into the oil intake (2.0 mm (0.079 in) diameter). Make sure the check ball (B) moves smoothly. • Check the oil jet operation with an air nozzle. It should take at least 132 kPa (1.35 kgf/cm^2 , 19.1 psi) to unseat the check ball. **NOTE:** Replace the oil jet, if the nozzle is damaged or bent.

PCV VALVE REMOVAL, INSTALLATION, AND INSPECTION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

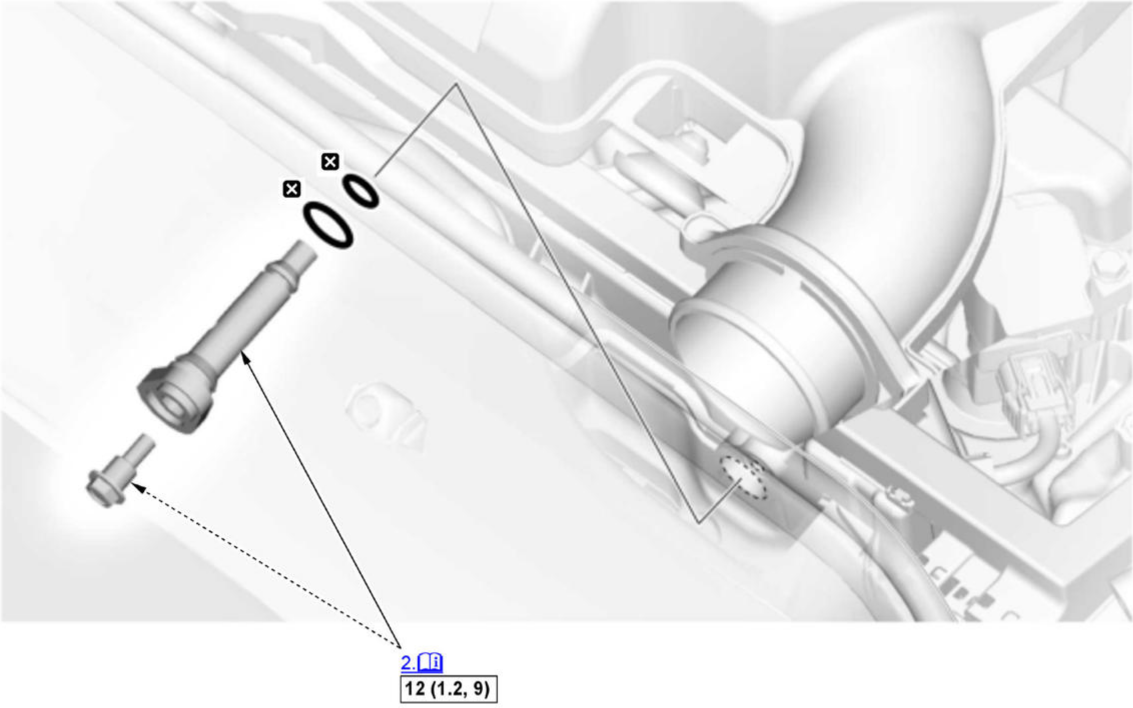

Fig. 6: Exploded View Of PCV Valve Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Air Intake Tube B - Remove
2. PCV Valve - Remove

   NOTE: Take care not to spill any oil on the hot engine.

   Note for installation

   Make sure the O-rings are in place.

3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

Inspection

1. PCV Valve - Inspect

	1. Check the PCV valve (A), the hoses (B), and their connections for leaks or restrictions.

	2. Enter the maintenance mode and start the engine. 3. At idle, make sure there is a clicking sound from the PCV valve (A) when the hose (B) between the cylinder head cover and intake manifold is lightly pinched with your fingers or pliers. If there is no clicking sound, check the O-rings for cracks or damage. If they are OK, replace the PCV valve and recheck.

Engine Rotation: Clockwise

HOW TO ENTER PGM-FI SYSTEM MAINTENANCE MODE

Procedure

1. Maintenance Mode - Enter

1. Turn the vehicle to the OFF (LOCK) mode.

NOTE: Do the following procedure within 60 seconds to start the engine in the maintenance mode.

2. Turn the vehicle to the ON mode without stepping on the brake pedal.

3. With the transmission to P position/mode, press the accelerator pedal to the floor, twice.

4. Press the brake pedal, shift the transmission to N position/mode, then press the accelerator pedal to the floor, twice.

5. Press the brake pedal, shift the transmission to P position/mode, then press the accelerator pedal to the floor, twice.

6. Press the power switch while pressing down on the brake pedal. The vehicle is now in the maintenance mode and the engine will start.

- If the engine coolant temperature gets too hot, the engine may not start until the engine coolant temperature drops.

- To turn the engine OFF and cancel the maintenance mode, turn the vehicle to the OFF (LOCK) mode.
- The VSA operates normally while the maintenance mode is in operation.
- During cold starts in maintenance mode, for about 60 seconds there may be some additional transmission noise, this is considered normal.
- When starting the engine in maintenance mode, you may hear a groan/rattle for about the first minute, or when the engine decelerates. This noise is caused by gear tolerances, when the generator is not under load. This noise is considered normal while in maintenance mode.

HOW TO SET READINESS CODES

Malfunction Indicator Lamp (MIL) Indication (In relation to Readiness Codes)

The vehicle has certain readiness codes that are part of the on-board diagnostics for the emissions systems. If the vehicle's 12 volt battery has been disconnected or gone dead, if DTCs have been cleared, or if the PCM has been reset, these readiness codes are reset to incomplete. In some states, part of the emissions testing is to make sure these codes are set to complete. If all of them are not set to complete, the vehicle may fail the emission test, or the test cannot be finished.

To check if the readiness codes are set to complete, turn the vehicle to the ON mode, but do not start the engine. The MIL comes on for 15-20 seconds. If it then goes off, the readiness codes are set to complete. If it flashes five times, one or more readiness codes are not set to complete. To set readiness codes from incomplete to complete, do the procedure for the appropriate code.

To check the status of a specific DTC system, **check the OBD status in the DTC MENU with the HDS** . This screen displays the DTC, the current data list of the enable criteria, and the status of the readiness testing.

Catalytic Converter Monitor and Readiness Code

NOTE:

- During the procedure, do not turn the vehicle to the ACCESSORY mode or the OFF (LOCK) mode.
- All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.
- Low ambient temperatures or excessive stop-and-go traffic may increase the drive time needed to switch the readiness code from incomplete to complete.
- The readiness code will not switch to complete until all the enable criteria are met.
- If a fault in the secondary HO2S system caused the MIL to come on, the readiness code cannot be set to complete until you correct the fault.

Enable Criteria

- ECT SENSOR 1 at 158B°F (70B°C) or more.
- IAT SENSOR at 20B°F (-7B°C) or more.
- Vehicle speed above 25 mph (40 km/h).

Procedure

1. **Connect the HDS to the vehicle's data link connector (DLC)**

, and bring up the READINESS CODEs screen for Catalyst in the DTCs MENU.

2. **Enter the maintenance mode, then start the engine**

3. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. After about 5 miles (8 km), the readiness code should switch to complete.

4. If the readiness code is still not set to complete, check for a Pending DTC with the HDS. If there is no DTC, one or more of the enable criteria were probably not met; repeat the procedure.

Evaporative Emission (EVAP) Control System Monitor and Readiness Code

NOTE: All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.

Enable Criteria

Refer to the following DTC.

- **P0441**
- **P0456**
- **P145E**

Procedure

Refer to the following DTC.

NOTE: Do not FUNCTION TEST with the HDS.

- **P0441**
- **P0456**
- **P145E**

Air Fuel Ratio (A/F) Sensor Monitor and Readiness Code

NOTE:

- During the procedure, do not turn the vehicle to the ACCESSORY mode or the OFF (LOCK) mode.
- All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.

Enable Criteria

ECT SENSOR 1 at 140B°F (60B°C) or more.

Procedure

1. **Enter the maintenance mode, then start the engine**.

2. Test-drive the vehicle under stop-and-go conditions with short periods of steady cruise. During the drive, decelerate (with the throttle fully closed) for 5 seconds. After about 3.5 miles (5.6 km), the readiness code should switch from incomplete to complete.

3. Check the readiness codes screen for the AIR FUEL RATIO (A/F) SENSOR in the DTCs MENU with the HDS.

- If the HDS indicates complete, readiness is complete.
- If the HDS indicates not complete, go to the next step.

4. Check for a Pending DTC. If there is no DTC, the enable criteria was probably not met. Select the DATA LIST Menu. Check ECT SENSOR 1 in the ALL DATA LIST with the HDS. If ECT SENSOR 1 is less than 140B°F (60B°C), run the engine until it is more than 140B°F (60B°C), then repeat the procedure.

Air Fuel Ratio (A/F) Sensor Heater Monitor Readiness Code

NOTE: All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.

Procedure

1. **Enter the maintenance mode, then start the engine**, and let it idle for 1 minute. The readiness code should switch from incomplete to complete.

2. If the readiness code is still not set to complete, check for a Pending DTC. If there is no DTC, repeat the procedure.

Misfire Monitor and Readiness Code

- This readiness code is always set to available because misfiring is continuously monitored.
- Monitoring pauses, and the misfire counter resets, if the vehicle is driven over a rough road.
- Monitoring also pauses, and the misfire counter holds at its current value, if the throttle position changes more than a predetermined value, or if driving conditions fall outside the range of any related enable criteria.

Fuel System Monitor and Readiness Code

- This readiness code is always set to available because the fuel system is continuously monitored during closed loop operation.
- Monitoring pauses when the catalytic converter, the EVAP control system, and the A/F sensor monitors are active.
- Monitoring also pauses when any related enable criteria are not being met. Monitoring resumes when the enable criteria is again being met.

Comprehensive Component Monitor and Readiness Code

This readiness code is always set to available because the comprehensive component monitor is continuously running whenever the engine is cranking or running.

EGR Monitor and Readiness Code

NOTE:

- During the procedure, do not turn the vehicle to the ACCESSORY mode or the OFF (LOCK) mode.
- All readiness codes are cleared when the 12 volt battery is disconnected, if DTCs have been cleared, or if the PCM is reset with the HDS.

Enable Criteria

ECT SENSOR 1 at 176B°F (80B°C) or more.

Procedure

1. **Connect the HDS to the DLC**.

2. **Enter the maintenance mode, then start the engine**.

3. Drive at a steady speed with the transmission in D at 50-62 mph (80-100 km/h) or above for more than 10 seconds.

4. With the transmission in D, decelerate from 62 mph (100 km/h) or above by completely releasing the throttle for at least 5 seconds. If the engine is stopped during this step, repeat steps 3 and 4.

5. Check the OBD status screen for DTC P0401 in the DTC's MENU with the HDS.

- If it is passed, the readiness code is complete.
- If it is not passed, go to step 3 and retest.

REWRITE

PCM UPDATE

Procedure

NOTE: High temperature in the engine compartment might cause the PCM to become too hot to run the update. If the engine has been running before this procedure, open the hood and cool the engine compartment.

1. PCM - Update
2. **CKP Pattern - Clear/Learn**

INSPECTION

APP SENSOR SIGNAL INSPECTION

Inspection

NOTE:

- This procedure checks the APP sensor in its fully closed position. In any other position, the PCM stores the APP sensor DTCs which are covered in other troubleshooting procedures.
- Check for Pending or Confirmed DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.
- Press the accelerator pedal several times to check its operation. If it does not operate smoothly, check the pedal. If you find a problem, **replace the accelerator pedal module** .

1. **HDS - Connect**
2. APP Sensor Signal - Inspect

1. Select the PGM-FI System with the HDS.

2. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.

- If it is 0 %, the APP sensor is OK.
- If it is not 0 %, **update the PCM if it does not have the latest software**, or **substitute a known-good PCM** , then go to step 3.

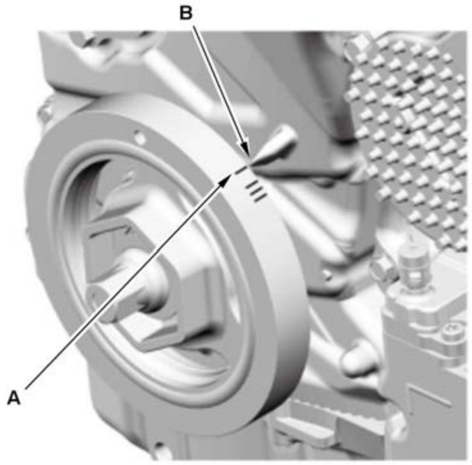
3. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.

- If it is 0 %, the APP sensor is OK.
- If it is not 0 %, **replace the accelerator pedal module** , then go to step 1.

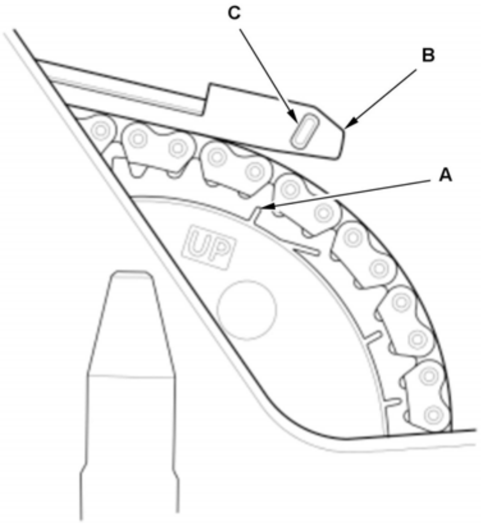
CAMSHAFT TIMING INSPECTION

Inspection

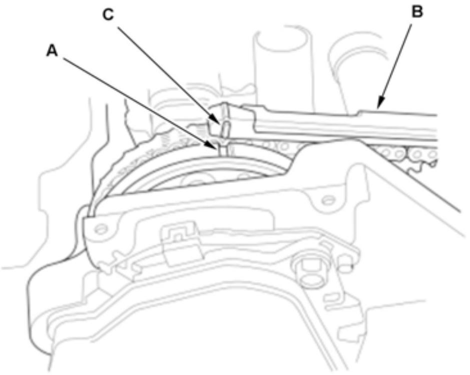
1. **Cylinder Head Cover - Remove**
2. Camshaft Timing - Inspect



1. Turn the crankshaft to align No. 1 position at top dead center (TDC); the white mark (A) on the crankshaft pulley lines up with the pointer (B).



2. Check the No. 1 piston at top dead center (TDC). The mark (A) on the exhaust camshaft sprocket should align up with the mark (C) on cam chain guide B.



3. Check the mark (A) on the VTC actuator and the mark (C) on cam chain guide B, the marks should align. If the marks are not aligned, **remove the cam chain and reinstall the cam chain properly** .

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

ENGINE COMPRESSION INSPECTION

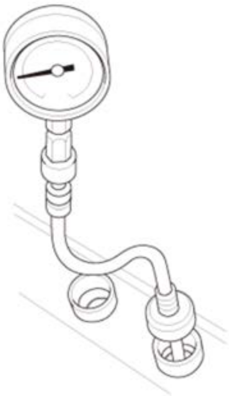
Inspection

NOTE: After this inspection, you must **reset the PCM**. Otherwise, the PCM will continue to stop the injectors from operating.

1. Engine - Warm Up

1. **Enter the maintenance mode, then start the engine**. Hold the engine speed at 3000 RPM with no load (P or N) until the cooling fan(s) comes on, then let it idle.

2. **HDS - Connect**
3. **Ignition Coil and Spark Plug - Remove**
4. Engine Compression - Inspect



1. Attach a compression gauge to the spark plug hole.

2. Select ALL INJECTORS STOP in the PGM-FI INSPECTION menu with the HDS.

NOTE:

- The engine will be driven by the electric motor when the [ENTER] button on the HDS is pressed in the HEV Engine Crank Mode.
- When measuring the compression, step on the accelerator pedal to fully open the throttle.
- Before measuring the pressure of other cylinders, make sure to press the [ENTER] button to stop the electric motor first. Remove and install the compression gauge on the next cylinder then press the [ENTER] button to restart the electric motor again.

3. Measure the compression on the remaining cylinders.

4. If the compression is not within specifications, perform a cylinder leak down test to determine the problem area. Then check the following items, and remeasure the compression:

- **Incorrect valve clearance**
- **Confirmation of camshaft timing**
- **Damaged or worn cam lobes**
- Damaged or worn valves and seats
- Damaged cylinder head gasket
- **Damaged or worn piston rings**
- **Damaged or worn piston and cylinder bore**
- **Damaged hydraulic tappet**

5. Turn the vehicle to the OFF (LOCK) mode, then remove the compression gauge from the spark plug hole.

Maximum Variation:
Within 200 kPa (2.04 kgf/cm^2 , 29.0 psi)

Compression Pressure:
Above 880 kPa (8.97 kgf/cm^2 , 127.6 psi)

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

IDLE SPEED INSPECTION

Inspection

NOTE:

- Before checking the idle speed, check these items:
-
    - The malfunction indicator lamp (MIL) has not been reported on, and there are no DTCs.
    - Spark plugs
    - Air cleaner
    - PCV system
- Apply the parking brake.

1. HDS - Connect
2. Idle Speed - Inspect

> 1. Enter the maintenance mode and start the engine
>
> 2. Hold the engine speed at 3000 RPM without load (in P or N) until the radiator fan comes on, then let it idle.
>
> 3. Check the idle speed under no load conditions: headlights, blower fan, radiator fan, audio system, and air conditioner off.**Idle speed should be: 1200 +/- 50 RPM (in P or N)**
>
> **NOTE:** If the idle speed is still not within specification, go to the symptom troubleshooting .

REPLACEMENT

TRANSMISSION END CRANKSHAFT OIL SEAL REPLACEMENT - IN CAR

Special Tools Required

Image	Description/Tool Number
	Driver Handle, 15 x 135L 07749-0010000
	Oil Seal Attachment, 96 mm 07ZAD-PNA0100 or 07ZAD-PNAA100

Replacement

NOTE: When removing the crankshaft oil seal, be careful not to damage the crankshaft and the engine block.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

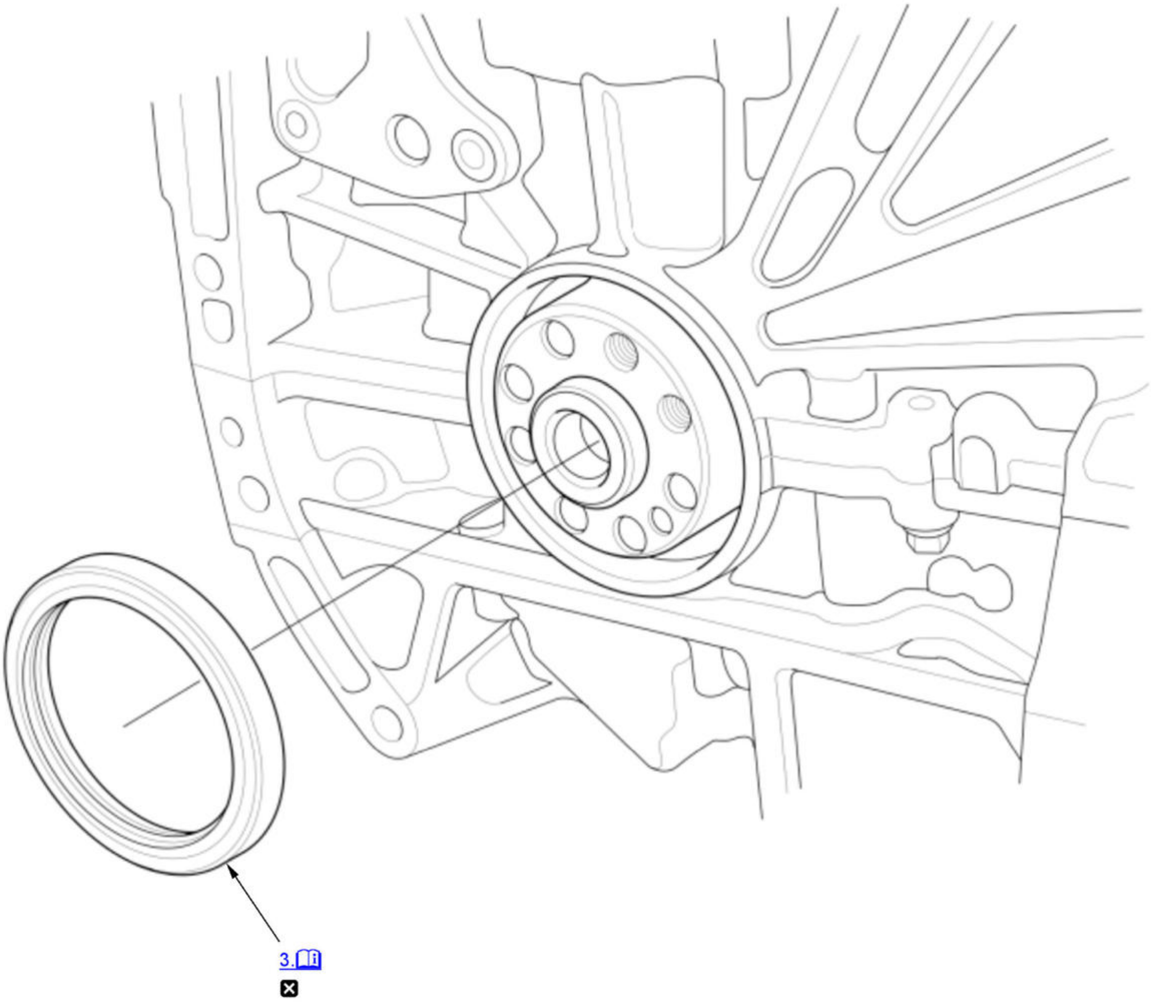


Fig. 7: Transmission End Crankshaft Oil Seal Replacement Components
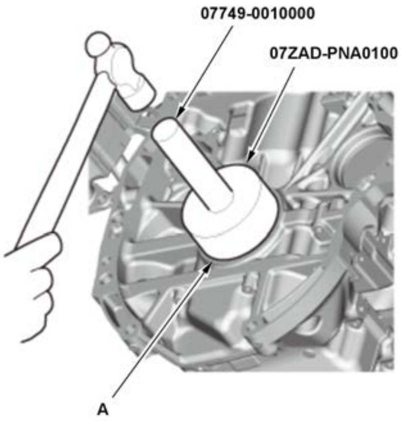
Courtesy of HONDA, U.S.A., INC.

☒	Replace

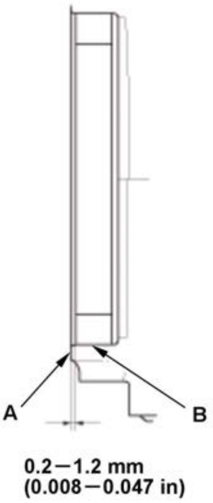
1. Transmission (e-CVT) - Remove
2. Drive Plate - Remove
3. Transmission End Crankshaft Oil Seal - Replace



1. Clean and dry the transmission end crankshaft oil seal housing.

2. Apply a light coat of new engine oil to the lip of the transmission end crankshaft oil seal.

3. Using the driver handle, 15 x 135L and the oil seal driver attachment, 96 mm, to drive the transmission end crankshaft oil seal (A) squarely into the engine block to the specified installed height.



4. Measure the distance between the lower block (A) and the transmission end crankshaft oil seal (B).

Transmission End Crankshaft Oil Seal Installed Height:

5. Clean the excess oil off the crankshaft, and check that the transmission end crankshaft oil seal lip is not distorted.

0.2-1.2 mm (0.008-0.047 in)

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SERVICING

LIQUID GASKET APPLYING PROCEDURE

Procedure

1. Liquid Gasket - Apply

1. Apply liquid gasket as shown.

NOTE:

- Remove all of the old liquid gasket of the mating surfaces of each part and clean.
- Apply liquid gasket (08718-0003, 08718-0004, or 08718-0009). Install the component within 4 minutes of applying the liquid gasket.
- If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.
- Wait at least 30 minutes before filling the engine with oil.
- Do not run the engine for at least 3 hours after installing the parts.

THROTTLE BODY REMOVAL, INSTALLATION, AND CLEANING

Removal and Installation

WARNING:

Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE:

- If you are replacing the throttle body, do the all procedures.
- If you are removing the throttle body, do the 3rd procedure (Intake Air Resonator - Remove) through the 9th procedure (Engine Coolant - Refill).

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

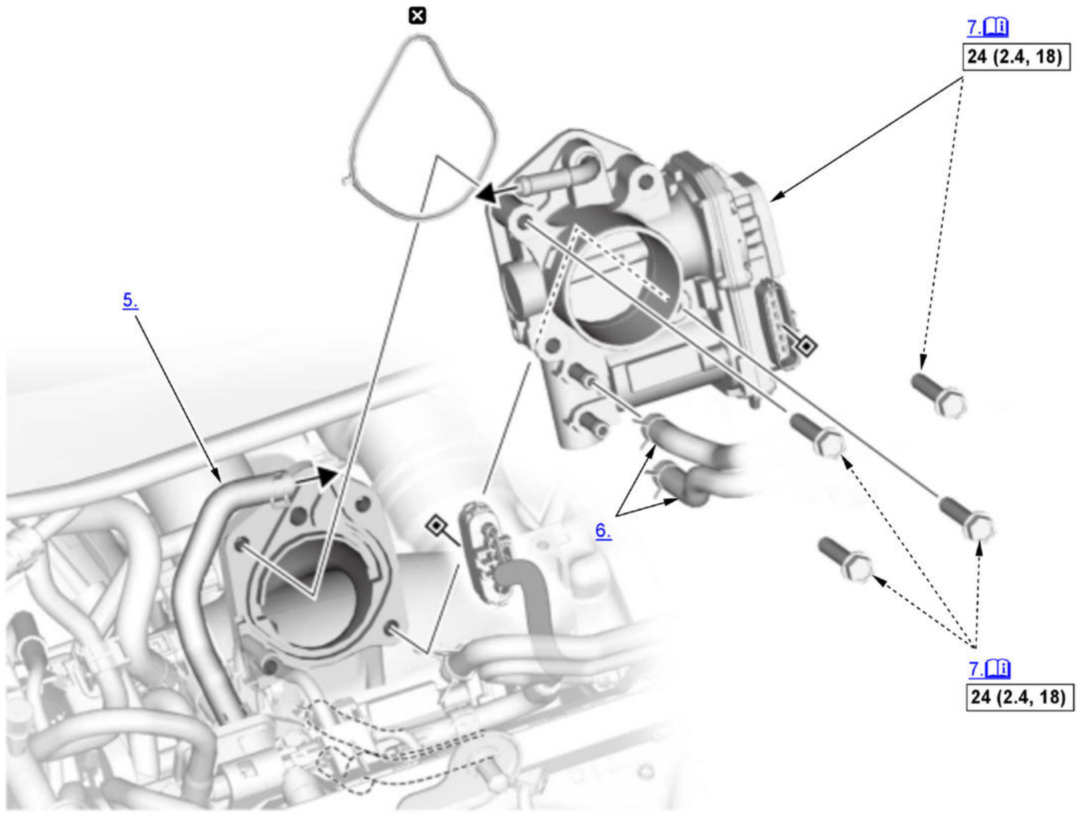

Fig. 8: Exploded View Of Throttle Body Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

☒	Replace

1. **HDS - Connect**
2. TP POSITION CHECK - Select

1. Select the PGM-FI System with the HDS. 2. Select the ETCS (TAC) TEST in the Function Test Menu with the HDS. 3. Select TP POSITION CHECK and clear the throttle position (TP) learned value. 4. Turn the vehicle to the OFF (LOCK) mode. 5. Turn the vehicle to the ON mode, and wait 2 seconds without pressing the accelerator pedal.

3. **Intake Air Resonator - Remove**
4. **Air Cleaner - Remove**
5. EVAP Purge Hose - Disconnect
6. Water Bypass Hoses - Disconnect and Plug
7. Throttle Body - Remove

Note for installation

- Tighten the throttle body mounting bolts in a cross pattern in three steps;
-
    - Tighten the bolts until they sit on the throttle body.
    - Tighten the bolts until the gasket is compressed and both parts are contacted.
    - Tighten the bolts to specified torque.

8. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

9. **Engine Coolant - Refill**
10. **PCM - Reset**

Cleaning

WARNING:

Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

1. **Air Cleaner Element - Check**
2. Throttle Body - Remove
3. Throttle Body - Clean

 This illustration shows an example.	1. Clean off the carbon from the throttle valve and inside the throttle body with a paper towel soaked in throttle plate cleaner. • Be careful not to pinch your fingers. • To avoid removing the molybdenum coating, do not clean the bearing area of the throttle shaft (A). • Do not spray throttle plate cleaner directly on the throttle body. • Use a commercially available throttle plate cleaner.

4. Throttle Body - Install
5. **HDS - Connect**
6. **PCM - Reset**
7. TP POSITION CHECK - Select

1. Select the PGM-FI System with the HDS.

2. Select the ETCS (TAC) TEST in the Function Test Menu with the HDS.

3. Select TP POSITION CHECK and clear the throttle position (TP) learned value.

4. Turn the vehicle to the OFF (LOCK) mode.

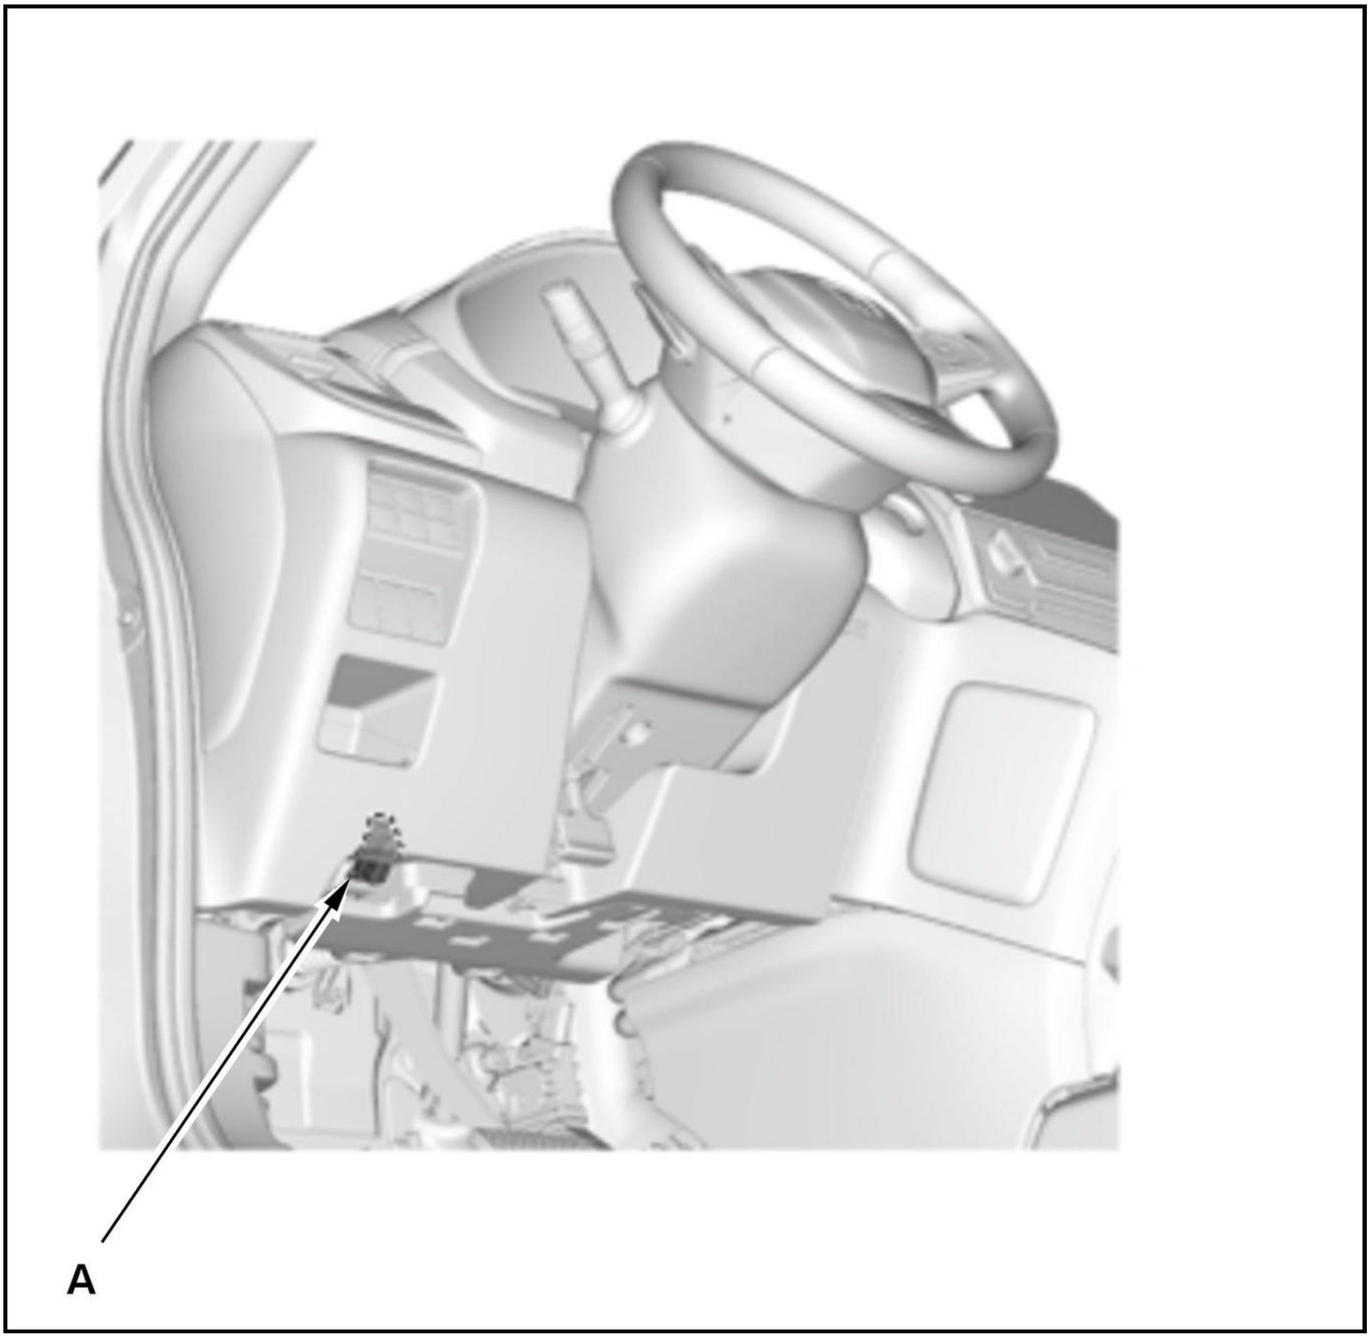
5. Turn the vehicle to the ON mode, and wait 2 seconds without pressing the accelerator pedal.

HOW TO INFORMATION

HOW TO CONNECT THE HDS

1. Turn the vehicle to the OFF (LOCK) mode.

2. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.



3. Turn the vehicle to the ON mode, but do not turn the vehicle to the READY TO DRIVE mode.

4. Activate the HDS, then make sure the HDS communicates with the PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting

.

TEST

VTEC ROCKER ARM TEST

Special Tools Required

Image	Description/Tool Number
	Air Pressure Regulator 07AAJ-PNAA101
	VCM Air Adapter 070AJ-001A101

Test

1. **Cylinder Head Cover - Remove**
2. VTEC Rocker Arm - Test

	1. Rotate the crankshaft pulley clockwise. Make sure that the intake secondary rocker arm (A), intake primary rocker arm (B), and the intake mid rocker arm (C) are separated and that the intake secondary rocker arm and the intake mid rocker arm should move independently: - If the mid, primary and secondary rocker arms move together, remove the mid, primary, and secondary rocker arms as an assembly, and check that the pistons in the rocker arms move smoothly. If any rocker arm needs replacing, replace the mid, primary, and secondary rocker arms as an assembly, then retest. - If the secondary rocker arm moves independently, go to step 2. 2. Check that the air pressure on the shop air compressor gauge indicates over 400 kPa (4.08 kgf/cm^2 , 58.0 psi). 3. **Inspect the valve clearance** .

	4. Install the VTEC air adapter to the inspection hole. 5. Connect the air supply. 6. Loosen the valve on the air supply, and apply the specified air pressure.

Specified Air Pressure:
290 kPa (2.96 kgf/cm^2 , 42.1 psi)

	7. With the specified air pressure applied, rotate the crankshaft pulley clockwise. The secondary rocker arm (A) should move together with the mid rocker arm (B) and the primary rocker arm (C): • If the mid, primary, and secondary rocker arms move independently, remove the mid, primary, and the secondary rocker arms as an assembly, and check that the pistons in the rocker arms move smoothly. If any rocker arm needs replacing, replace the mid, primary, and secondary rocker arms as an assembly, then retest. • If the mid, primary, and secondary rocker arms move together, go to step 8. 8. Remove the air supply and the VTEC air adapter.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Terminal number	Terminal name	Description
1	Not used	B
2	Not used	B
3	IG1_MISS_SOL (POWER SOURCE FOR SOLENOID VALVES)	Power source for solenoid valves
4	SO2HT (SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S) (SENSOR 2) HEATER CONTROL)	Drives secondary HO2S (Sensor 2) heater
5	FI_MAIN_RLY_CL- (PGM-FI MAIN RELAY 1/IGNITION COIL RELAY)	Drives PGM-FI main relay 1 and ignition coil relay
6	CCV (EVAP CANISTER CHANGE OVER VALVE)	Drives EVAP canister change over valve
7	+B_BACKUP_FI-ECU (VOLTAGE BACK UP)	Power source for PCM memory
8	FI_MAIN_RLY_OUT (POWER SOURCE)	Power source for PCM
9	Not used	B
10	LIN (BATT_SENSOR) (LOCAL INTERCONNECT NETWORK)	Sends and receives communication signal
11	FUEL_PUMP_RLY_CL- (IMMOBILIZER FUEL PUMP RELAY)	Drives PGM-FI main relay 2
12	PADDLE_SW_UP (PADDLE SHIFTER +)	Detects paddle shifter + signal
13	FI_ECU_GND (GROUND)	Ground for PCM
14	ATP-R (REVERSE RELAY)	Drives reverse relay
15	Not used	B
16	FI_SUB_RLY_OUT (POWER SOURCE)	Power source for PCM
17	FAN_CONTROL (RFC UNIT CONTROL)	Drives RFC unit
18	FAN_LO_SIGNAL (RFC RELAY)	Drives RFC relay

Terminal number	Terminal name	Description
19	ELCMP (EVAP LEAK CHECK MODULE VACUUM PUMP)	Drives ELCM vacuum pump
20	EP-CAN A_L (CAN COMMUNICATION SIGNAL LOW)	Sends and receives communication signal
21	EP-CAN A_H (CAN COMMUNICATION SIGNAL HIGH)	Sends and receives communication signal
22	Not used	B
23	Not used	B
24	ENG W/PUMP RLY CL- (ENGINE EWP RELAY)	Drives engine EWP relay
25	FI_SUB_RLY_CL- (PGM-FI SUBRELAY)	Drives PGM-FI subrelay
26	STOP_SW (BRAKE PEDAL POSITION SWITCH)	Detects brake pedal position switch signal
27	SCS (SERVICE CHECK SIGNAL)	Detects service check signal
28	STS (STARTER SWITCH SIGNAL)	Detects starter switch signal
29	PADDLE_SW_DOWN (PADDLE SHIFTER -)	Detects paddle shifter - signal
30	EVTC_RLY_CL- (ELECTRIC VTC RELAY)	Drives electric VTC relay
31	Not used	B
32	APS1 (ACCELERATOR PEDAL POSITION (APP) SENSOR A)	Detects APP sensor A signal
33	PD_SENSOR (A/C PRESSURE SENSOR)	Detects A/C pressure sensor signal
34	APS2 (ACCELERATOR PEDAL POSITION (APP) SENSOR B)	Detects APP sensor B signal
35	VSP (VEHICLE SPEED SIGNAL OUTPUT)	Sends vehicle speed signal
36	F-CAN A_L (CAN COMMUNICATION SIGNAL LOW)	Sends and receives communication signal
37	F-CAN A_H (CAN COMMUNICATION SIGNAL HIGH)	Sends and receives communication signal
38	F-CAN B_L (CAN COMMUNICATION SIGNAL LOW)	Sends and receives communication signal
39	F-CAN B_H (CAN COMMUNICATION SIGNAL HIGH)	Sends and receives communication signal
40	S-NET (SERIAL COMMUNICATION FOR IMMOBILIZER)	Sends serial communication signal
41	Not used	B
42	ELCMPA (EVAP LEAK CHECK MODULE PRESSURE SENSOR)	Detects ELCM pressure sensor signal
43	SG5 (SENSOR GROUND)	Sensor ground
44	VCC5 (SENSOR VOLTAGE)	Provides sensor reference voltage
45	VCC4 (SENSOR VOLTAGE)	Provides sensor reference voltage
46	SG4 (SENSOR GROUND)	Sensor ground
47	SO2 (SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S) (SENSOR 2))	Detects secondary HO2S (Sensor 2) signal
48	SO2_SG (SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S) (SENSOR 2) SENSOR GROUND)	Sensor ground for secondary HO2S (Sensor 2)
49	BKSWNC (BRAKE PEDAL POSITION SWITCH)	Detects brake pedal position switch signal
50	Not used	B

PCM Connector E (80P) (female terminals)

Terminal number	Terminal name	Description
1	Not used	B
2	Not used	B
3	Not used	B
4	Not used	B
5	Not used	B
6	Not used	B
7	Not used	B
8	Not used	B
9	Not used	B
10	EEGR (EXHAUST GAS RECIRCULATION (EGR) VALVE)	Drives EGR valve
11	Not used	B
12	Not used	B
13	AFHT (AIR FUEL RATIO (A/F) SENSOR (SENSOR 1) HEATER CONTROL)	Drives A/F sensor (Sensor 1) heater
14	Not used	B
15	Not used	B
16	Not used	B
17	Not used	B
18	INJ_1 (No. 1 INJECTOR)	Drives No. 1 injector
19	INJ_4 (No. 4 INJECTOR)	Drives No. 4 injector
20	INJ_3 (No. 3 INJECTOR)	Drives No. 3 injector
21	INJ_2 (No. 2 INJECTOR)	Drives No. 2 injector
22	GND_4 (GROUND)	Ground for PCM
23	GND_3 (GROUND)	Ground for PCM

Terminal number	Terminal name	Description
24	GND_2 (GROUND)	Ground for PCM

Terminal number	Terminal name	Description
25	SHB (SHIFT SOLENOID VALVE B)	Drives shift solenoid valve B
26	SHA (SHIFT SOLENOID VALVE A)	Drives shift solenoid valve A
27	MTR1 (THROTTLE ACTUATOR)	Drives throttle actuator
28	MTR2 (THROTTLE ACTUATOR)	Drives throttle actuator
29	EWP_C (SWP) (ELECTRIC ENGINE COOLANT PUMP CONTROL)	Sends electric engine coolant pump control signal
30	EVTS (ELECTRIC VTC REVOLUTION SENSOR)	Detects electric VTC revolution sensor signal
31	EVTP (ELECTRIC VTC CONTROL SIGNAL)	Sends electric VTC control signal
32	PARKBUSY (COMMUNICATION SIGNAL FOR PARK PAWL ACTUATOR DRIVER UNIT)	Detects PARK position signal
33	PODCL (TRANSMISSION FLUID PRESSURE SENSOR)	Detects transmission fluid pressure sensor signal
34	KSGND (KNOCK SENSOR GROUND)	Sensor ground for knock sensor
35	KS (KNOCK SENSOR)	Detects knock sensor signal
36	IG1 (MONI) (IGNITION SIGNAL)	Detects ignition signal
37	IGN01A (No. 1 IGNITION COIL PULSE)	Drives No. 1 ignition coil
38	IGN02A (No. 2 IGNITION COIL PULSE)	Drives No. 2 ignition coil
39	IGN03A (No. 3 IGNITION COIL PULSE)	Drives No. 3 ignition coil
40	IGN04A (No. 4 IGNITION COIL PULSE)	Drives No. 4 ignition coil
41	CAM (CAMSHAFT POSITION (CMP) SENSOR A)	Detects CMP sensor A signal
42	Not used	B
43	TDC (CAMSHAFT POSITION (CMP) SENSOR B)	Detects CMP sensor B signal
44	CRKP (CRANKSHAFT POSITION (CKP) SENSOR)	Detects CKP sensor signal
45	SG6 (SENSOR GROUND)	Sensor ground
46	EVTD (ELECTRIC VTC REVOLUTION SENSOR)	Detects electric VTC revolution sensor signal
47	Not used	B
48	IP (AIR FUEL RATIO (A/F) SENSOR (SENSOR 1) IP CELL)	Detects A/F sensor (Sensor 1) pump cell signal
49	Not used	B
50	THL1 (THROTTLE POSITION (TP) SENSOR A)	Detects TP sensor A signal
51	THL2 (THROTTLE POSITION (TP) SENSOR B)	Detects TP sensor B signal
52	TW (ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1)	Detects ECT sensor 1 signal
53	TA (INTAKE AIR TEMPERATURE (IAT) SENSOR 1)	Detects IAT sensor 1 signal
54	TW2 (ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2)	Detects ECT sensor 2 signal

Terminal number	Terminal name	Description
55	INTA (INTAKE AIR TEMPERATURE (IAT) SENSOR 2)	Detects IAT sensor 2 signal
56	MAP (PB) (MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR)	Detects MAP sensor signal
57	EVTM (ELECTRIC VTC DIAGNOSIS)	Detects electric VTC diagnosis signal
58	OPSEN (ENGINE OIL PRESSURE SENSOR)	Detects engine oil pressure sensor signal
59	POIL (ROCKER ARM OIL PRESSURE SENSOR)	Detects rocker arm oil pressure sensor signal
60	EWP_REV (NWP) (ELECTRIC ENGINE COOLANT PUMP)	Detects electric engine coolant pump revolution signal
61	VGP (MASS AIR FLOW (MAF) SENSOR + SIDE)	Detects MAF sensor signal
62	VGM (MASS AIR FLOW (MAF) SENSOR - SIDE)	Ground for MAF sensor signal
63	VCC6 (SENSOR VOLTAGE)	Provides sensor reference voltage
64	PARKCMD (COMMUNICATION SIGNAL FOR PARK PAWL ACTUATOR DRIVER UNIT)	Sends PARK position switching signal
65	VTS (ROCKER ARM OIL CONTROL SOLENOID)	Drives rocker arm oil control solenoid
66	NGENPLS (GENERATOR ROTOR PULSE)	Detects generator rotor rotation pulse
67	Not used	B
68	Not used	B
69	EGRL (EXHAUST GAS RECIRCULATION (EGR) VALVE POSITION SENSOR)	Detects EGR valve position sensor signal
70	VCC1 (SENSOR VOLTAGE)	Provides sensor reference voltage

Terminal number	Terminal name	Description
71	SG1 (SENSOR GROUND)	Sensor ground
72	Not used	B
73	VS (AIR FUEL RATIO (A/F) SENSOR (SENSOR 1) VS CELL)	Detects A/F sensor (Sensor 1) VS cell signal
74	VCENT (AIR FUEL RATIO (A/F) SENSOR (SENSOR 1) VIRTUAL GROUND)	Provides reference voltage for A/F sensor (Sensor 1)
75	VCC3 (DBW) (SENSOR VOLTAGE)	Provides sensor reference voltage
76	SG3 (DBW) (SENSOR GROUND)	Sensor ground
77	VCC2 (SENSOR VOLTAGE)	Provides sensor reference voltage
78	SG2 (SENSOR GROUND)	Sensor ground
79	PCS2 (EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VALVE 2)	Drives EVAP canister purge valve 2
80	PCS1 (EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VALVE 1)	Drives EVAP canister purge valve 1

CHECK

THROTTLE BODY CARBON ACCUMULATION CHECK

Test

1. **HDS - Connect**

2. Throttle Body - Test

1. **Enter the maintenance mode and start the engine**

2. Hold the engine speed at 3000 RPM without load (in P or N) until the radiator fan comes on, then let it idle.

3. Select the PGM-FI System with the HDS.

4. Check the SOC in the DATA LIST with the HDS. If the reading is below 35%, keep idling until the SOC reaches 35%.

5. Check the REL TP SENSOR in the DATA LIST with the HDS. The reading should be below 2.97B°. If it is not, **clean the throttle body**

.

TROUBLESHOOTING

MIL CIRCUIT TROUBLESHOOTING

MIL Circuit Troubleshooting

1. Gauge control module check

-1. Turn the vehicle to the ON mode.

-2. **Do the gauge control module self-diagnostic function** .

Does the MIL flash?

YES

Go to step 2.

NO

Substitute a known-good gauge control module , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

2. PCM check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Connect the HDS to the DLC**.

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
SCS	Short	B	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

3. Shorted wire check (SCS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Disconnect the HDS from the DLC.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 27**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The SCS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the SCS wire between the PCM (A27) and the DLC.

PCM POWER AND GROUND CIRCUIT TROUBLESHOOTING

PCM Power and Ground Circuit Troubleshooting

1. Engine starting check

-1. **Enter the maintenance mode, then try to start the engine**.

Does the engine start and idle smoothly?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 2.

2. Fuse check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A12**

Is the fuse OK?

YES

Go to step 3.

NO

Go to step 4.

3. Determine possible failure area (+B_BACKUP_FI-ECU line, others)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 7**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 5.

NO

Repair an open in the +B_BACKUP_FI-ECU wire between PCM (A7) and the **No. A12 fuse** .

4. Shorted wire check (+B_BACKUP_FI-ECU line)

-1. Remove the blown **No. A12 fuse** .

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 7**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 5.

NO

Repair a short in the +B_BACKUP_FI-ECU wire between the PCM (A7) and the No. A12 fuse. Also replace the No. A12 fuse.

5. Fuse check 2

-1. Check the following fuse.

Fuse	**No. A7**

Is the fuse OK?

YES

Go to step 9.

NO

Go to step 6.

6. Shorted wire check (+B_IGP line)

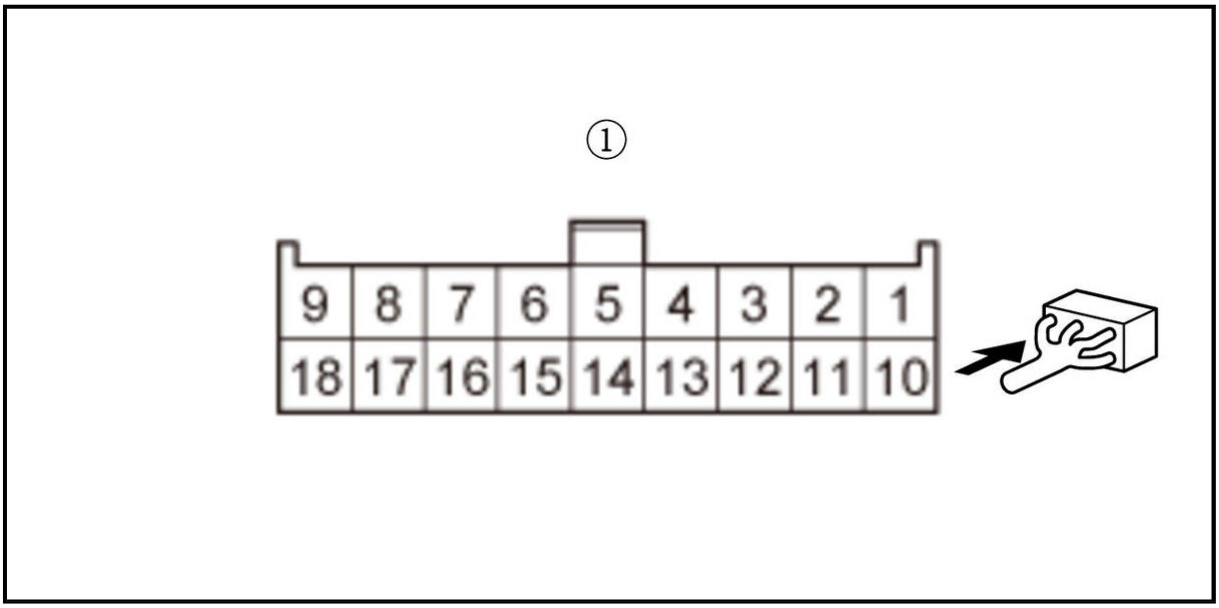
-1. Remove the blown **No. A7 fuse** .

-2. Disconnect the following connector.

Relay circuit board connector C (18P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 18: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 7.

NO

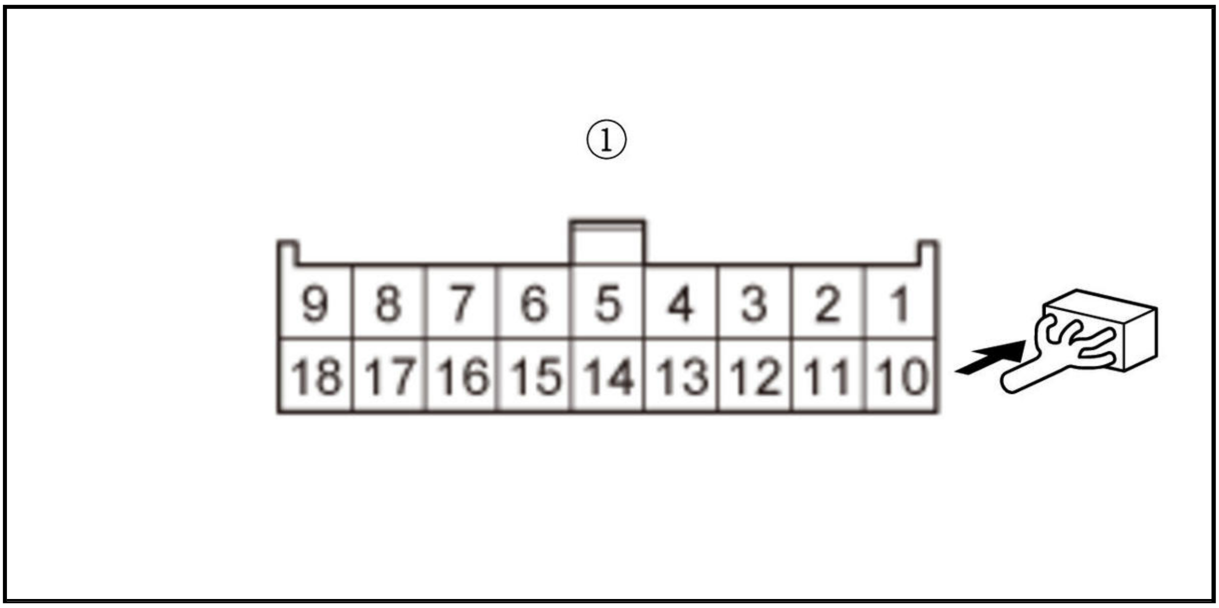
Repair a short in the +B_IGP wire between the No. A7 fuse and the relay circuit board. If the wire is OK, **replace the under-hood fuse/relay box** . Also replace the No. A7 fuse.

7. Part(s) internal circuit check (short in FI_MAIN_RLY_OUT line):

Disconnect each of the parts or connectors below, one at a time, then check for continuity between test points 1 and 2.

- PGM-FI main relay 2
- PCM connector A (50P)
- Each injector 2P connector

Test condition	Vehicle OFF (LOCK) mode Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	Body ground



Does continuity go away when one of the above components is disconnected?

YES

Replace the part that made the short to body ground go away when it was disconnected. If the part is the PCM, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** . Also replace the **No. A7 fuse** .

NO

Parts are OK. Go to step 8.

8. Shorted wire check (FI_MAIN_RLY_OUT line):

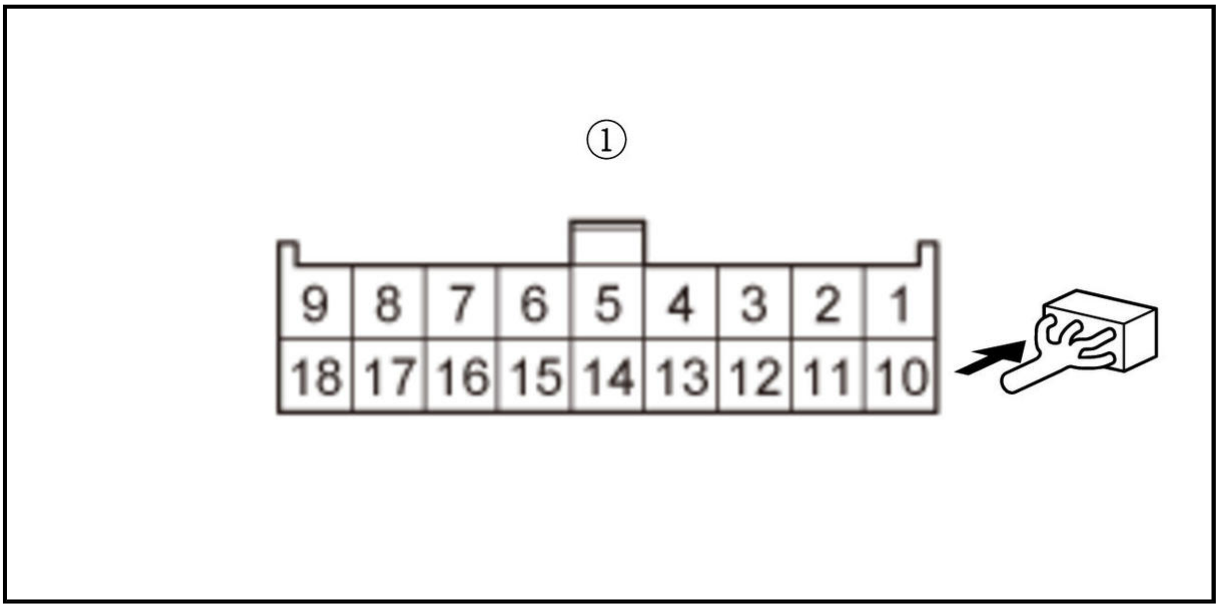
Disconnect the following parts or connectors:

- PGM-FI main relay 2
- PCM connector A (50P)

- Each injector 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board connector C (18P): disconnected
B	PGM-FI main relay 2: disconnected
B	PCM connector A (50P): disconnected
B	Each injector 2P connector: disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The FI_MAIN_RLY_OUT wire is OK. **Replace the relay circuit board** . Also replace the **No. A7 fuse** .

NO

Repair a short in the FI_MAIN_RLY_OUT wire between the relay circuit board and each part. Also replace the No. A7 fuse.

9. Fuse check 3

-1. Check the following fuse.

Fuse	**No. D8**

Is the fuse OK?

YES

Go to step 14.

NO

Go to step 10.

10. Relay check

-1. **Remove PGM-FI main relay 2** .

-2. **Test PGM-FI main relay 2** .

Is the relay OK?

YES

PGM-FI main relay 2 is OK. Go to step 11.

NO

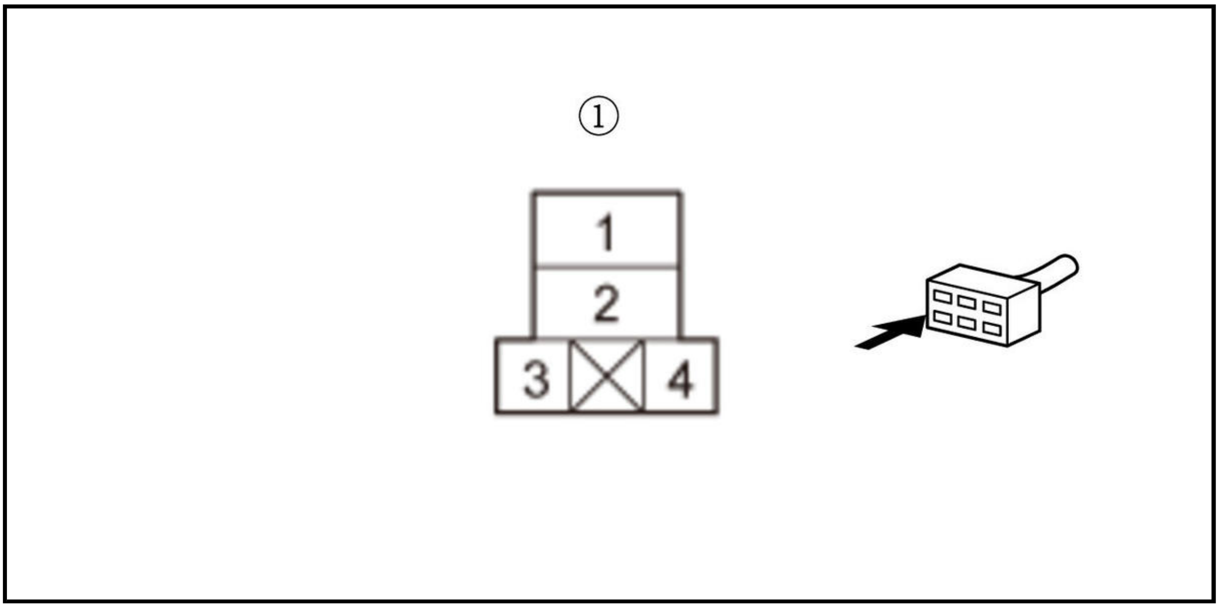
Replace PGM-FI main relay 2. Also replace the **No. D8 fuse** .

11. Determine possible failure area (IG1_FUEL_PUMP line, others)

-1. Remove the blown **No. D8 fuse** .

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 13.

NO

Go to step 12.

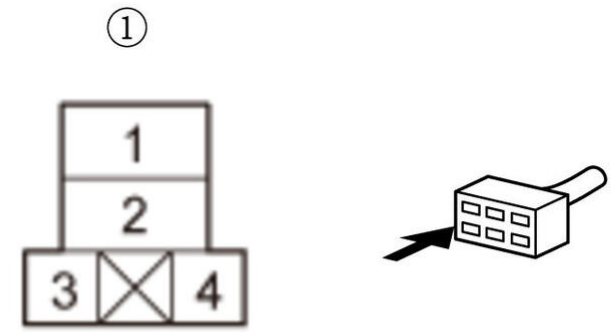
12. Shorted wire check (IG1_FUEL_PUMP line)

-1. Disconnect the following connector.

Under-dash fuse/relay box connector C (27P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
B	Under-dash fuse/relay box connector C (27P): disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The IG1_FUEL_PUMP wire is OK. Replace the **No. D8 fuse** . If the fuse blown again, **replace the under-dash fuse/relay box** .

NO

Repair a short in the IG1_FUEL_PUMP wire between PGM-FI main relay 2 and the No. D8 fuse. Also replace the No. D8 fuse.

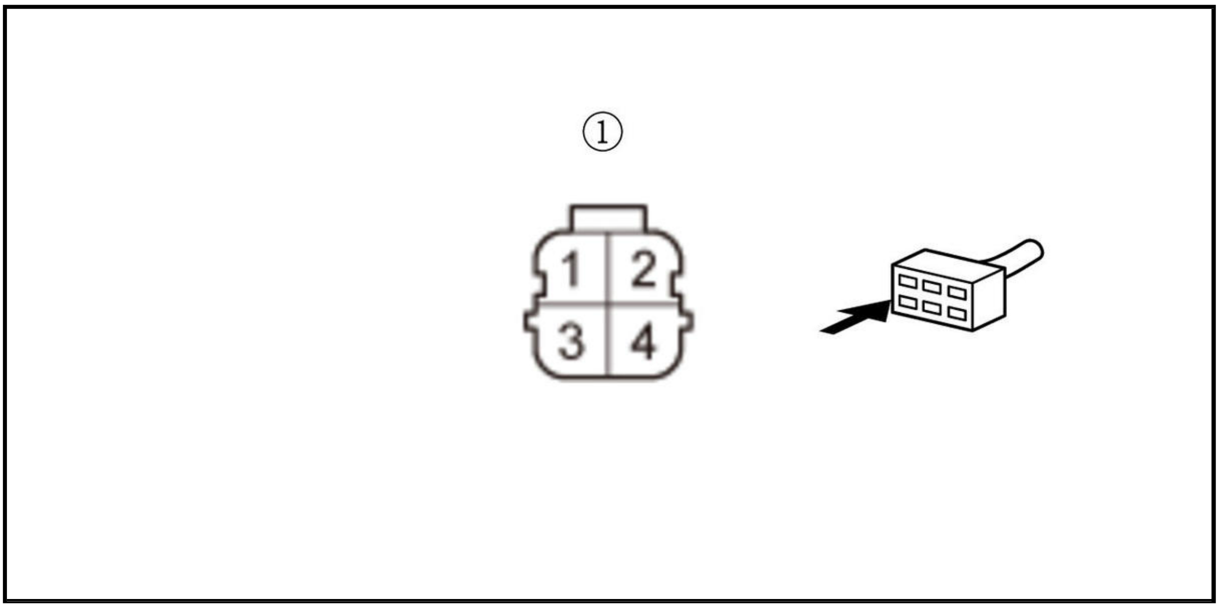
13. Shorted wire check (FUEL_PUMP_RLY_OUT line)

-1. Disconnect the following connector.

Fuel tank unit 4P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
B	Fuel tank unit 4P connector: disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The FUEL_PUMP_RLY_OUT wire is OK. Check the fuel pump, and **replace it** if needed. Also replace the **No. D8 fuse** .

NO

Repair a short in the FUEL_PUMP_RLY_OUT wire between PGM-FI main relay 2 and the fuel tank unit. Also replace the No. D8 fuse.

14. Open wire check (IG1_FUEL_PUMP line)

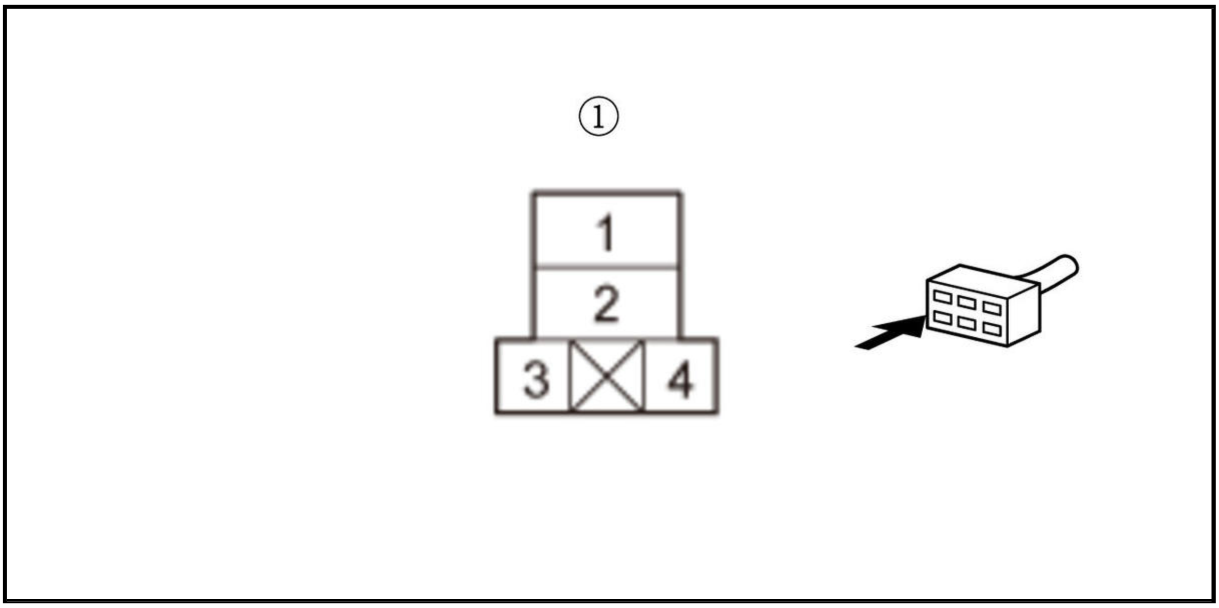
-1. **Remove PGM-FI main relay 2** .

-2. Exit the SCS mode with the HDS.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1_FUEL_PUMP wire is OK. Go to step 15.

NO

Repair an open in the IG1_FUEL_PUMP wire between the **No. D8 fuse** and PGM-FI main relay 2.

15. Fuse check 4

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. D11**

Is the fuse OK?

YES

Go to step 17.

NO

Go to step 16.

16. Shorted wire check (IG1 (MONI)/IG1_MON line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected

B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 36**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The IG1 (MONI)/IG1_MON wire is not shorted. Go to step 18.

NO

Repair a short in the IG1 (MONI)/IG1_MON wire between the PCM (E36) and the **No. D11 fuse** . Also replace the No. D11 fuse.

17. Open wire check (IG1 (MONI)/IG1_MON line)

-1. Reinstall the **No. D11 fuse** .

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 36**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 (MONI)/IG1_MON wire is OK. Go to step 18.

NO

Repair an open in the IG1 (MONI)/IG1_MON wire between the PCM (E36) and the No. D11 fuse.

18. Determine possible failure area (PGM-FI main relay 1 control circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector A (50P) No. 5**

Test point 2	Body ground

Is there battery voltage?

YES

Go to step 21.

NO

Go to step 19.

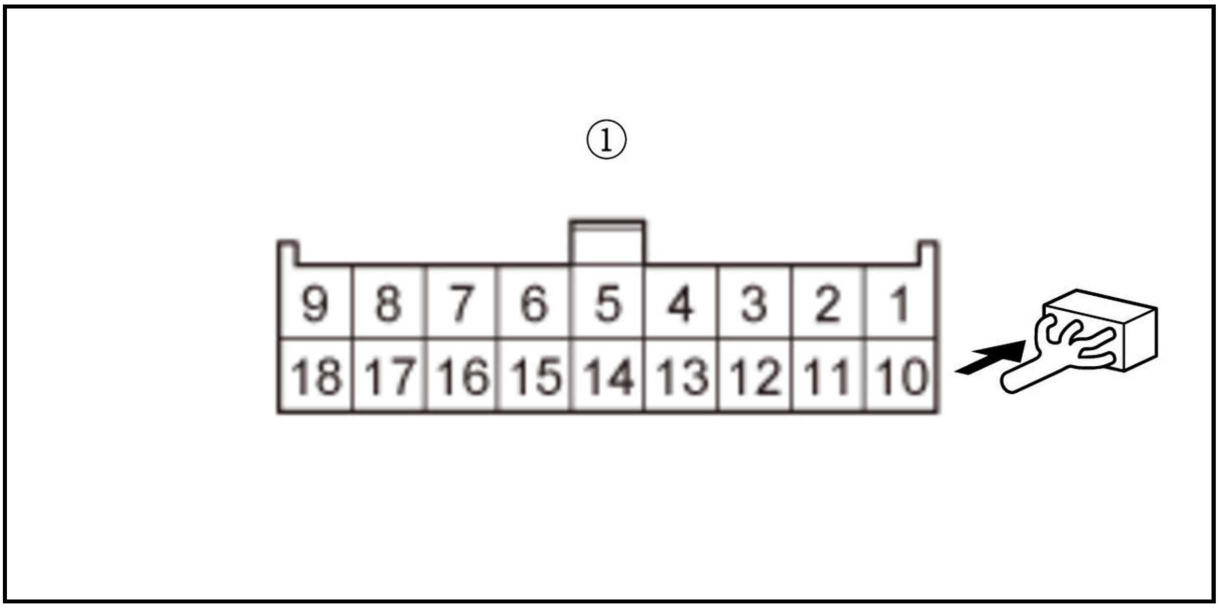
19. Open wire check (+B_IGP line)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
B	PCM connector E (80P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 18: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 20.

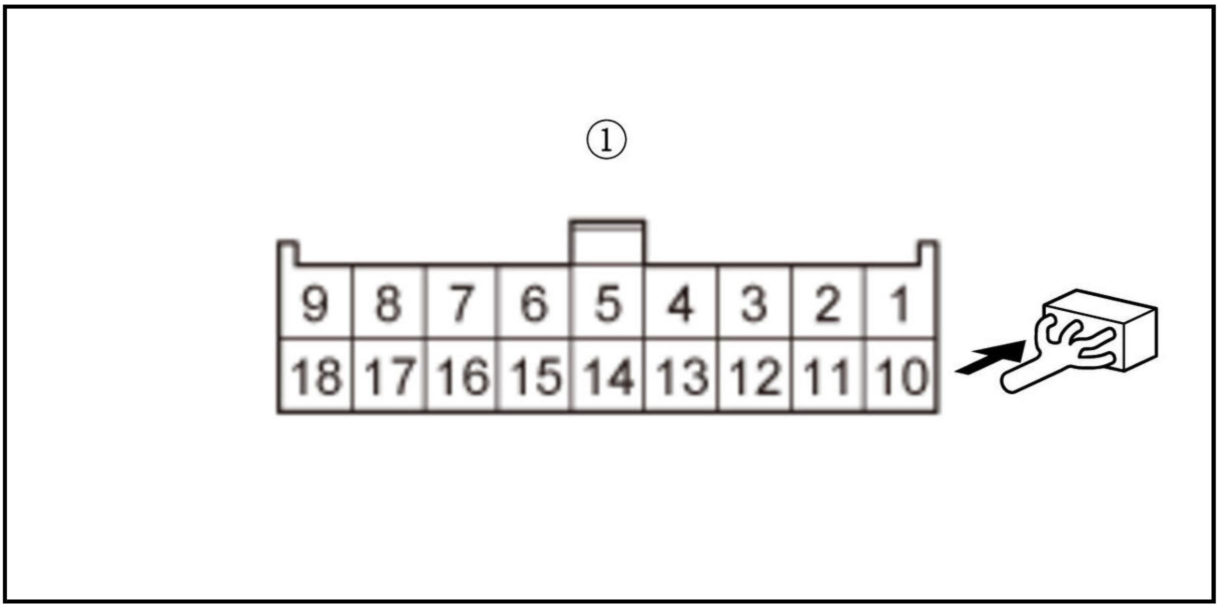
NO

Repair an open in the +B_IGP wire between the relay circuit board and the **No. A7 fuse** .

20. Open wire check (FI_MAIN_RLY_CL- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
B	PCM connector E (80P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 5: ①
Test point 2	**PCM connector A (50P) No. 5**



Is there 1.0 Ω or less?

YES

The FI_MAIN_RLY_CL- wire is OK. **Remove and test the relay circuit board** . If the relay circuit board is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

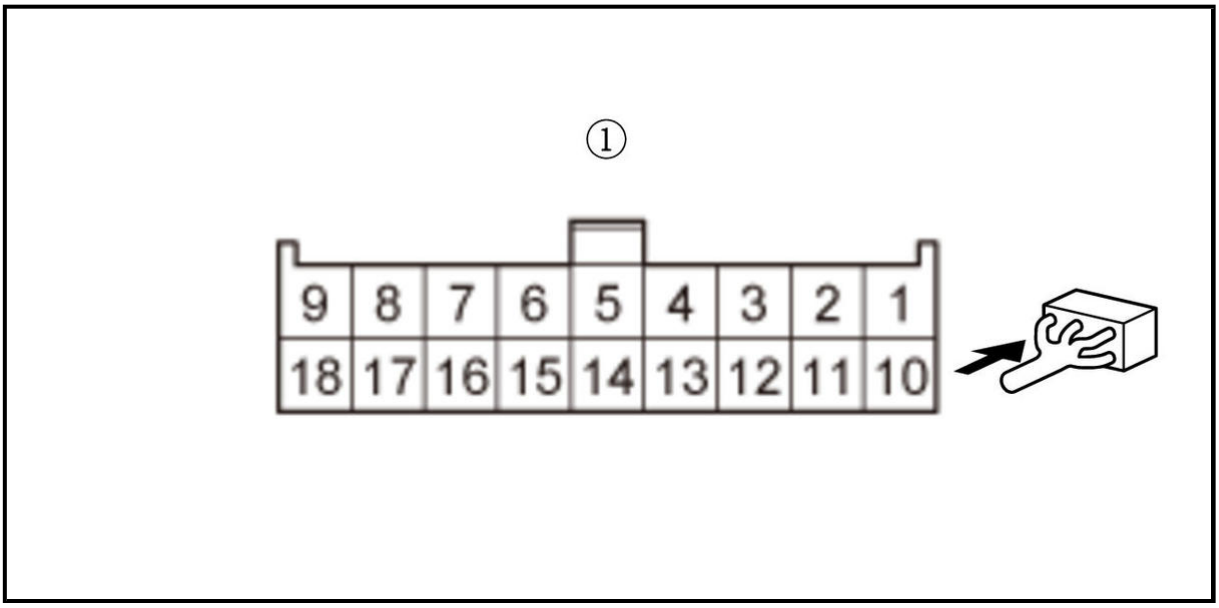
NO

Repair an open in the FI_MAIN_RLY_CL- wire between the PCM (A5) and the relay circuit board.

21. Open wire check (FI_MAIN_RLY_OUT line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
B	PCM connector E (80P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	**PCM connector A (50P) No. 8**



Is there 1.0 Ω or less?

YES

The FI_MAIN_RLY_OUT wire is OK. Go to step 22.

NO

Repair an open in the FI_MAIN_RLY_OUT wire between the PCM (A8) and the relay circuit board.

22. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

The relay circuit board is OK. Go to step 23.

NO

Replace the relay circuit board .

23. Open wire check (GND lines)

-1. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	PGM-FI main relay 2: disconnected
B	PCM connector E (80P): disconnected
B	Relay circuit board: removed

Connector	Terminal
PCM connector A (50P)	No. 13

Connector	Terminal
PCM connector E (80P)	No. 22
	No. 23

Connector	Terminal
	No. 24

Is there 1.0 Ω or less?

YES

The FI_ECU_GND wire, the GND_2 wire, the GND_3 wire, and the GND_4 wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the FI ECU GND wire, the GND_2 wire, the GND_3 wire, and/or the GND_4 wire between the PCM (A13, E22, E23, E24) and G101.

ADJUSTMENT

VALVE CLEARANCE ADJUSTMENT

Special Tools Required

Image	Description/Tool Number
	Adjuster 07MAA-PR70110
	Locknut Wrench 07MAA-PR70120

Adjustment

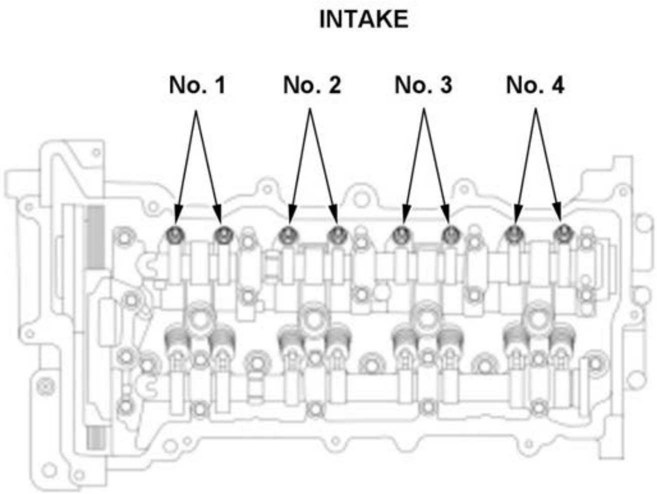
NOTE: **Connect the HDS to the DLC**, and monitor ECT SENSOR 1. Adjust the valve clearance only when the engine coolant temperature is less than 100B°F (38B°C).

1. **Cylinder Head Cover - Remove**

2. Valve Clearance - Adjust

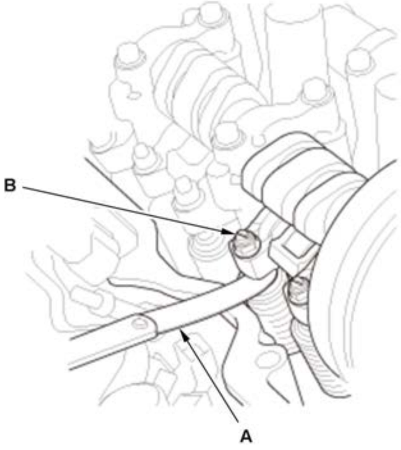
	1. Set the "UP" mark (A) on the exhaust camshaft sprocket as shown.

	2. Set CMP pulse plate A as shown.

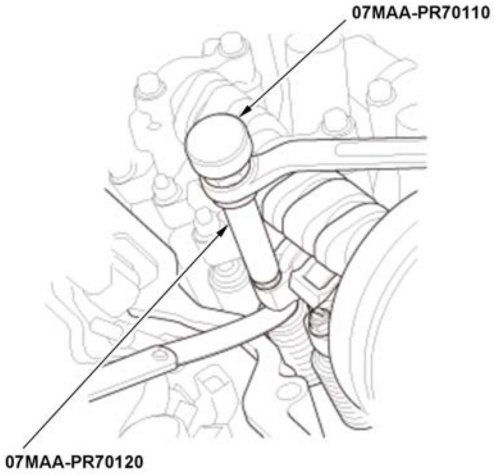


3. Select the correct feeler gauge for the valve clearance you are going to check.

Valve Clearance	
Intake:	**0.18-0.22 mm (0.0071-0.0087 in)**
Exhaust:	**No adjustment (Hydraulic tappet)**



4. Insert the feeler gauge (A) between the adjusting screw (B) and the end of the valve stem on the No. 1 cylinder, and slide it back and forth; you should feel a slight amount of drag.



5. If you feel too much or too little drag, loosen the locknut with the locknut wrench, and turn the adjusting screw with the adjuster until the drag on the feeler gauge is correct.

6. Tighten the locknut to the specified torque, and recheck the clearance. Repeat the adjustment if necessary.

Specified Torque:
14 N.m (1.4 kgf.m, 10 lbf.ft)
Apply new engine oil to the nut threads.

	7. Rotate the crankshaft 180B° clockwise (camshaft pulley turns 90B°). 8. Check and, if necessary, adjust the valve clearance on the No. 3 cylinder.

	9. Rotate the crankshaft 180B° clockwise (camshaft pulley turns 90B°). 10. Check and, if necessary, adjust the valve clearance on the No. 4 cylinder.

	11. Rotate the crankshaft 180B° clockwise (camshaft pulley turns 90B°). 12. Check and, if necessary, adjust the valve clearance on the No. 2 cylinder.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. Maintenance Minder - Reset

1. If the Maintenance Minder requires the valve clearance to be adjusted, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder").

LEARNING, RESET & CLEAR

CKP PATTERN CLEAR/CKP PATTERN LEARN PROCEDURE

Procedure

NOTE:

- Clearing the DTCs with the HDS does not require you to do this procedure.
- The PCM memorizes the learning status in its memory an hour after turning the vehicle to the OFF (LOCK) mode. If you need to disconnect the 12 volt battery terminals before memorizing the learning status in the PCM, jump the SCS line with the HDS, and wait 60 seconds, then disconnect the 12 volt battery terminals.

1. **HDS - Connect**
2. CKP Pattern - Clear/Learn

1. Select the PGM-FI System with the HDS.

2. Select CRANK PATTERN in the Adjustment Menu with the HDS.

3. Select CRANK PATTERN CLEAR with the HDS, and clear the CKP pattern.

4. Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts.

5. Turn the vehicle to the OFF (LOCK) mode.

6. Jump the SCS line with the HDS.

7. Wait 60 seconds, and exit the SCS mode with the HDS.

PCM RESET

Procedure

1. **HDS - Connect**
2. PCM - Reset

1. Select the PGM-FI system with the HDS.

2. Reset the PCM with the HDS while the engine is stopped.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Turn the vehicle to the ON mode, and wait 30 seconds.

5. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS from the DLC.

VTC POSITION LEARN PROCEDURE

Procedure

NOTE:

- Clearing the DTCs with the HDS does not require you to do this procedure.
- The PCM memorizes the learning status in its memory after passed an hour from turning the vehicle to the OFF (LOCK) mode. If you need to disconnect the 12 volt battery terminals before memorizing the learning status in the PCM, jump the SCS line with the HDS, and wait 60 seconds, then disconnect the 12 volt battery terminals.

1. **HDS - Connect**
2. VTC Position - Learn

1. Select the PGM-FI System with the HDS.

2. Select E-VTC LEARNING in the ADJUSTMENT with the HDS, and follow the screen prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Jump the SCS line with the HDS.

5. Wait 60 seconds, and exit the SCS mode with the HDS.

Engine Cooling Service Specifications - CR-V

STANDARDS AND SERVICE LIMITS (2020-21)

COOLING SYSTEM

Item	Measurement	Qualification	Standard or New	Service Limit
Radiator	Coolant capacity (including engine, heater, hoses, and expansion tank) (with cooler valve body)	Engine overhaul	7.6 L (2.01 US gal)	-
		Coolant change	6.3 L (1.66 US gal)	-
	Coolant capacity (including engine, heater, hoses, and expansion tank) (without cooler valve body)	Engine overhaul	7.6 L (2.01 US gal)	-
		Coolant change	6.2 L (1.64 US gal)	-
	Coolant type (except Ecuador)	B	Use Honda Long Life Antifreeze/Coolant Type 2, and add Honda Extreme Cold Weather Antifreeze/Coolant Type 2.**NOTE:** If the vehicle is regularly driven in very low temperatures (below -22 deg.F (-30 deg.C)), a 60 % concentration of coolant should be used.	
	Coolant type (Ecuador)	B	Honda All Season Antifreeze/Coolant Type 2	

Item	Measurement	Qualification	Standard or New	Service Limit
Expansion tank	Coolant capacity	B	0.8 L (0.21 US gal)	-
Expansion tank cap	Opening pressure	B	93-123 kPa (0.95-1.25 kgf/cm 2, 13.5-17.8 psi)	-
Thermostat	Opening temperature	Begins to open	169-176 deg.F (76-80 deg.C)	-
		Fully open	194 deg.F (90 deg.C)	-
	Valve lift at fully open	B	8.0 mm (0.315 in) min.	-

REMOVAL & INSTALLATION TEST

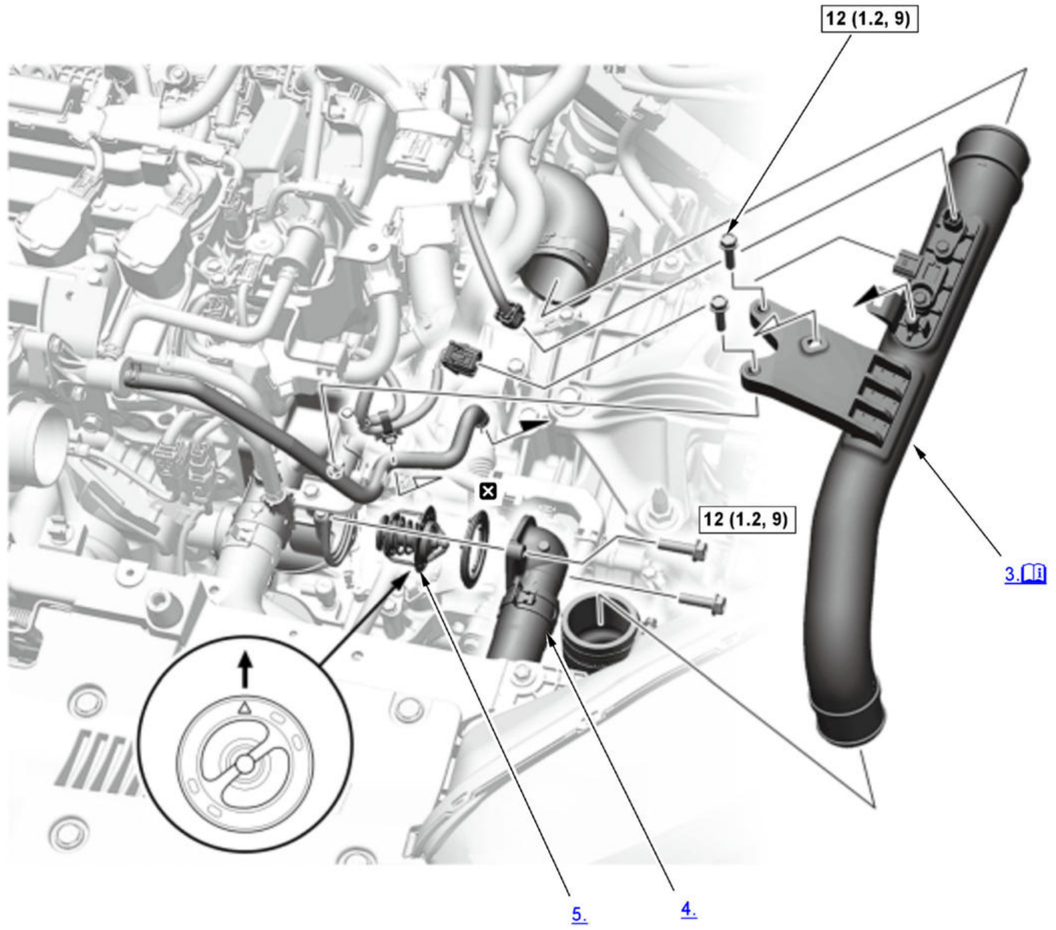
THERMOSTAT REMOVAL, INSTALLATION, AND TEST (1.5 L ENGINE)

Removal and Installation

NOTE:

- ℹ Where icon is shown, further information shown below.
- Be sure to install the thermostat in the direction shown.

1



ℹ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Engine Coolant - Drain
2. Air Cleaner - Remove

3. Throttle Body Inlet Pipe - Remove

NOTE: **Make sure the end of hose band is aligned with the mark on the hose band after the throttle body inlet pipe is installed.**

4. Thermostat Cover - Remove
5. Thermostat - Remove
6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

After installing all the removed parts, refill the radiator with engine coolant, and bleed the air from the cooling system .

Test

NOTE: Replace the thermostat if it is stuck in the open position at room temperature.

1. Thermostat - Test

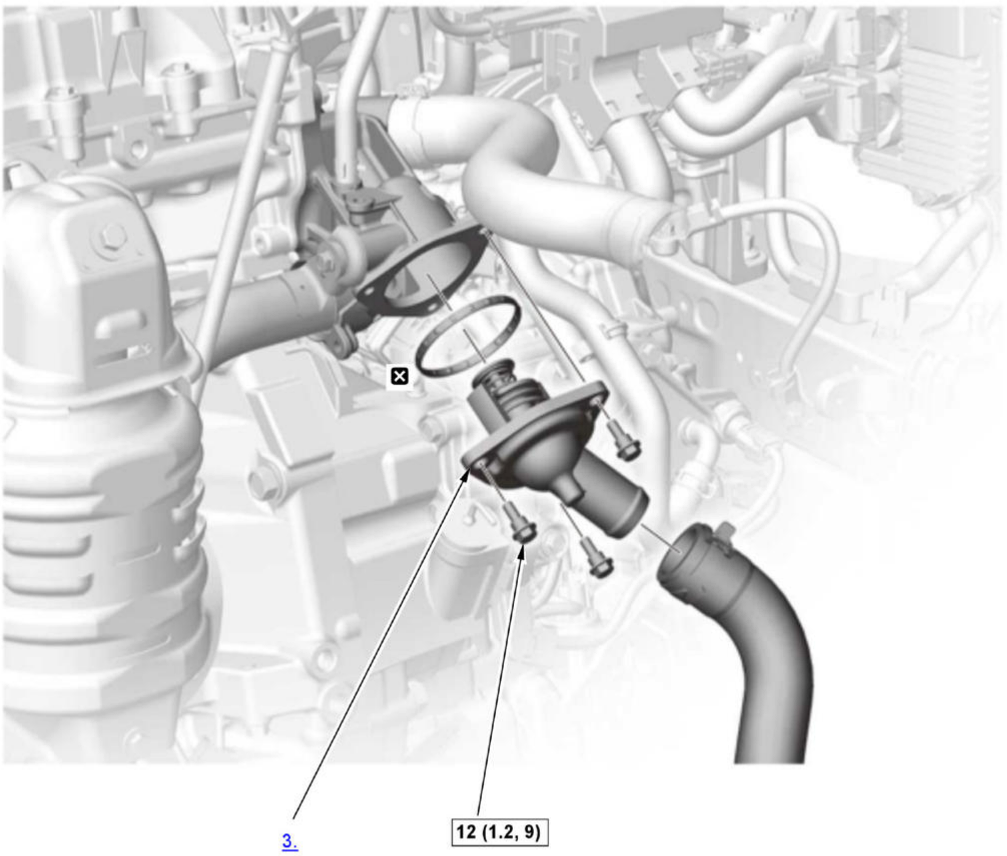
	To test a closed thermostat: 1. Suspend the thermostat (A) in a container of water. Do not let the thermostat and the thermometer (B) touch the bottom of the hot container. 2. Heat the water, and check the temperature with a thermometer. Check the temperature when the thermostat first opens, and when it is fully open. 3. Measure the lift height of the thermostat when it is fully open.

Standard Thermostat	
Lift Height:	**Above 8.0 mm (0.315 in) min.**
Starts Opening:	**169-176B°F (76-80B°C)**
Fully Open:	**194B°F (90B°C)**

THERMOSTAT REMOVAL, INSTALLATION, AND TEST (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

1



▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Engine Coolant - Drain
2. Air Cleaner - Remove
3. Thermostat - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

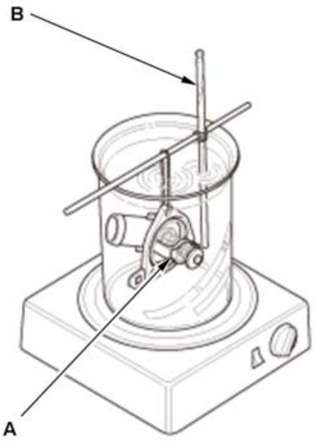
NOTE:

After installing all the removed parts, refill the radiator with engine coolant, and bleed the air from the cooling system .

Test

Replace the thermostat if it is stuck in the open position at room temperature.

1. Thermostat - Test



To test a closed thermostat:

1. Suspend the thermostat (A) in a container of water. Do not let the thermostat and the thermometer (B) touch the bottom of the hot container.

2. Heat the water, and check the temperature with a thermometer. Check the temperature when the thermostat first opens, and when it is fully open.

3. Measure the lift height of the thermostat when it is fully open.

Standard Thermostat	
Lift Height (NIPPON THERMOSTAT):	**Above 10.0 mm (0.394 in) min.**
Lift Height (FUJI BELLOWS):	**Above 8.0 mm (0.315 in) min.**
Starts Opening:	**169-176B°F (76-80B°C)**
Fully Open:	**194B°F (90B°C)**

WATER OUTLET REMOVAL AND INSTALLATION

Removal and Installation

WARNING:

The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain **service precautions** before doing repairs or service.

NOTE:

- Use fender covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring, hoses, or interfere with other parts.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

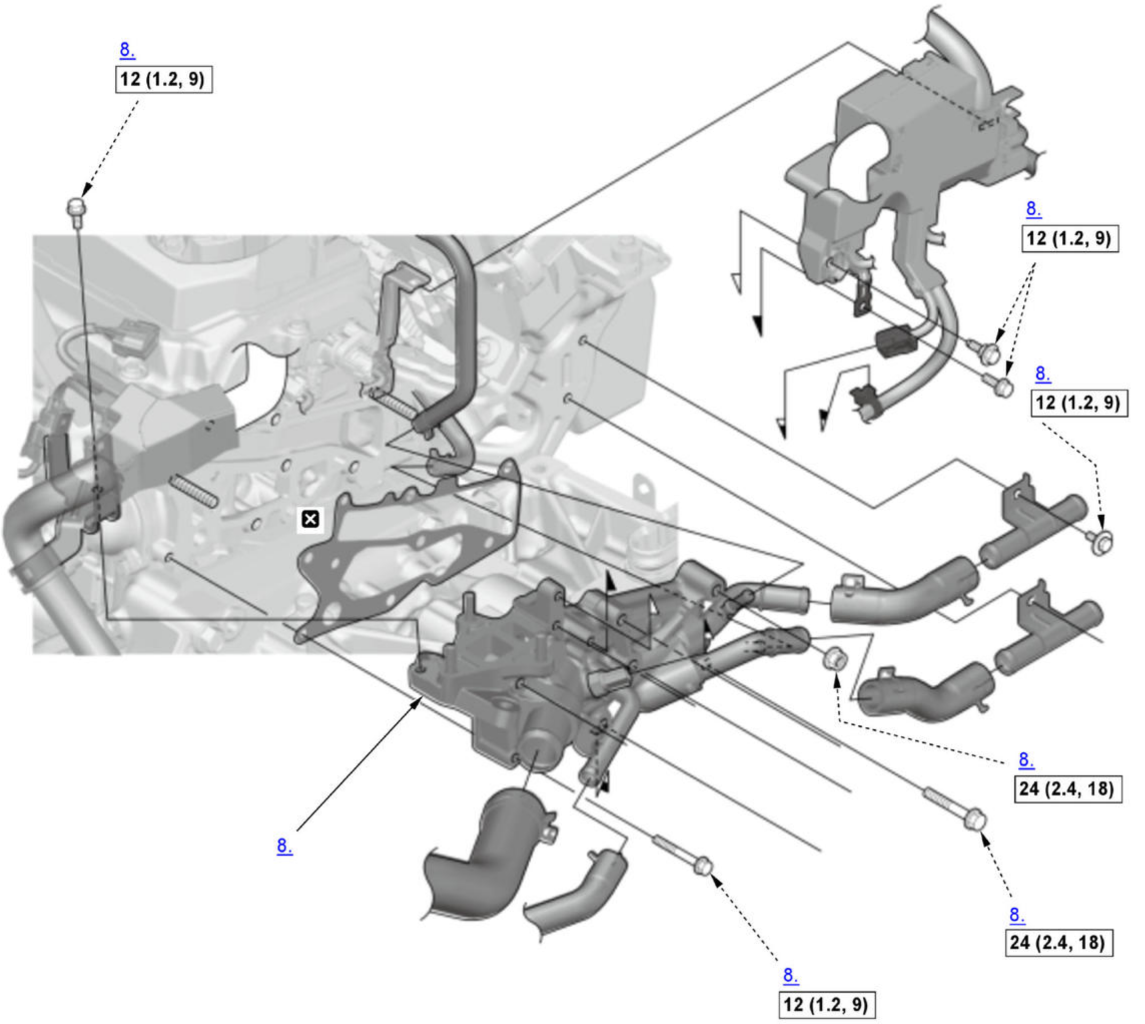

Fig. 9: Exploded View Of Water Outlet Replacement Components With Torque Specifications

*1	These parts have inspection items

1. Engine Coolant - Drain
2. Thermostat Cover - Remove
3. Thermostat - Remove
4. All Removed Parts - Install
    1. Install the parts in the reverse order of removal.

Test

NOTE: Replace the thermostat if it is stuck in the open position at room temperature.

1. Thermostat - Test

	To test a closed thermostat: 1. Suspend the thermostat (A) in a container of water. Do not let the thermostat and the thermometer (B) touch the bottom of the hot container. 2. Heat the water, and check the temperature with a thermometer. Check the temperature when the thermostat first opens, and when it is fully open. 3. Measure the lift height of the thermostat when it is fully open.

Standard Thermostat	
Lift Height:	**Above 8.0 mm (0.315 in) min.**
Starts Opening:	**176-183B°F (80-84B°C)**
Fully Open:	**203B°F (95B°C)**

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

ENGINE OVERHEATS

Diagnostic Procedure

- Check the coolant level.
- Check for any engine coolant leakage (from gaskets, hoses, O-rings, etc.).
- Check for dirt, leaves, or insects on the radiator and the A/C condenser.
- Check for deteriorated coolant.
- Check for a damaged or deformed fan shrouds.
- Check the RFC unit is operating properly (air should be blowing toward the engine).
- Check the radiator cap.
- Check the thermostat .
- Check for plugged or deteriorated radiator hoses.
- Check for a plugged heater core or hoses.
- Check for a damaged cylinder head gasket.

Also check for

Check the RFC unit is operating properly.

DESCRIPTION & OPERATION

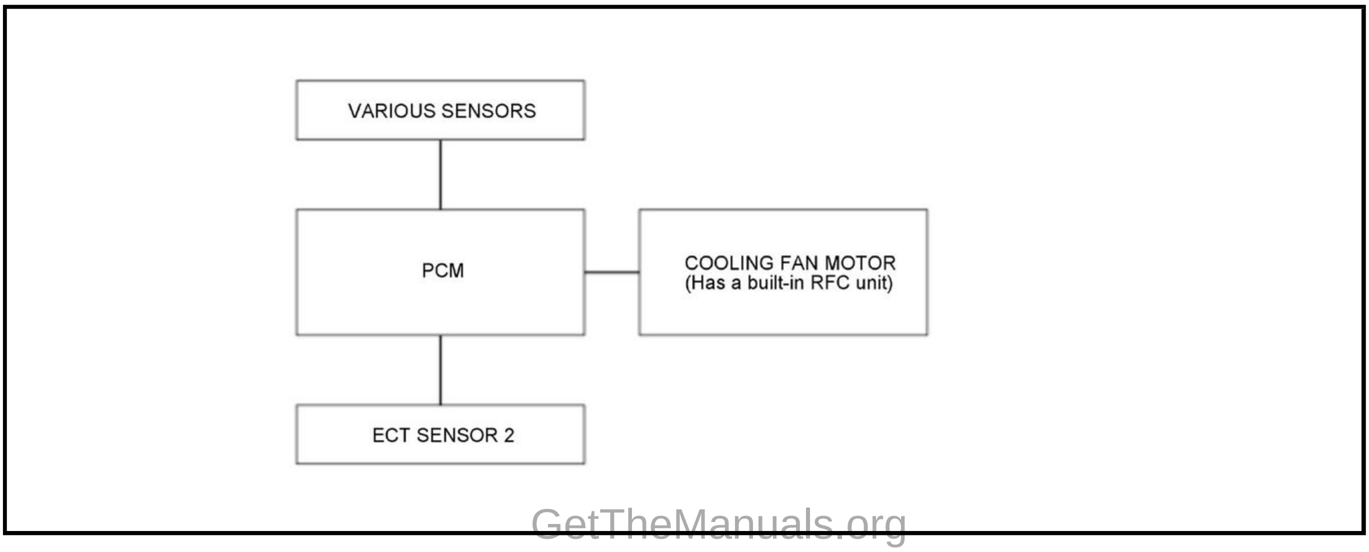
COOLING FAN CONTROLS SYSTEM DESCRIPTION - OVERVIEW

For locations of each component on vehicle, refer to Component Location Index.

Overview

Cooling Fan Control

The PCM decides the optimal fan drive depending on the signals from various sensors, and outputs duty signals to control the cooling fan motor. By performing a sensitive drive control depending on the situation, it efficiently maintains the temperature of the coolant, and reduces fan noise. ECT sensor 2 detects the temperature of the coolant.



SYMPTOM TROUBLESHOOTING INDEX

COOLING FAN CONTROLS SYMPTOM TROUBLESHOOTING INDEX

NOTE: Do an all DTC check with the HDS, and troubleshoot any DTCs first before following the repair procedures listed in the index.

Symptom	Diagnostic Procedure	Also check for
Engine overheats	• **Check the coolant level**. • Check for any engine coolant leakage (from gaskets, hoses, O-rings, etc.). • Check for dirt, leaves, or insects on the radiator and the A/C condenser. • Check for deteriorated coolant. • Check for a damaged or deformed fan shrouds. • Check the RFC unit is operating properly (air should be blowing toward the engine). • **Check the radiator cap**. • **Check the thermostat** . • Check for plugged or deteriorated radiator hoses. • Check for a plugged heater core or hoses. • Check for a damaged cylinder head gasket.	Check the RFC unit is operating properly.

SERVICING

COOLANT CHECK AND REPLACEMENT

Check

Coolant Level Check

1. Coolant - Check

	1. Check the coolant level in the coolant reservoir. Make sure it is between the MAX mark (A) and MIN mark (B). 2. If the coolant level in the coolant reservoir is at or below the MIN mark, add coolant to bring it between the MIN and MAX marks, then inspect the cooling system for leaks. 3. Check the coolant level in the radiator, and add Honda Long Life Antifreeze/Coolant Type 2 into the radiator up to the base of the filler neck, if needed. **NOTE:** • Always use Honda Long Life Antifreeze/Coolant Type 2. Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.

	- Honda Long Life Antifreeze/Coolant Type 2 is a mixture of 50% antifreeze and 50% water. Do not add water.

Coolant Leak Test

1. Coolant Leak - Test

	1. Wait until the engine is cool, then carefully remove the radiator cap, and fill the radiator with engine coolant to the base of the filler neck. 2. Attach a commercially available pressure tester (A) to the radiator, and apply a pressure of 93-123 kPa (0.95-1.25 kgf/cm 2, 13.5-17.8 psi). 3. Inspect for engine coolant leaks and a drop in pressure. 4. Remove the pressure tester, then reinstall the radiator cap.

Replacement

NOTE:

- **How to read the torque specifications** .
- Engine coolant is poisonous. If ingested, get medical attention immediately.

1. Radiator Cap - Remove

1. Turn the vehicle to the ON mode, and make sure to turn the A/C switch OFF, then turn the vehicle to the OFF (LOCK) mode. 2. Wait until the engine is cool, then carefully remove the radiator cap.

2. Engine Coolant - Drain

	1. Loosen the drain plug (A), and drain the coolant.

3. **Right Front Wheel - Remove**
4. Cylinder Block Coolant - Drain

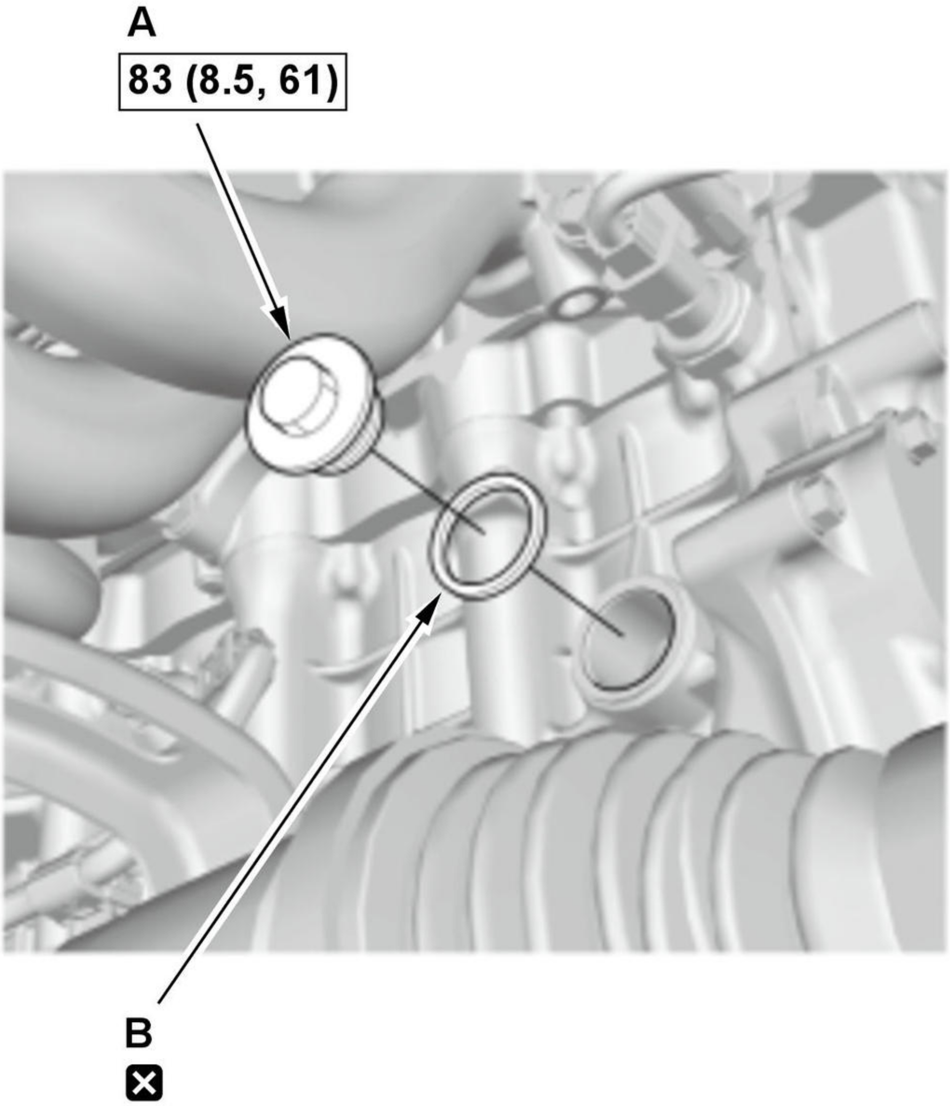


Fig. 1: Cylinder Block Coolant Drain Bolt With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the drain bolt (A).

2. After the coolant has drained, reinstall the drain bolt with a new washer (B).

3. Tighten the radiator drain plug securely.

5. **Right Front Wheel - Install**
6. Coolant Reservoir - Refill

	1. Remove, drain and reinstall the coolant reservoir (A). 2. Fill the coolant reservoir to the MAX mark (B) with Honda Long Life Antifreeze/Coolant Type 2.

7. Engine Coolant - Refill

1. Pour Honda Long Life Antifreeze/Coolant Type 2 into the radiator up to the base of the filler neck.

NOTE:

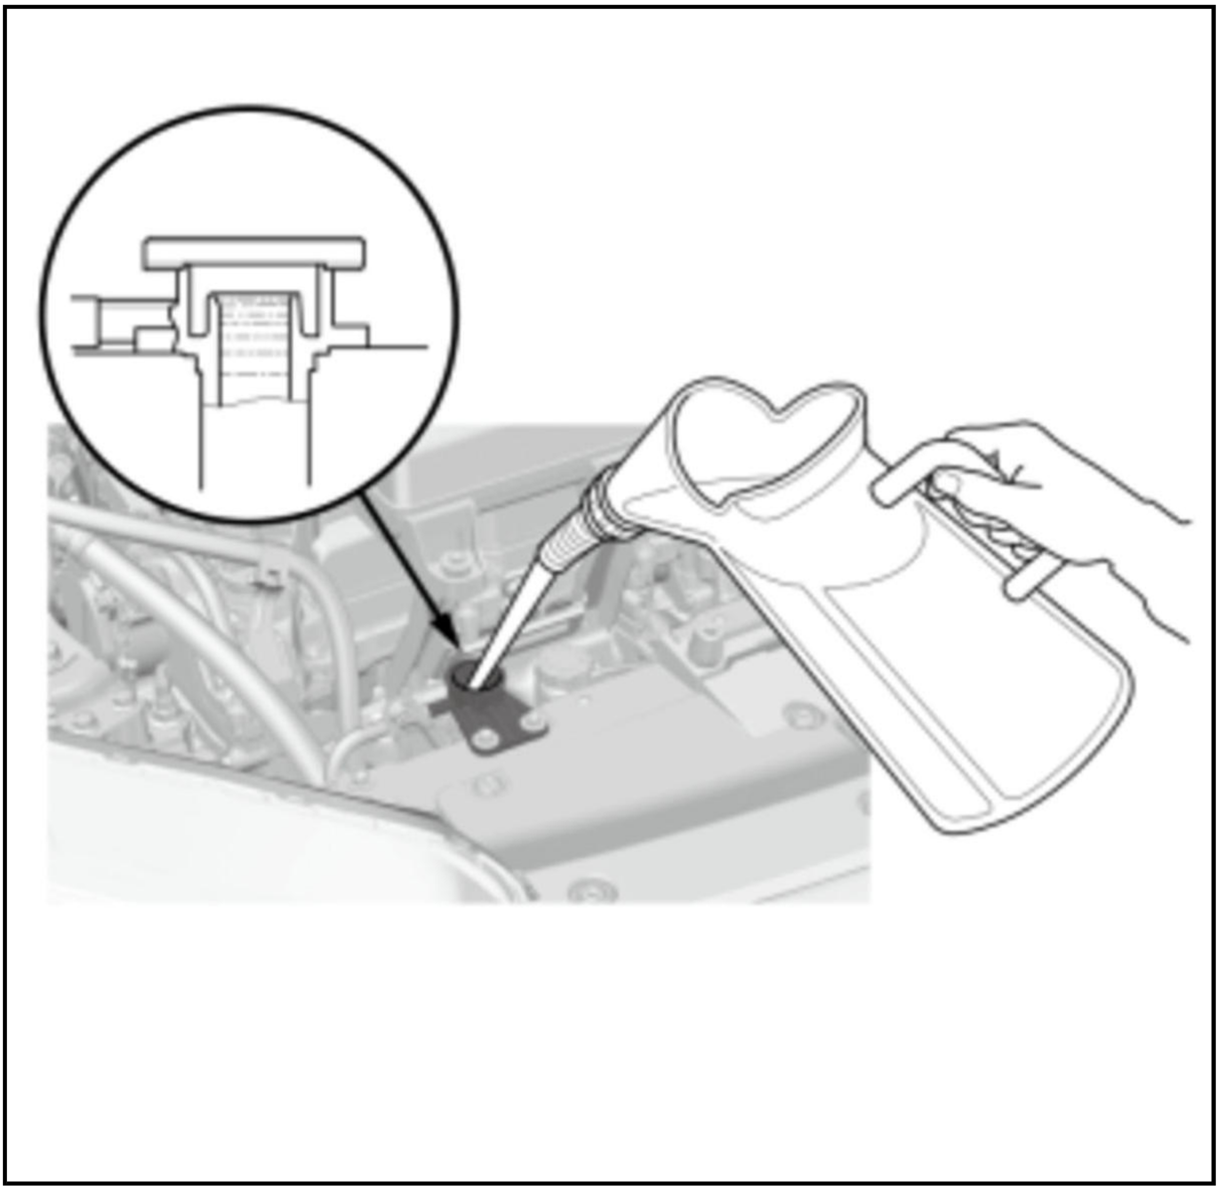
- Use Honda Long Life Antifreeze/Coolant Type 2, and if necessary add Honda Extreme Cold Weather Antifreeze/Coolant Type 2 (concentrate). Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.
- Honda Long Life Antifreeze/Coolant Type 2 is a mixture of 50% antifreeze and 50% water. Honda Extreme Cold Weather Antifreeze/Coolant Type 2 is a 100% concentration coolant. Do not add water to either coolant.
- If the vehicle is regularly driven in very low temperatures (below -22B°F (-30B°C)), a 60 % concentration of coolant should be used.

Operation	Vehicle Usage (Desired Mixture)	Current Mixture	Coolant Drain	Add Amount of Honda Extreme Cold Weather Antifreeze/Coolant Type 2 (100% concentrate)	Then add Honda Long Life Antifreeze/Coolant Type 2 (50/50)
Coolant Change	Normal Area (50/50)	50/50 60/40 unknown	Drain radiator and reservoir	None	Top off the cooling system
	Very Cold Area (60/40)	50/50 unknown	Drain radiator and reservoir	About **1.4 L (47 fl oz)**	
		60/40		About **1.2 L (41 fl oz)**	
Engine Overhaul	Normal Area	-	-	None	

Operation	**Vehicle Usage (Desired Mixture)**	**Current Mixture**	**Coolant Drain**	**Add Amount of Honda Extreme Cold Weather Antifreeze/Coolant Type 2 (100% concentrate)**	**Then add Honda Long Life Antifreeze/Coolant Type 2 (50/50)**
	(50/50)				
	Very Cold Area (60/40)	-	-	About **1.4 L (47 fl oz)**	
Coolant Winterizing	Very Cold Area (60/40)	50/50	Drain about **2.0 L (68 fl oz)** from radiator	About **1.4 L (47 fl oz)**	
		unknown*	Drain radiator and reservoir		

*: When you want to winterize the coolant with the minimum amount of coolant change but the current coolant concentration in the vehicle is unknown, you must drain all coolant from the cooling system.

Engine Coolant Refill Capacities (Including the coolant reservoir capacity of 0.7 L (0.18 US gal)	
At Coolant Change:	**5.6 L (1.48 US gal)**
After Engine Overhaul:	**6.9 L (1.82 US gal)**



8. Engine Coolant - Air Bleed

1. Loosely install the radiator cap.

2. **Enter the maintenance mode, then start the engine** , and let it run until it warms up (the cooling fan(s) comes on at least twice).

3. Turn the vehicle to the OFF (LOCK) mode. Check the level in the radiator, and add Honda All Season Antifreeze/Coolant Type 2, if needed.

9. Engine Coolant Leak - Check

1. Put the radiator cap securely and **enter the maintenance mode, then start the engine again** , and check for leaks.

2. Clean up any spilled engine coolant.

10. Maintenance Minder - Reset

1. If the Maintenance Minder required to replace the engine coolant, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder"). If the Maintenance Minder did not require to replace the engine coolant, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

TEST

RADIATOR CAP TEST

Test

1. Radiator Cap - Test

	1. Wait until the engine is cool, then carefully remove the radiator cap (A). Wet the radiator cap seal with engine coolant, then install it on a commercially available pressure tester (B). 2. Apply a pressure of 93-123 kPa (0.95-1.25 kgf/cm 2, 13.5-17.8 psi). 3. Check for a drop in pressure. 4. If the pressure drops, replace the radiator cap.

REPLACEMENT

COOLANT REPLACEMENT (1.5 L ENGINE)

Replacement

NOTE: How to read the torque specifications .

1. Expansion Tank Cap - Remove

	1. Wait until the engine is cool, then carefully remove the expansion tank cap (A).

2. Engine Coolant - Drain

	1. Loosen the drain plug (A), and drain the coolant.

3. Cylinder Block Coolant - Drain

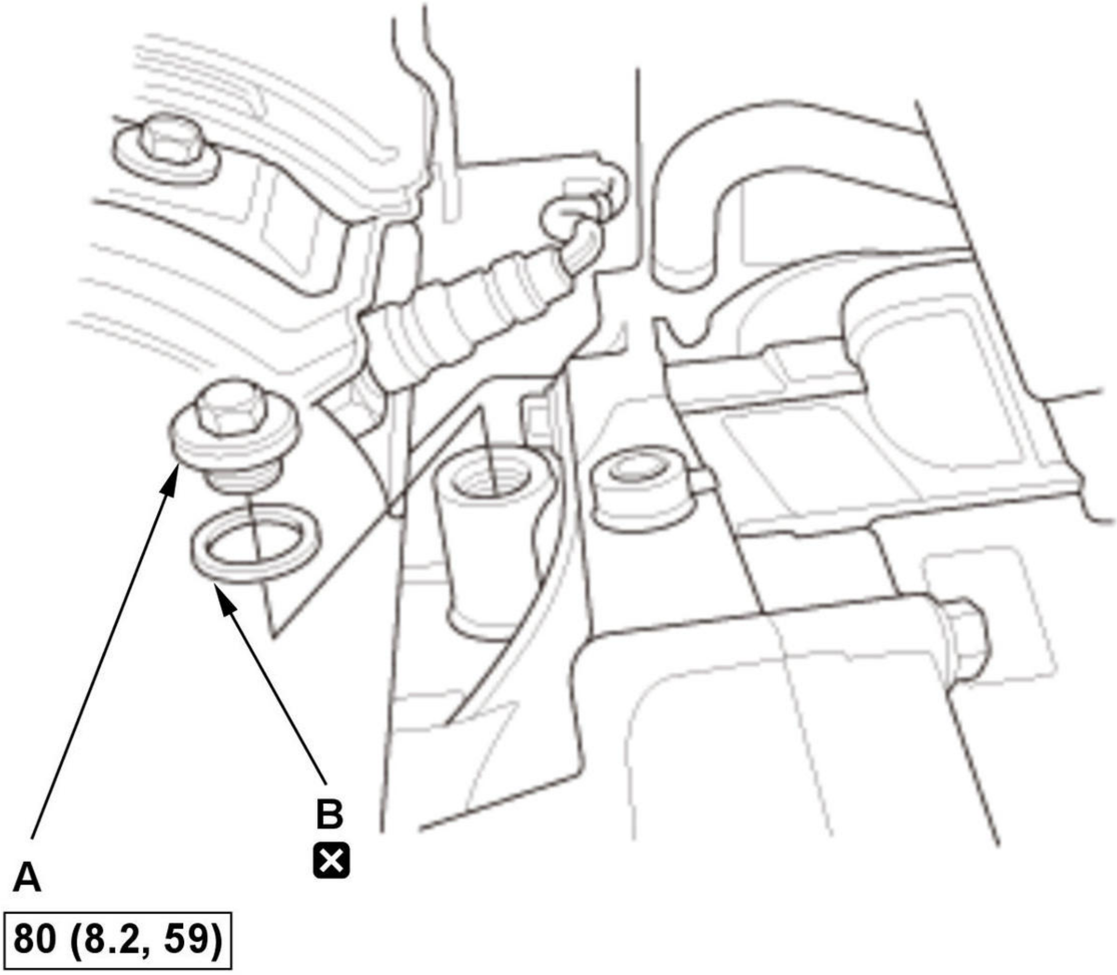

Fig. 1: Radiator Drain Plug With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the drain bolt (A).

2. After the coolant has drained, reinstall the drain bolt with a new washer (B).

3. Tighten the radiator drain plug securely.

4. Expansion Tank Coolant - Drain
5. Engine Coolant - Refill

1. Pour Honda Long Life Antifreeze/Coolant Type 2 (for except Ecuador)/Honda All Season Antifreeze/Coolant Type 2 (for Ecuador) into the expansion tank (A) to the MAX mark (B).**Except Ecuador**

NOTE:

- Always use Honda Long Life Antifreeze/Coolant Type 2 or Honda Extreme Cold Weather Antifreeze/Coolant Type 2. Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.
- Honda Long Life Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Honda Extreme Cold Weather Antifreeze/Coolant Type 2 is a 100% concentration coolant. Do not add water to either coolant.
- If the vehicle is regularly used in very low temperatures (under -22 deg. F (-30 deg. C)), a 60% concentration of coolant should be used.

Operation	Vehicle Usage (Desired Mixture)	Current Mixture	Coolant Drain	Add Amount of Honda Extreme Cold Weather Antifreeze/Coolant Type 2 (100% concentrate)	Then add Honda Long Life Antifreeze/Coolant Type 2 (50/50)
Coolant Change	Normal Area (50/50)	50/5060/40unknown	Drain radiator, engine block, and expansion tank	None	Top off the cooling system
	Very Cold Area (60/40)	50/50unknown	Drain radiator, engine block, and expansion tank	About 1.6 L (54 fl oz)	
		60/40		About 1.3 L (44 fl oz)	
Engine Overhaul	Normal Area (50/50)	-	-	None	
	Very Cold Area (60/40)	-	-	About 1.6 L (54 fl oz)	
Coolant Winterizing	Very Cold Area (60/40)	50/50	Drain about 2.0 L (68 fl oz) from radiator	About 1.6 L (54 fl oz)	
		unknown*	Drain radiator, engine block, and expansion tank		

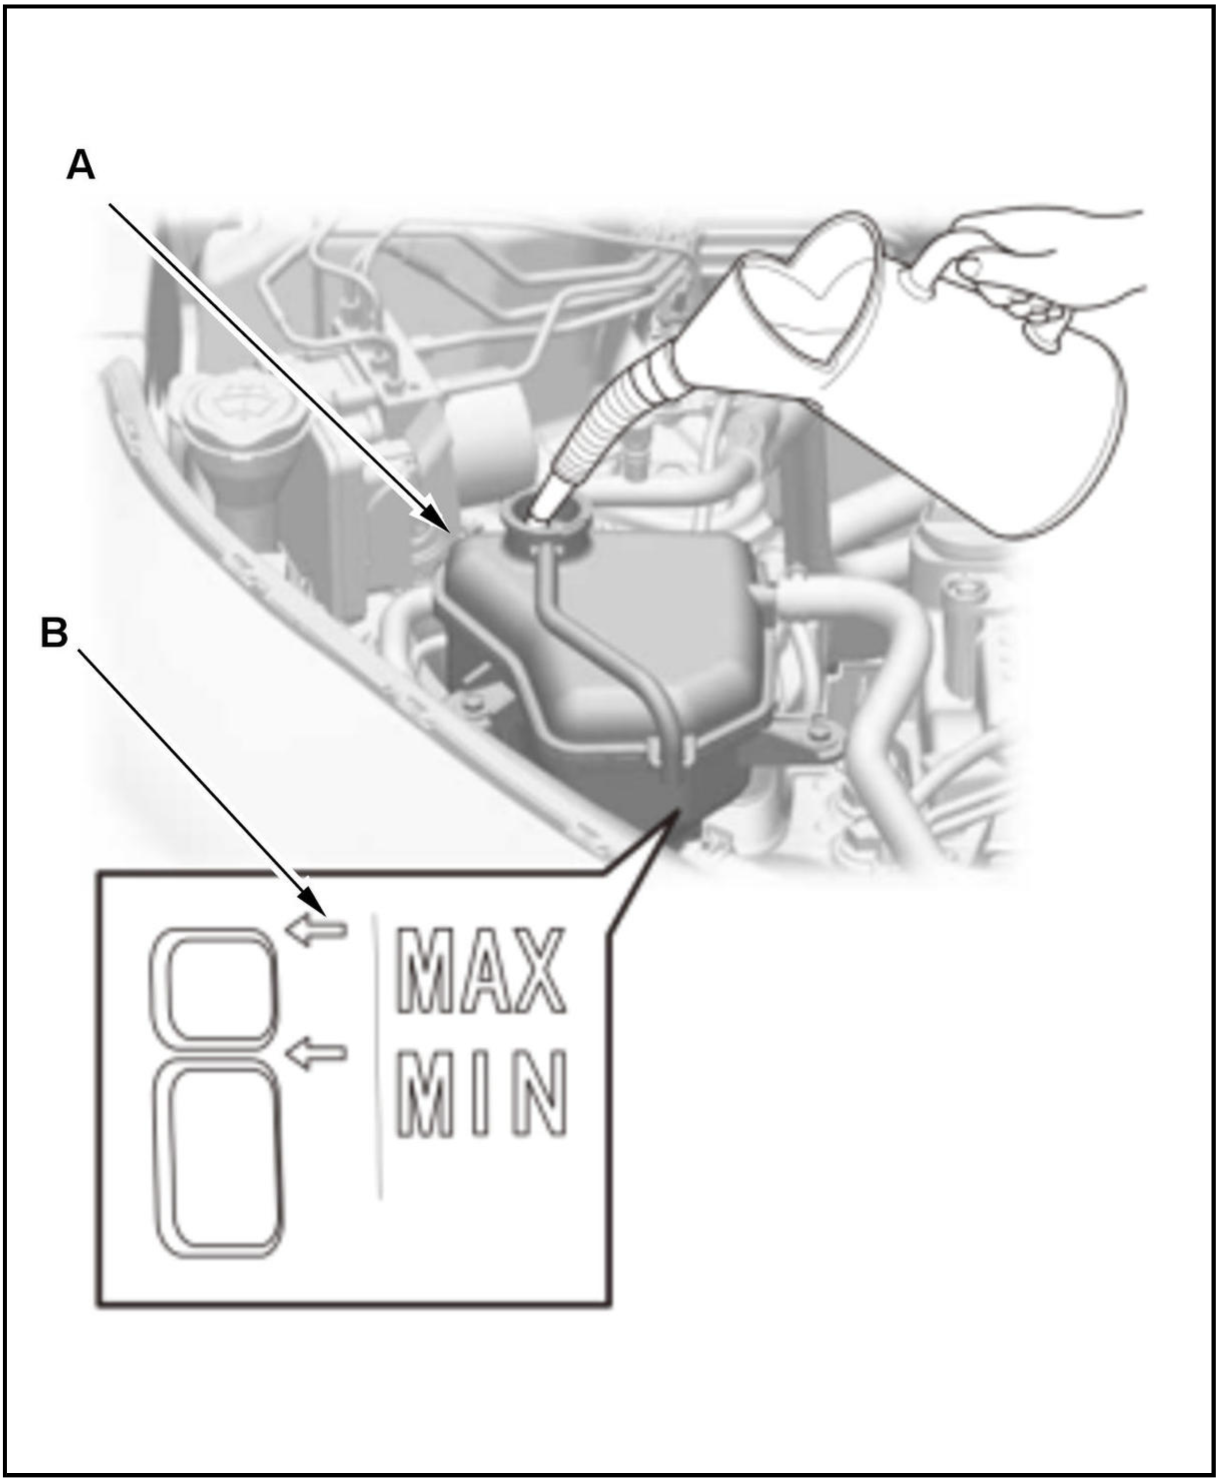
*: When you want to winterize the coolant with the minimum amount of coolant change but the current coolant concentration in the vehicle is unknown, you must drain all coolant from the cooling system.**Ecuador**

NOTE:

- Always use Honda All Season Antifreeze/Coolant Type 2. Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.
- Honda All Season Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Do not add water.

Engine Coolant Capacities (Including the expansion tank capacity of 0.8 L (0.21 US gal))
With cooler valve body
At Coolant Change:
6.3 L (1.66 US gal)
After Engine Overhaul:
7.6 L (2.01 US gal)
Without cooler valve body

At Coolant Change:
6.2 L (1.64 US gal)
After Engine Overhaul:
7.6 L (2.01 US gal)



6. Engine Coolant - Air Bleed

1. Loosely install the expansion tank cap.

2. Start the engine and let it run until the cooling fan comes on at least twice. Do not operate the air conditioning system.

3. Turn off the engine. Check the level in the expansion tank, and add Honda Long Life Antifreeze/Coolant Type 2 (for except Ecuador)/Honda All Season Antifreeze/Coolant Type 2 (for Ecuador), if needed.

7. Engine Coolant Leak - Check

1. Put the expansion tank cap securely, then start the engine again, and check for leaks. 2. Clean up any spilled engine coolant.

8. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the engine coolant, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder"). If the Maintenance Minder did not require to replace the engine coolant, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

COOLANT REPLACEMENT (2.4 L ENGINE) (2017 2018 2019)

Replacement

NOTE: **How to read the torque specifications** .

1. Radiator Cap - Remove

1. Wait until the engine is cool, then carefully remove the radiator cap.

2. **Vehicle - Lift**
3. Engine Coolant - Drain

	1. Loosen the drain plug (A), and drain the coolant.

4. Cylinder Block Coolant - Drain

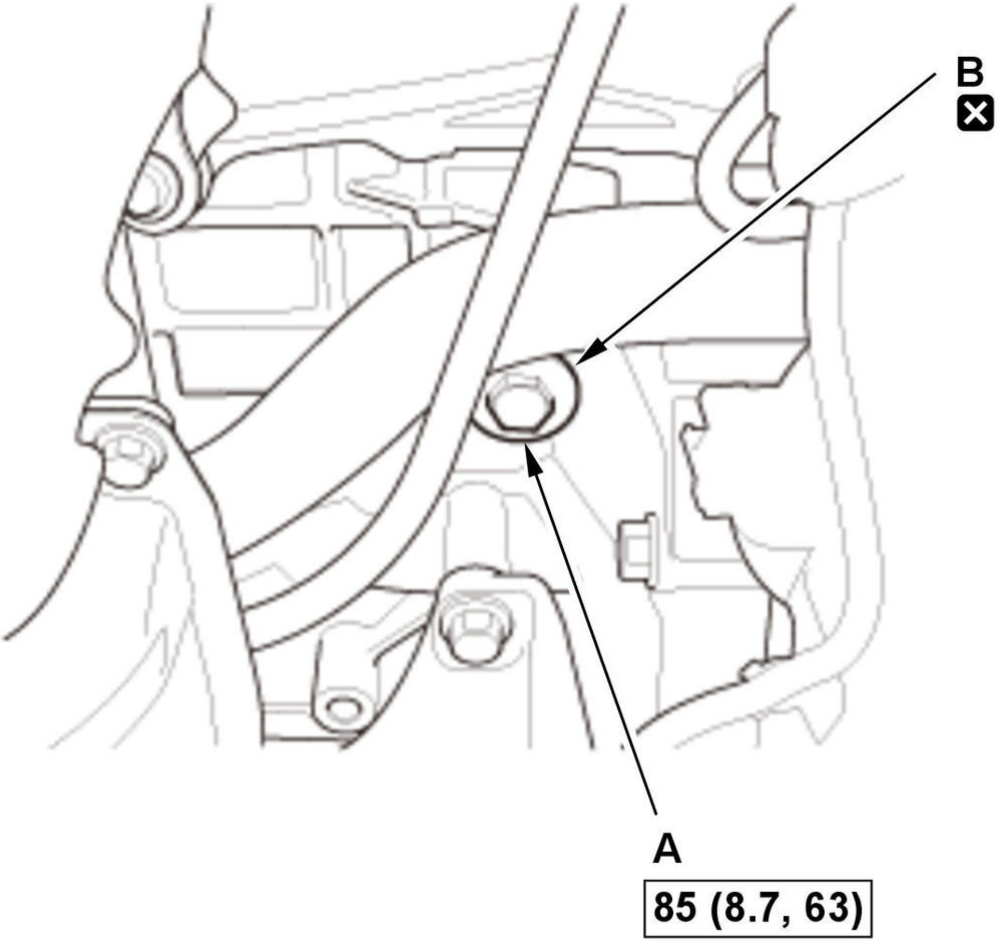


Fig. 2: Radiator Drain Plug With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the drain bolt (A). 2. After the coolant has drained, reinstall the drain bolt with a new washer (B). 3. Tighten the radiator drain plug securely.

5. Coolant Reservoir- Refill

	1. Remove, drain and reinstall the coolant reservoir. 2. Fill the coolant reservoir to the MAX mark (A) with Honda Long Life Antifreeze/Coolant Type 2.

6. Engine Coolant - Refill

1. Follow the chart and pour coolant into the radiator up to the base of the filler neck.**Except Ecuador**

NOTE:

- Always use Honda Long Life Antifreeze/Coolant Type 2, and if necessary add Honda Extreme Cold Weather Antifreeze/Coolant Type 2. Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.
- Honda Long Life Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Honda Extreme Cold Weather Antifreeze/Coolant Type 2 is a 100% concentration coolant. Do not add water to either coolant.
- If the vehicle is regularly used in very low temperatures (under - 22 deg. F (- 30 deg. C)) a 60% concentration of coolant should be used.

Operation	Vehicle Usage (Desired Mixture)	Current Mixture	Coolant Drain	Add Amount of Honda Extreme Cold Weather Antifreeze/Coolant Type 2 (100 % concentrate)	Then add Acura Long Life Antifreeze/Coolant Type 2 (50/50)
Coolant Change	Normal Area (50/50)	50/5060/40unknown	Drain radiator, engine block, and reservoir	None	Top off the cooling system
	Very Cold Area (60/40)	50/50unknown	Drain radiator, engine block, and reservoir	About 1.5 L (51 fl oz)	
		60/40		About 1.3 L (44 fl oz)	
Engine Overhaul	Normal Area (50/50)	-	-	None	
	Very Cold Area (60/40)	-	-	About 1.5 L (51 fl oz)	
Coolant Winterizing	Very Cold Area (60/40)	50/50	Drain about 2.0 L (68 fl oz) from radiator	About 1.5 L (51 fl oz)	
		unknown*	Drain radiator, engine block, and reservoir		

*: When you want to winterize the coolant with the minimum amount of coolant change but the current coolant concentration in the vehicle is unknown, you must drain all coolant from the cooling system.

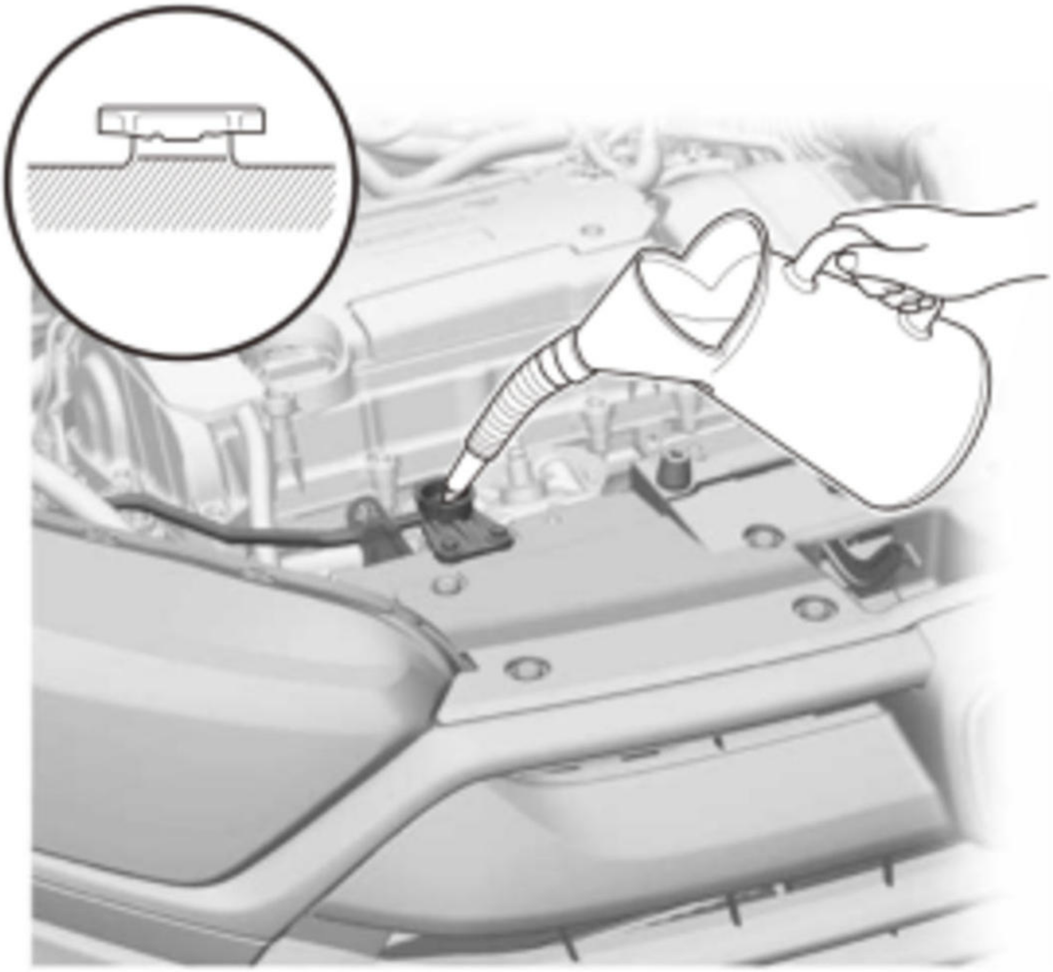
Ecuador

NOTE:

- Always use Honda All Season Antifreeze/Coolant Type 2. Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.

- Honda All Season Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Do not add water.

Engine Coolant Refill Capacities (Including the coolant reservoir capacity of 0.7 L (0.18 US gal))	
At Coolant Change:	**6.3 L (1.66 US gal)**
After Engine Overhaul:	**7.7 L (2.03 US gal)**



7. Engine Coolant - Air Bleed

1. Loosely install the radiator cap.

2. Start the engine, and let it run until it warms up (the radiator fan comes on at least twice).

3. Turn off the engine. Check the level in the radiator, and add Honda Long Life Antifreeze/Coolant Type 2 (for except Ecuador)/Honda All Season Antifreeze/Coolant Type 2 (for Ecuador), if needed.

8. Engine Coolant Leak - Check

1. Put the radiator cap securely, then start the engine again, and check for leaks.

2. Clean up any spilled engine coolant.

9. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the engine coolant, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder"). If the Maintenance Minder did not require to replace the engine coolant, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

DESCRIPTION & OPERATION

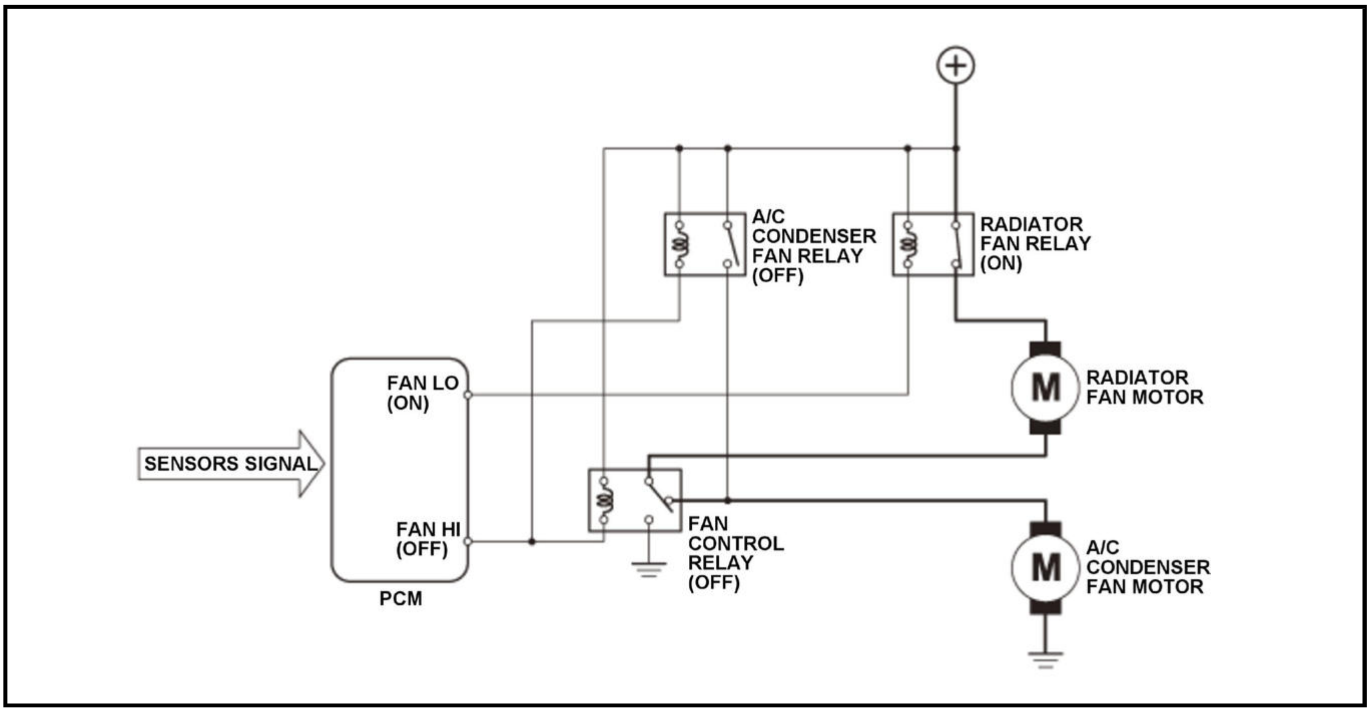
COOLING FAN CONTROLS SYSTEM DESCRIPTION

Overview

Receiving various signals (such as coolant temperature signals and refrigerant compression signals) from sensors, the PCM performs the fan control switching the fan speed (HI/LO) as needed. This control efficiently operates the radiator fan and A/C condenser fan, and improves fuel efficiency by reducing electrical load.

Fan LO Control Operation

In fan LO control, the PCM switches the FAN LO terminal to the ON position, which then switches the radiator fan relay to the ON position. This causes current to flow from the 12 volt battery to the radiator fan relay, the radiator fan motor, the fan control relay and the A/C condenser fan motor, to create a series connection through the radiator fan motor and the A/C condenser fan motor. Using this series connection, the fan rotates at a lower speed.



Fan HI Control Operation

In fan HI control, the PCM powers the FAN LO terminal and the FAN HIGH terminal. This switches the radiator fan relay, the fan control relay, and the A/C condenser fan relay to the ON position. With the radiator fan relay and the fan control relay in the ON position, current from the 12 volt battery flows through the radiator fan relay to the radiator fan motor, and then through the fan control relay to the ground. This rotates the radiator fan at a high speed. In addition, with the A/C condenser fan relay and the fan control relay in the ON position, current from the 12 volt battery flows through the A/C condenser fan relay to the A/C condenser fan motor to the ground. This rotates the A/C condenser fan at a high speed.

CHECK

COOLANT CHECK (1.5 L ENGINE)

Check

1. Coolant - Check

	1. Check the coolant level in the expansion tank. Make sure it is between the MAX mark (A) and MIN mark (B). 2. If the coolant level in the expansion tank is at or below the MIN mark, add coolant to bring it between the MIN and MAX marks, then inspect the cooling system for leaks. 3. Check the coolant level in the expansion tank, and add Honda Long Life Antifreeze/Coolant Type 2 (for except Ecuador)/Honda All Season Antifreeze/Coolant Type 2 (for Ecuador) into the expansion tank to the MAX mark, if needed. **NOTE:** • Always use Honda Long Life Antifreeze/Coolant Type 2 (for except Ecuador)/Honda All Season Antifreeze/Coolant Type 2 (for Ecuador). Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail. • Honda Long Life Antifreeze/Coolant Type 2 (for except Ecuador)/Honda All Season Antifreeze/Coolant Type 2 (for Ecuador) is a mixture of 50 % antifreeze and 50 % water. Do not add water.

COOLANT CHECK (2.4 L ENGINE) (2017 2018 2019)

Check

1. Coolant - Check

	1. Check the coolant level in the coolant reservoir. Make sure it is between the MAX mark (A) and MIN mark (B). 2. If the coolant level in the coolant reservoir is at or below the MIN mark, add coolant to bring it between the MIN and MAX marks, then inspect the cooling system for leaks. 3. Check the coolant level in the radiator, and add Honda Long Life Antifreeze/Coolant Type 2 (for except Ecuador)/Honda All Season Antifreeze/Coolant Type 2 (for Ecuador) into the radiator up to the base of the filler neck, if needed. **NOTE:** • Always use Honda Long Life Antifreeze/Coolant Type 2 (for except Ecuador)/Honda All Season Antifreeze/Coolant Type 2 (for Ecuador). Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail. • Honda Long Life Antifreeze/Coolant Type 2 (for except Ecuador)/Honda All Season Antifreeze/Coolant Type 2 (for Ecuador) is a mixture of 50 % antifreeze and 50 % water. Do not add water.

DTC TROUBLESHOOTING

RADIATOR FAN HIGH SPEED CIRCUIT TROUBLESHOOTING

Radiator Fan High Speed Circuit Troubleshooting

1. Fuse check

-1. Check the following fuses.

Fuse	Location
No. A1-3 (30 A)	Under-hood fuse/relay box
No. B25 (7.5 A)	Fuse/relay holder A
No. D9 (10 A)	Under-dash fuse/relay box

Are the fuses OK?

YES

Reinstall the fuses, then go to step 2.

NO

Replace the fuse (s), and recheck. If the fuse (s) blows again, repair the short to ground on the No. A1-3 (30 A) fuse, the No. B25 (7.5 A) fuse, and/or the No. D9 (10 A) fuse circuit (s).

2. Radiator fan and fan control relays check

-1. Check the following relays.

Relay	Location
Radiator fan relay	Under-hood fuse/relay box
Fan control relay	Relay holder F

Are the relays OK?

YES

Go to step 3.

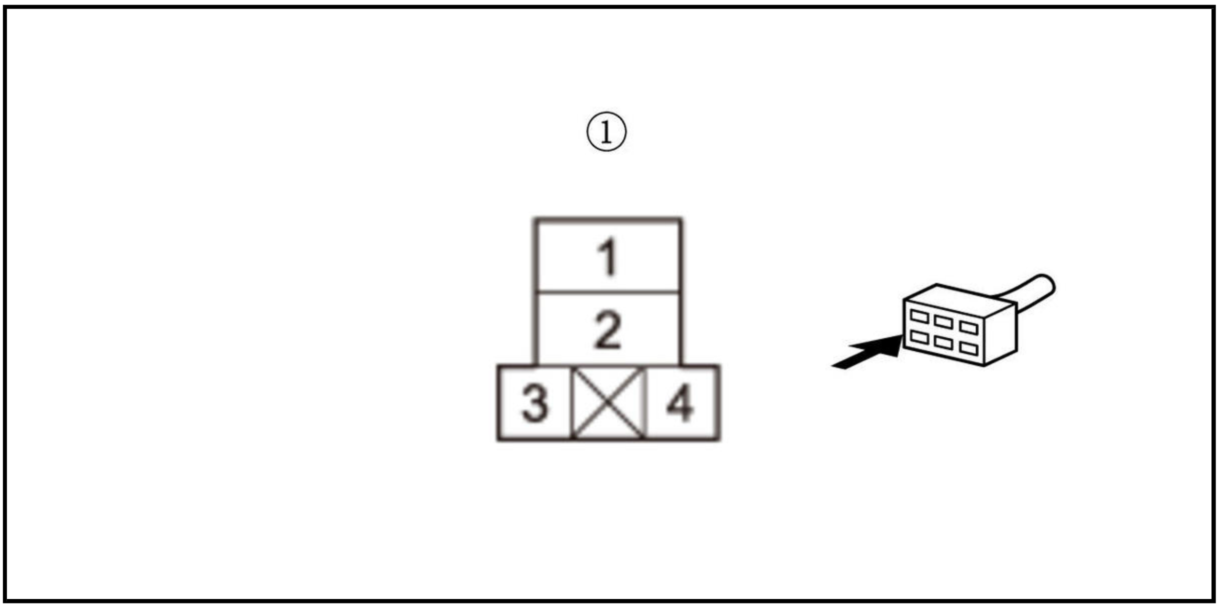
NO

Replace the relay (s).

3. Open wire check (+B MAIN FAN line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Radiator fan relay: disconnected
Test point 1	Radiator fan relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

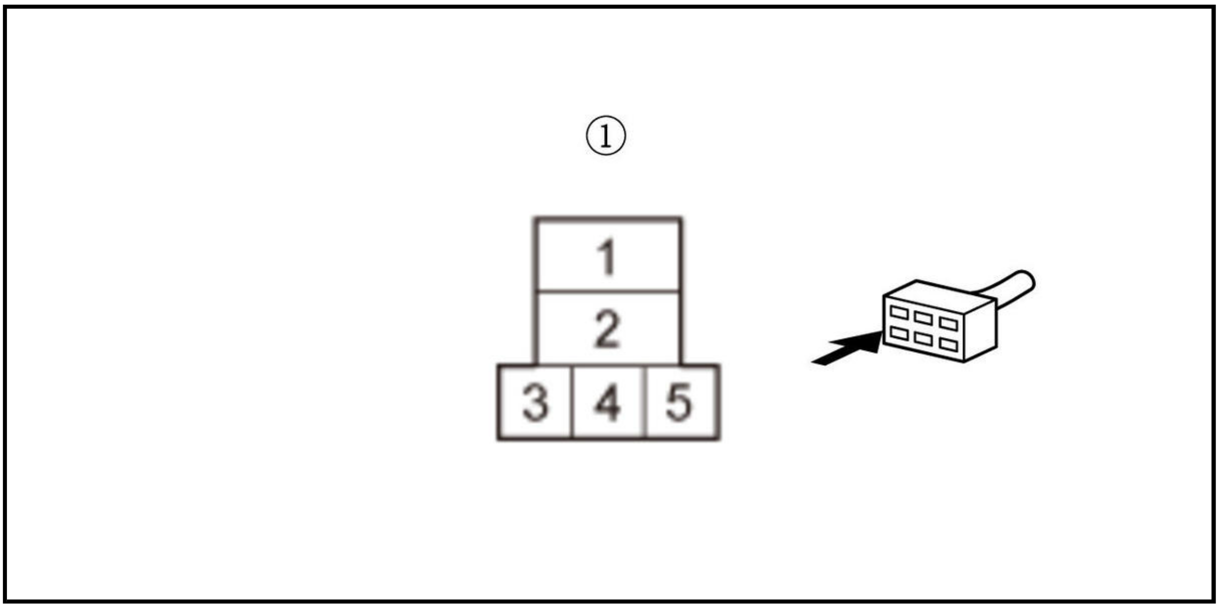
Repair an open in the +B MAIN FAN wire between the radiator fan relay and the No. A1-3 (30 A) fuse.

4. Determine possible failure area (GND line, others)

-1. Connect terminals A and B with a jumper wire.

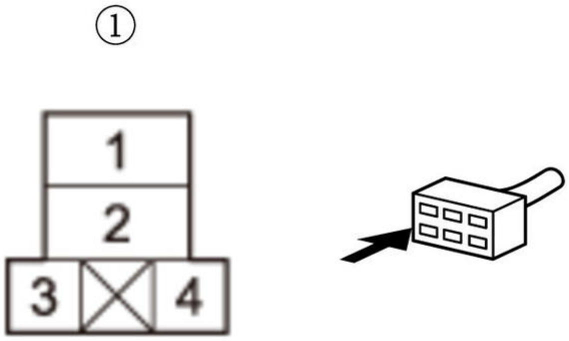
Terminal A	Fan control relay 5P socket (female terminals) No. 1: ①

Terminal B	Fan control relay 5P socket (female terminals) No. 2: ①



-2. Connect terminals A and B with a jumper wire.

Terminal A	Radiator fan relay 4P socket (female terminals) No. 1: ①
Terminal B	Radiator fan relay 4P socket (female terminals) No. 2: ①



Does the radiator fan run at high speed?

YES

Remove the jumper wires, then go to step 9.

NO

Remove the jumper wires, then go to step 5.

5. Radiator fan motor operation check

-1. Test the radiator fan motor .

Is the motor OK?

YES

Go to step 6.

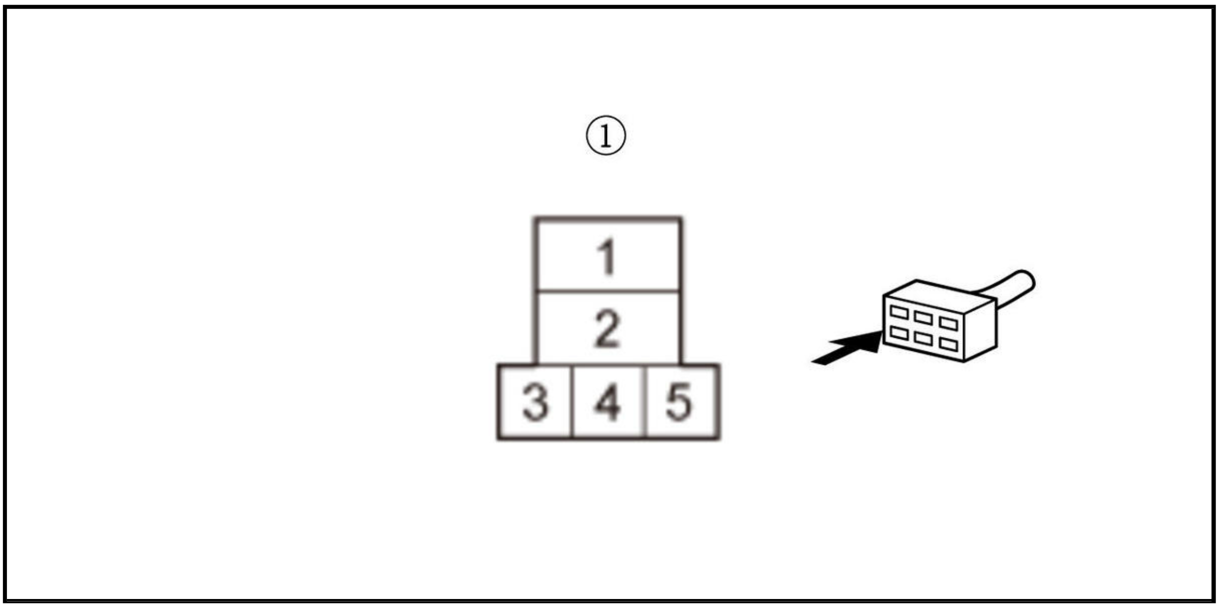
NO

Replace the radiator fan motor .

6. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Radiator fan relay: disconnected
B	Fan control relay: disconnected
Test point 1	Fan control relay 5P socket (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 7.

NO

Repair an open in the GND wire between the fan control relay and ground G351.

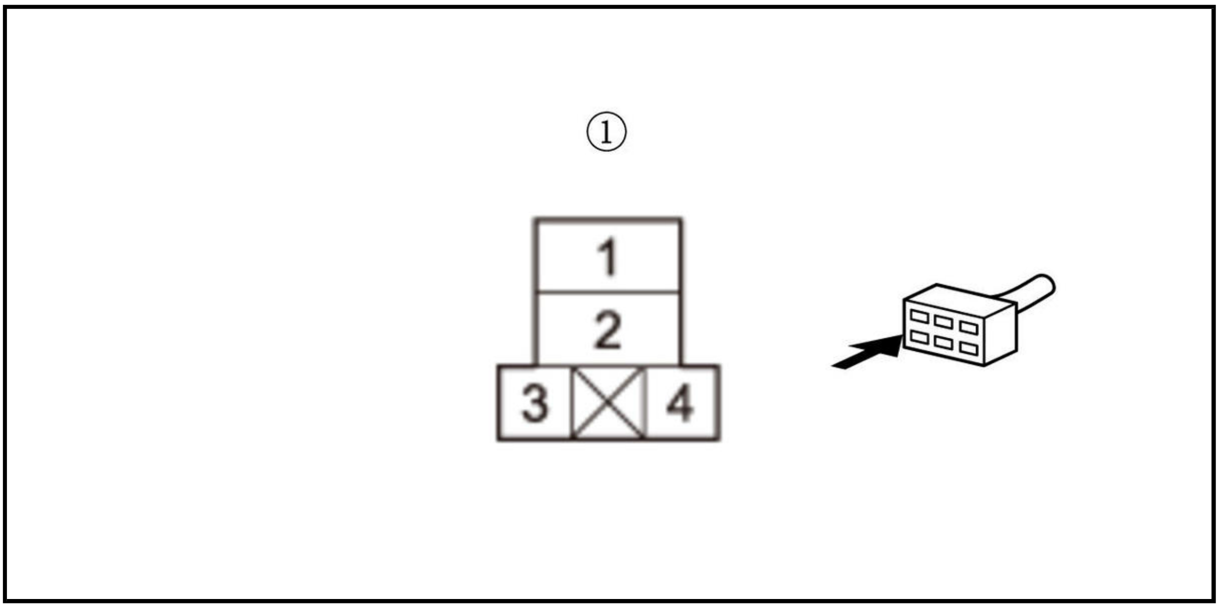
7. Open wire check (MAIN FAN MOTOR line)

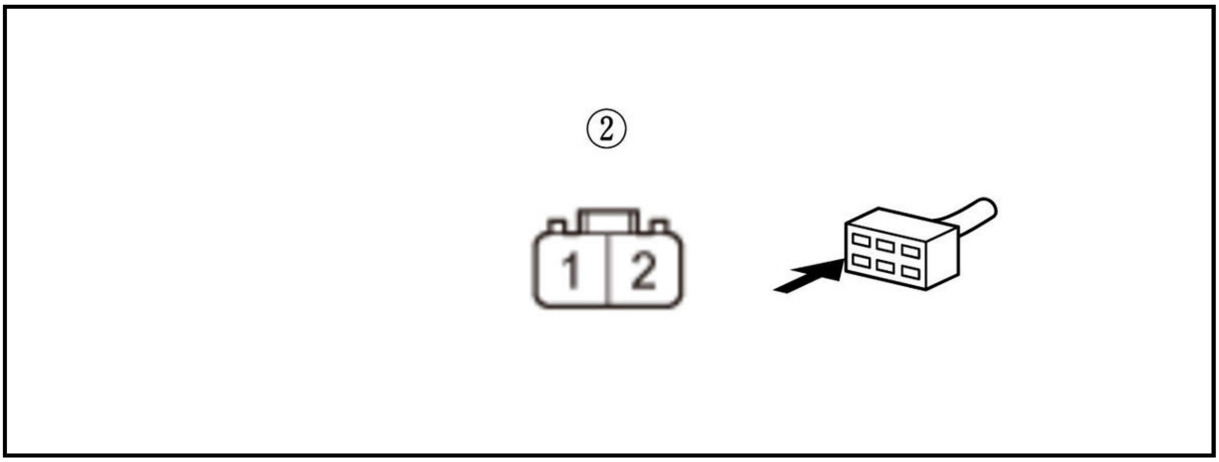
-1. Disconnect the following connector.

Radiator fan motor 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Radiator fan relay: disconnected
B	Fan control relay: disconnected
B	Radiator fan motor 2P connector: disconnected
Test point 1	Radiator fan relay 4P socket (female terminals) No. 2: ①
Test point 2	Radiator fan motor 2P connector (female terminals) No. 1: ②





Is there continuity?

YES

Go to step 8.

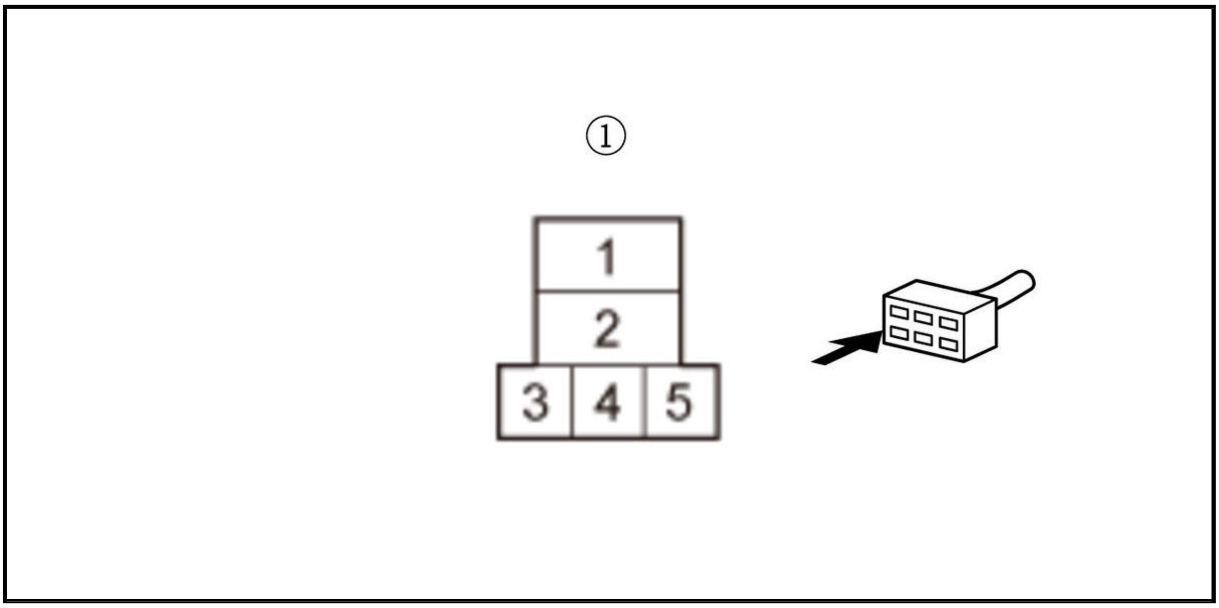
NO

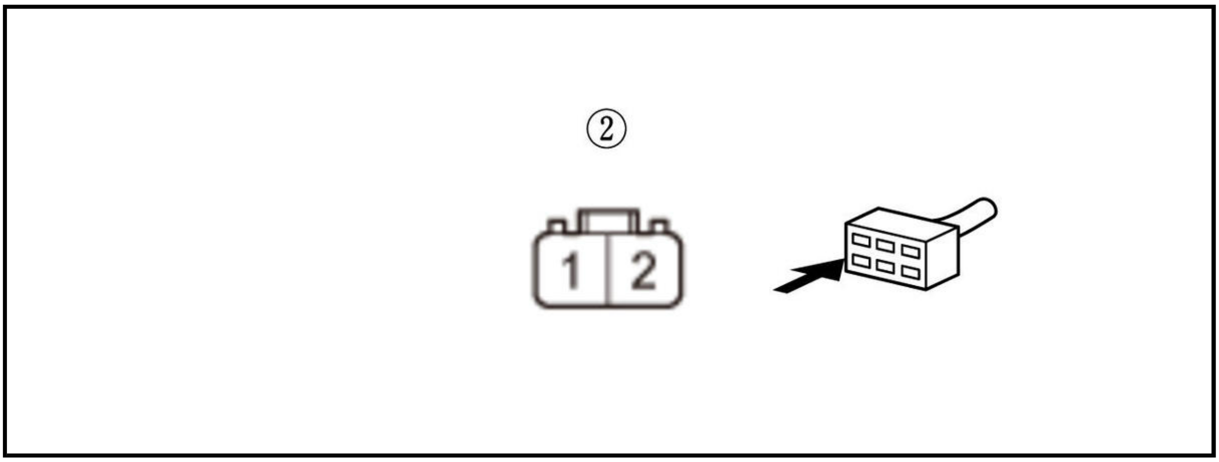
Repair an open in the MAIN FAN MOTOR wire between the radiator fan relay and the radiator fan motor.

8. Open wire check (FAN HI/LO RLY COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Radiator fan relay: disconnected
	Fan control relay: disconnected
B	Radiator fan motor 2P connector: disconnected
Test point 1	Fan control relay 5P socket (female terminals) No. 1: ①
Test point 2	Radiator fan motor 2P connector (female terminals) No. 2: ②





Is there continuity?

YES

Check for poor connections or loose terminals at the under-hood fuse/relay box and the radiator fan motor.

NO

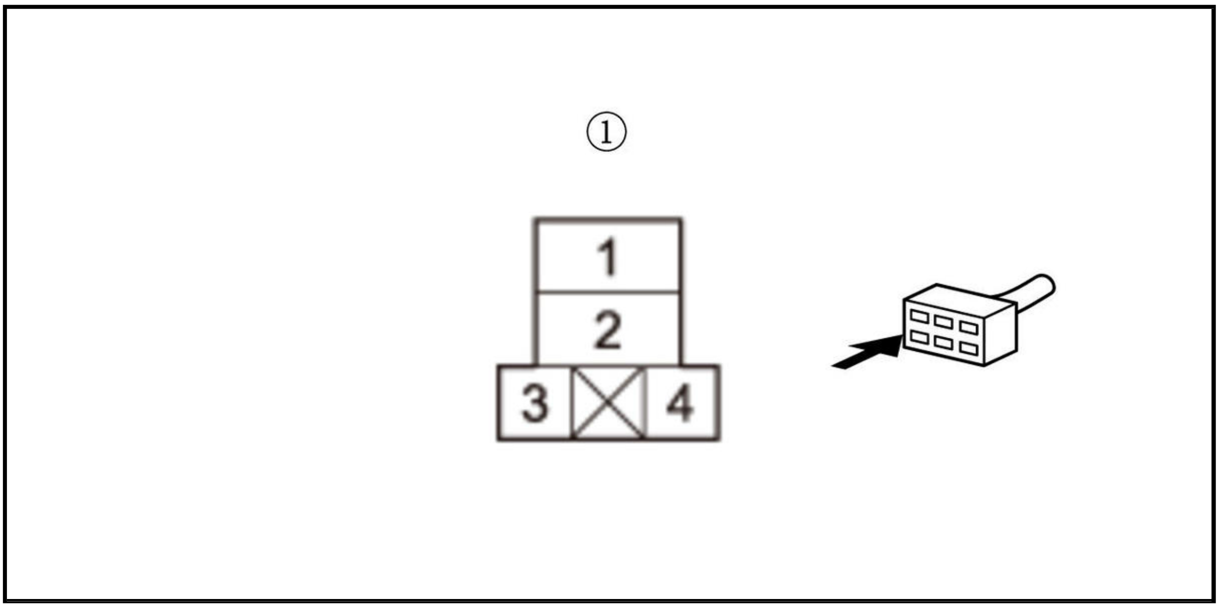
Repair an open in the FAN HI/LO RLY COM wire between the fan control relay 5P and the radiator fan motor.

9. Open wire check (IG2 A/C line)

   -1. Turn the vehicle to the ON mode.

   -2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Radiator fan relay: disconnected
B	Fan control relay: disconnected
Test point 1	Radiator fan relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 10.

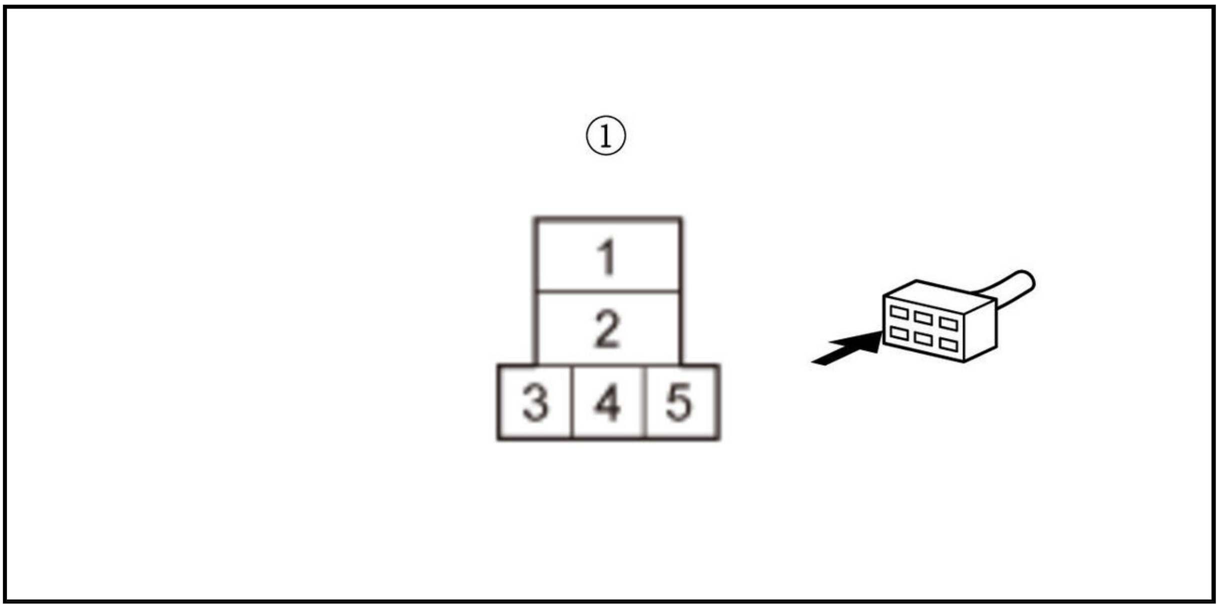
NO

Repair an open in the IG2 A/C wire between the radiator fan relay and the No. D9 (10 A) fuse.

10. Open wire check (IGP2 SUB line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Radiator fan relay: disconnected
B	Fan control relay: disconnected
Test point 1	Fan control relay 5P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 11.

NO

Repair an open in the IGP2 SUB wire between the fan control relay and the No. B25 (7.5 A) fuse.

11. Open wire check (FAN LO SIGNAL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Connect the HDS to the DLC** .

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

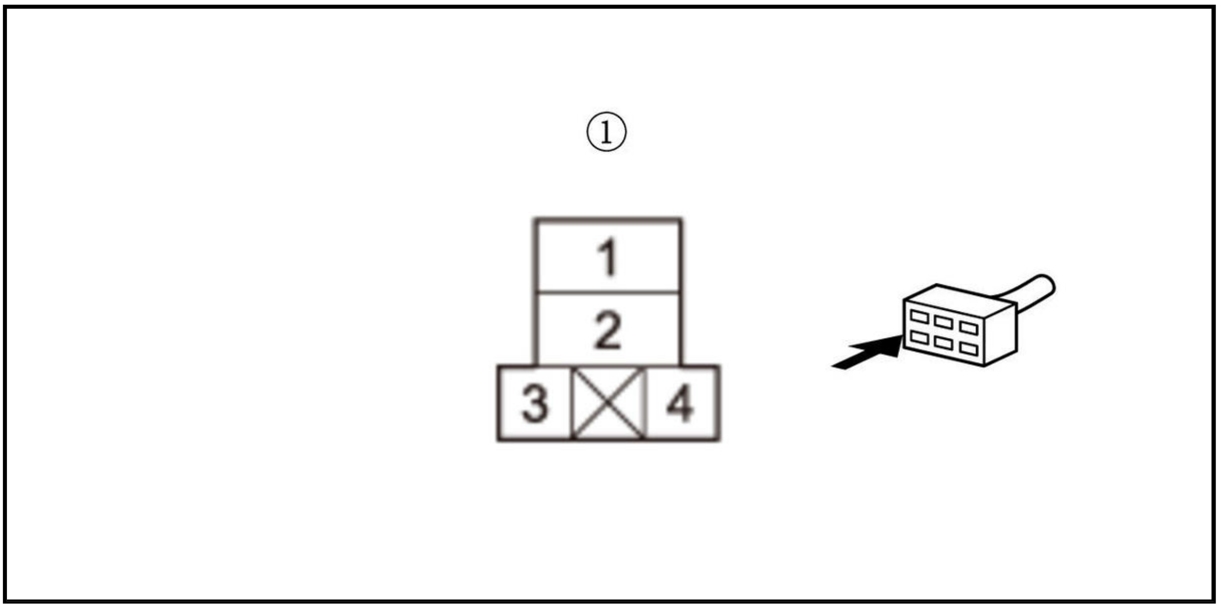
NOTE: This step must be done to protect the PCM from damage.

-4. Disconnect the following connector.

1.5 L engine: PCM connector A (50P)
2.4 L engine: PCM connector A (51P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Radiator fan relay: disconnected
	Fan control relay: disconnected
B	PCM connector A (50P or 51P): disconnected
1.5 L engine:	B
Test point 1	Radiator fan relay 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (50P) No. 17**
2.4 L engine:	
Test point 1	Radiator fan relay 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (51P) No. 9**



Is there continuity?

YES

Go to step 12.

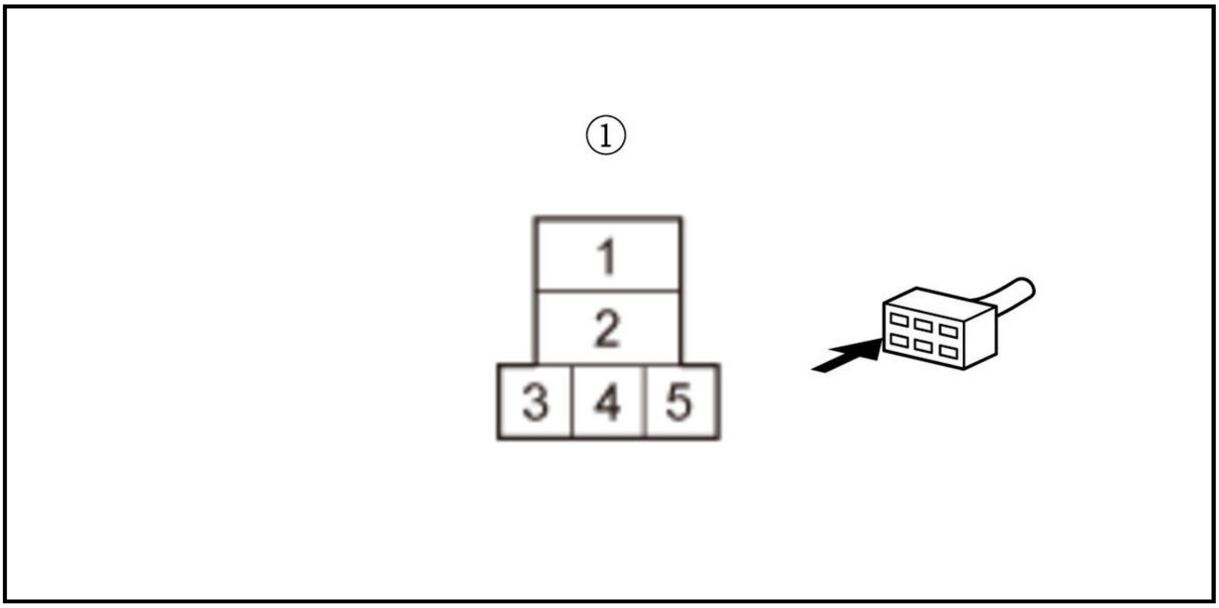
NO

Repair an open in the FAN LO SIGNAL wire between the radiator fan relay and the PCM.

12. Open wire check (FAN HI SIGNAL line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Radiator fan relay: disconnected
	Fan control relay: disconnected
B	PCM connector A (50P or 51P): disconnected
1.5 L engine:	B
Test point 1	Fan control relay 5P socket (female terminals) No. 5: ①
Test point 2	**PCM connector A (50P) No. 18**
2.4 L engine:	
Test point 1	Fan control relay 5P socket (female terminals) No. 5: ①
Test point 2	**PCM connector A (51P) No. 10**



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the PCM was substituted, and the symptom/indication goes away, **replace the original PCM** .

NO

Repair an open in the FAN HI SIGNAL wire between the fan control relay and the PCM.

SERVICE INFORMATION

DRIVE BELT AUTO-TENSIONER AIR BLEEDING (2.4 L ENGINE) (2017 2018 2019)

Bleeding

1. **Drive Belt - Remove**
2. Drive Belt Auto-Tensioner - Air Bleed

	1. From the top of the engine. Set a wrench on the drive belt auto-tensioner. Take at least 3 seconds to complete a full stroke to compress the drive belt auto-tensioner in the direction of the arrow. Then take 3 seconds to complete a full stroke to move the drive belt auto-tensioner in the opposite direction (decompressing it). Repeat the full compress/decompressing action three more times.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

TEST

EXPANSION TANK CAP TEST (1.5 L ENGINE)

Test

1. Expansion Tank Cap - Test

	1. Wait until the engine is cool, then carefully remove the expansion tank cap (A). Wet the expansion tank cap seal with engine coolant, then install it on a commercially available pressure tester (B). 2. Apply a pressure of 93-123 kPa (0.95-1.25 kgf/cm 2, 13.5- 17.8 psi). 3. Check for a drop in pressure. 4. If the pressure drops, replace the expansion tank cap.

RADIATOR CAP TEST (2.4 L ENGINE) (2017 2018 2019)

Test

1. Radiator Cap - Test

	1. Wait until the engine is cool, then carefully remove the radiator cap (A). Wet the radiator cap seal with engine coolant, then install it on a commercially available pressure tester (B). 2. Apply a pressure of 93-123 kPa (0.95-1.25 kgf/cm 2, 13.5-17.8 psi). 3. Check for a drop in pressure. 4. If the pressure drops, replace the radiator cap.

SYMPTOM TROUBLESHOOTING INDEX

COOLING FAN CONTROLS SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic Procedure	Also check for
Engine overheats	- Check the coolant level. - Check for any engine coolant leakage (from gaskets, hoses, O-rings, etc.). - Check for dirt, leaves, or insects on the radiator and the A/C condenser. - Check for deteriorated coolant. - Check for a damaged or deformed fan shrouds. - Check the fan motors are operating properly (air should be blowing toward the engine).	Check the radiator and A/C condenser fans are operating properly

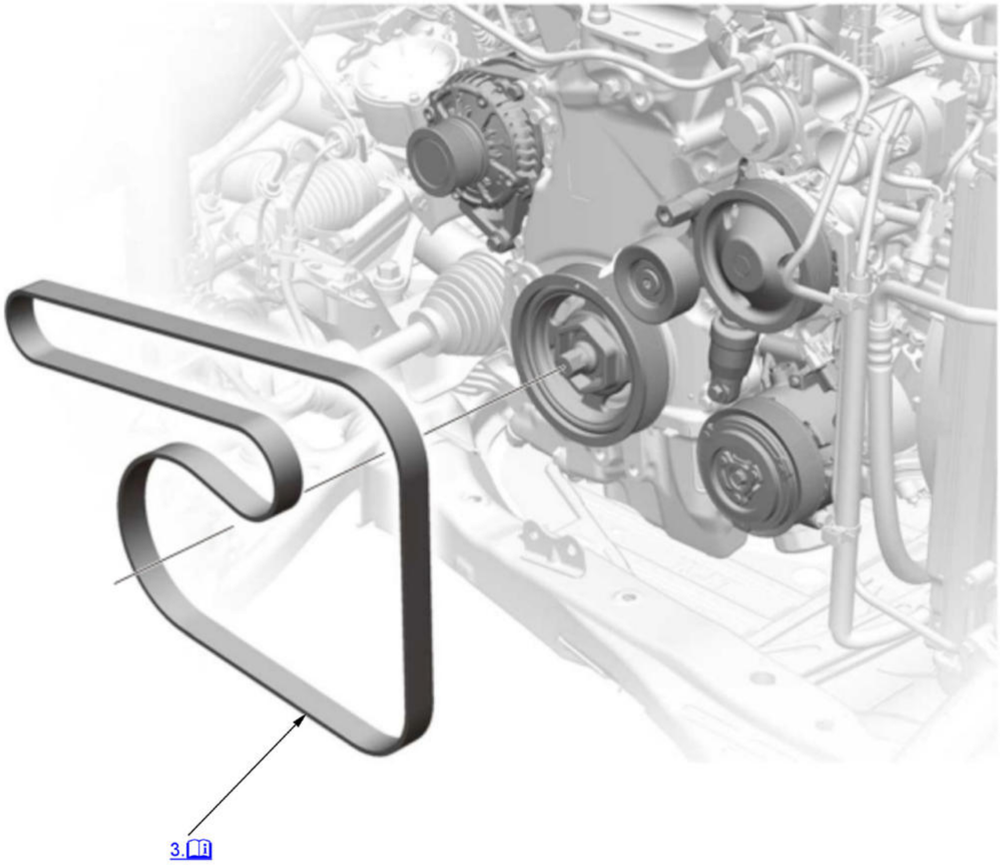
Symptom	Diagnostic Procedure	Also check for
	- **Inspect the fan motors** or **fan relays** . - 1.5 L engine: **Check the expansion tank cap**. - 2.4 L engine: **Check the radiator cap**. - **Check the thermostat** . - **Inspect the water pump**. - Check for clogged radiator. - Check for plugged or deteriorated radiator hoses. - Check for a plugged heater core or hoses. - Check for a damaged cylinder head gasket.	
The radiator fan does not run at high speed	**Radiator fan high speed circuit troubleshooting**.	Check the connectors are properly connected and the terminals are making good contact
Both the radiator fan and the A/C condenser fan do not run at low speed	**Radiator and A/C condenser fans low speed circuit troubleshooting** .	Check the connectors are properly connected and the terminals are making good contact
The A/C condenser fan does not run at high speed	**A/C condenser fan high speed circuit troubleshooting** .	Check the connectors are properly connected and the terminals are making good contact

REMOVAL, INSTALLATION & INSPECTION

DRIVE BELT REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Removal and Installation

NOTE: ℹ Where icon is shown, further information shown below.



[Fig. 3: Drive Belt Routing](#)
Courtesy of HONDA, U.S.A., INC.

🛈	Detailed information, notes, and precautions

1. **Right Front Wheel - Remove**
2. **Engine Undercover - Remove**
3. Drive Belt - Remove

	1. Attach a wrench to the drive belt auto-tensioner (A) and move it in the direction shown. Fix the drive belt auto-tensioner by aligning the water passage hole with drive belt auto-tensioner hole and inserting a 6 x 45 mm (15/64 x 1.77 in) pin (B) deep into the holes. **NOTE:** This is a hydraulic type auto-tensioner, so you must turn the wrench slowly. 2. Remove the drive belt (C).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Inspection

1. Drive Belt - Inspect

	1. Inspect the belt for cracks or damage. If the belt is cracked or damaged, replace it. 2. Check the position of the drive belt auto-tensioner indicator pointer (A) is within the standard range (B) as shown. If it is out of the standard range, replace the drive belt.

2. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to inspect the drive belt, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder").

WATER PUMP REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Removal and Installation

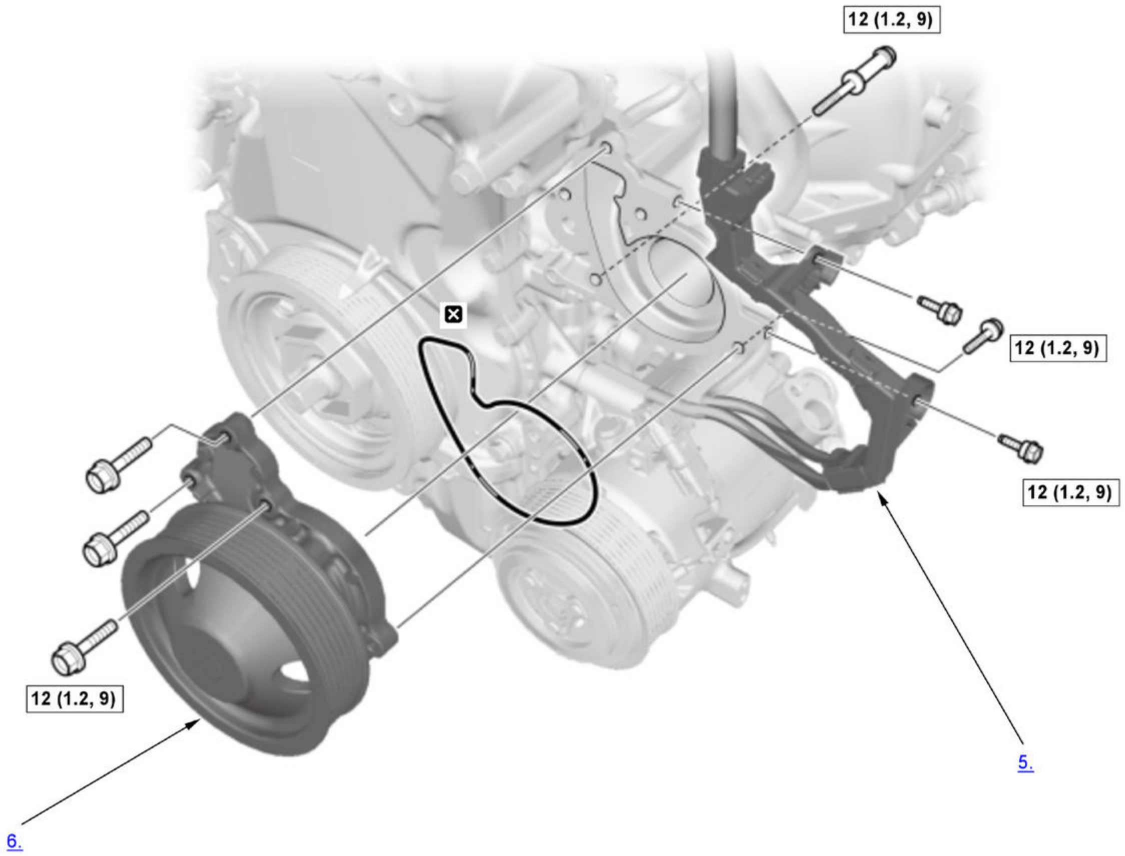


Fig. 4: Water Pump Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Engine Coolant - Drain
2. Drive Belt - Remove
3. Drive Belt Auto-Tensioner - Remove
4. Turbocharger - Remove
5. Harness Holder - Move
6. Water Pump - Remove
7. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- Inspect and clean the O-ring groove and the mating surface of the water passage.
- After installing all the removed parts, refill the radiator with engine coolant, and bleed the air from the cooling system.

Inspection

1. Drive Belt - Remove
2. Water Pump - Inspect

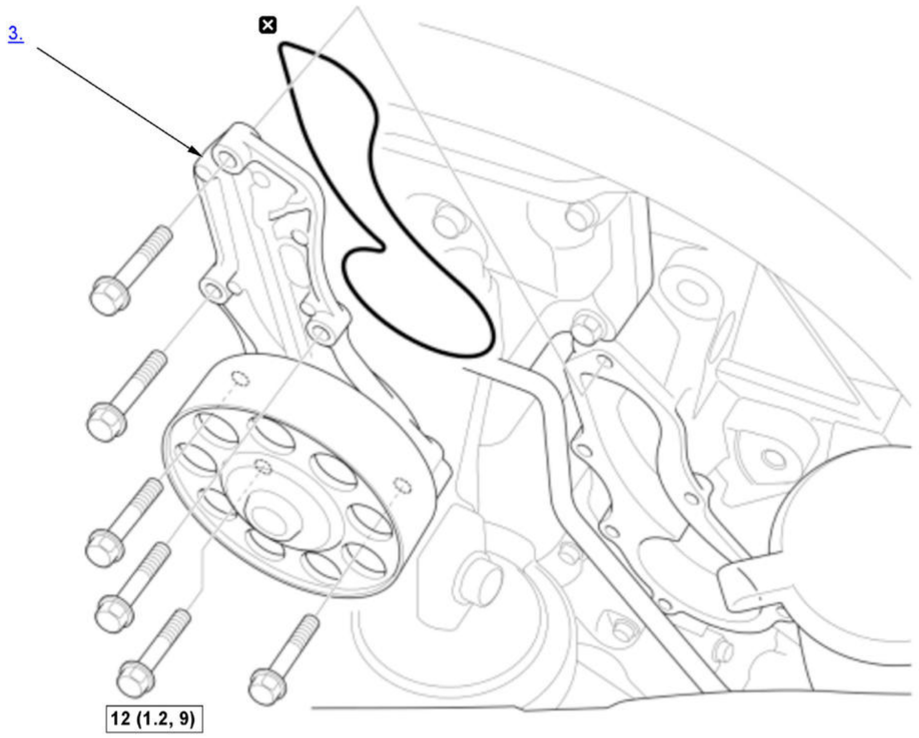
	1. Turn the water pump pulley clockwise, and check that it turns freely and smoothly. If it does not turn smoothly, replace the water pump. **NOTE:** When you check the water pump, you may see a small amount of "weeping" from the bleed holes (A). This is normal.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

WATER PUMP REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation



☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Engine Coolant - Drain**
2. **Alternator - Remove**
3. Water Pump - Remove
4. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.
> **NOTE:**
>
> - Inspect and clean the O-ring groove and the mating surface of the engine block.
> - After installing all the removed parts, **refill the radiator with engine coolant, and bleed the air from the cooling system**.

Inspection

1. **Drive Belt - Remove**
2. Water Pump - Inspect

	1. Turn the water pump pulley counterclockwise, and check that it turns freely and smoothly. If it does not turn smoothly, replace the water pump. **NOTE:** When you check the water pump, you may see a small amount of "weeping" from the bleed holes (A). This is normal.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

BOTH THE RADIATOR FAN AND THE A/C CONDENSER FAN DO NOT RUN AT LOW SPEED

Diagnostic Procedure

- **Radiator and A/C condenser fans low speed circuit troubleshooting** .

Also check for

Check the connectors are properly connected and the terminals are making good contact

ENGINE OVERHEATS

Diagnostic Procedure

- **Check the coolant level**.
- Check for any engine coolant leakage (from gaskets, hoses, O-rings, etc.).
- Check for dirt, leaves, or insects on the radiator and the A/C condenser.
- Check for deteriorated coolant.
- Check for a damaged or deformed fan shrouds.
- Check the fan motors are operating properly (air should be blowing toward the engine).
- **Inspect the fan motors** or **fan relays** .
- 1.5 L engine: **Check the expansion tank cap**.
- 2.4 L engine: **Check the radiator cap**.
- **Check the thermostat** .
- **Inspect the water pump**.
- Check for clogged radiator.
- Check for plugged or deteriorated radiator hoses.
- Check for a plugged heater core or hoses.
- Check for a damaged cylinder head gasket.

Also check for

Check the radiator and A/C condenser fans are operating properly

THE A/C CONDENSER FAN DOES NOT RUN AT HIGH SPEED

Diagnostic Procedure

- **A/C condenser fan high speed circuit troubleshooting** .

Also check for

Check the connectors are properly connected and the terminals are making good contact

THE RADIATOR FAN DOES NOT RUN AT HIGH SPEED

Diagnostic Procedure

- **Radiator fan high speed circuit troubleshooting**.

Also check for

Check the connectors are properly connected and the terminals are making good contact

2020-21 ENGINE

Engine Fuel System Service Specifications - CR-V

STANDARDS AND SERVICE LIMITS (2020-21)

FUEL AND EMISSIONS

Item	Measurement	Qualification	Standard or New	Service Limit
Fuel pressure regulator	Pressure with fuel pressure gauge connected	B	390-440 kPa (3.98-4.49 kgf/cm 2, 56.6-63.9 psi)	-
Engine idle	Idle speed without load	In N or P	720 +/- 50 rpm	
		In N or P (1.5L engine: high altitude (BARO sensor in the DATA LIST with the HDS: less than 563 mmHg))	975 +/- 50 rpm	
	Idle speed with high electrical load	In N or P	720 +/- 50 rpm	
	Idle CO (KX)	B	0.1 % max.	

Engine Lubrication Service Specifications - CR-V (Hybrid)

ENGINE LUBRICATION

Item	Measurement	Qualification	Standard or New	Service Limit
Engine oil	Capacity	Engine overhaul	4.5 L (4.8 US qt)	-
		Oil change including filter	3.8 L (4.0 US qt)	-
		Oil change without filter	3.5 L (3.7 US qt)	-
Oil pump	Oil pressure with oil temperature at 176B°F (80B°C)	At idle	168.7 kPa (1.720 kgf/cm^2 , 24.46 psi) min.	-
		At 2, 000 rpm	217.7 kPa (2.220 kgf/cm^2 , 31.58 psi) min.	-

2020-21 ENGINE

Engine Lubrication Service Specifications - CR-V

STANDARDS AND SERVICE LIMITS (2020-21)

ENGINE LUBRICATION

Item	Measurement	Qualification	Standard or New	Service Limit
Engine oil	Capacity	Engine overhaul	4.0 L (4.2 US qt)	-
		Oil change including filter	3.5 L (3.7 US qt)	-
		Oil change without filter	3.2 L (3.4 US qt)	-
	Recommended oil (except Ecuador/KX)	B	API certified motor oil for gasoline engines Honda Motor Oil: 0W-20	
Oil pump	Oil pressure with oil temperature at 176 deg.F (80 deg.C)	At idle	90 kPa (0.92 kgf/cm 2, 13.1 psi) min.	-
		At 3,000 rpm	280 kPa (2.86 kgf/cm 2, 40.7 psi) min.	-

STANDARDS AND SERVICE LIMITS (2020-21)

ENGINE ASSEMBLY

Item	Measurement	Qualification	Standard or New	Service Limit
Compression	Pressure	Minimum	-	980 kPa (9.99 kgf/cm 2, 142.1 psi)
		Maximum variation	-	200 kPa (2.04 kgf/cm 2, 29.0 psi)

CYLINDER HEAD

GENERAL SERVICE

ENGINE MOUNT TIGHTENING PROCEDURE (1.5 L ENGINE)

Procedure

NOTE:

- How to read the torque specifications.
- Reinstall the mounting bolts and support nuts in the sequence given in the following steps. Failure to follow this sequence may cause excessive noise and vibration, and reduce engine mount life.

1. Jack - Remove
2. Engine/Transmission Mount/Torque Rod - Tightening Procedure

NOTE: When installing the side engine mount, tighten the ① - 1 bolts at first and temporarily tighten the ① - 3 bolt while attaching the side engine mount bracket to the side engine mount, then tighten the remaining bolts and nuts in te sequence as shown below.

Tightening Sequence

Mount Removed	Mount Tightening Sequence
Side Engine Mount:	①, ②, ③, and ④
Transmission Mount:	②, ③, and ④
Lower Torque Rod:	③ and ④
Upper Torque Rod:	④

Tightening Torque

Mount No.	Mount Name	Mount Bolt/Nut Tightening Sequence				
		1	2	3	4	5

ENGINE MOUNT TIGHTENING PROCEDURE (2.4 L ENGINE) (2017 2018 2019)

Procedure

NOTE:

- How to read the torque specifications .
- Reinstall the mounting bolts and support nuts in the sequence given in the following steps. Failure to follow this sequence may cause excessive noise and vibration, and reduce engine mount life.

1. Jack - Remove
2. Engine/Transmission Mount/Torque Rod - Tightening Procedure

NOTE: When installing the side engine mount, tighten the ① - $\boxed{1}$ bolts at first and temporarily tighten the ① - $\boxed{3}$ bolt while attaching the side engine mount bracket to the side engine mount, then tighten other remaining bolts and nuts as the corresponding procedures that can be seen on the following chart.

Tightening Sequence

Mount Removed	**Mount Tightening Sequence**
Side Engine Mount:	①, ②, ③, and ④
Transmission Mount:	②, ③, and ④
Lower Torque Rod:	③ and ④
Upper Torque Rod:	④

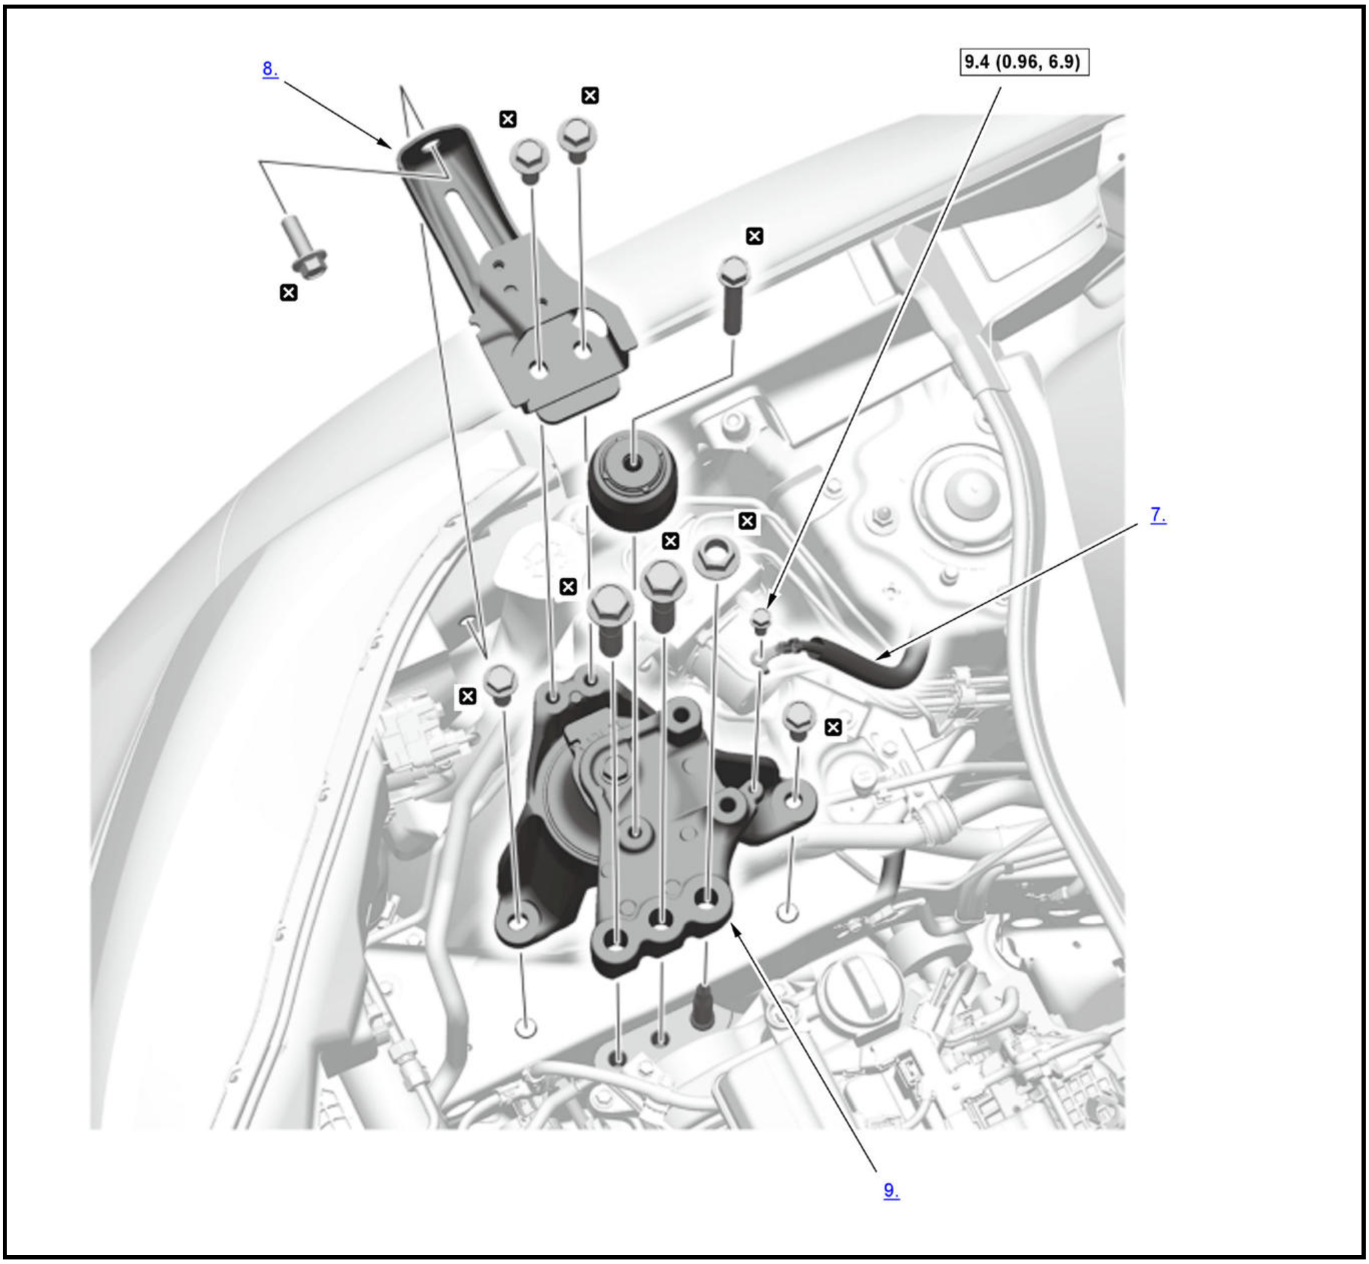
REMOVAL AND INSTALLATION

SIDE ENGINE MOUNT REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal and Installation

1



☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Engine Undercover Lid - Remove**
2. Engine - Support

    1. Lift and support the engine with a jack and a wood block under the oil pan.

3. Upper Torque Rod - Remove
4. Expansion Tank - Move

   NOTE: Do not disconnect the water bypass hoses.

5. Expansion Tank Bracket - Remove
6. Dynamic Dumper - Remove
7. Ground Cable - Disconnect
8. Side Engine Mount Bracket - Remove
9. Side Engine Mount - Remove
10. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

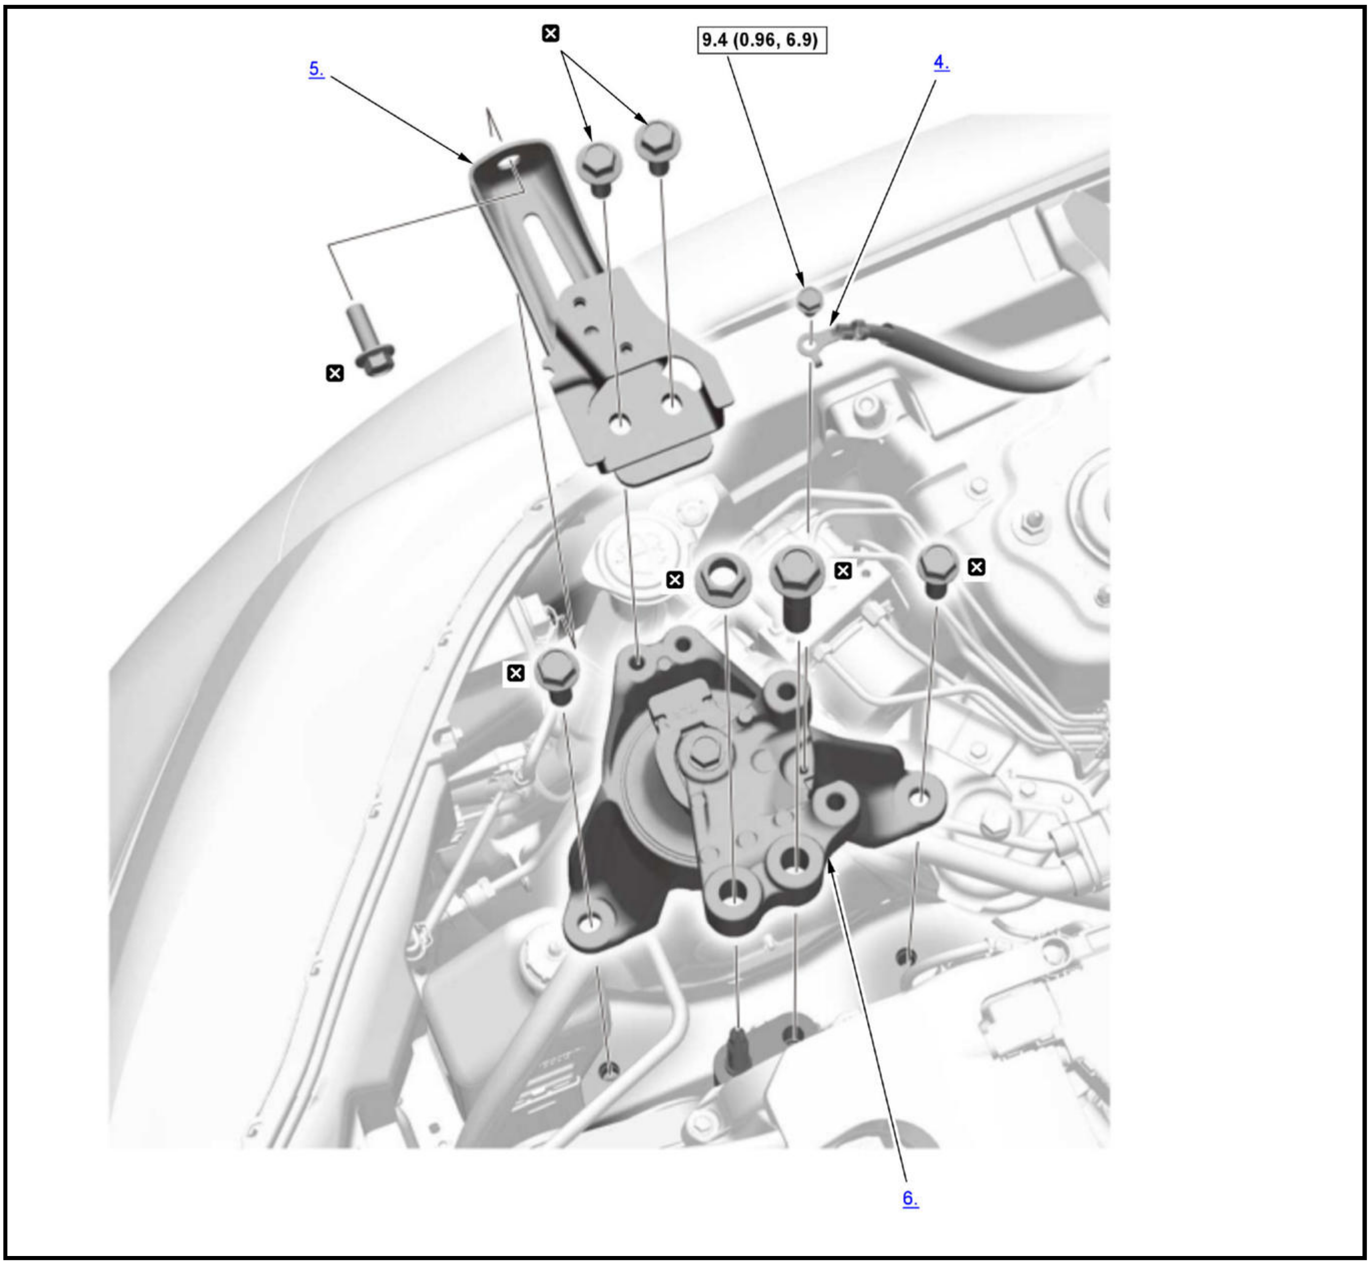
NOTE:

Do the mounts tightening procedure before tightening all of the mounts' bolts and nuts.

SIDE ENGINE MOUNT REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

1



▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Engine Undercover Lid - Remove
2. Engine - Support
    1. Lift and support the engine with a jack and a wood block under the oil pan.
3. Upper Torque Rod - Remove
4. Ground Cable - Disconnect
5. Side Engine Mount Bracket - Remove
6. Side Engine Mount - Remove
7. All Removed Parts - Install
    1. Install the parts in the reverse order of removal.

NOTE:

Do the mounts tightening procedure before tightening all of the mounts' bolts and nuts.

▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

Lower Torque Rod

1. Engine Undercover - Remove
2. Engine - Support

> 1. Support the engine with a transmission jack and a wood block under the oil pan.

3. Lower Torque Rod Mounting Bolt and Lower Torque Rod Bracket Mounting Bolt - Remove
4. Lower Torque Rod Bracket - Remove
5. Lower Torque Rod - Remove

   Note for installation

   Make sure to install the lower torque rod with the "UP" marks facing up.

6. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.

Tightening Procedure

NOTE: Reinstall the mounting bolts and support nuts in the sequence given in the following steps. Failure to follow this sequence may cause excessive noise, vibration, and severe damage to the engine mount brackets.

1. Jack - Remove
2. Engine/Transmission Mount - Tightening Procedure

NOTE: When installing the side engine mount, tighten the ① - $\boxed{1}$ bolts at first and temporarily tighten the ① - $\boxed{3}$ bolts while attaching the side engine mount bracket to the side engine mount, then tighten other remaining bolts and nuts as the corresponding procedures that can be seen on the following table.

Tightening Sequence

Mount Removed	Mount Tightening Sequence
Side Engine Mount	①, ②, ③, and ④

☒	Replace
*1	With break head band

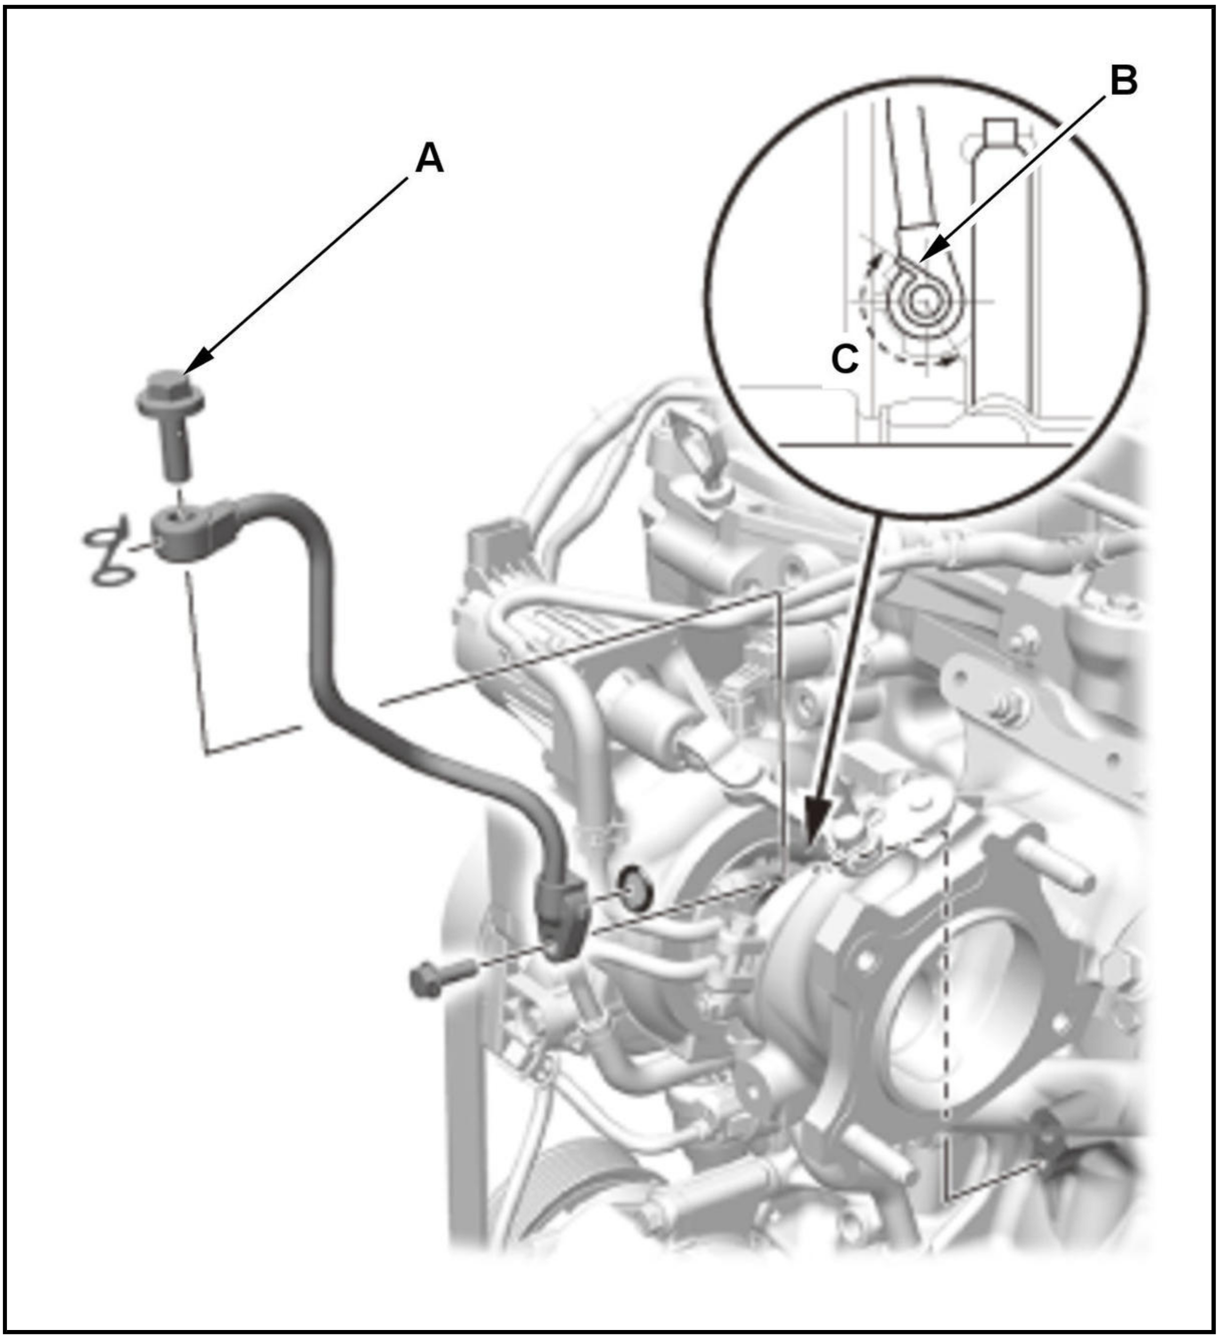
1. **Engine Coolant - Drain**
2. **Intake Parts - Remove**

   NOTE: Remove the necessary part(s).

3. **Expansion Tank - Remove**
4. **A/F Sensor - Remove**
5. **TWC Assembly - Remove**
6. Turbocharger Joint - Remove

	**NOTE:** (With break head band) Use commercially available cutting pliers as necessary to cut the band off the hose while avoiding damage to the hose. **Note for installation (with break head band):** When installing a new break head band, do the following procedures. 1. Tighten the break head bolt until the bolt head (A) is twisted off completely. **NOTE:** **Do not use an air tool.** 2. Make sure the stopper end (B) contacts to the housing end (C) after tightening the break head bolt.

7. Turbocharger Cover - Remove
8. Oil Feed Pipe - Remove



Note for installation

NOTE:

- Apply new engine oil to the threads of the oil feed pipe orifice bolt (A).
- Make sure the washer portion (B) is installed on the area (C) as shown.

9. Turbocharger and Bracket - Remove

	1. Remove the turbocharger (A). **NOTE:** **Do not hold the wastegate control valve rod (B) and the turbocharger wastegate control actuator (C).** 2. Remove the bracket (D).

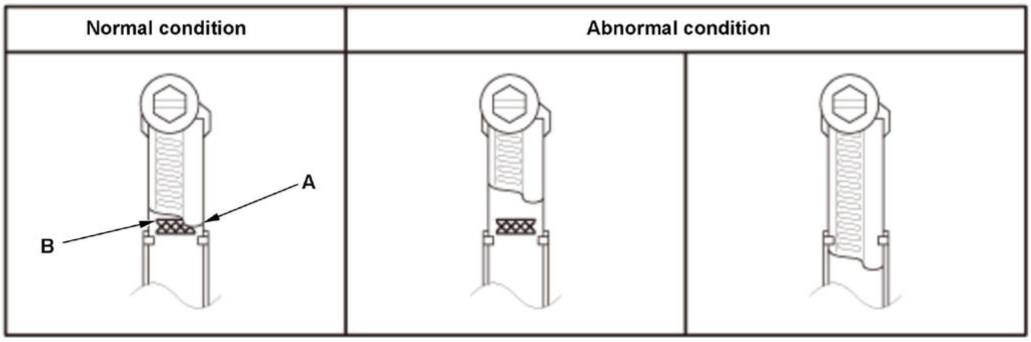
10. Oil Return Pipe - Remove
11. Water Pipe - Remove
12. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

13. Hose Band - Precaution

Note for installation

NOTE: Make sure the end of the hose band (A) is at or within the hash mark (B) on the hose band after the parts are installed.



14. Engine Oil Level - Check

Procedure After Replacing Turbocharger

15. PCM - Reset
16. PCM Idle - Learn

REMOVAL AND INSTALLATION

EXHAUST PIPE AND MUFFLER REMOVAL AND INSTALLATION

Removal and Installation

NOTE: Although a numbered sequence is shown, exhaust pipe A and the muffler are two separate components. If removal or replacement of one of the components is needed, it is not necessary to remove the other.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

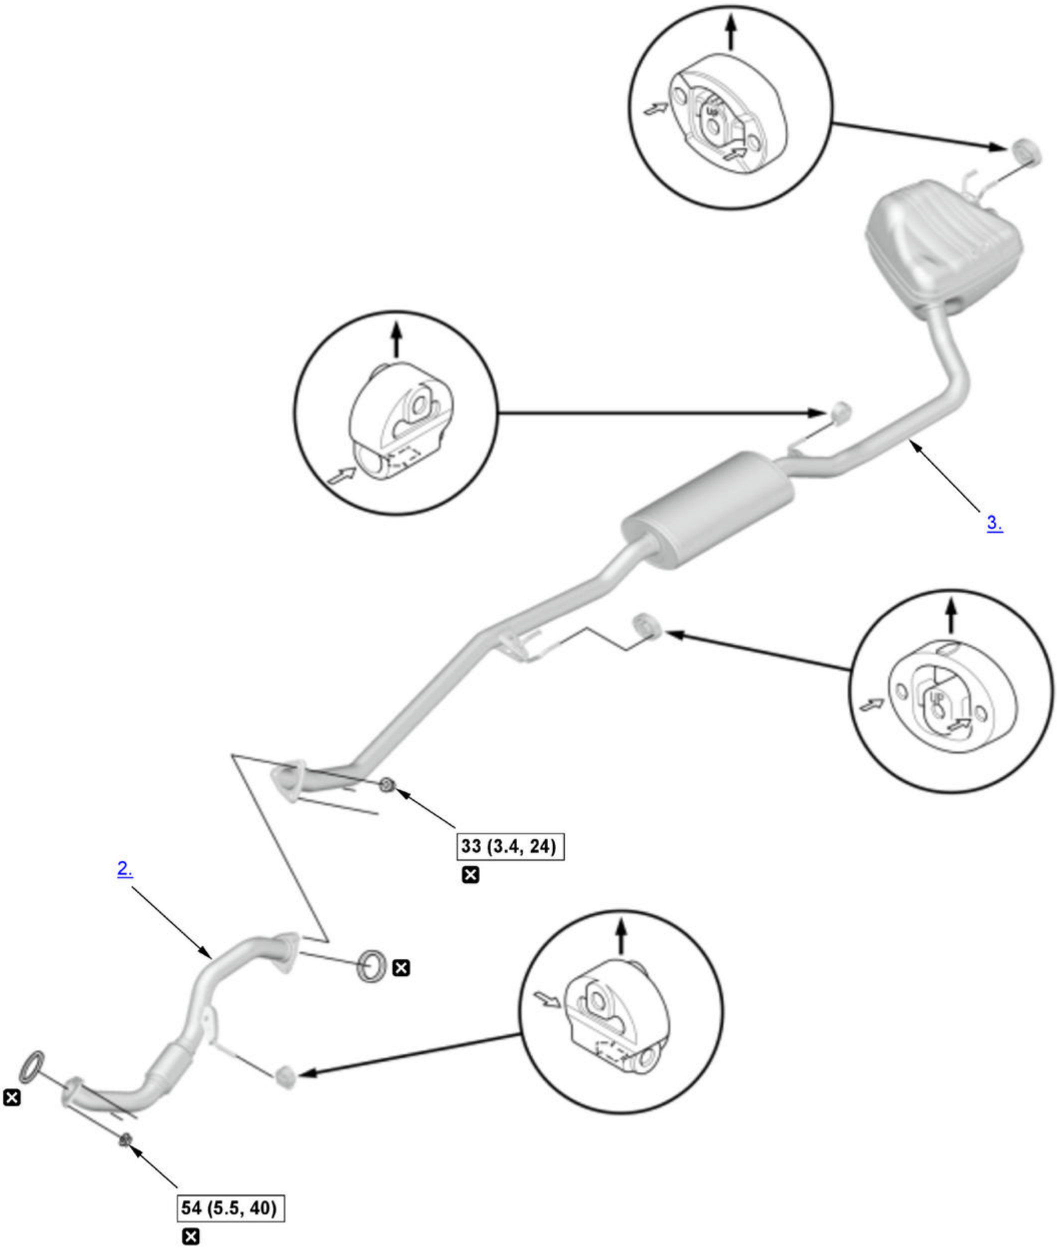


Fig. 1: Exploded View Of Exhaust Pipe And Muffler Replacement Components With Torque

Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Engine Undercover - Remove**

   NOTE: Remove the necessary part(s).

2. Exhaust Pipe A - Remove
3. Muffler - Remove
4. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

INSPECTION

TURBOCHARGER BYPASS CONTROL VALVE INSPECTION (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	Vacuum Pump/Gauge, 0-30 in Hg Snap-on YA4000A or equivalent, commercially available

Inspection

1. Turbocharger Bypass Control Valve - Inspect

	1. Disconnect the vacuum hose (A). 2. Connect the vacuum pump/gauge, 0-30 in Hg, to the vacuum hose. Apply vacuum to the turbocharger bypass control valve. Make sure the turbocharger bypass control valve moves. If the valve does not move, replace the turbocharger joint .

ℹ	Detailed information, notes and precautions
☐	Torque: N.m (kgf.m, lbf.ft)

1. Fuel Pressure - Relieve
2. Fuel Tank - Drain

1. Remove the fuel tank unit .
2. Using a hand pump, a hose, and a container suitable for fuel, draw the fuel from the fuel tank.

NOTE:

Drain the fuel tank, then reinstall the fuel tank unit without connecting the fuel tank unit connector and the quick-connect fitting.

3. Left Middle Floor Undercover - Remove
4. Propeller Shaft - Remove (AWD model)
5. Rear Inner Fender (Left Side) - Remove
6. Heat Shield - Remove
7. Fuel Tank Protector - Remove
8. Fuel Tank Guard Pipe - Remove (If Necessary)
9. EVAP Canister Line Hose - Disconnect
10. Fuel Fill Pipe Clamp - Remove
11. Fuel Tank Straps and Nut - Remove

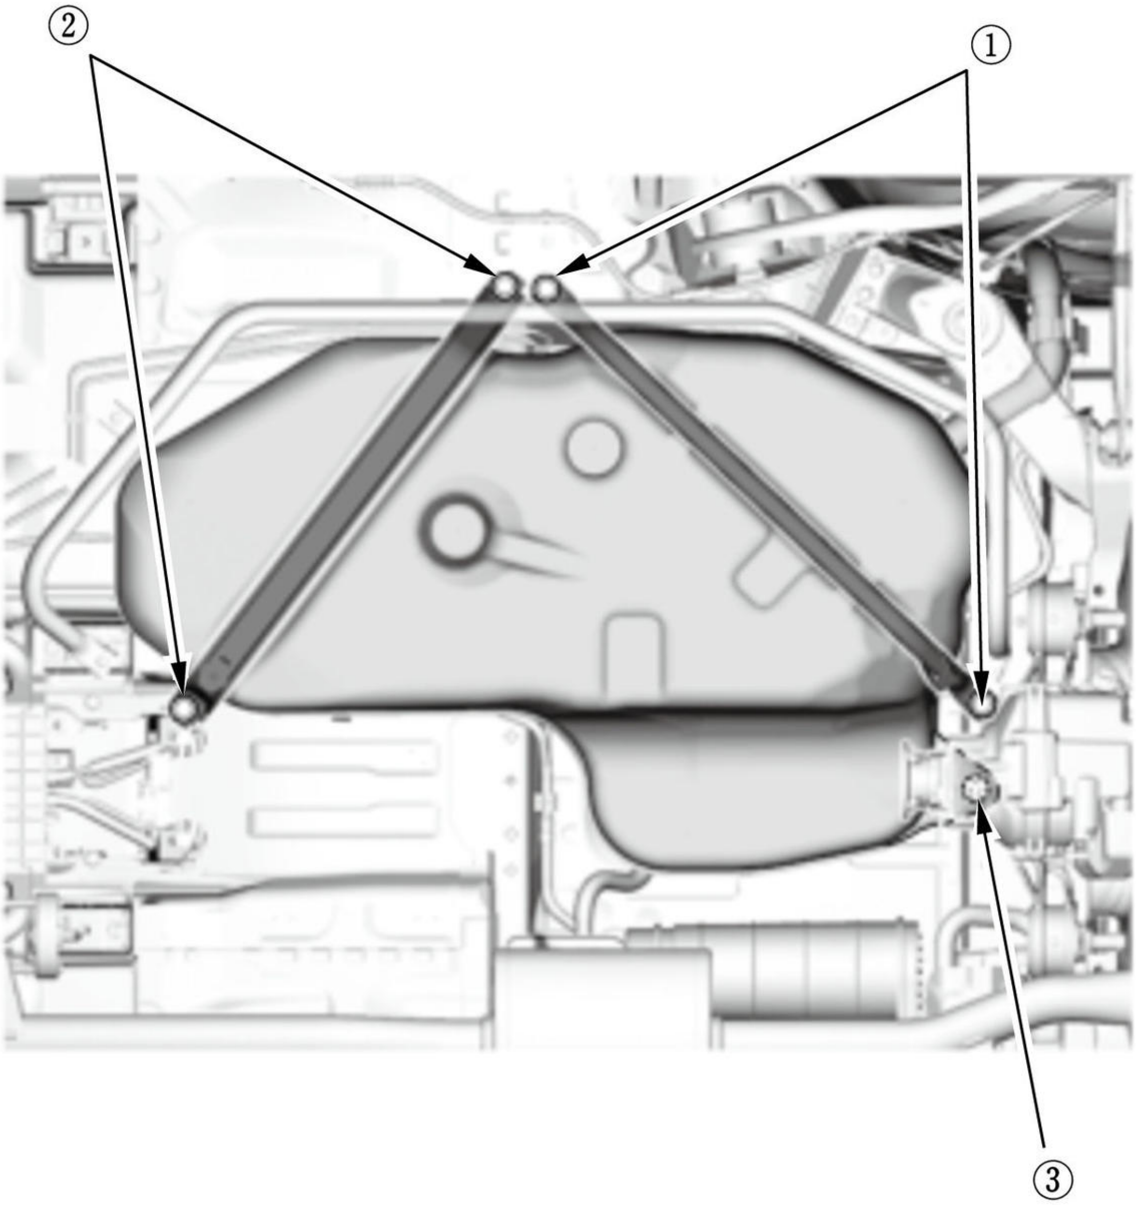

Fig. 1: Tightening Fuel Tank And Fuel Tank Straps In Sequence
Courtesy of HONDA, U.S.A., INC.

1. Place a jack or other support under the fuel tank. **Note for installation** Set the fuel tank and the fuel tank straps, and loosely install the bolts and the nut. Then tighten the bolts and nut in the numbered sequence shown in illustration.

12. Fuel Tank Assembly - Remove
13. Fuel Tube - Remove (If Necessary)

    NOTE: If necessary, refer to the following procedures.

    - Fuel Line/Quick-Connect Fitting Precautions .
    - Fuel Line Inspection .
14. All Removed Parts - Install

	1. Install the parts in the reverse order of removal.**NOTE:** - **Check the fuel hose/tube connections** . - Before install the access panel (A), do the following fuel leak check. Connect the connector (B), then turn the vehicle to the ON mode, but do not start the engine. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three times, then check for fuel leakage.

HIGH PRESSURE FUEL PUMP REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal

WARNING:

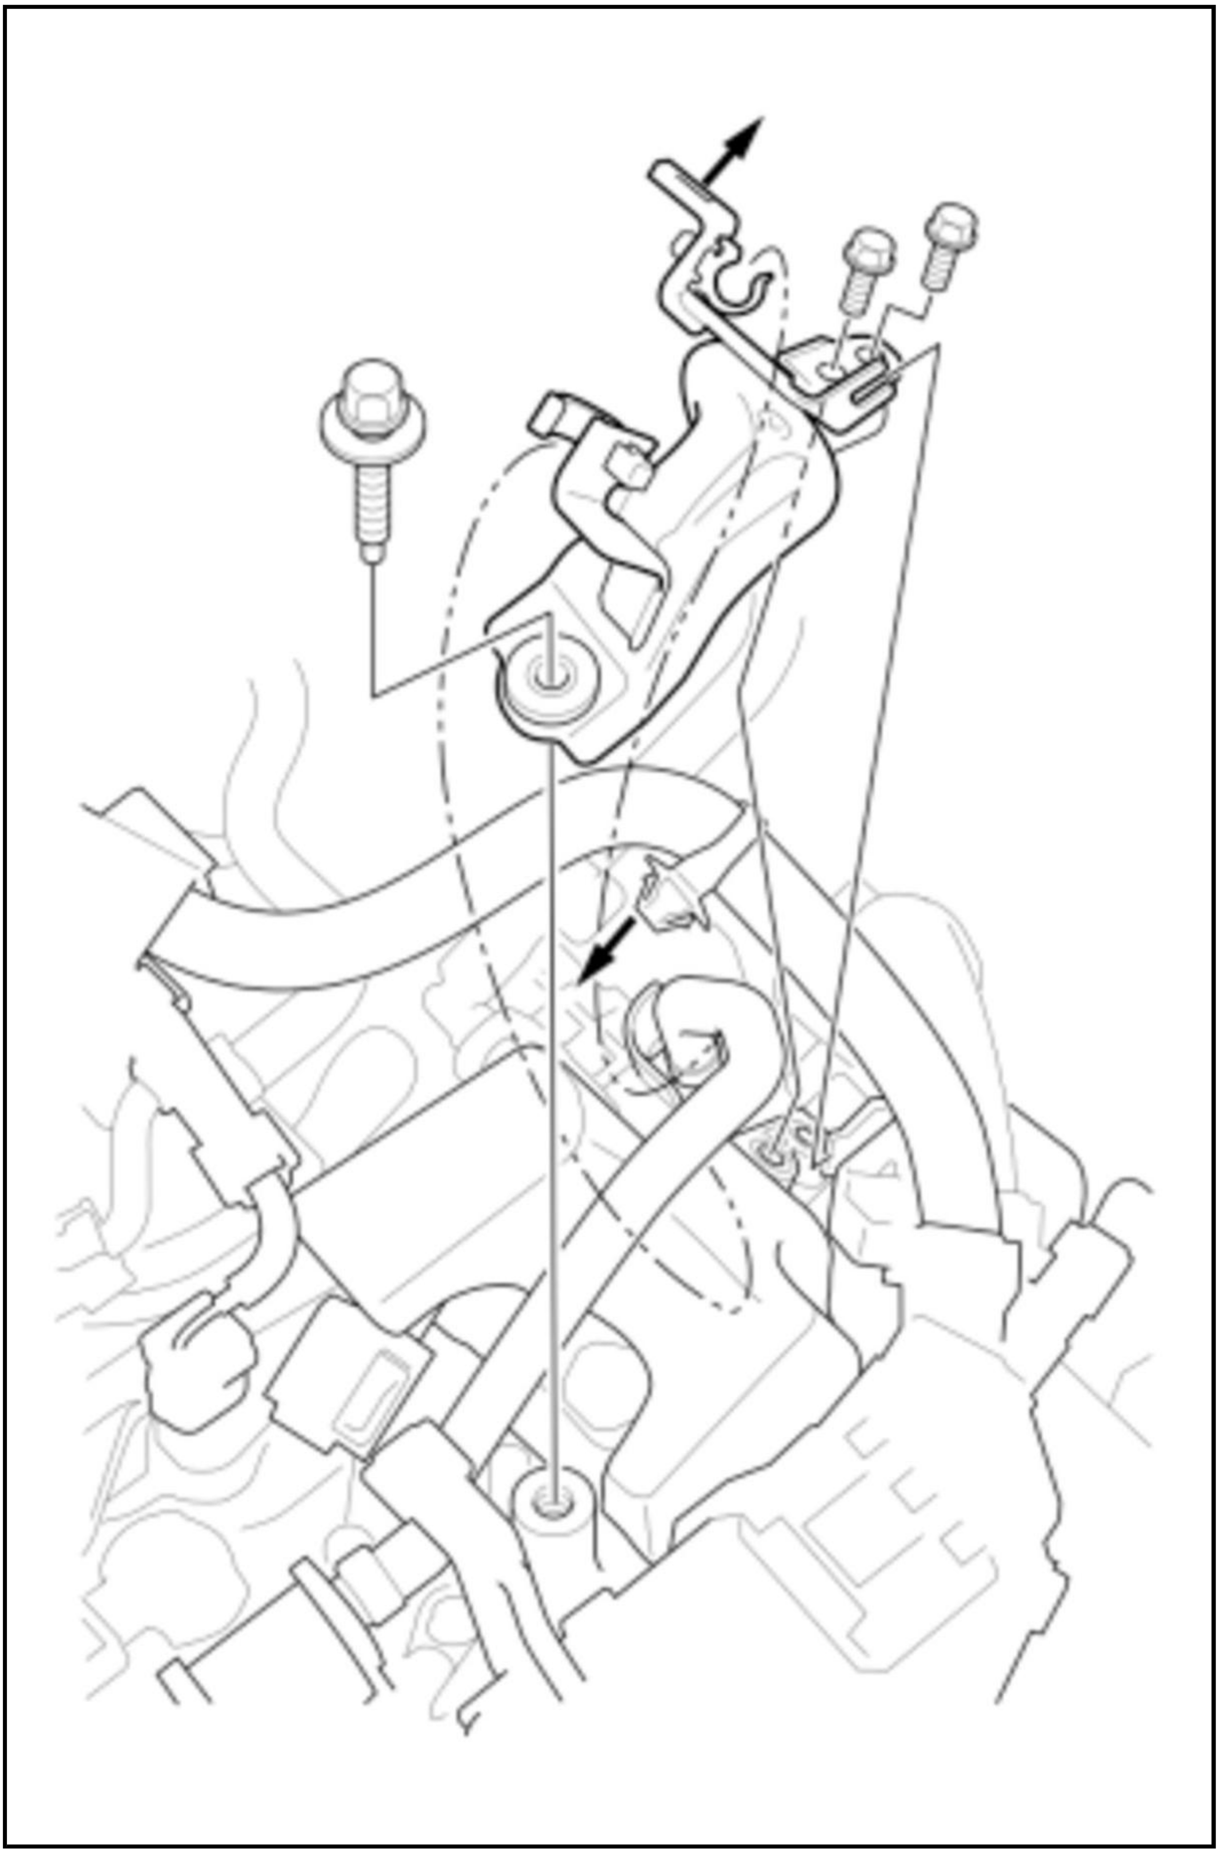
Flammable - Keep Fire Away

NOTE: Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.

1. **Fuel Pressure - Relieve**
2. **Intake Air Resonator - Remove**
3. **Throttle Body - Move**

   NOTE:

   - Do not disconnect the water bypass hoses.
   - Do not bend the water bypass hoses excessively.
4. Intake Manifold Bracket - Remove



5. **Intake Manifold - Remove**

6. High Pressure Fuel Pump Cover - Remove

	1. Disconnect the quick-connect fitting (A). 2. Remove the high pressure fuel pump cover (B).

7. Fuel Joint Pipe - Remove

	1. Remove the fuel joint pipe (A).

8. High Pressure Fuel Pump - Remove

	1. Disconnect the connector (A). 2. Loosen the bolts (B) alternately, and remove the high pressure fuel pump (C) with the O-ring (D), and the roller (E).

	3. Remove the fuel feed pipe (A) with the sealing washers (B) from the high pressure fuel pump (C).

9. High Pressure Fuel Pump Cam - Check

	1. Rotate the crankshaft and check the high pressure fuel pump cam (A) for pits, scores, or excessive wear. If needed, **replace the intake camshaft** .

	2. Set the No. 1 piston at bottom dead center (BDC). 3. Install the roller (A) to the high pressure fuel pump cam. 4. Set the gauge (B) on the roller and hold it, then set the dial to zero. 5. Rotate the crankshaft 720 deg. and measure the four cam lobes height. If the cam lobes are excessive worn, **replace the intake camshaft** .**NOTE:** The high pressure fuel pump cam has four cam lobes.**Cam Lobe Height Standard (New): 0.146 in (3.7 mm)**

Installation

WARNING:

Flammable - Keep Fire Away

NOTE:

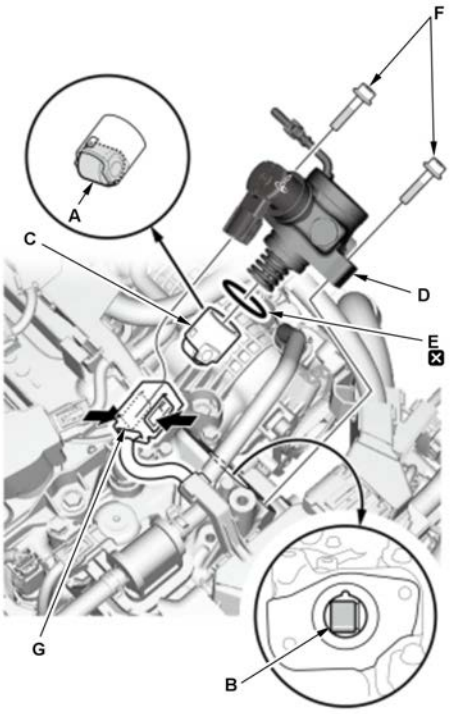
- **How to read the torque specifications** .
- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.

1. Camshaft Timing - Set

	1. Check the position of the cam (A) that drives high pressure fuel pump as shown.

2. High Pressure Fuel Pump - Install

	1. Install the fuel feed pipe (A) to the high pressure fuel pump (B) with new sealing washers (C).

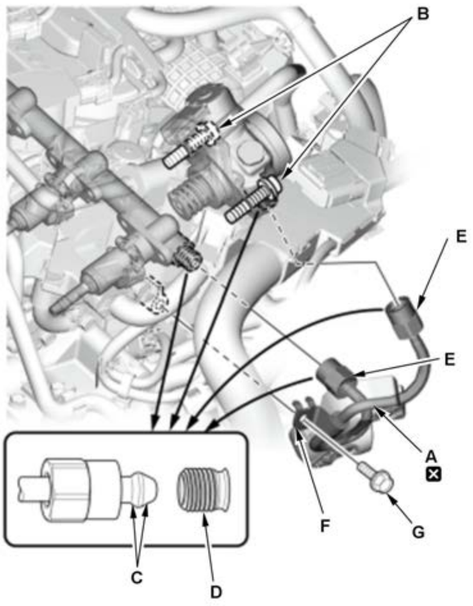


2. Coat the roller (A) and the cam (B) with clean engine oil.

3. Install the roller (C) and the high pressure fuel pump (D) with a new O-ring (E) coated with clean engine oil. Install the bolts (F) loosely by hand in an alternating pattern.

4. Connect the connector (G).

3. Fuel Joint Pipe - Install



NOTE: Before you install the fuel joint pipe (A), loosen the high pressure fuel pump mounting bolts (B).

1. Lubricate the top of the new fuel joint pipe (C) and the threaded area (D) of the fuel rail and the high pressure fuel pump with polyethylene glycol of a new fuel joint pipe kit.

NOTE:

Do not reuse the fuel joint pipe.

2. Tighten the fuel joint pipe nuts (E) by hand until the end of the joint pipe is seated on the fuel rail or high pressure fuel pump.

3. Set the fuel joint pipe bracket (F) to the cylinder head, and loosely install the bolt (G).

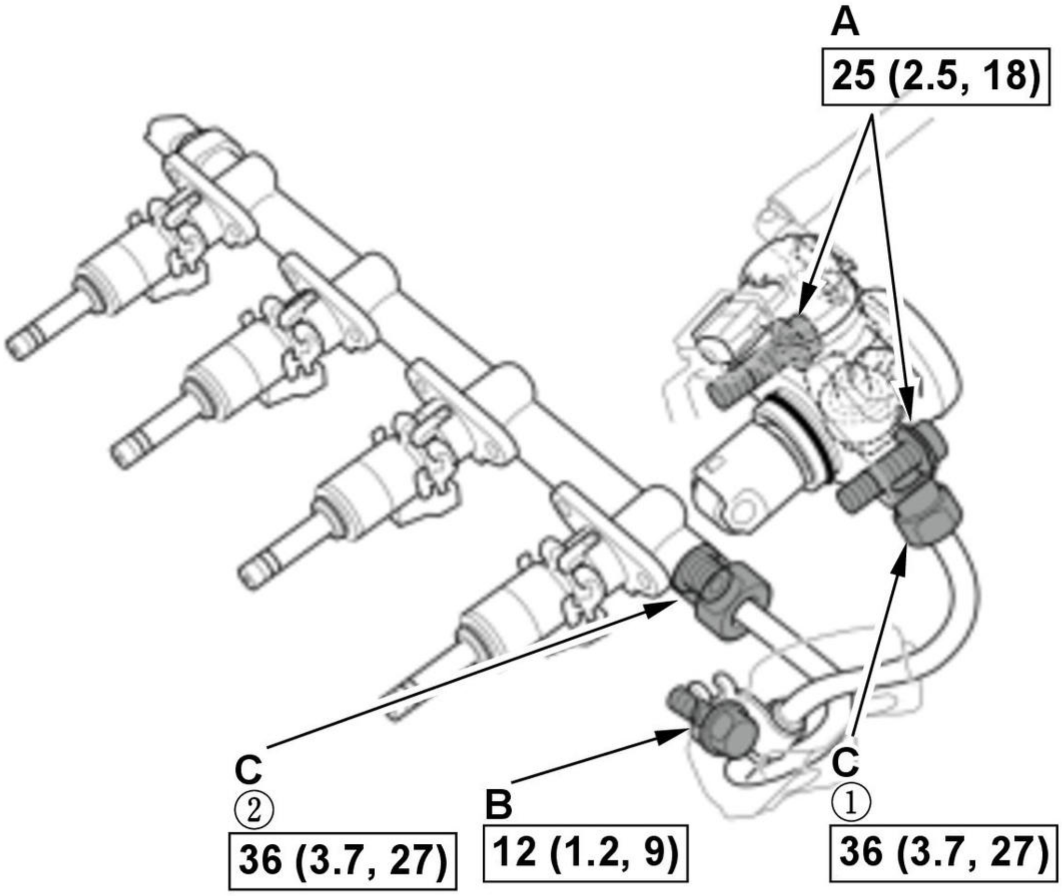


Fig. 2: Tightening Fuel Joint Pipe Nut In Sequence With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

4. Tighten the high pressure fuel pump mounting bolts (A) to the specified torque.

5. Tighten the fuel joint pipe bracket mounting bolt (B) to the specified torque.

6. Tighten the fuel joint pipe nut (C) to the specified torque in the numbered sequence shown in illustration.

NOTE:

A crowfoot-type special tool increases the torque applied by the torque wrench. Refer to Service Precautions for details on how to recalculate the torque

wrench setting .

4. High Pressure Fuel Pump Cover - Install

	1. Install the high pressure fuel pump cover (A). **NOTE:** **The high pressure fuel pump cover will be reinstalled after the fuel leak check.** 2. Connect the quick-connect fitting (B).

5. Fuel Leak - Check

HIGH PRESSURE FUEL PUMP REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

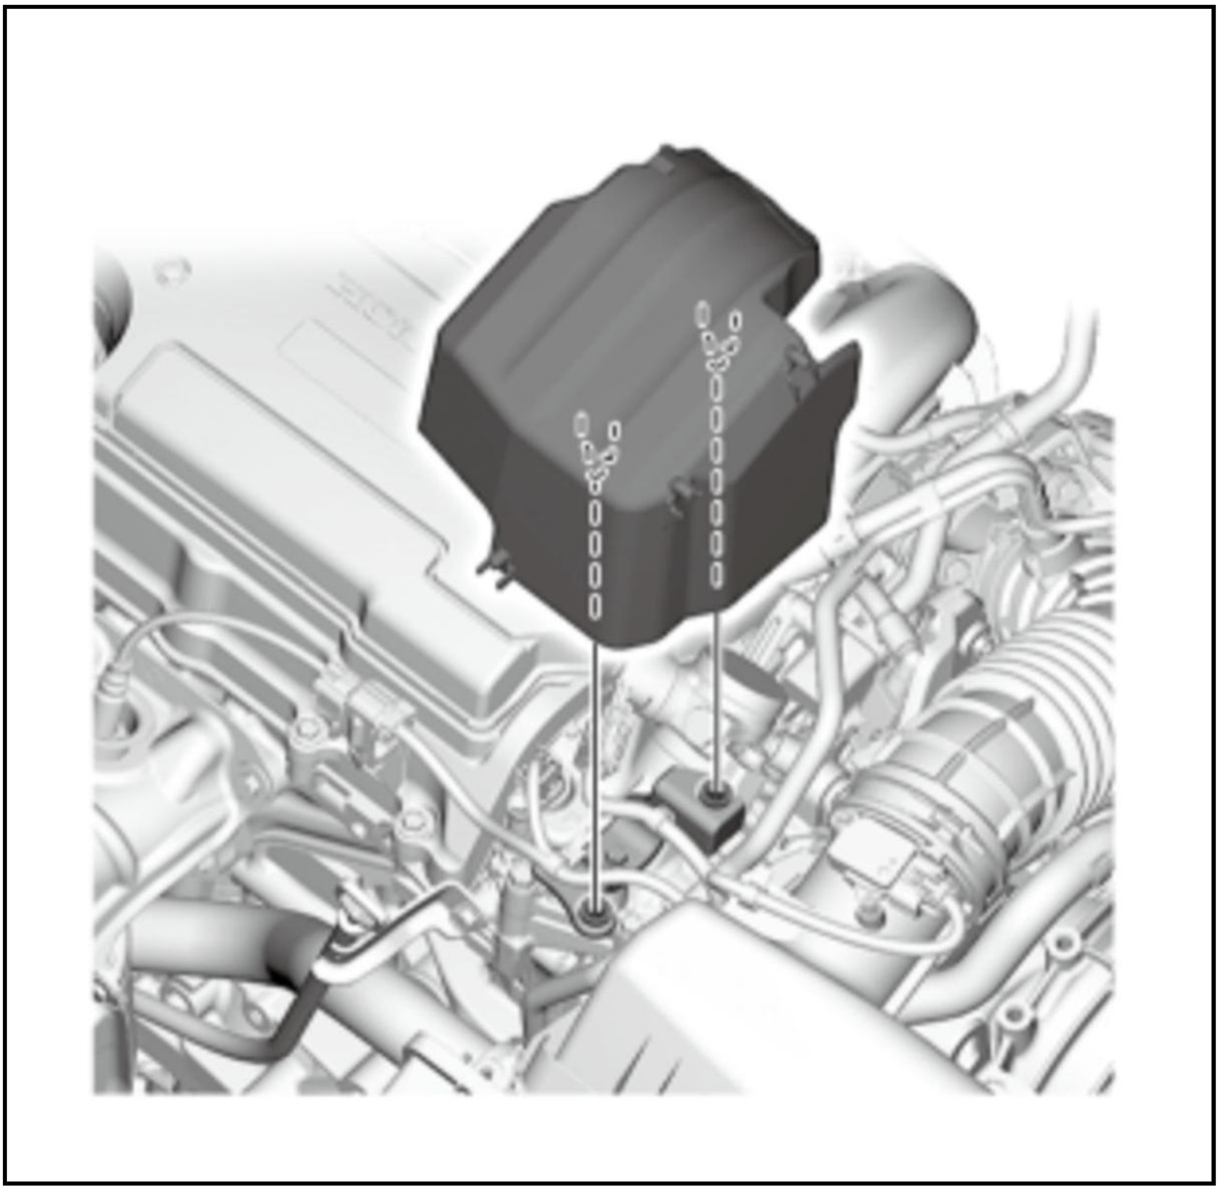
Removal

WARNING:

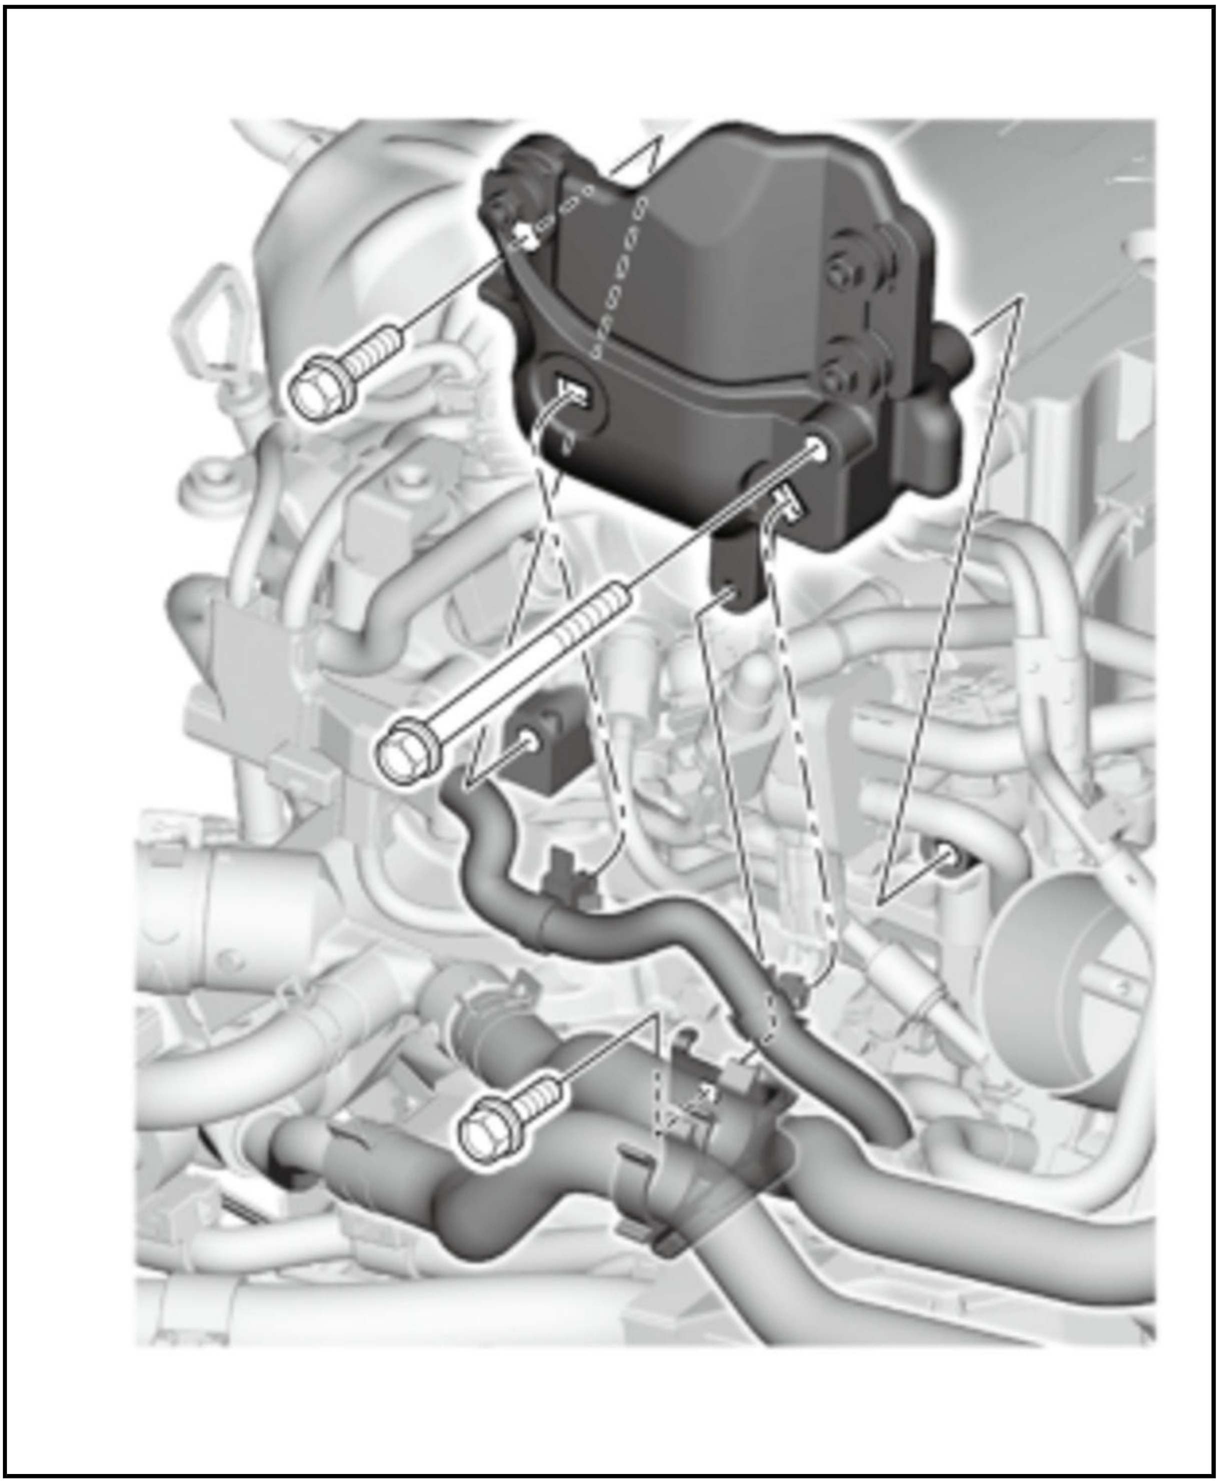
Flammable - Keep Fire Away

NOTE: Refer to the Fuel and Emissions Systems Service Precautions before disconnecting the fuel line.

1. Fuel Pressure - Relieve
2. Air Cleaner - Remove
3. High Pressure Fuel Pump Cover - Remove



4. Fuel Bracket - Remove



5. EVAP Canister Purge Valve - Remove
6. **Intake Manifold - Remove**
7. Fuel Joint Pipe - Remove

	1. **Disconnect the quick-connect fitting** (A). 2. Remove the fuel joint pipe (B).

8. High Pressure Fuel Pump - Remove

	1. Disconnect the connector (A). 2. Loosen the bolts (B) alternately, and remove the high pressure fuel pump (C) with the O-ring (D), and the roller (E).

	3. Remove the fuel feed pipe (A) with the sealing washers (B) from the high pressure fuel pump (C).

9. High Pressure Fuel Pump Cam - Check

	1. Rotate the crankshaft and check the high pressure fuel pump cam (A) for pits, scores, or excessive wear. If needed, replace the exhaust camshaft .

	2. Set the No. 1 piston at bottom dead center (BDC). 3. Install the roller (A) to the high pressure fuel pump cam. 4. Set the gauge (B) on the roller and hold it, then set the dial to zero. 5. Rotate the crankshaft 720 deg. and measure the four cam lobes height. If the cam lobes are excessive worn, replace the exhaust camshaft **NOTE:** **The high pressure fuel pump cam has four cam lobes.Cam Lobe Height Standard (New): 4.0 mm (0.157 in)**

Installation

WARNING:

Flammable - Keep Fire Away

NOTE:

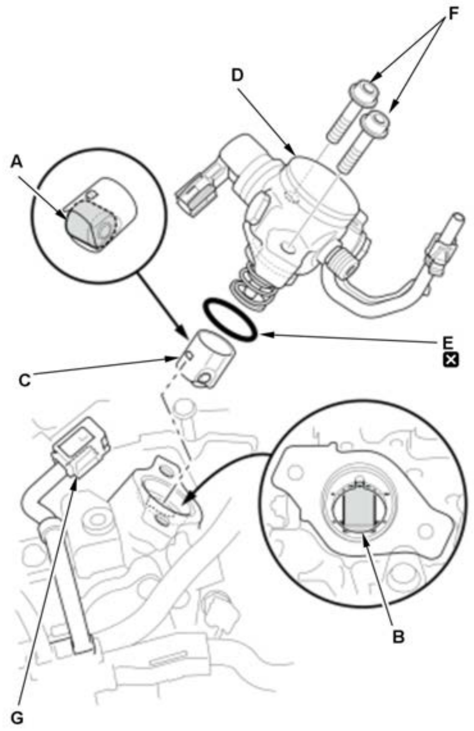
- **How to read the torque specifications** .
- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.

1. Camshaft Timing - Set

	1. Check the position of the cam (A) that drives high pressure fuel pump as shown.

2. High Pressure Fuel Pump - Install

	1. Install the fuel feed pipe (A) to the high pressure fuel pump (B) with new sealing washers (C).

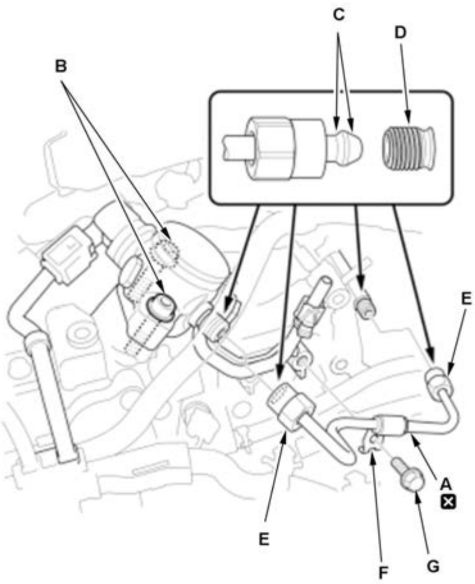


2. Coat the roller (A) and the cam (B) with clean engine oil.

3. Install the roller (C) and the high pressure fuel pump (D) with a new O-ring (E) coated with clean engine oil. Install the bolts (F) loosely by hand in an alternating pattern.

4. Connect the connector (G).

3. Fuel Joint Pipe - Install



NOTE:

Before you install the fuel joint pipe (A), loosen the high pressure fuel pump mounting bolts (B).

1. Lubricate the top of the new fuel joint pipe (C) and the threaded area (D) of the fuel rail and the high pressure fuel pump with polyethylene glycol of a new fuel joint pipe kit.

NOTE:

Do not reuse the fuel joint pipe.

2. Tighten the fuel joint pipe nuts (E) by hand until the end of the joint pipe is seated on the fuel rail or high pressure fuel pump.

3. Set the fuel joint pipe bracket (F) to the cylinder head, and loosely install the bolt (G).

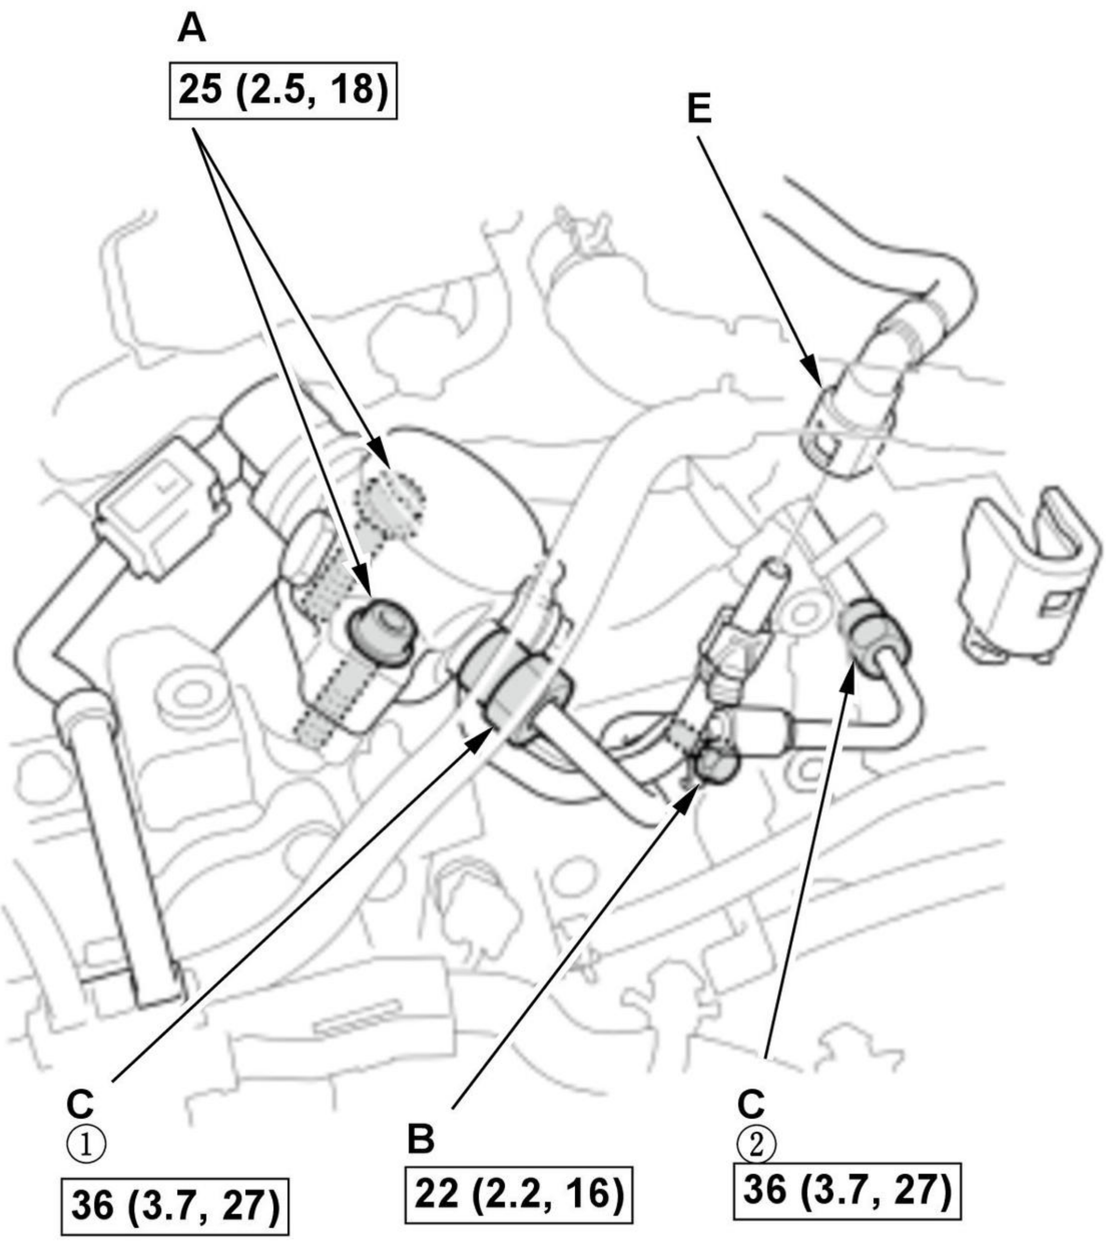


Fig. 3: Tightening Fuel Joint Pipe Nut In Sequence With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

4. Tighten the high pressure fuel pump mounting bolts (A) to the specified torque.

5. Tighten the fuel joint pipe bracket mounting bolt (B) to the specified torque.

6. Tighten the fuel joint pipe nut (C) to the specified torque in the numbered sequence shown.

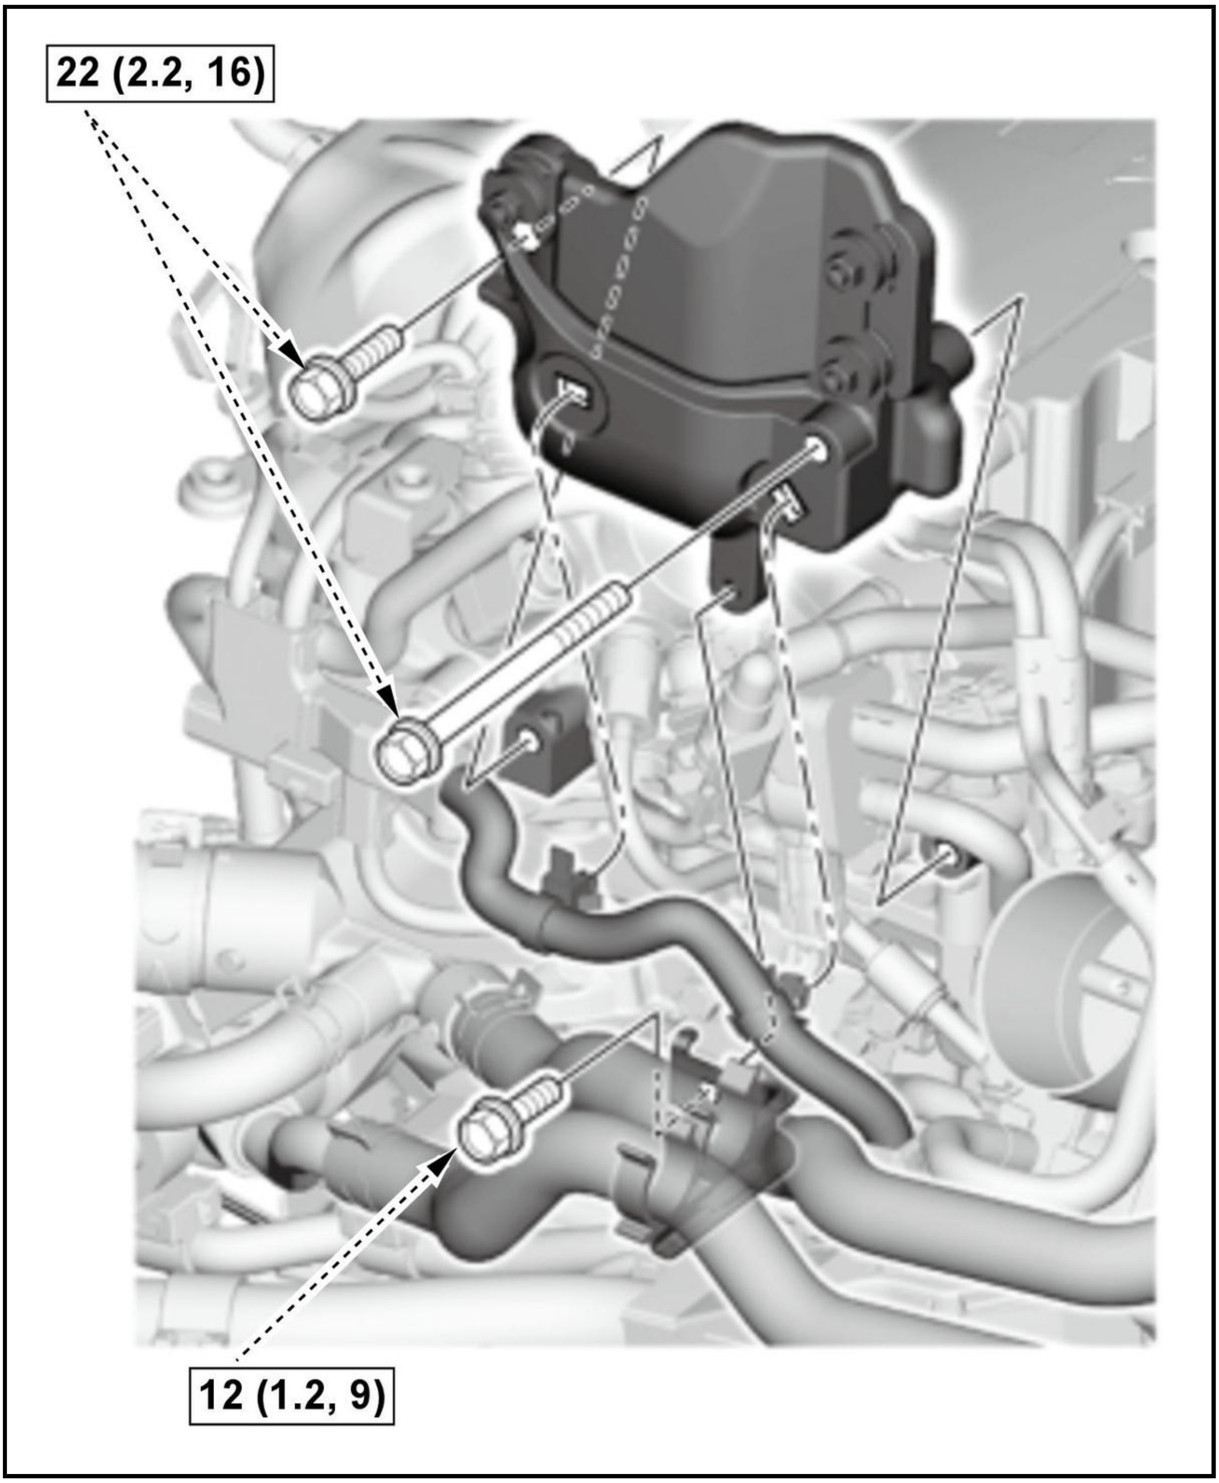
NOTE:

A crowfoot-type special tool increases the torque applied by the torque

wrench. Refer to Service Precautions for details on how to recalculate the torque wrench setting **.**

7. Connect the quick-connect fitting **(E).**

4. EVAP Canister Purge Valve - Install
5. Fuel Bracket - Remove



6. **Fuel Leak - Check**

MIS-FUEL INHIBIT DEVICE REMOVAL AND INSTALLATION (KA/KC)

Removal and Installation

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

1. **Fuel Fill Door Adapter - Remove**
2. Mis-Fuel Inhibit Device - Remove

	1. Pull out the rubber cover (A). 2. Insert a small tip screwdriver into the 3 lock tabs (B) and lift up to release the mis-fuel inhibit device (C). **NOTE:** - **Be careful not to damage the fuel fill pipe or the fuel fill pipe top side surface (D).** - **Never reuse the mis-fuel inhibit device.**

3. Nozzle Setting Bracket - Remove

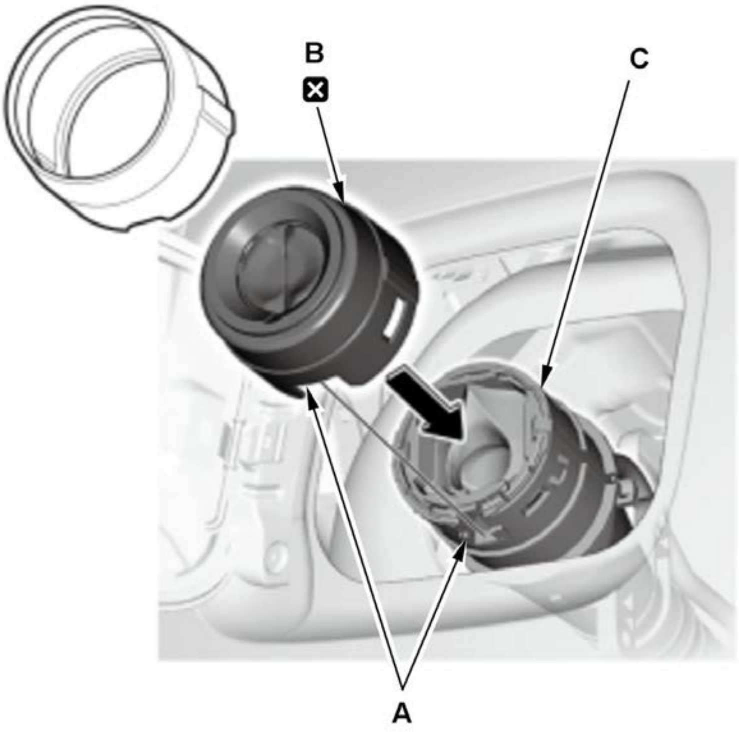
	1. Disengage the retainer (A) towards the direction show.

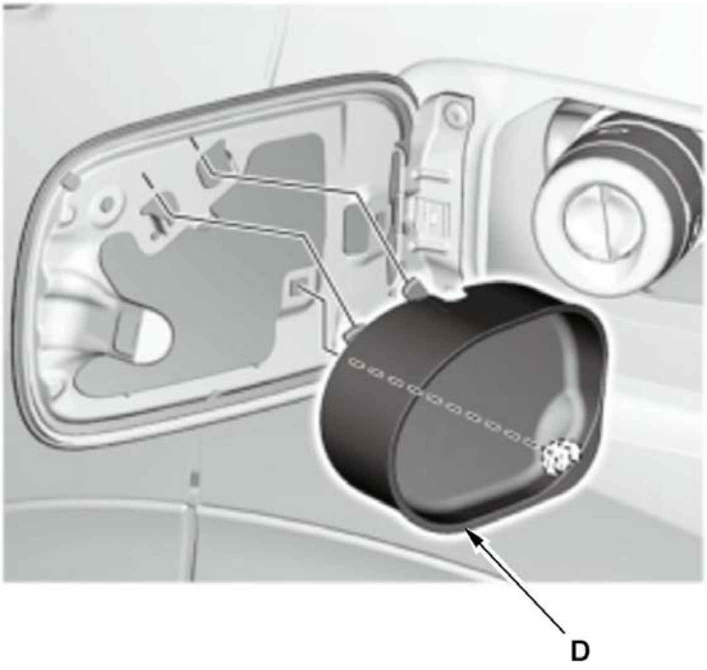
 	2. Using a small tip screwdriver, insert it into the slots to disengage the tabs (A) while pulling the nozzle setting bracket (B).

4. Main Flap Unit - Remove

 	1. Fold in the four lock tabs (A) and pull the main flap unit (B). **NOTE:** **It may be necessary to lightly pry under main flap unit. Be careful not to damage the full fill pipe.**

5. All Removed Parts - Install





1. Install the parts in the reverse order of removal.

NOTE:

- **Align the part (A) on the mis-fuel inhibit device (B) and the fuel fill pipe (C).**
- **If needed, replace the cover (D).**

REMOVAL AND INSTALLATION

FUEL PULSATION DAMPER REMOVAL AND INSTALLATION

Removal and Installation

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the Fuel and Emissions Systems Service Precautions before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

Procedure

NOTE: Numbered call-outs in figure pertain to list numbers in following procedure.

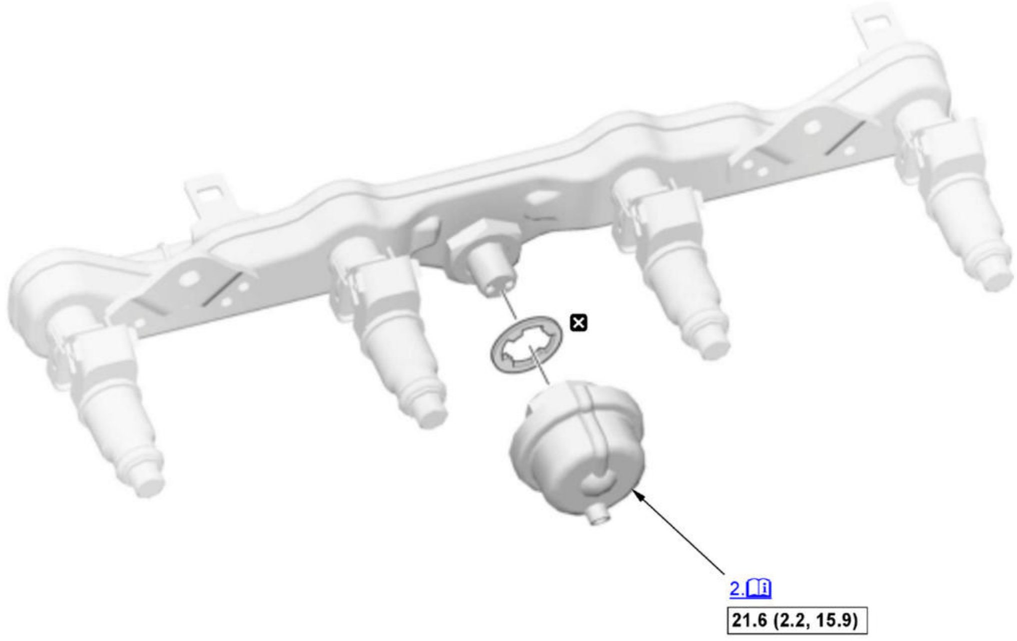


Fig. 1: Fuel Pulsation Damper Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Fuel Rail - Remove
2. Fuel Pulsation Damper - Remove

 	1. Place a wrench (A) on the fuel rail (B). 2. Place a wrench (C) on the fuel pulsation damper (D). 3. Fix a wrench at the fuel rail side, turn a wrench at the fuel pulsation damper side, then remove the fuel pulsation damper and the gasket. **Note for Installation** Make sure the hole of the fuel pulsation damper cap (E) is in the position of its range shown.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

FUEL TANK REMOVAL AND INSTALLATION

Removal and Installation

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.

- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.
- Fuel tank damage may cause flammable gas leaks and may result in fire. Do not damage the fuel tank and keep sparks, flame and cigarettes away.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

Courtesy of HONDA, U.S.A., INC.

1. **Fuel Pressure - Relieve**
2. Fuel Tank - Drain

1. **Remove the fuel tank unit** . 2. Using a hand pump, a hose, and a container suitable for fuel, draw the fuel from the fuel tank. **NOTE:** Drain the fuel tank, then reinstall the fuel tank unit without connecting the fuel tank unit connector and the quick-connect fitting.

3. **Left Middle Floor Undercover - Remove**
4. Fuel Tank Protector (Front Side) - Remove
5. **Rear Inner Fender (Left Side) - Remove**
6. **Propeller Shaft - Remove**
7. **Heat Shield - Remove**
8. EVAP Canister Line Hose - Disconnect

   Note for Installation

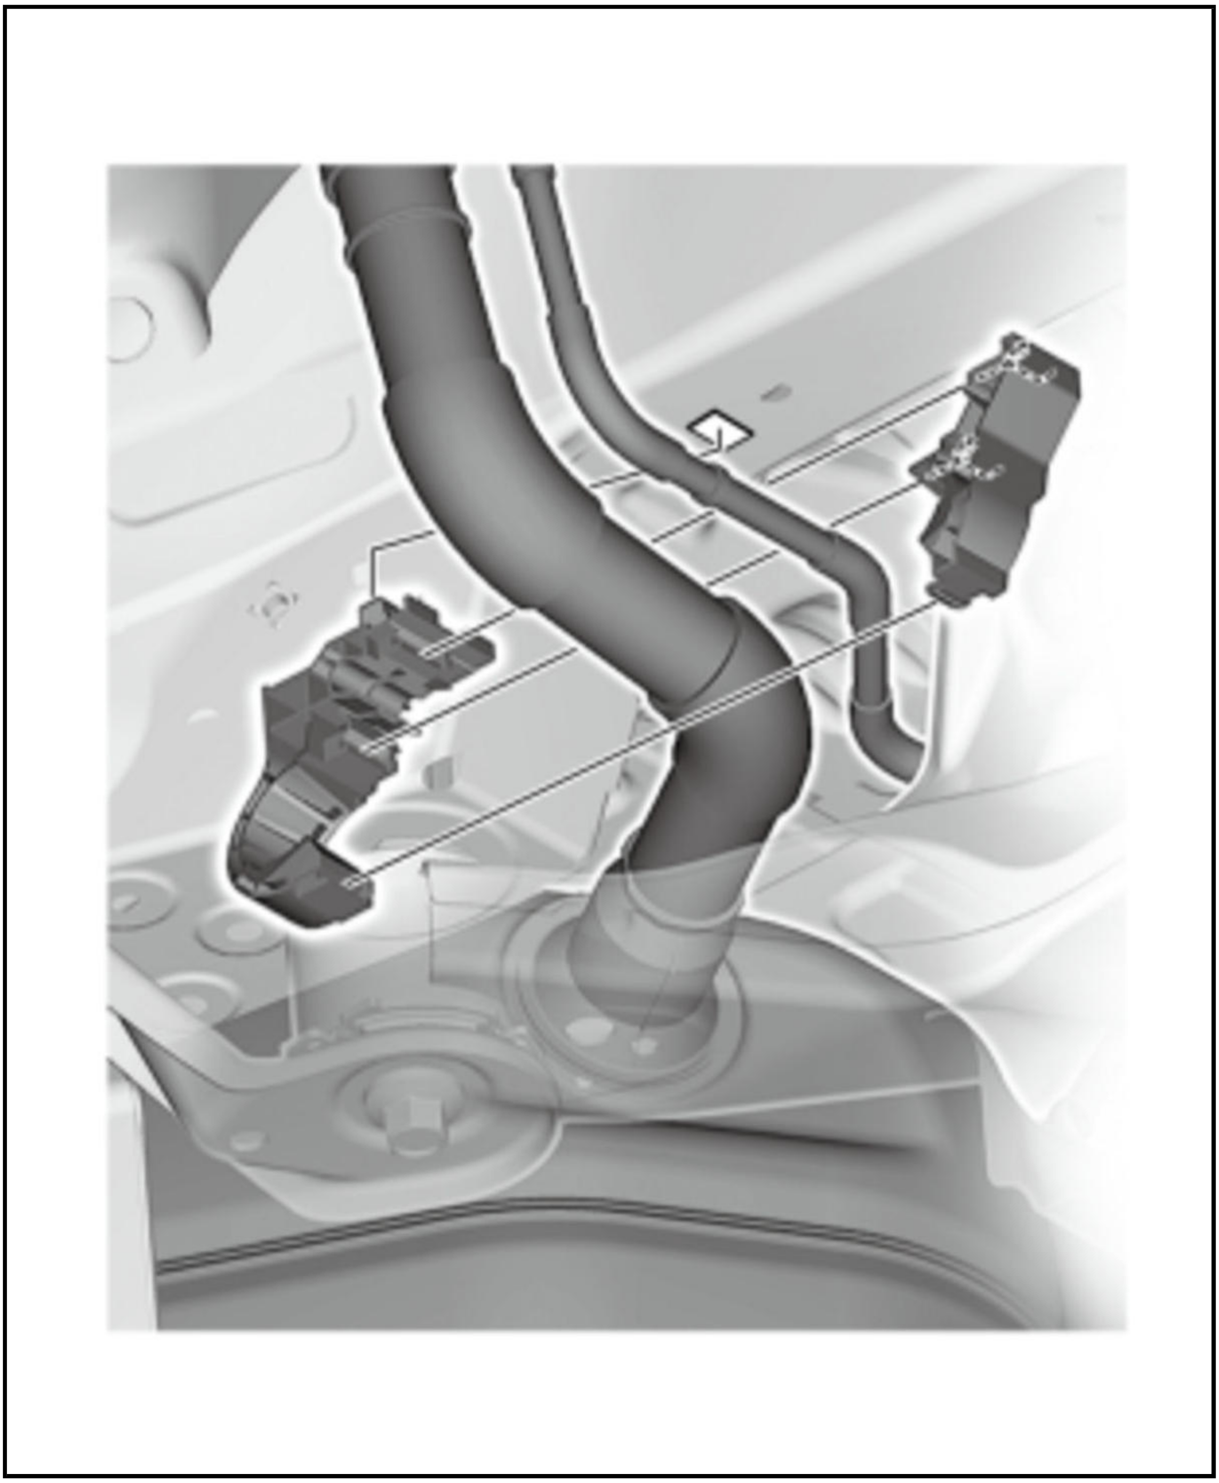
   Make sure the connector is connected securely .

9. Fuel Fill Pipe Bracket - Remove
10. Fuel Tank Protector (Rear Side) - Remove

11. Fuel Tank Guard Pipe - Remove
12. Fuel Line Quick-Connect Fitting - Disconnect

	1. **Remove the quick-connect fitting cover (A)** 2. Check the fuel quick-connect fitting (B) for dirt, and clean it if needed. 3. **Disconnect the quick-connect fitting** .

13. Fuel Fill Pipe Clamp - Remove



14. Fuel Tank Assembly and Fuel Tank Strap - Remove

1. Place a jack or other support under the fuel tank.

15. Fuel Feed Tube and Fuel Tank Unit - Remove (If Necessary)

NOTE: If necessary, refer to the following procedures.

- **Fuel Line/Quick-Connect Fitting Precautions** .
- **Fuel Line Inspection** .

16. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

MIS-FUEL INHIBIT DEVICE REMOVAL AND INSTALLATION

Removal and Installation

WARNING:

Flammable - Keep Fire Away

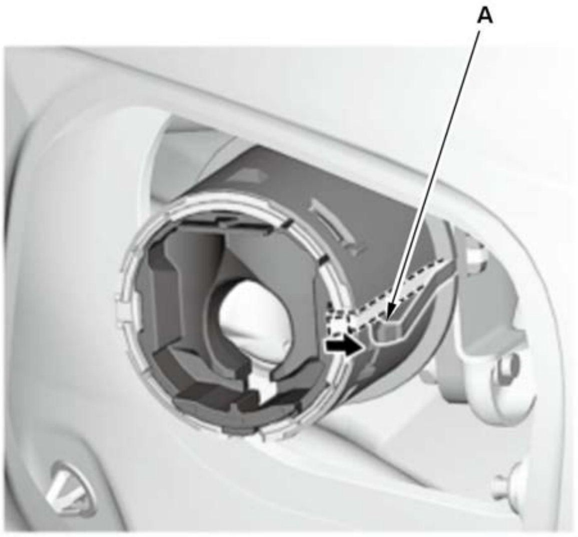
NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

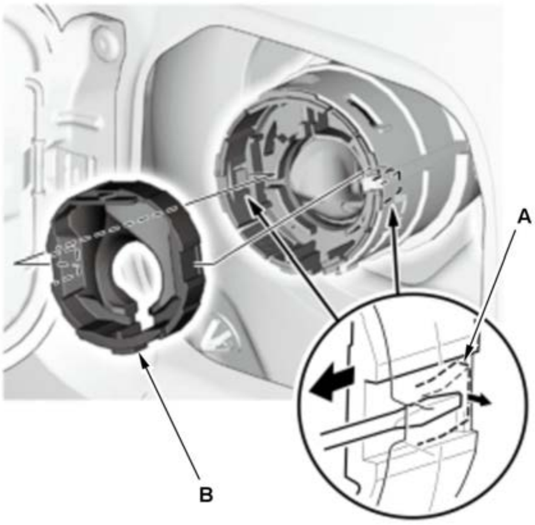
1. **Fuel Fill Door Adapter - Remove**
2. Mis-Fuel Inhibit Device - Remove

	1. Pull out the rubber cover (A). 2. Insert a small tip screwdriver into the 3 lock tabs (B) and lift up to release the mis-fuel inhibit device (C). **NOTE:** - Be careful not to damage the fuel fill pipe or the fuel fill pipe top side surface (D). - Never reuse the mis-fuel inhibit device.

3. Nozzle Setting Bracket - Remove

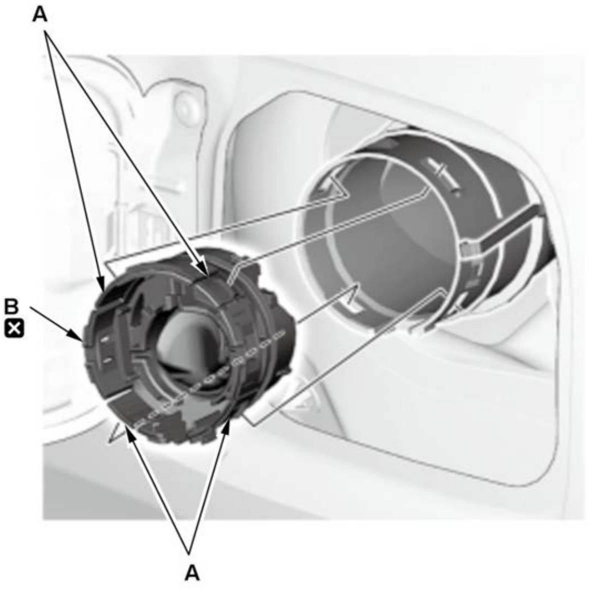


1. Disengage the retainer (A) towards the direction show.
NOTE: If the retainer is damage, **remove the fuel fill pipe bracket** and replace the retainer.



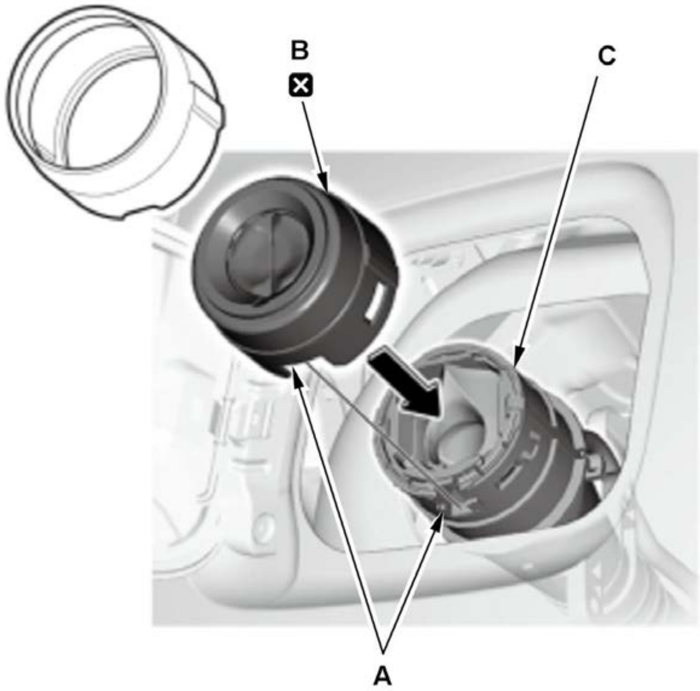
2. Using a small tip screwdriver, insert it into the slots to disengage the tabs (A) while pulling the nozzle setting bracket (B).

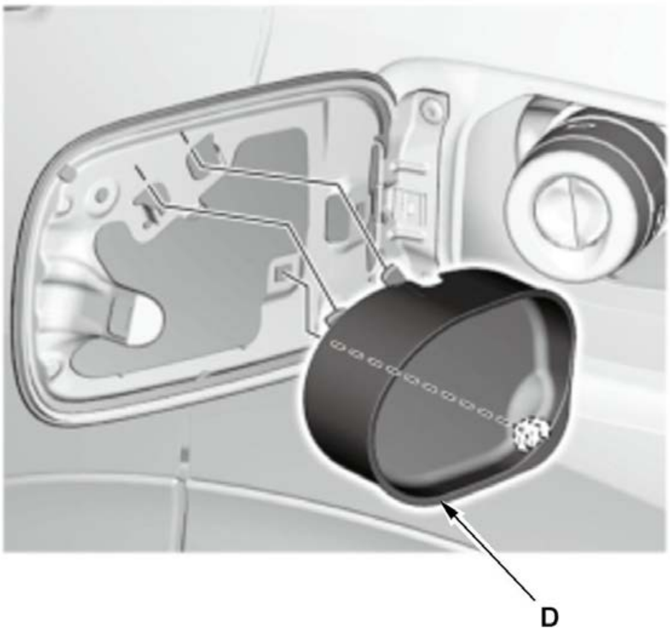
4. Main Flap Unit - Remove



1. Fold in the four lock tabs (A) and pull the main flap unit (B).
NOTE: It may be necessary to lightly pry under main flap unit. Be careful not to damage the fuel fill pipe.

5. All Removed Parts - Install





1. Install the parts in the reverse order of removal.

NOTE:

- Align the part (A) on the mis-fuel inhibit device (B) and the fuel fill pipe (C).
- If needed, replace the cover (D).

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

FUEL OVERFLOWS DURING REFUELING (NO DTCS SET)

Diagnostic procedure

- Replace the fuel tank.

Also check for

Malfunctioning gas station filling nozzle

DESCRIPTION & OPERATION

IMPROVEMENT CONTROL IN PRACTICAL USE FUEL CONSUMPTION SYSTEM DESCRIPTION - EFFECTIVE CONTROL

Outline (ECON Mode)

The control system for improved fuel efficiency in actual traffic aims at disseminating eco-driving. It consists of an effective control system that is activated by operating the ECON switch to set the ECON ON mode. When the ECON mode is ON, the engine control system, the cruise control system*, the gear control system, and the air conditioning system work to control fuel consumption by reducing the negative effects of the driver's driving style in an attempt to improve fuel efficiency.

*: There are cases where it is not controlled depending on the vehicle model.

For locations of each component on vehicle, refer to Component Location Index

Gauge Control Module
ECON Indicator ON/OFF
Ambient Meter Function
F-CAN SIGNAL
F-CAN SIGNAL
B-CAN SIGNAL
Engine Control System
Cruise Control System*
Gear Control System
Motor/Battery Control System
Air Conditioning System*

*: There are cases where it is not controlled depending on the vehicle model.
NOTE: This illustration shows an example only. Appearance and structure of the actual parts may vary depending on the model.

Gear Control System

- Change in shift map allocation against accelerator full pedal depression
- Moderation of gear change responsiveness

Air Conditioning (A/C) System

- Switching to the recirculation mode
- Reduction in compressor operation frequency
- Lower flow rate

Ambient Meter Function

The ambient meter function evaluates the driver's driving from a fuel consumption perspective and displays its information via the ambient meter in the gauge control module.

Outline (SPORT Mode)

In the SPORT mode, a motor/battery control system, engine control system, and gear control system enhances driving force response for powerful and sporty driving. The PCM controls a gauge control module to change the colors of an ambient meter into red and it stays on during the SPORT mode.

For locations of each component on the vehicle, refer to Component Location Index.

GENERAL INFORMATION

FUEL LINE/QUICK-CONNECT FITTING PRECAUTIONS

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.
- Replace the fuel feed hose, fuel line, or the quick-connect fitting to new one if it is damaged.

When removing or installing the fuel feed hose/line, or when disconnecting or connecting the quick-connect fittings, pay attention to the following:

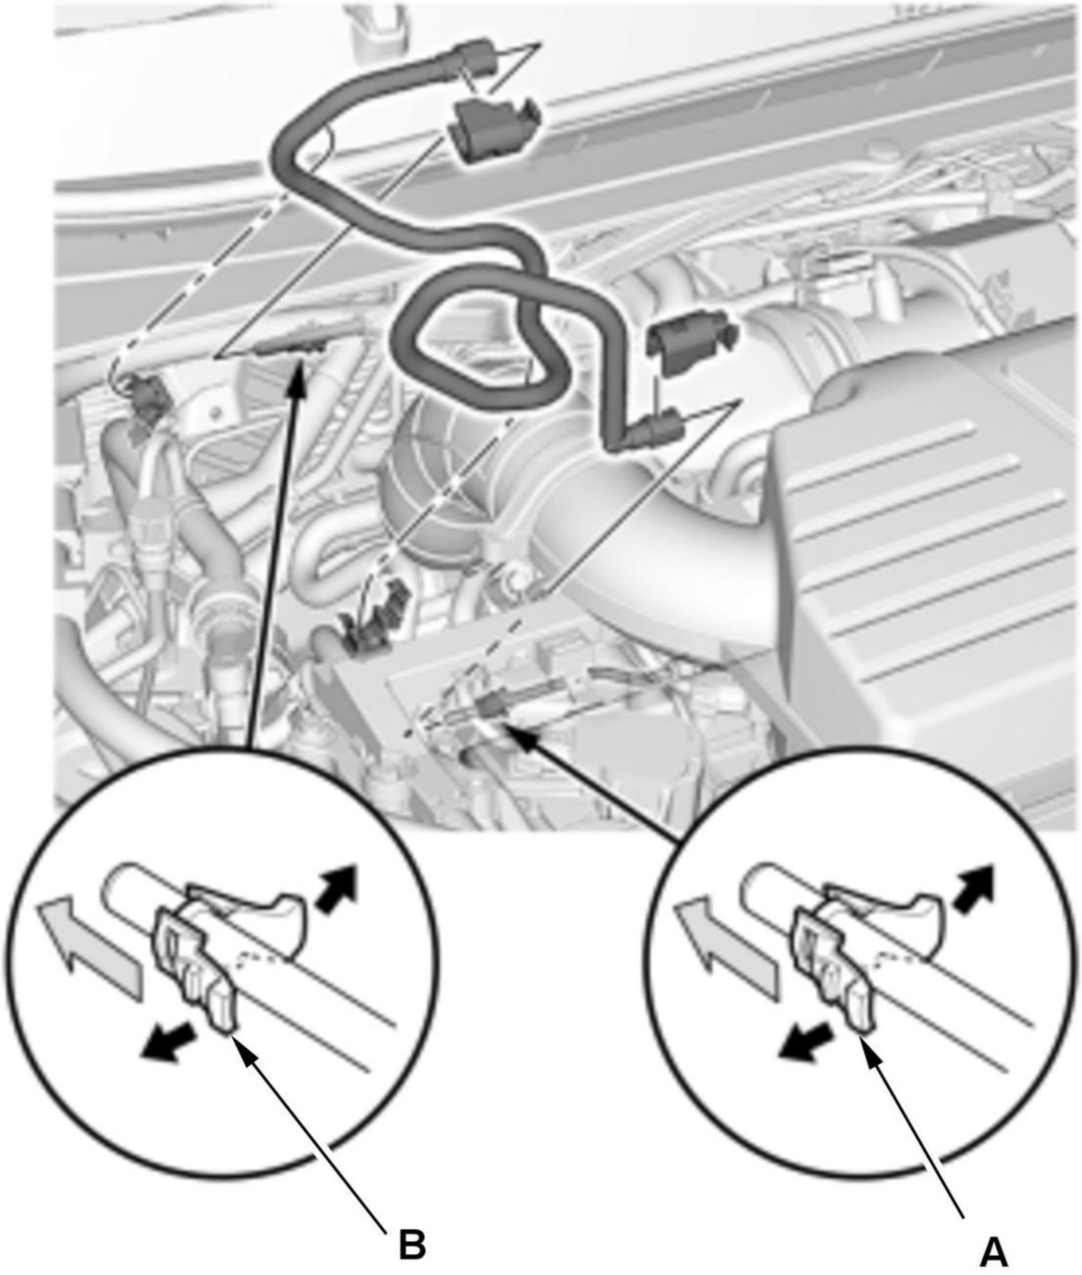
- No heat-resistance; Be careful not to damage them during welding or other heat-generating procedures.
- No acid-proof; Do not touch them with a shop towel that was used for wiping 12 volt battery electrolyte or something similar.
- No stress-resistance; Be careful not to bend or twist the fuel feed hose/line excessively.

Retainer Replacement

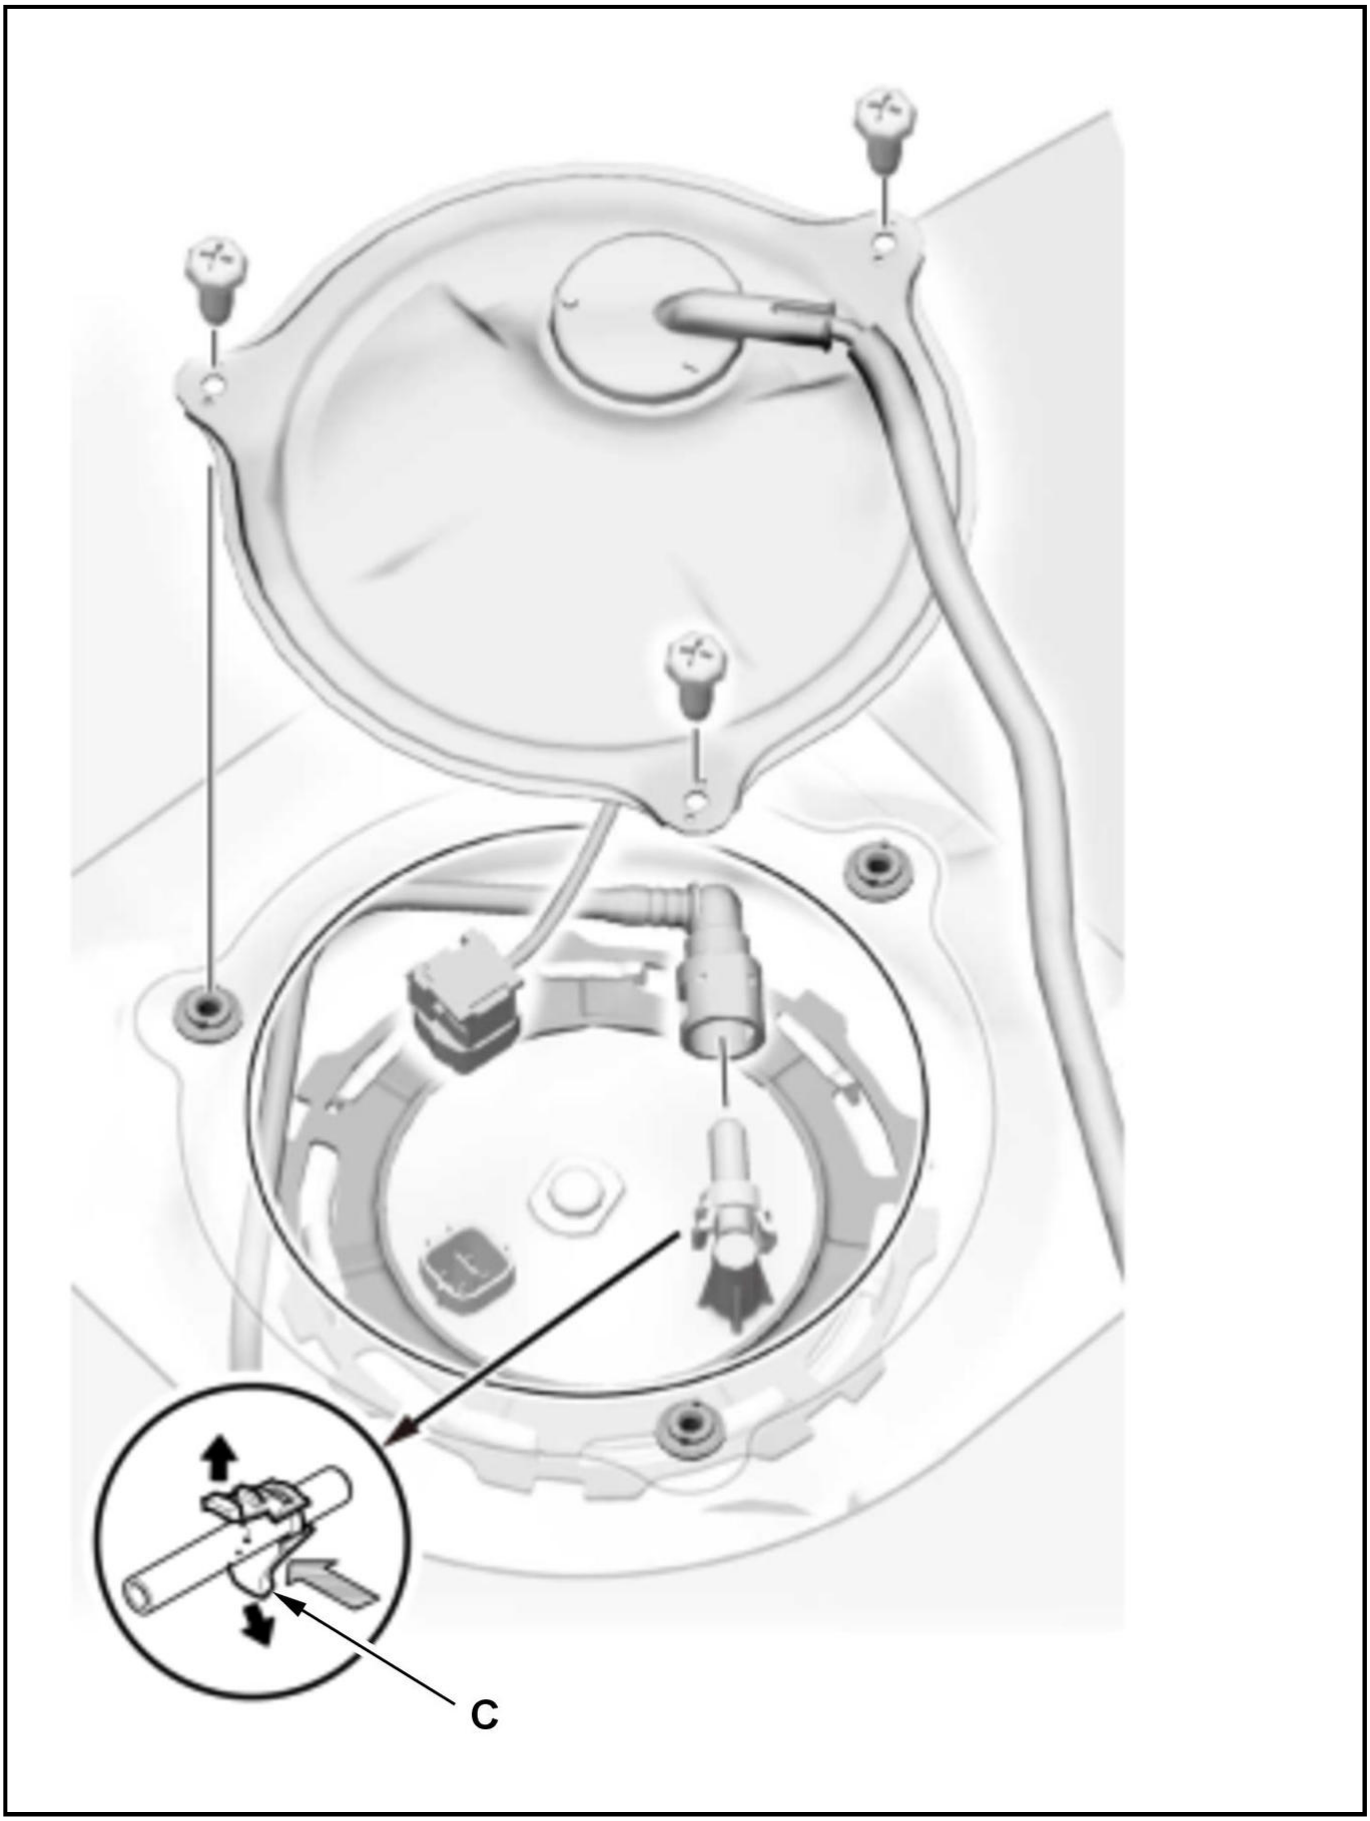
A disconnected quick-connect fitting can be reconnected, but the retainer on the mating line cannot be reused once it has been removed from the line.

NOTE: Use the same manufacturer retainer and the same size retainer when the replacing the retainer.

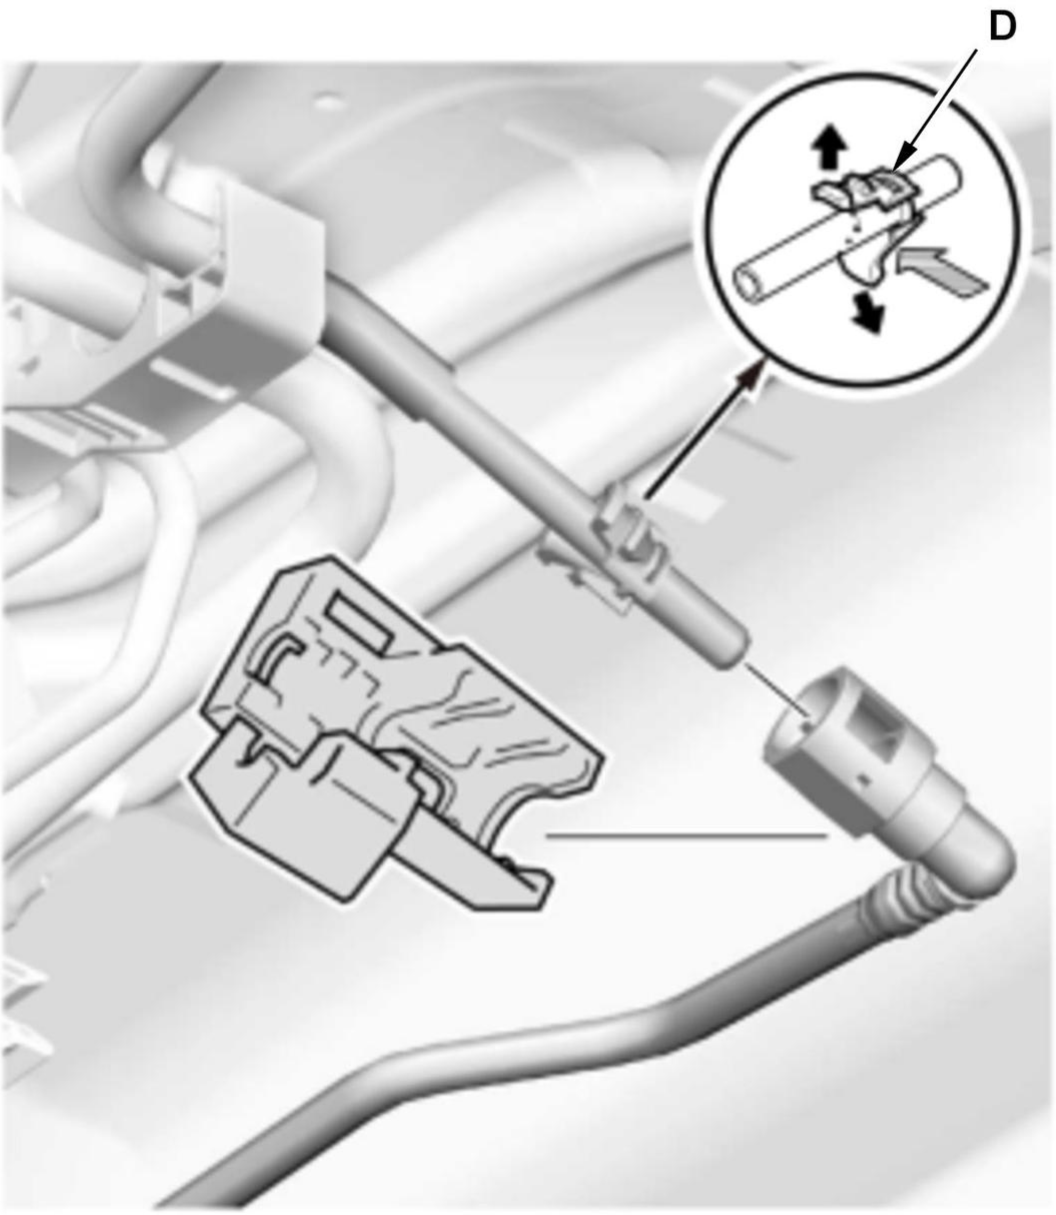
Location	**Manufacturer**	**Retainer color**	**Piping diameter**	**Remarks**
Fuel feed hose retainer (A)	Tokai	Green	0.2500 in (6.35 mm)	-
Fuel feed hose retainer (B)	Tokai	Blue Green	0.315 in (8.0 mm)	-
Fuel tank unit retainer (C)	Sanoh	White	0.374 in (9.5 mm)	-
Fuel feed tube retainer (D)	Sanoh	White	0.315 in (8.0 mm)	-
EVAP Canister retainer (E)	Sanoh	White	0.63 in (16 mm)	-



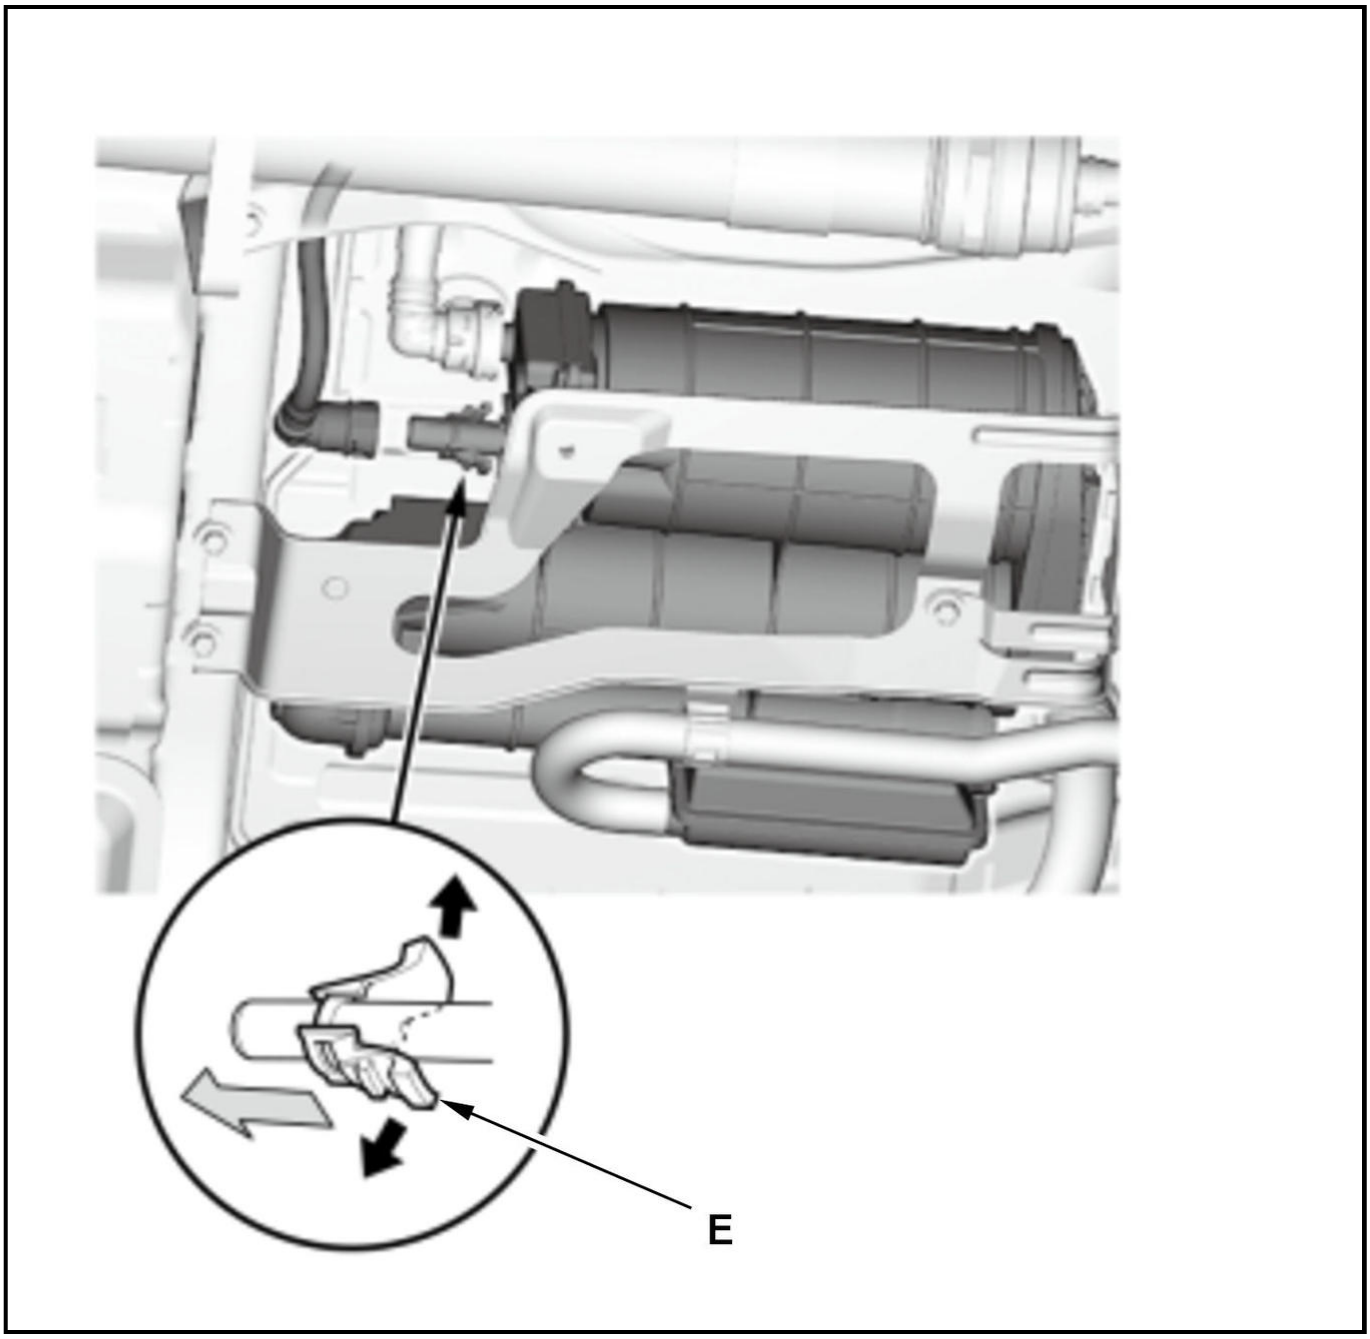
B
A



C



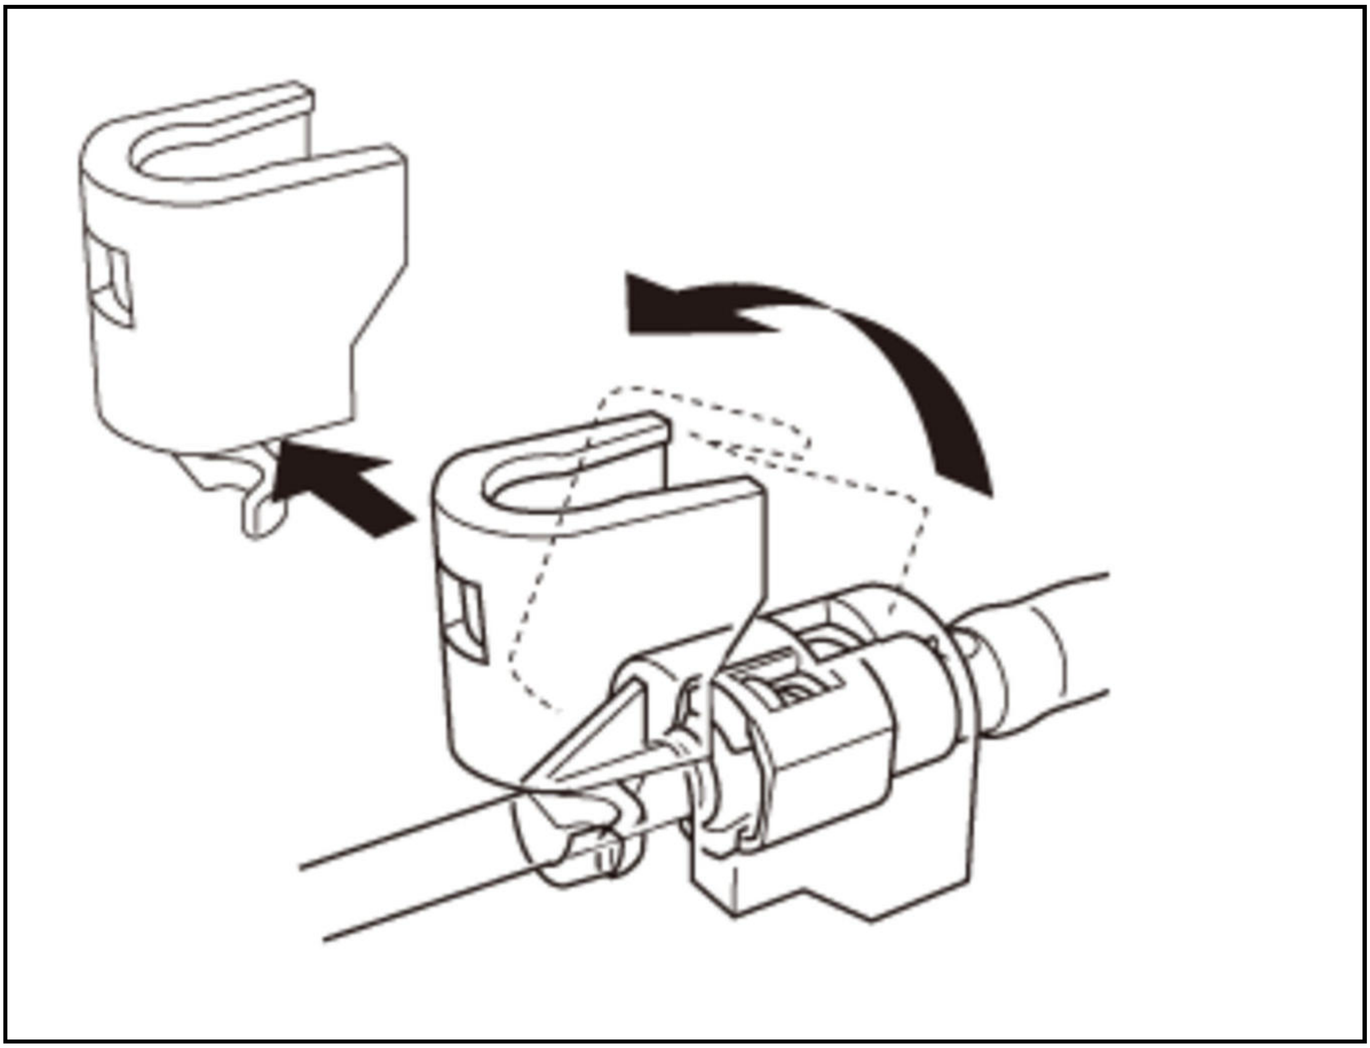
D



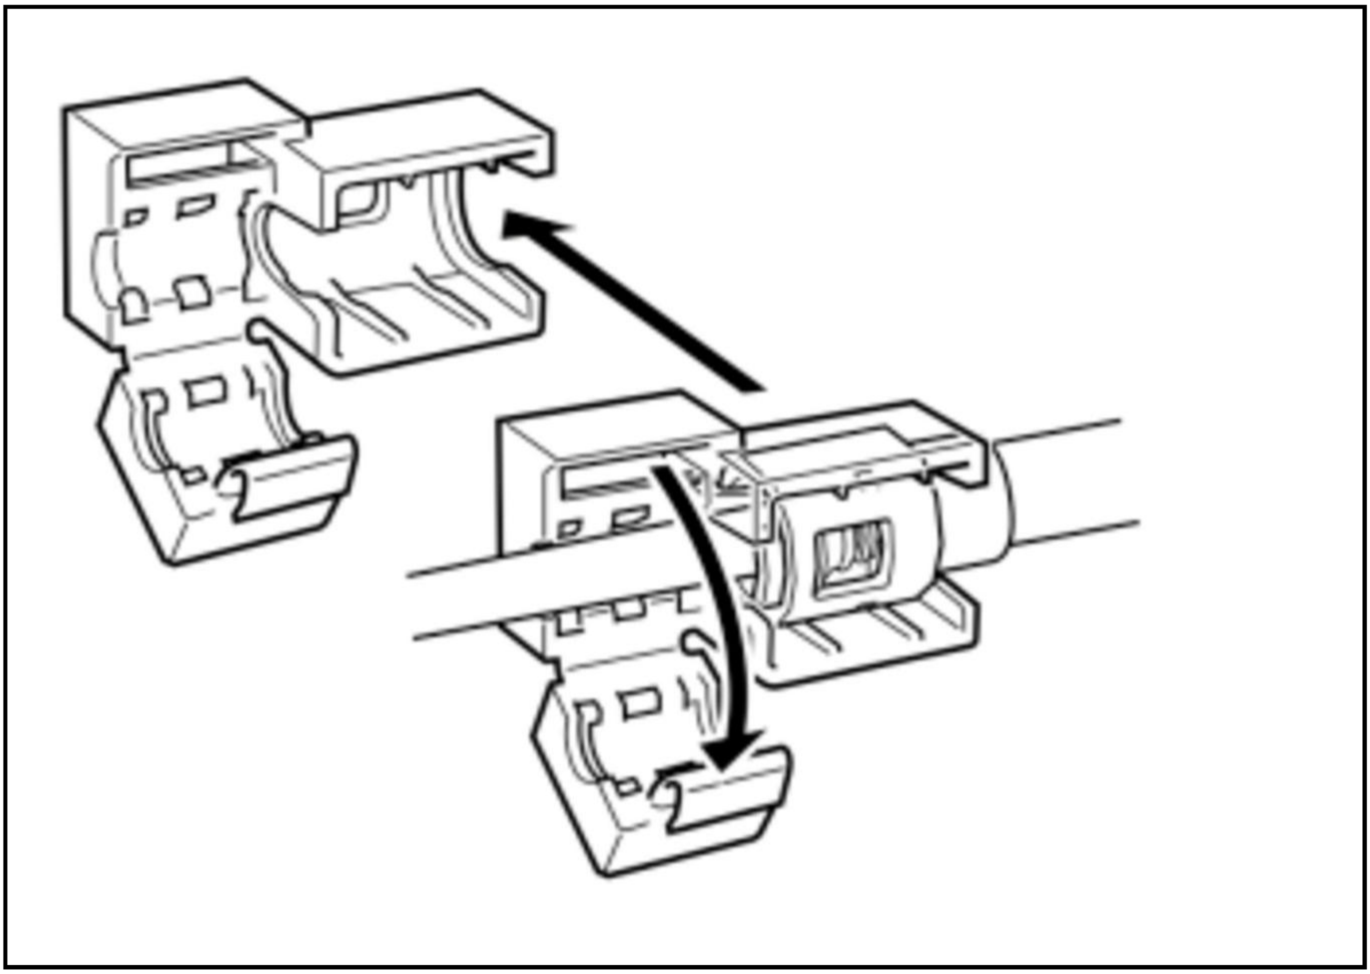
Fuel Line/Quick-Connect Fitting Removal

1. Remove the fuel line/quick-connect fitting cover (If equipped).

Type A



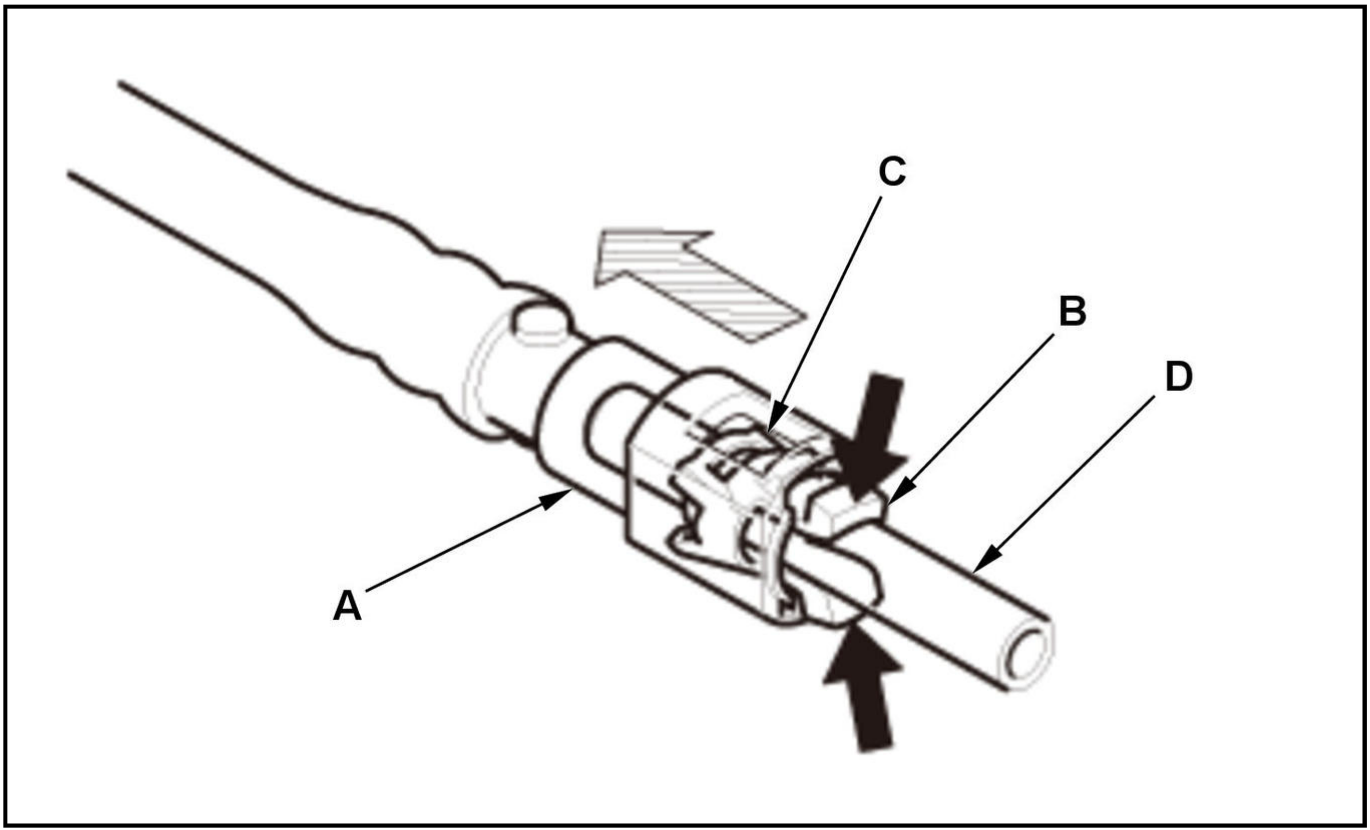
Type B



2. Check the fuel quick-connect fittings for dirt, and clean it if needed.

3. Place a rag or shop towel over the quick-connect fitting.

4. Hold the connector (A) with one hand, and squeeze the retainer tabs (B) with the other hand to release them from the locking tabs (C).



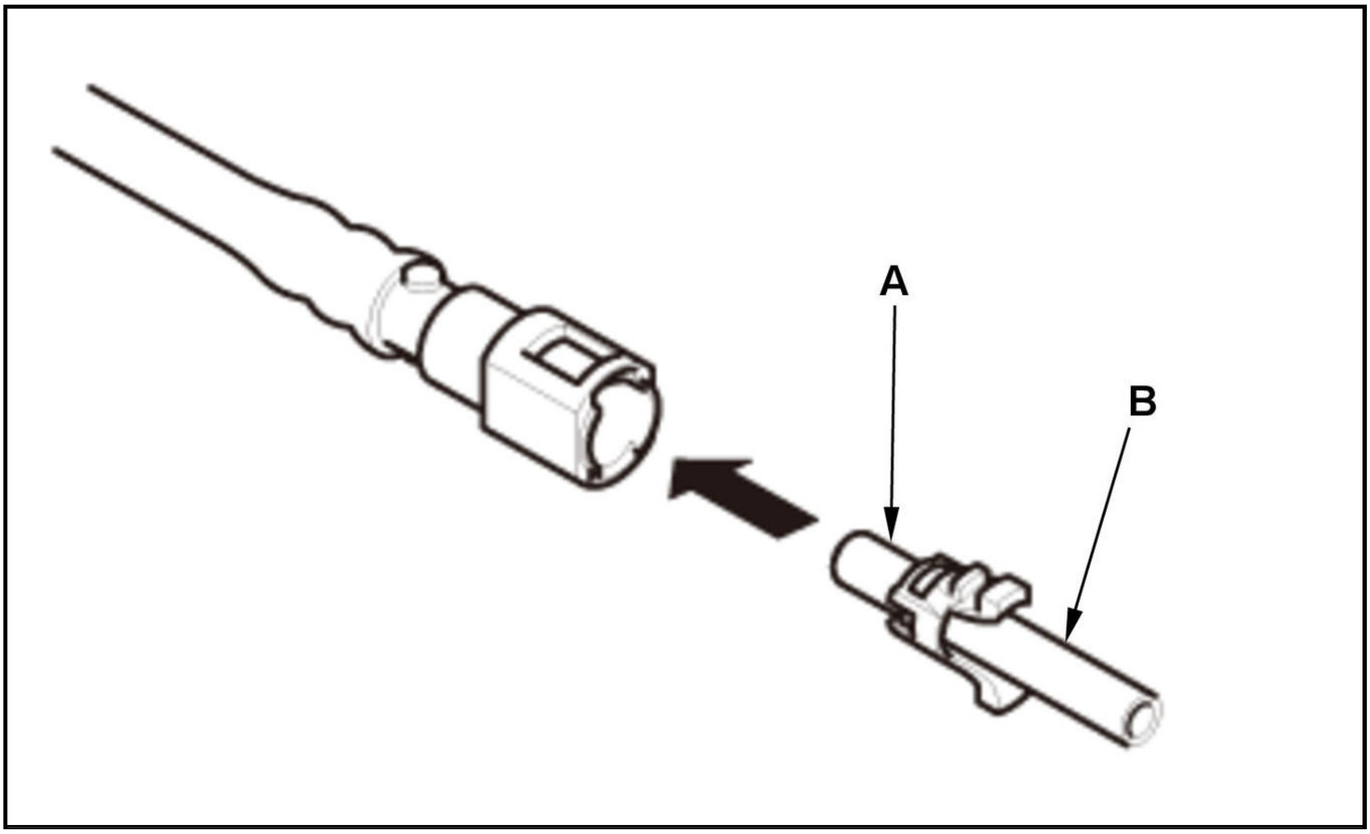
Pull the connector off.

NOTE:

- Be careful not to damage the line (D) or other parts. Do not use tools.
- If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.
- Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.

Check the contact area (A) of the line (B) for dirt or damage.

- If it is dirty, clean it.
- If it is rusty or damaged, replace the damaged fuel line or the damaged part.



To prevent damage and keep foreign matter out, cover the disconnected connector and line ends with plastic bags (A).

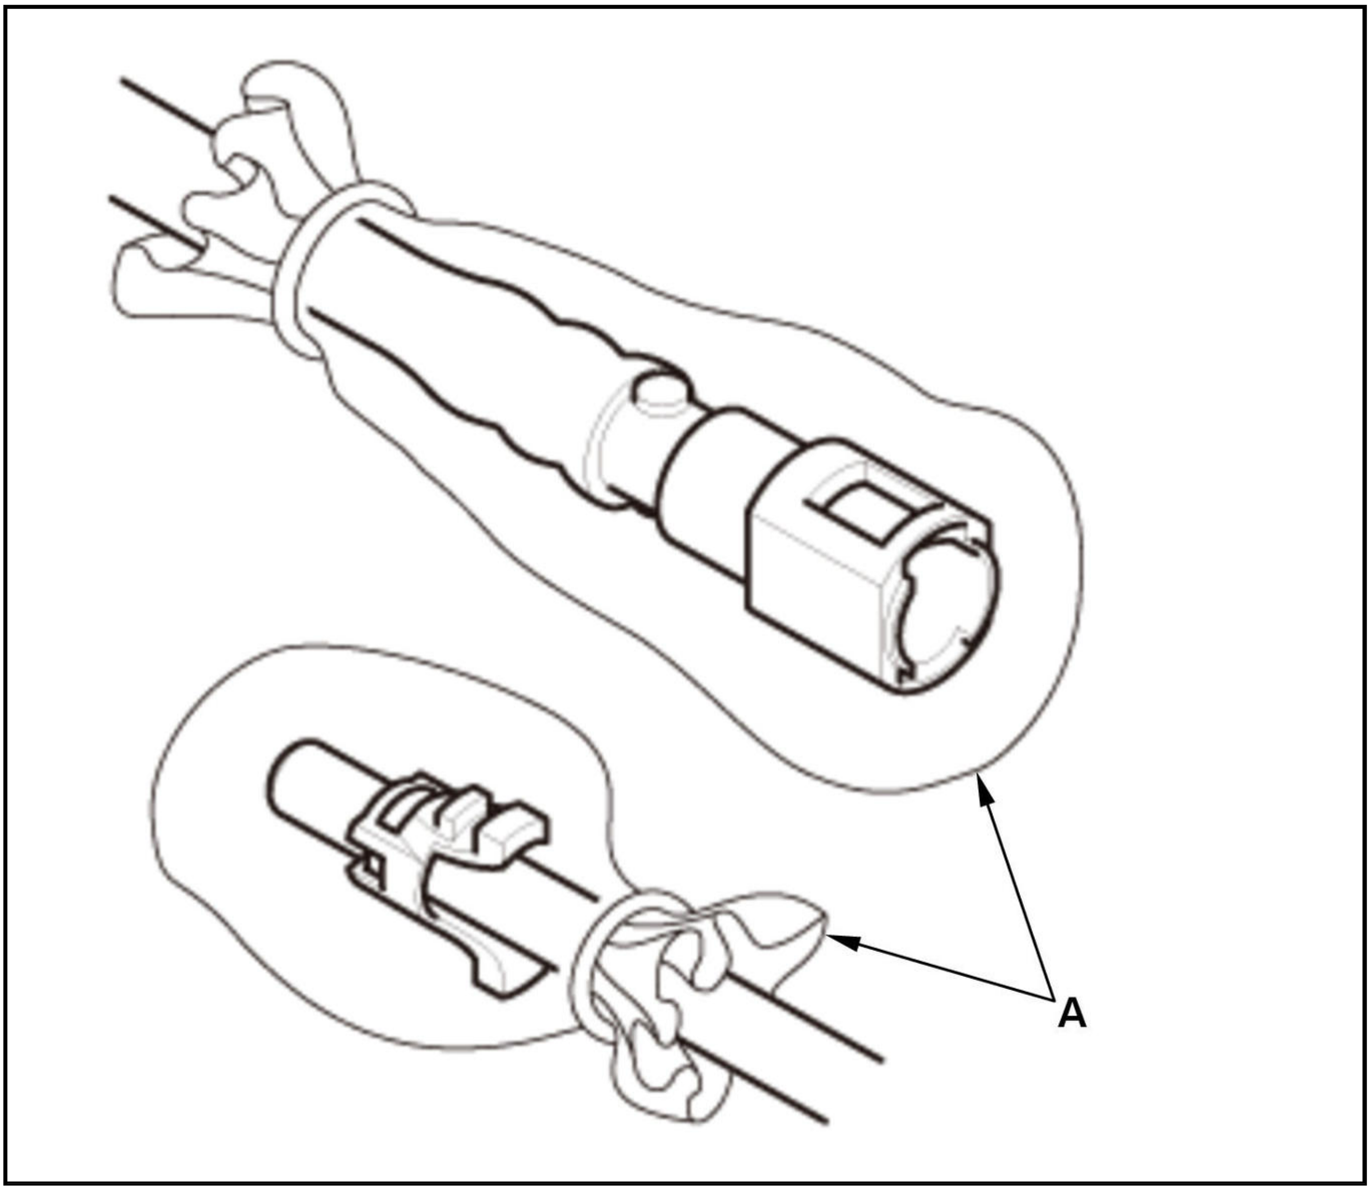
NOTE:

- The retainer cannot be reused once it has been removed from the line.
- Replace the retainer when:
-
    - -

      Replacing a new part that does not include the retainer. (a fuel line, a fuel tank unit etc.)
    - -

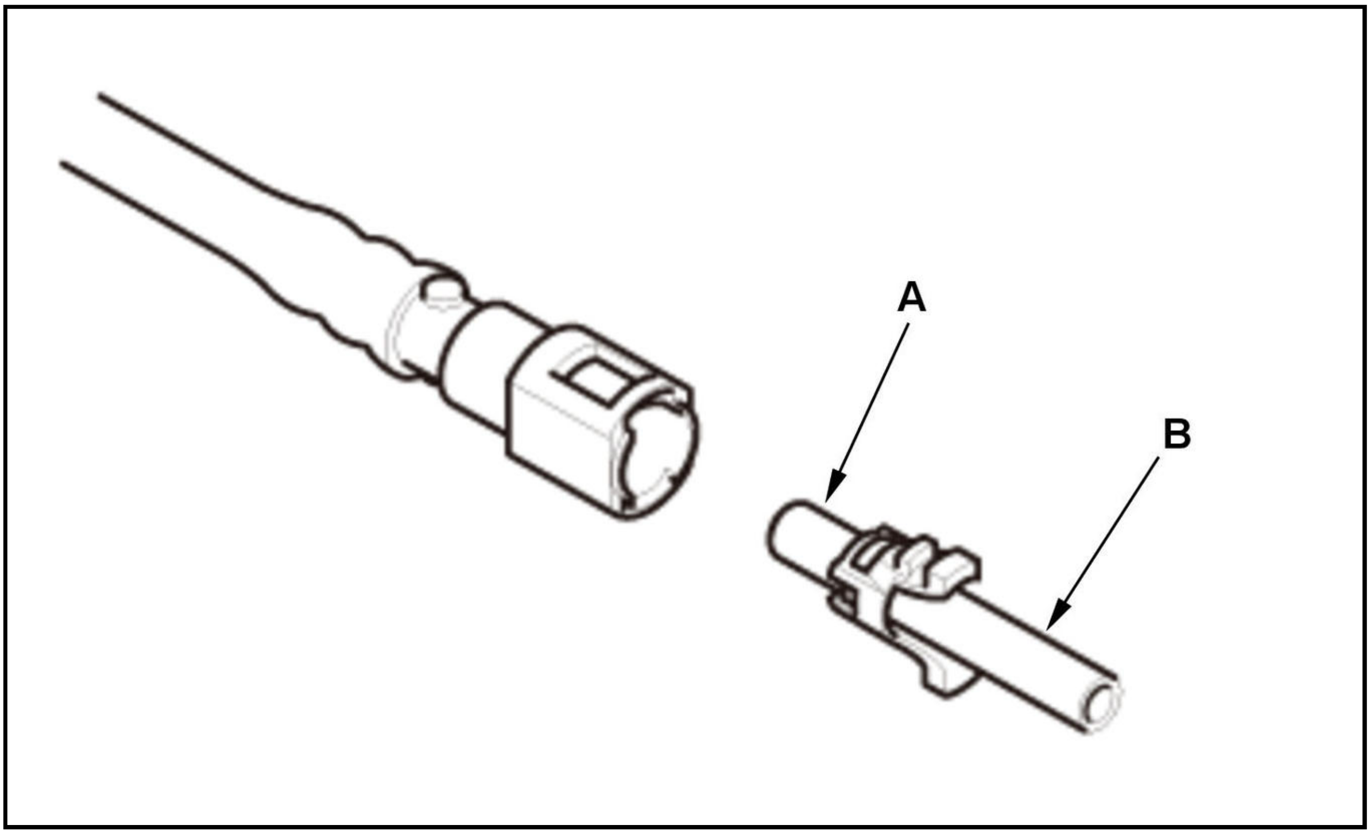
      It has been removed from the line.
    - -

      It is damaged.



Fuel Line/Quick-Connect Fitting Installation

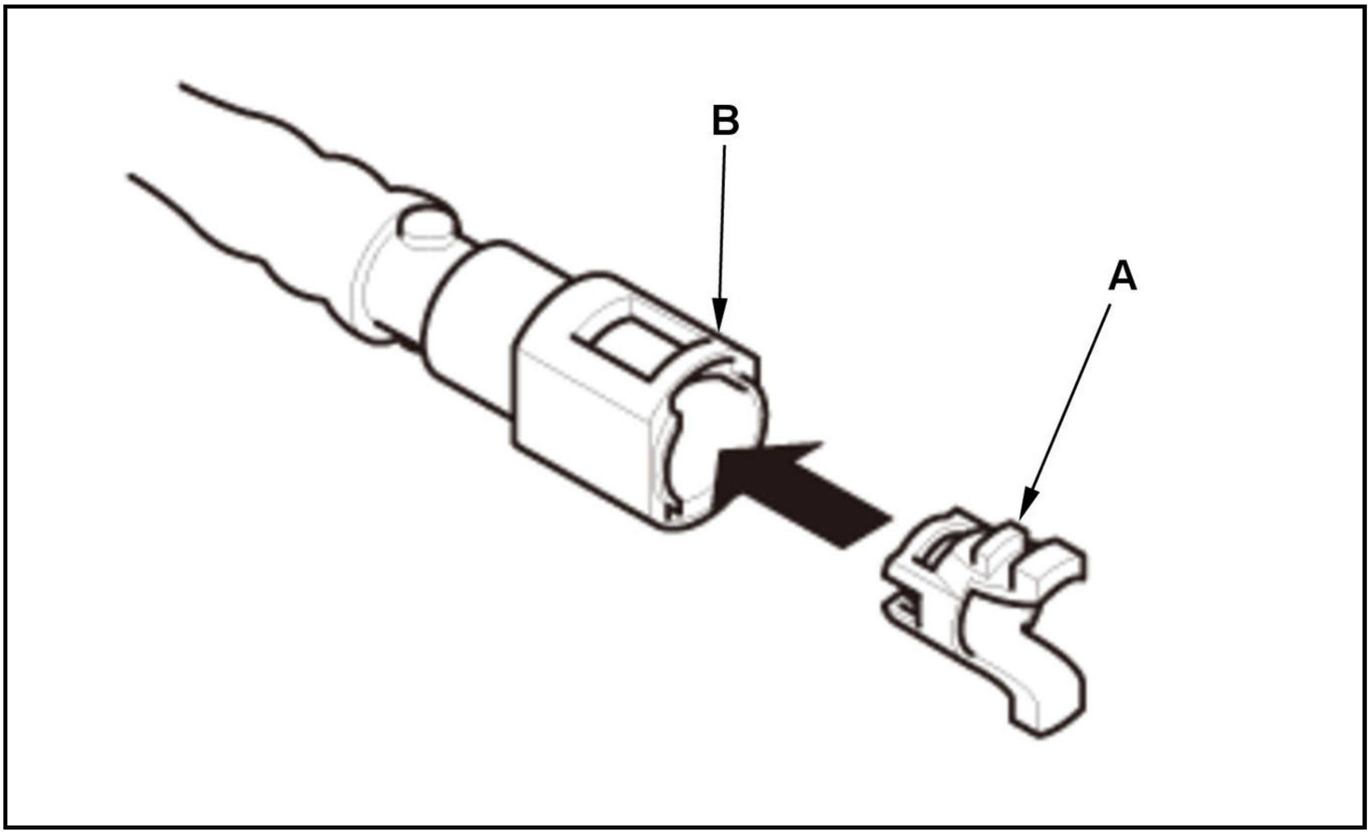
1. Check the contact area (A) of the line (B) for dirt or damage, and clean it if needed.



Insert a new retainer (A) into the connector (B) if the retainer is damaged, or after:

- Replacing new part which does not pack with the suitable retainer. (a fuel line, a fuel tank unit etc.)
- Removing the retainer from the line.

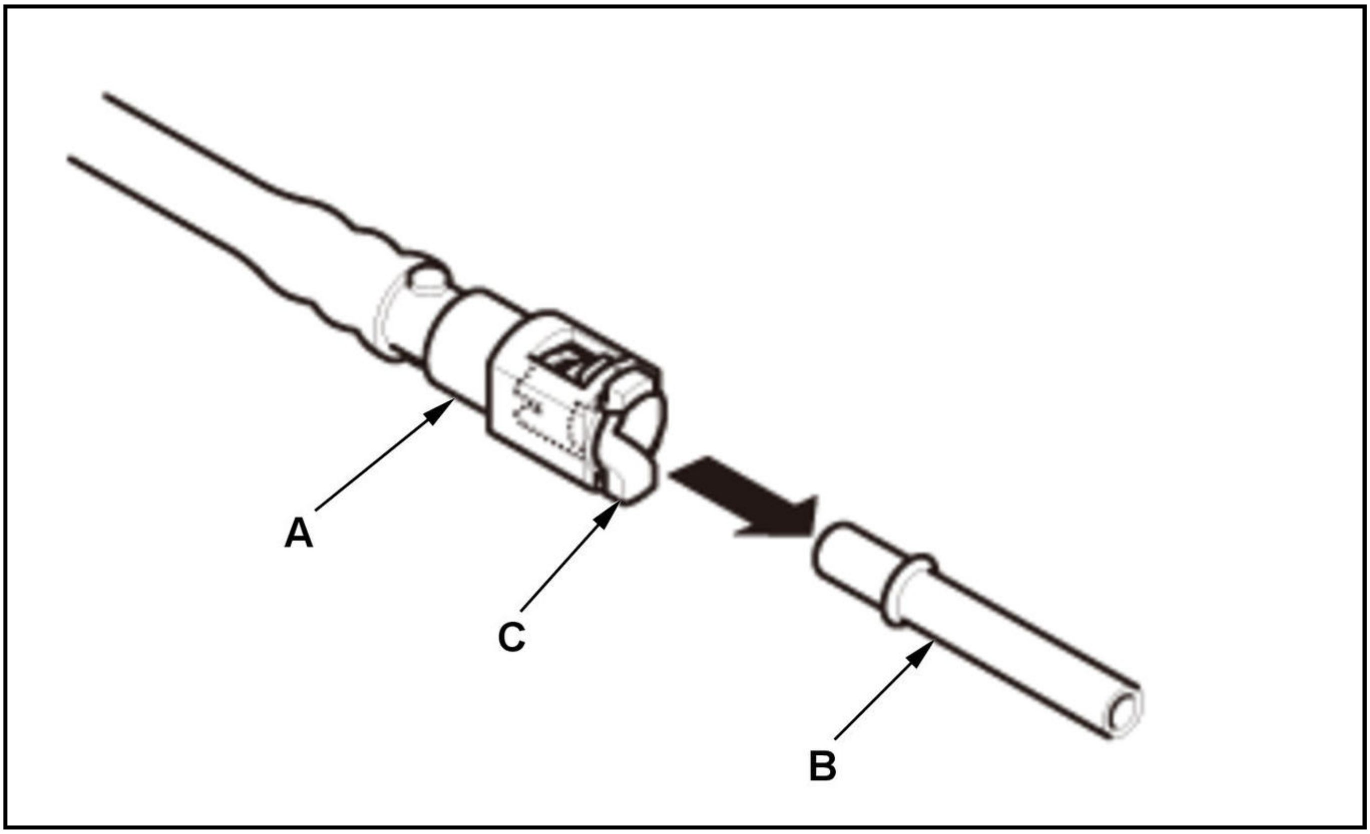
NOTE: Use the same manufacturer retainer and the same size retainer when the replacing the retainer.



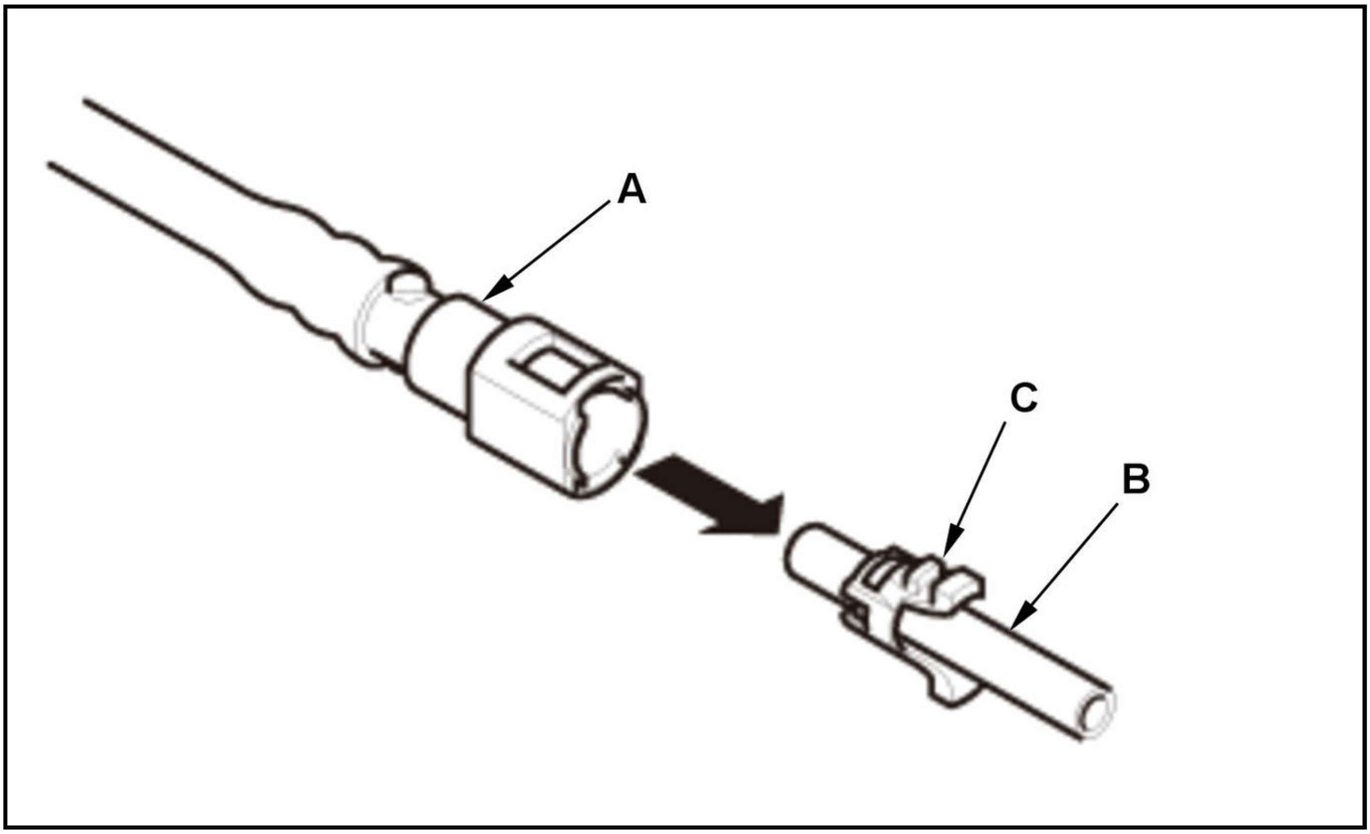
3. Before connecting a new fuel line/quick-connect fittings, remove the old retainer from the mating line.

4. Align the quick-connect fittings (A) with the line (B), and align the retainer (C) locking tabs with the connector grooves.

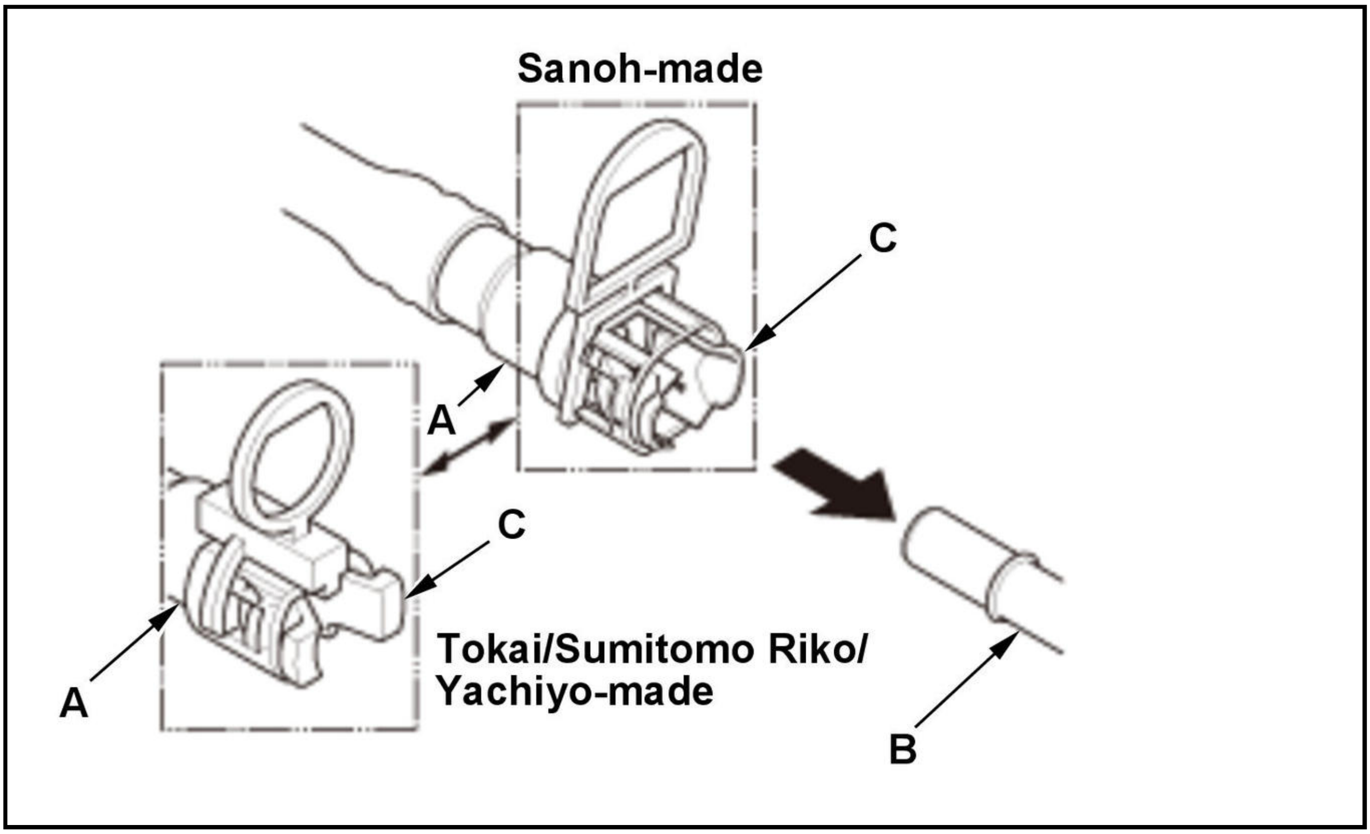
Connection with new retainer



Reconnection to existing retainer



Connection to new fuel line

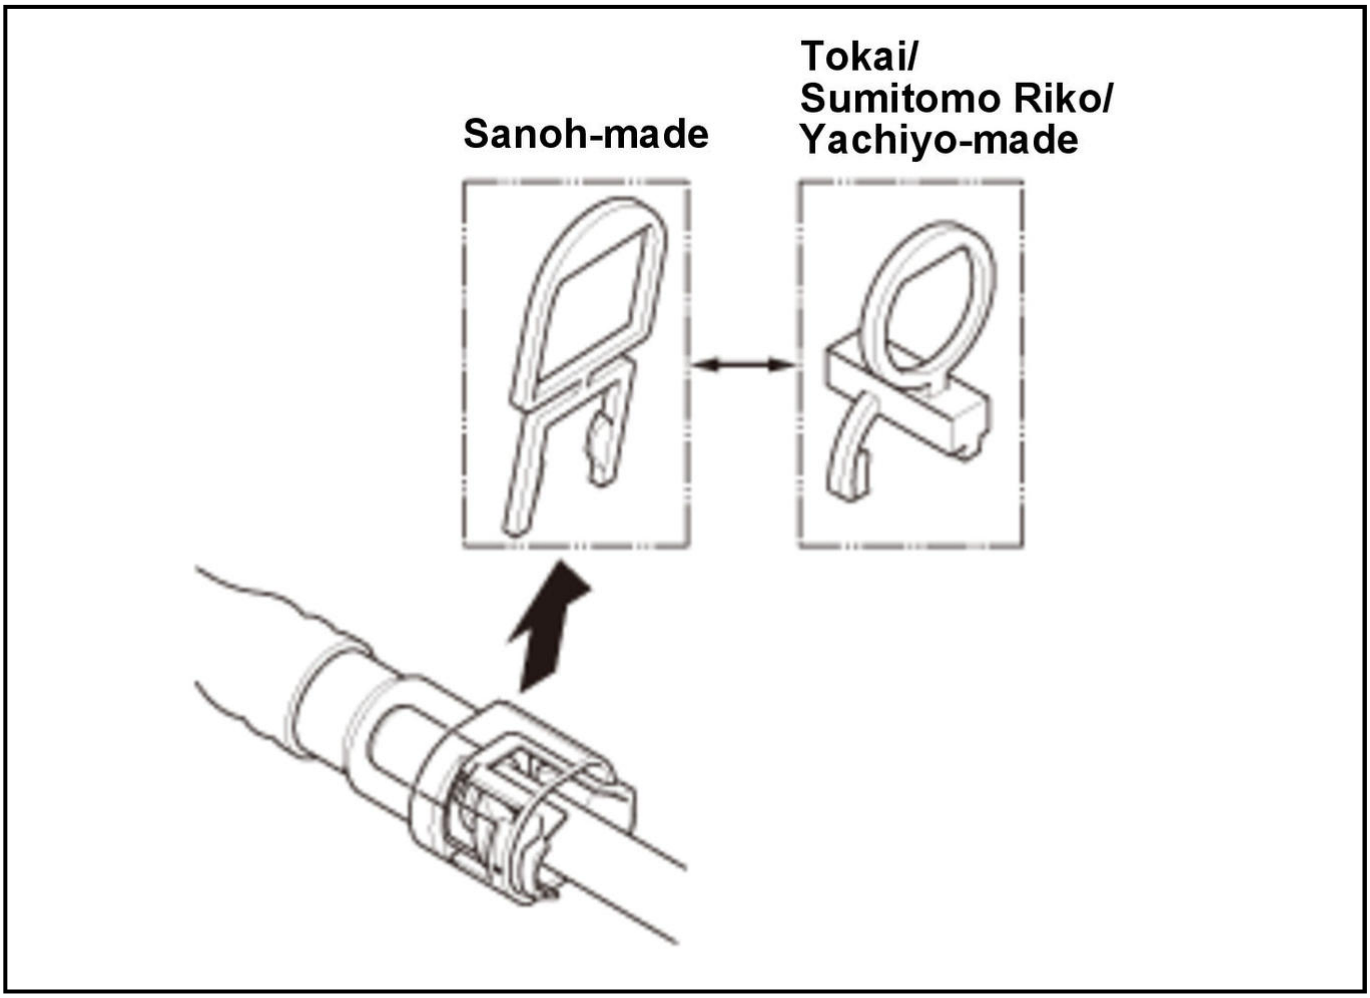


5. Press the quick-connect fittings onto the line until both retainer tabs lock with a clicking sound.

NOTE: If it is hard to connect, put a small amount of new engine oil on the line end.

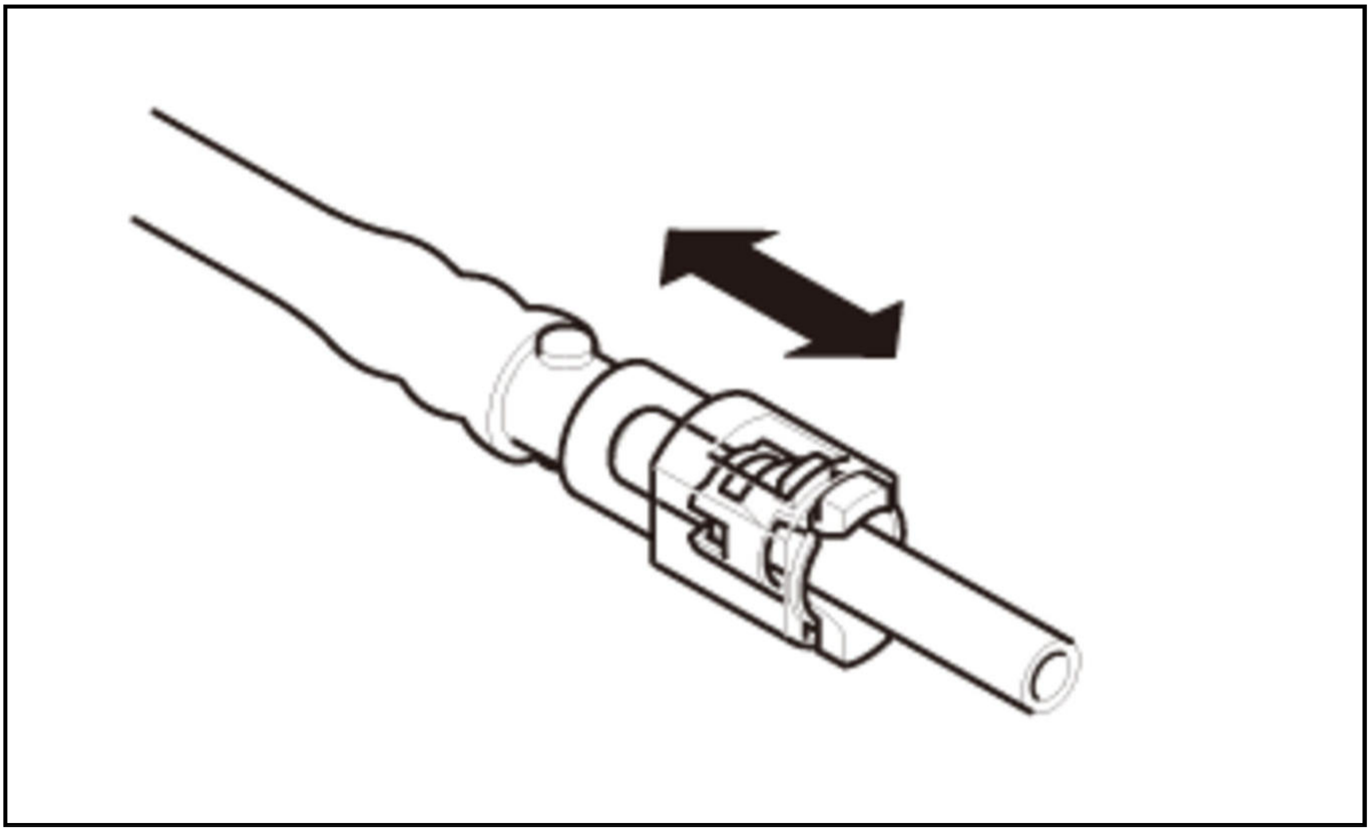
6. When replacing the fuel line with a new retainer as a set, make sure you remove the ring pull upwards after you confirm the connection is secure.

NOTE: Before you remove the ring pull, make sure the fuel line connection is secure. If the connection is not secure, the ring pull could break when you try to remove it.



Sanoh-made
Tokai/
Sumitomo Riko/
Yachiyo-made

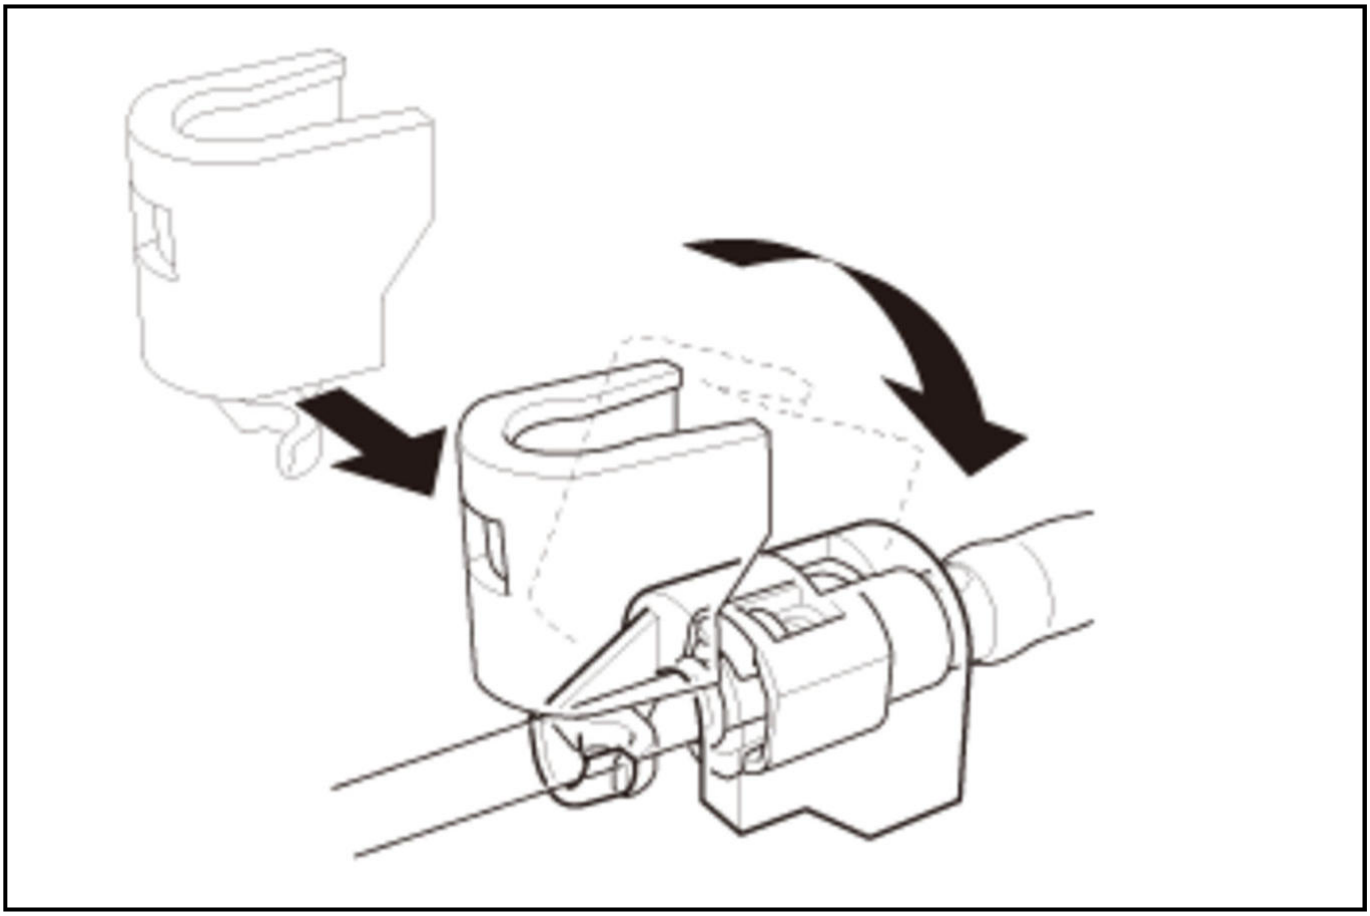
7. Make sure the connection is secure and the tabs are firmly locked into place; check visually and also by pulling the connector.



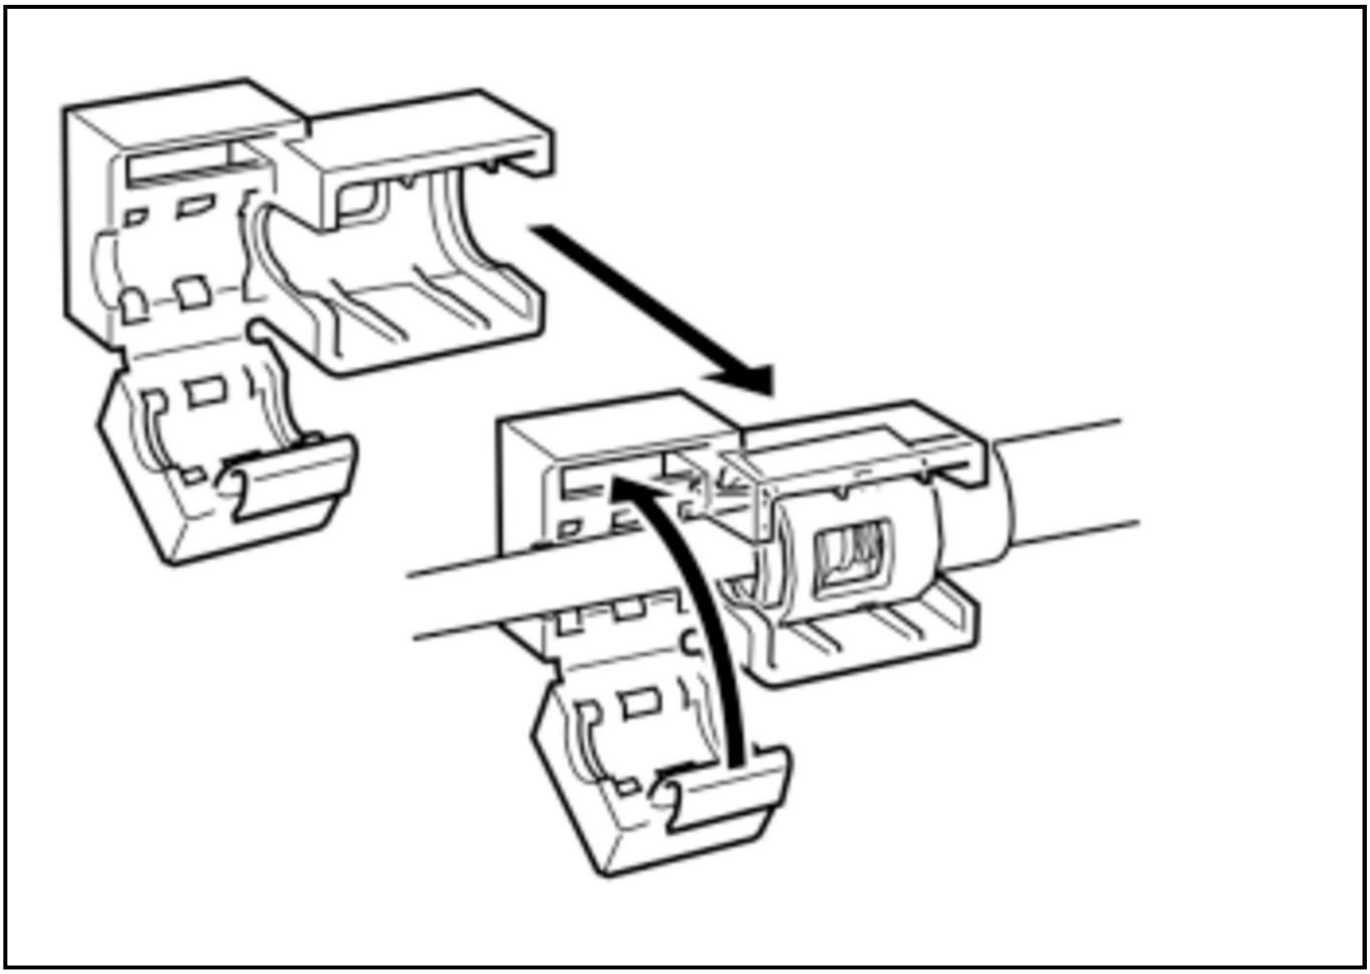
8. Turn the vehicle to the ON mode, but do not turn the vehicle to the READY TO DRIVE mode. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three times, then check for fuel leakage.

9. Set the groove of the quick-connect fitting cover on the fuel line as shown, then install it. Make sure the cover is firmly locked in place.

Type A



Type B



SYMPTOM TROUBLESHOOTING INDEX

FUEL AND EMISSIONS SYSTEMS SYMPTOM TROUBLESHOOTING INDEX

Symptom Troubleshooting Index

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure	Also check for
Engine will not start (MIL works OK, no DTCs set, generator motor works OK)	• Test the 12 volt battery . • Check the fuel pressure. • Troubleshoot the fuel pump circuit.	• Low compression • No ignition spark • Exhaust restriction • Intake air leaks • Locked up engine • Broken cam chain • Fuel contamination
Engine will not start, and HDS does not communicate with the PCM (MIL comes on and stays on, no DTCs set)	• Do the DLC circuit troubleshooting . • Do the PCM Power and Ground Circuit Troubleshooting .	B
MIL comes on and stays on, or never comes on at all, no DTCs set	Troubleshoot the MIL circuit .	B

Symptom	Diagnostic procedure	Also check for
Engine starts but stalls immediately (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	**Check the keyless access system** .	• Low compression • Intake air leaks • Weak spark • Low fuel pressure
Engine is hard to start (MIL works OK, no DTCs set)	• **Test the 12 volt battery** . • **Check the fuel pressure**. • **Do the carbon accumulation check** .	• Low compression • Intake air leaks • Fuel contamination • Weak spark
Cold fast idle too low (MIL works OK, no DTCs set)	• **Check the idle speed.** • **Do the carbon accumulation check** .	• Incorrect valve adjustment • Intake air leaks
Cold fast idle too high (MIL works OK, no DTCs set)	**Check the idle speed.**	Intake air leaks
Idle speed fluctuates (MIL works OK, no DTCs set)	• **Check the idle speed** . • **Check the fuel pressure**. • **Do the carbon accumulation check** .	• Incorrect valve adjustment • Intake air leaks
After warming up, idle speed is below specifications without load (MIL works OK, no DTCs set)	**Do the carbon accumulation check** .	Incorrect valve timing or clearance adjustment
After warming up, idle speed is above specifications without load (MIL works OK, no DTCs set)	**Inspect the APP sensor** .	Intake air leaks
Low power (MIL works OK, no DTCs set)	• **Check the fuel pressure**. • **Check the air cleaner element** .	• Low compression • Incorrect camshaft timing • Incorrect engine oil level • Exhaust restriction • Fuel contamination
Engine stalls (MIL works OK, no DTCs set)	• **Check the fuel pressure**. • **Check the idle speed** .	• Intake air leaks • Faulty harness and sensor connections • Fuel contamination
Difficult to refuel (MIL works OK, NO DTCs set)	• Check the fuel vent tube between the EVAP canister and the fuel tank unit.	• Malfunctioning gas station filling nozzle

Symptom	Diagnostic procedure	Also check for
	- Check the fuel tank vapor recirculation tube between the fuel fill pipe and the fuel tank unit. - Insert the emergency fuel funnel into the fuel filler neck, then check the operation of the shut-off valve flap. **NOTE:** The emergency fuel funnel is stored in the trunk tool box. - **Replace the fuel tank**.	- Faulty fuel tank vapor control valve
Fuel overflows during refueling (No DTCs set)	**Replace the fuel tank**.	Malfunctioning gas station filling nozzle
HDS does not communicate with the PCM or the vehicle	**Troubleshoot the DLC circuit** .	Correct HDS software

INSPECTION

FUEL LINE INSPECTION

Inspection

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

1. Fuel Line - Inspect
    - Check the fuel system lines and hoses for damage, leaks, and deterioration. Replace any damaged parts.
    - Check all clamps, and make sure they are properly positioned and tightened.
    -
        - -

          Make sure the clamps are in the position of its range shown.
        - -

          Align the marks on the hoses and the pipes.
        - -

          There should be no clearance between the hoses and the pipes.

SYMPTOM TROUBLESHOOTING

FUEL AND EMISSIONS SYSTEMS SYMPTOM TROUBLESHOOTING - ENGINE STALLS-DIAGNOSTIC INTERVIEW

Engine stalls-Diagnostic interview

• Date	B	B
B	B	B
• Place	B	B
B	B	B
1. Accessories/modifications	A: No modification	B: Modified
B		
2. Situation when occurred	Booming noise, vibration occurs when deceleration, stopping, engine stalls	
B		
3. Situation when occurred	Engine stalls without vibrations as if stopped by turning off the ignition switch	
B		
4. Situation when occurred	Outside temperature, engine temperature (cold/warmed-up), engine could restart right away or not, others	

Engine stalls condition-Possible cause pattern chart from diagnostic interview

B	Conditions when the engine stalls	Possible causes
Pattern 1	Accessories/modifications	"Hard to start engine" or "engine stall" sometimes occurs due to a fault in the ignition system, intake duct, intake manifold, or exhaust system. (Intermittent failure may occur due to modification)
Pattern 2	Booming noise, vibration occurs when deceleration, stopping, engine stalls	The following intermittent failures may exist. • Intermittent failure of PGM-FI main relay 2 • Faulty fuel supply (parameter ST FUEL TRIM) • Delay of EGR function (parameter EGR) (only vehicles with EGR) • Delay of VTEC, VTC system function (parameter VTEC) (only vehicles with VTEC or VTC) • Delay of lock-up operation (parameter SLIP RATIO OF TORQ OR STARTCLUTCH) (AT, CVT vehicles)
Pattern 3	Engine stalls without vibrations as if turning off the ignition switch	The following intermittent failures may exist. • Intermittent failure of ignition coil relay • Intermittent failure of PGM-FI main relay 1 • Intermittent failure of PGM-FI subrelay • Intermittent failure of ETCS control relay

SERVICING

FUEL PRESSURE RELIEVING

Procedure

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.
- Before disconnecting fuel lines or hoses, relieve pressure from the system by disabling the fuel pump and disconnecting the fuel line/quick connect fitting in the engine compartment.

1. Fuel Tank Pressure - Relieve

	1. Remove the emergency fuel funnel (A).

	2. Insert the emergency fuel funnel (A) into the fuel filler neck to relieve the pressure in the fuel tank.

2. Fuel Pressure - Relieve

1. **Remove PGM-FI main relay 2** . 2. **Enter the maintenance mode and start the engine** . Then let it idle until it stalls. **NOTE:** If any DTCs are stored, clear and ignore them. 3. Turn the vehicle to the OFF (LOCK) mode. 4. Install PGM-FI main relay 2.

3. **12 Volt Battery Terminal - Disconnect**

FUEL TANK UNIT/FUEL FILTER REMOVAL, INSTALLATION, DISASSEMBLY, AND REASSEMBLY

Special Tools Required

Image	Description/Tool Number
	Wrench, Fuel Sender 070AA-TLA0100

Removal

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

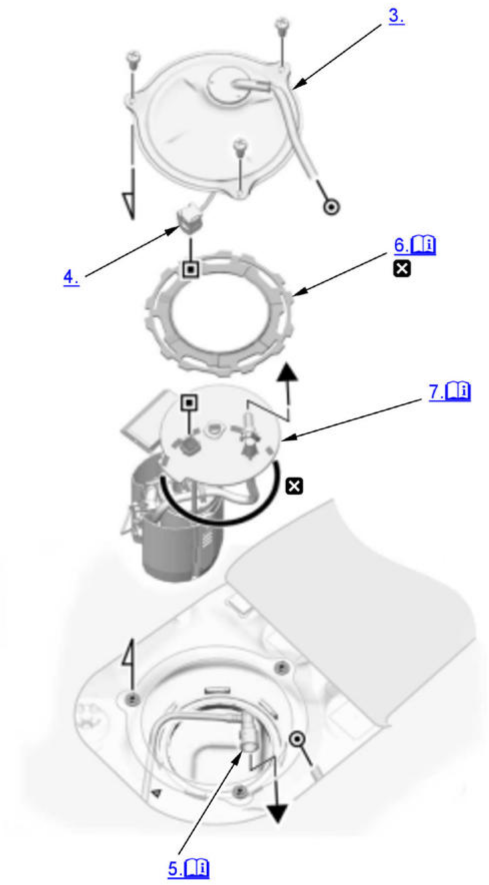

Fig. 1: Exploded View Of Fuel Tank Unit/Fuel Filter Replacement Components For Removal
Courtesy of HONDA, U.S.A., INC.

☒	Replace

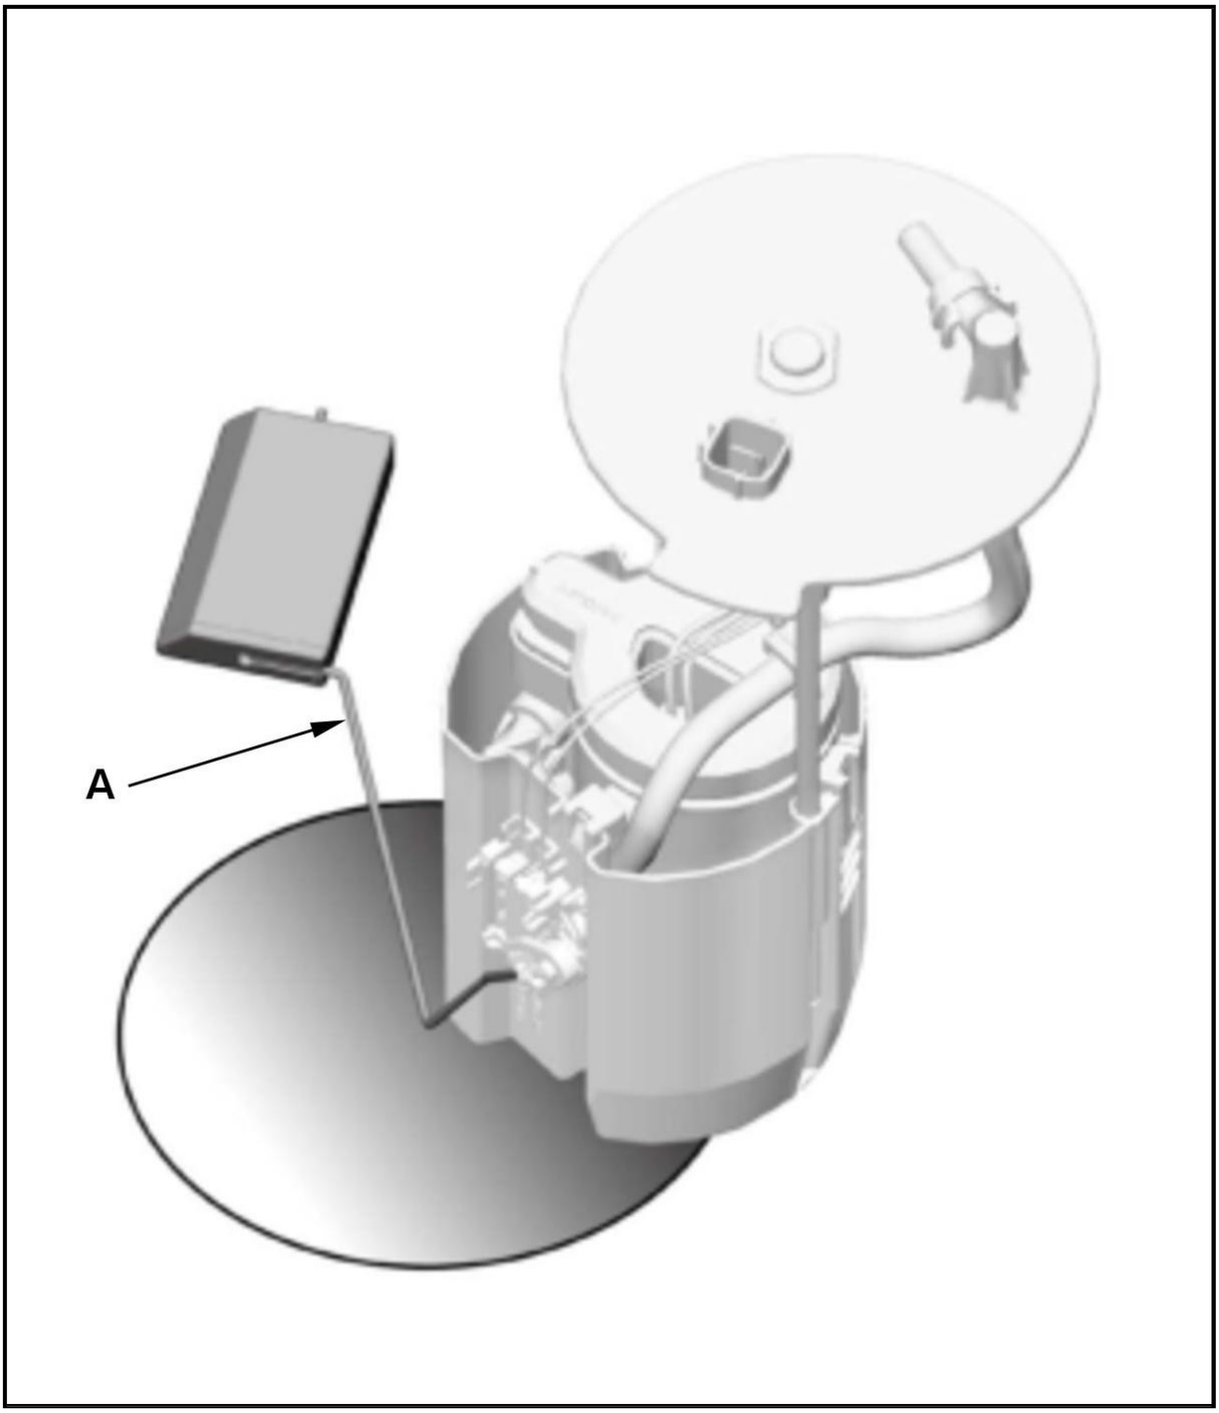
1. **Fuel Pressure - Relieve**
2. **Rear Seat Cushion - Lift**
3. Fuel Tank Unit Access Panel - Remove
4. Connector (Fuel Tank Unit) - Disconnect
5. Fuel Line Quick-Connect Fitting - Disconnect

	1. Place a rag or shop towel (A) over the quick-connect fitting. 2. **Disconnect the quick-connect fitting** from the fuel tank unit.

6. Fuel Tank Unit Cam Lock Ring - Unlock

	1. Set the fuel sender wrench (A) as shown. 2. Turn the fuel tank unit cam lock ring (B) counterclockwise. **NOTE:** Try to keep the fuel sender wrench from floating.

7. Fuel Tank Unit - Remove



NOTE: Be careful not to bend or twist the fuel level sensor arm (A) excessively.

Installation

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

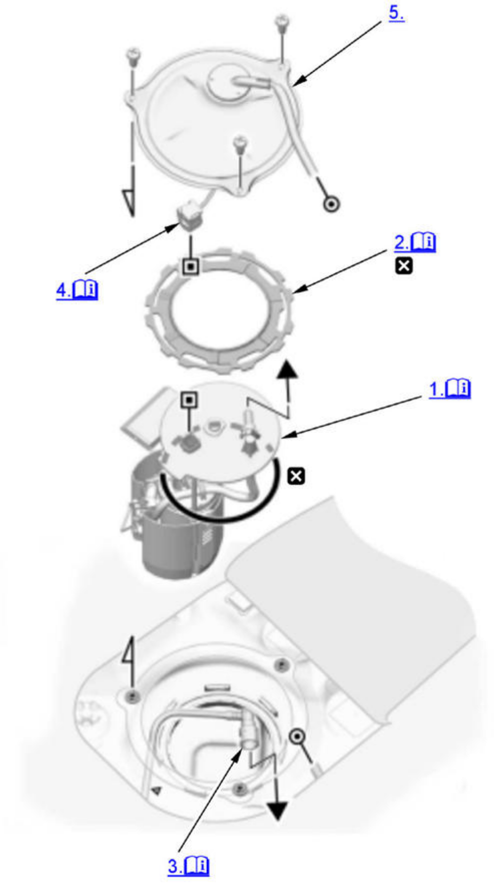


Fig. 2: Exploded View Of Fuel Tank Unit/Fuel Filter Replacement Components For Installation
Courtesy of HONDA, U.S.A., INC.

☒	Replace

1. Fuel Tank Unit - Install

	**NOTE:** - Be careful not to bend or twist the fuel level sensor arm (A) excessively. - Be careful not to damage the O-ring (B). - Do not coat the O-ring with oil. 1. Insert the fuel tank unit (C) partially into the fuel tank with the O-ring.

	2. Align the tab (A) of the fuel tank unit as shown, and temporarily insert the fuel tank unit cam lock ring (B).

2. Fuel Tank Unit Cam Lock Ring - Lock

	1. Rotate the fuel tank unit cam lock ring (A) and slide the fuel tank unit cam lock tabs (B) into the positioning edge (C) slightly as shown by hand. **NOTE:** Confirm the fuel cam lock ring is not floating.

 070AA-TLA0100	2. Using the fuel sender wrench (A), turn the fuel tank unit cam lock ring (B) clockwise. **NOTE:** - Try to keep the fuel sender wrench from floating. - Securely set the positioning edge (C) of the fuel tank at the fuel tank unit cam lock ring tabs (D) on the fuel tank unit cam lock ring as shown.

3. Fuel Line (Fuel Line Quick-Connect Fitting) - Connect

	1. **Connect the quick-connect fitting** (A) to the fuel tank unit.

4. Fuel Leak - Check (Connector (Fuel Tank Unit) - Connect)

 	1. Connect the fuel tank unit connector (A). 2. Turn the vehicle to the ON mode, but do not turn to the READY TO DRIVE mode. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three times, then check for fuel leakage.

5. Fuel Tank Unit Access Panel - Install
6. **Rear Seat Cushion - Install**

Disassembly and Reassembly

WARNING:

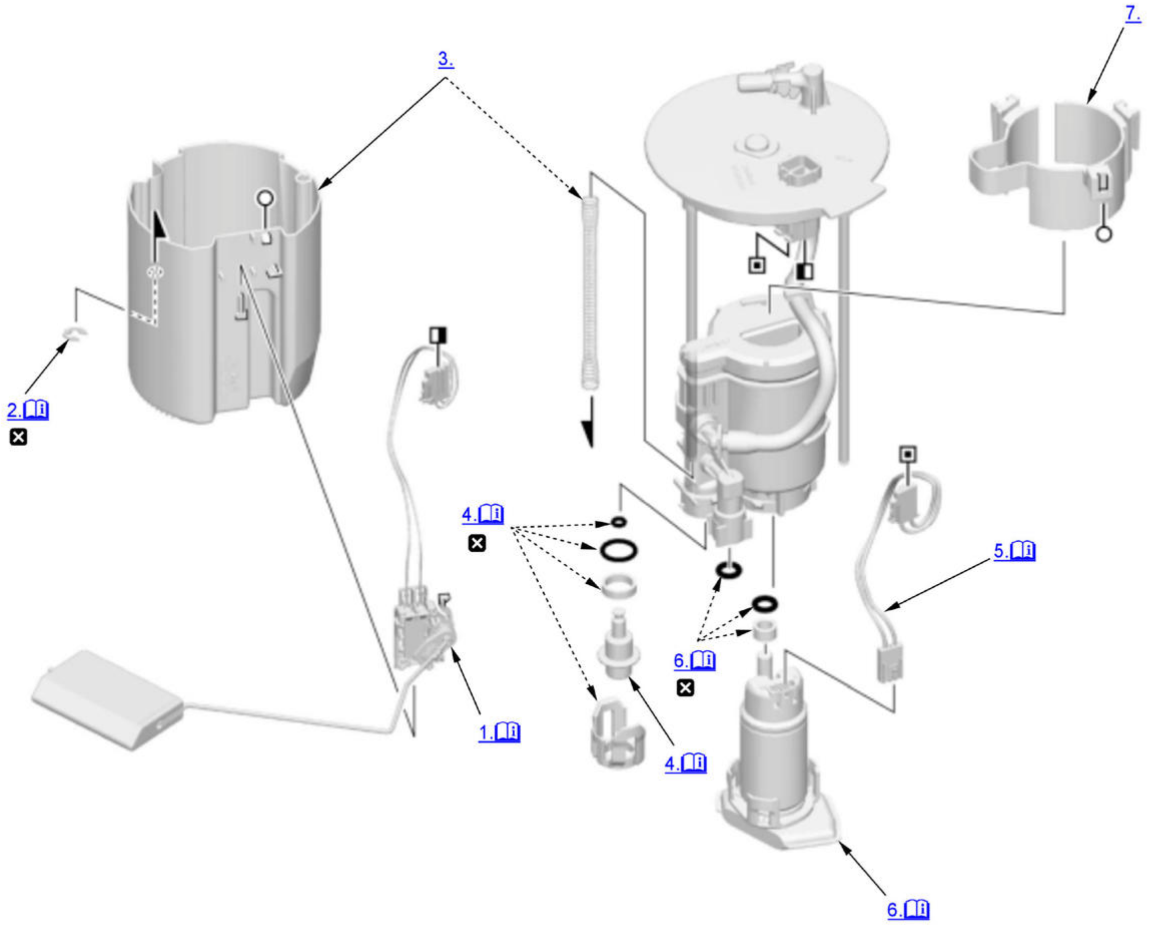
Flammable - Keep Fire Away

NOTE:

- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.
- The fuel filter should be replaced whenever the fuel pressure drops below the specified value, after making sure that the fuel pump and the fuel pressure regulator are OK.
- When replacing the fuel filter or the fuel pressure regulator, use all the new parts supplied in the replacement kit.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**



[Fig. 3: Exploded View Of Fuel Tank Unit/Fuel Filter Replacement Components For Disassembly And Reassembly](#)

Courtesy of HONDA, U.S.A., INC.

☒	Replace

1. Fuel Gauge Sending Unit - Remove

   NOTE: Be careful not to bend or twist the fuel level sensor arm excessively.

   Note for installation

   Make sure the connection is secure and the connector is firmly locked into place.

2. E-Ring - Remove

   Note for installation

   Make sure the E-ring is firmly installed.

3. Reservoir - Remove
4. Fuel Pressure Regulator - Remove

   Note for installation

   - Coat the O-rings with clean engine oil; do not use any other oil or fluid.
   - Do not pinch the O-rings during installation.

5. Fuel Pump Harness - Remove

Note for installation

When connecting the wire harness, make sure the connection is secure and the connectors are firmly locked into place.

6. Fuel Pump - Remove

   Note for installation

   - Coat the O-rings with clean engine oil; do not use any other oil or fluid.
   - Do not pinch the O-rings during installation.
7. Bracket - Remove
8. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

FUEL AND EMISSIONS SYSTEMS SERVICE PRECAUTIONS

Fuel Flow Line Disconnection

- Flammable - Keep fire away; Do not light any fires near the work area, and handle the fuel carefully. Setting fire to fuel will cause a serious accident.
- Relieve the fuel pressure before the fuel line disconnection to avoid a risk of fuel spraying from there.
- Disconnect the 12 volt battery negative terminal before the electric connector disconnection to avoid a risk of starting a fire caused by the sparks coming off the connector.
- Clean the contact area of the joint. Any dirt may cause fuel leakage by a misconnection.

Others

- Do not apply the brake fluid, engine coolant, plant-based oil, or alcohol-based oil to the O-ring. Any undesignated fluid or oil may cause material deterioration or damage.
- Follow the instructions in order to guarantee the quality of the parts and the repair.
- If the way how the hose should be installed is not shown in the procedure, install it in the same position as before removal, and make sure that the hose clamps do not interfere with surrounding parts.

TEST

FUEL PRESSURE TEST

Special Tools Required

Image	Description/Tool Number
	GAUGE, FUEL PR. 100PSI 07406-004000C

Image	Description/Tool Number
	Fuel Pressure Gauge Attachment Set 07AAJ-S6MA150 or 07AAJ-S6MA151

Test

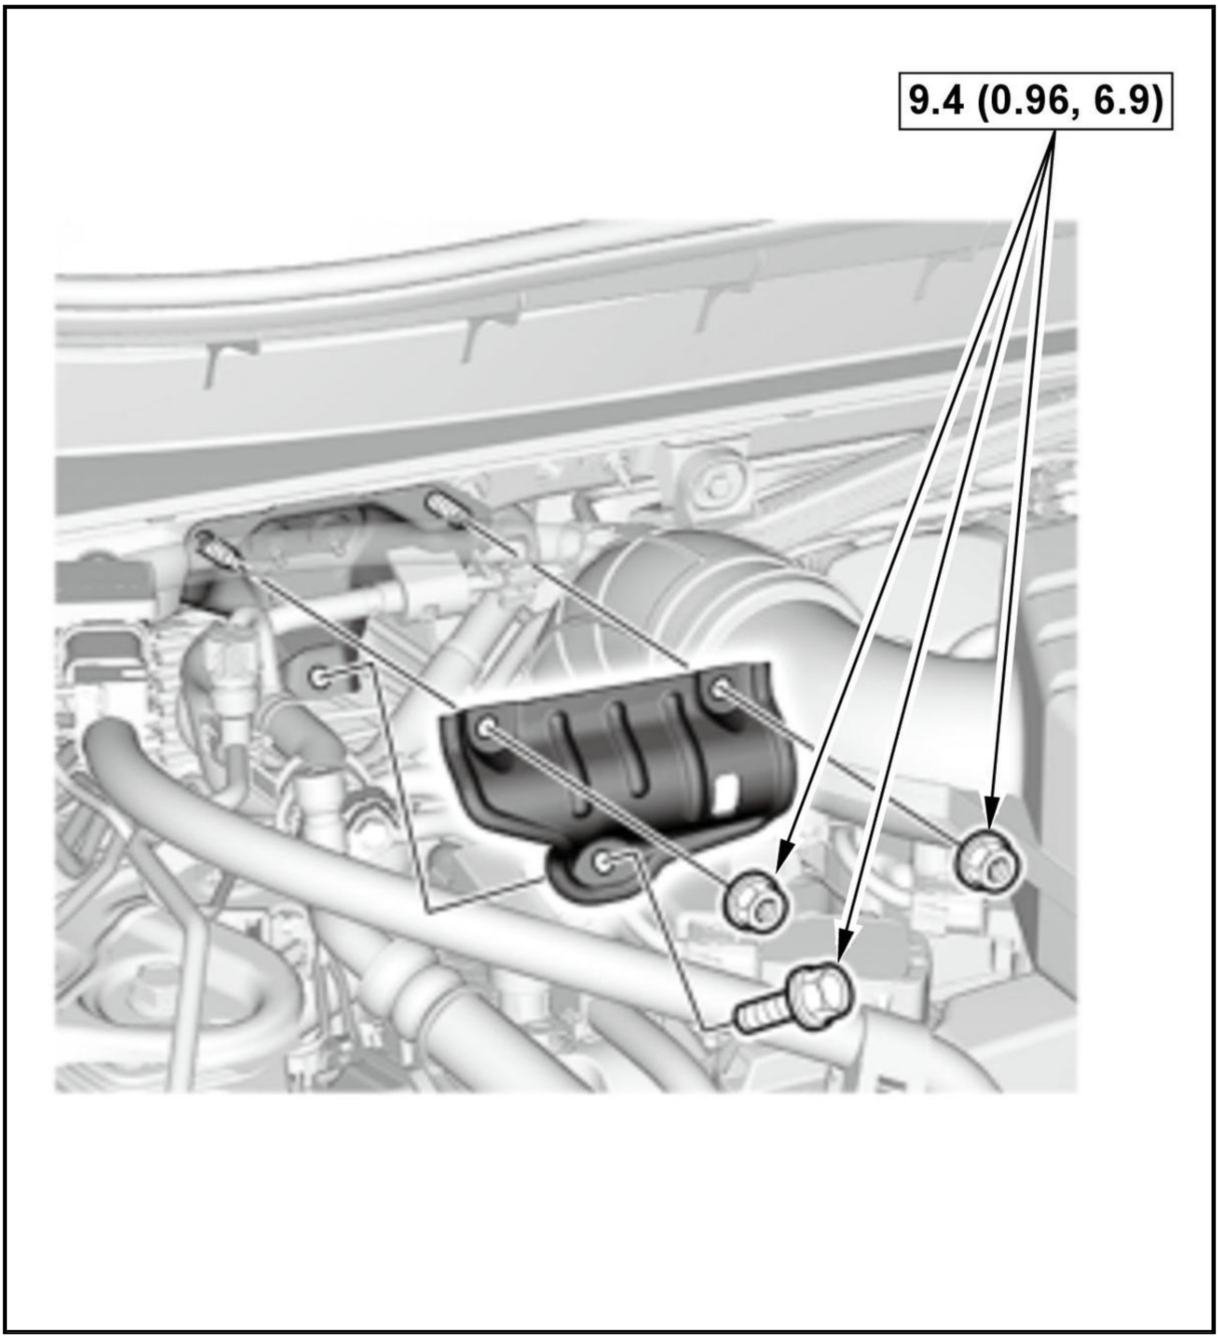
WARNING:

Flammable - Keep Fire Away

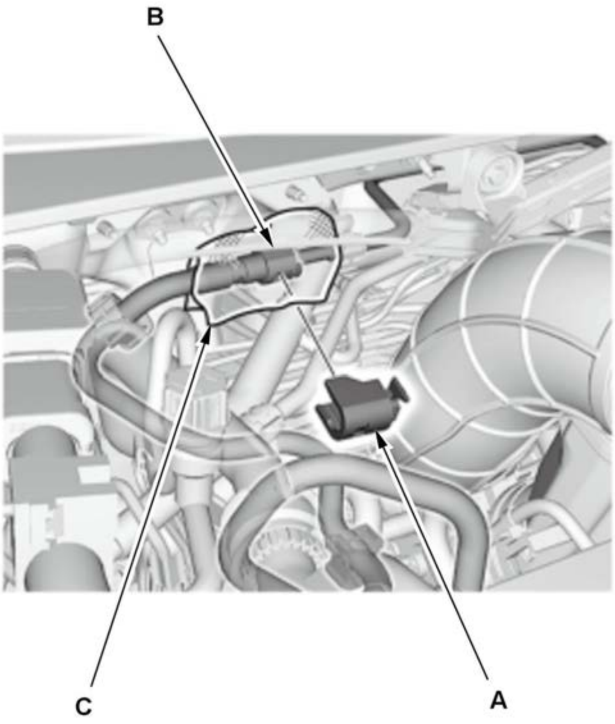
NOTE:

- **How to read the torque specifications** .
- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

1. **Fuel Pressure - Relieve**
2. Fuel Hose Cover - Remove



3. Fuel Line Quick-Connect Fitting - Disconnect



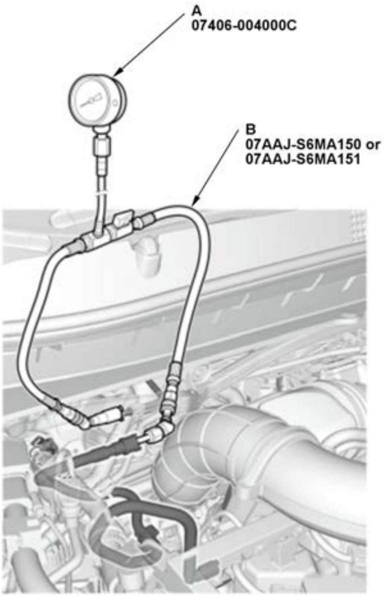
1. **Remove the quick-connect fitting cover (A)**

2. Check the fuel quick-connect fitting (B) for dirt, and clean it if needed.

3. Place a rag or shop towel (C) over the quick-connect fitting.

4. **Disconnect the quick-connect fitting**.

4. Fuel Pressure - Test



NOTE: If you were referred to this procedure from a troubleshooting procedure, test the fuel pressure under the same conditions the malfunction occurred (engine speed, load, throttle position, etc.).

1. Attach the gauge set fuel pressure (A), and the fuel pressure gauge attachment (B). Check for leaks with the gauge set attached.

2. **Enter the maintenance mode and start the engine** . Then let it idle.

- If the engine starts, go to step 3 and read the fuel pressure gauge.
- If the pump does not run, **do the fuel pump circuit troubleshooting**.

3. Read the fuel pressure gauge. The pressure should be: **380-430 kPa (3.87-4.38 kgf/cm^2 , 55.1-62.4 psi)**

- If the pressure is OK, the test is complete.
- If the pressure is out of specification, **replace the fuel pressure regulator** and **the fuel filter**, then recheck the fuel pressure.

TROUBLESHOOTING

FUEL PUMP CIRCUIT TROUBLESHOOTING

If you suspect a problem with the fuel pump, check that the fuel pump actually runs; when it is on, you will hear some noise if you listen to the fuel fill port. The fuel pump should run for 2 seconds when the vehicle is turned to ON mode. If the fuel pump does not make noise, check as follows:

1. Determine possible failure area (FI_MAIN_RLY_OUT line, others)

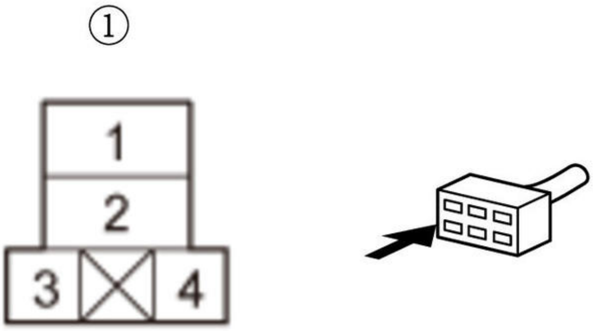
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove PGM-FI main relay 2** .

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 3.

NO

Go to step 2.

2. Open wire check (FI_MAIN_RLY_OUT line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

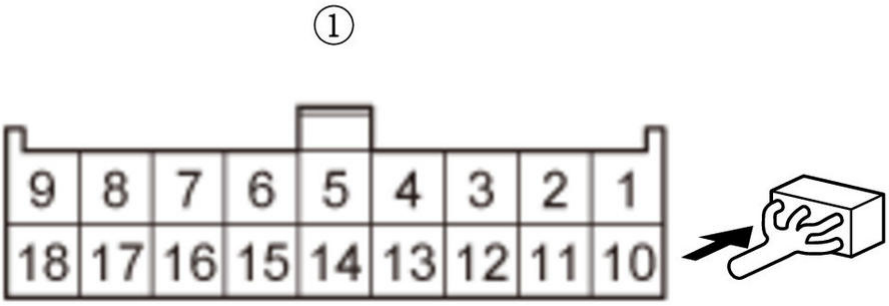
   -2. Disconnect the following connector.

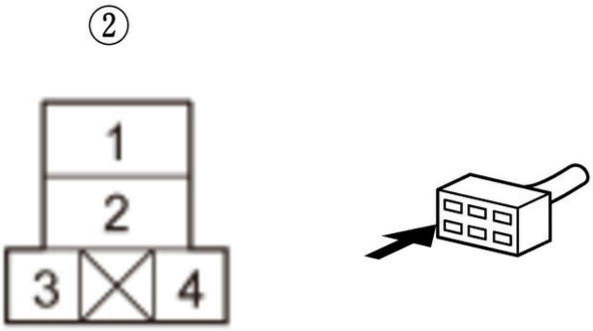
Relay circuit board connector C (18P)

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PGM-FI main relay 2: disconnected
	Relay circuit board connector C (18P): disconnected

Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	PGM-FI main relay 2 4P socket (female terminals) No. 3: ②





Is there 1.0 Ω or less?

YES

Remove and test the relay circuit board , and replace it if needed.

NO

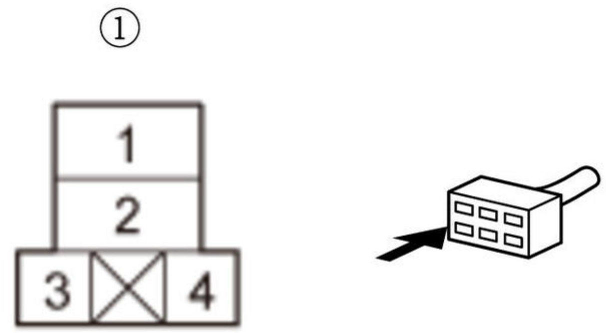
Repair an open in the FI_MAIN_RLY_OUT wire between the relay circuit board and PGM-FI main relay 2.

3. Open wire check (IG1_FUEL_PUMP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PGM-FI main relay 2: disconnected

Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

Check the **No. D8 fuse** . If the fuse is OK, repair an open in the IG1_FUEL_PUMP wire between the No. D8 fuse and PGM-FI main relay 2. If needed, **replace the under-dash fuse/relay box** .

4. Open wire check (FUEL_PUMP_RLY_CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

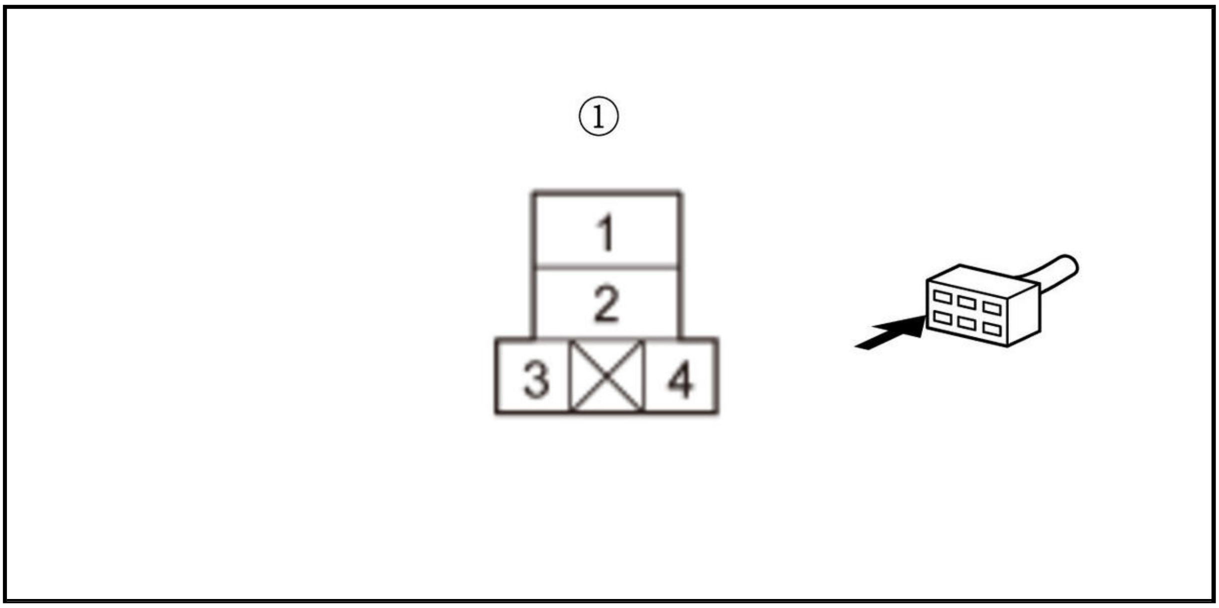
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PGM-FI main relay 2: disconnected
B	PCM connector A (50P): disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (50P) No. 11**



Is there 1.0 Ω or less?

YES

The FUEL_PUMP_RLY_CL- wire is OK. Go to step 5.

NO

Repair an open in the FUEL_PUMP_RLY_CL- wire between the PCM (A11) and PGM-FI main relay 2.

5. Determine possible failure area (PGM-FI main relay 2, others)

-1. **Reinstall PGM-FI main relay 2** .

-2. Connect terminals A and B with a jumper wire.

Terminal A	**PCM connector A (50P) No. 5**
Terminal B	Body ground

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
B	PCM connector A (50P) No. 5: jumped to body ground
Test point 1	**PCM connector A (50P) No. 11**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 6.

NO

Replace PGM-FI main relay 2.

6. PCM operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove PGM-FI main relay 2** .

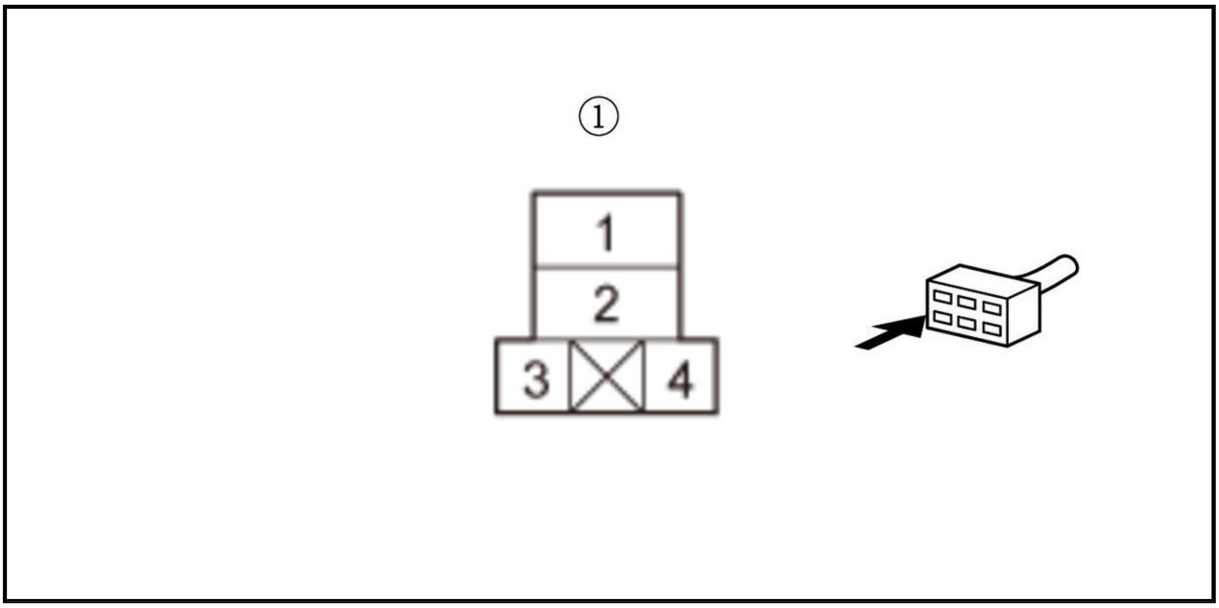
-3. Remove the jumper wire from PCM connector A (50P).

-4. Reconnect PCM connector A (50P).

-5. Exit the SCS mode with the HDS.

-6. Turn the vehicle to the ON mode, and measure the voltage between test points 1 and 2.

Test condition	Within 2 seconds after turning vehicle to ON mode
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 3: ①
Test point 2	PGM-FI main relay 2 4P socket (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 7.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

7. Determine possible failure area (FUEL_PUMP_RLY_OUT line, GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

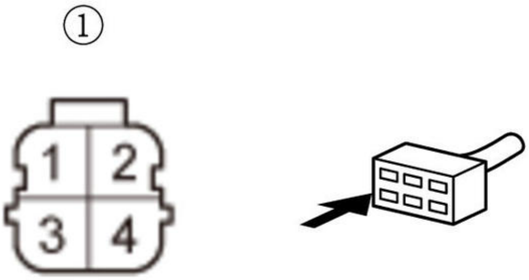
-2. Disconnect the following connector.

Fuel tank unit 4P connector

-3. **Reinstall PGM-FI main relay 2** .

-4. Turn the vehicle to the ON mode, and measure the voltage between test points 1 and 2.

Test condition	Within 2 seconds after turning vehicle to ON mode
B	Fuel tank unit 4P connector: disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 9.

NO

Go to step 8.

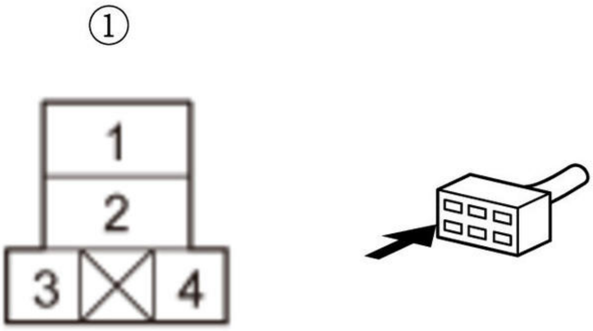
8. Open wire check (FUEL_PUMP_RLY_OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove PGM-FI main relay 2** .

-3. Connect terminals A and B with a jumper wire.

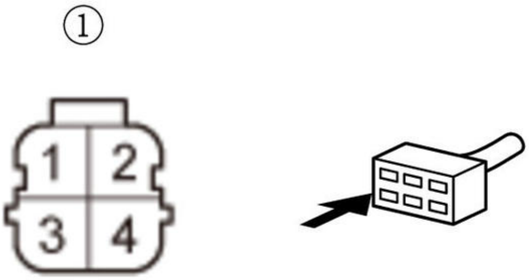
Terminal A	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Terminal B	PGM-FI main relay 2 4P socket (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Fuel tank unit 4P connector: disconnected
B	PGM-FI main relay 2: disconnected
B	PGM-FI main relay 2 4P socket No. 1 and No. 2: jumped
Test point 1	Fuel tank unit 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The FUEL_PUMP_RLY_OUT wire is OK. Replace PGM-FI main relay 2.

NO

Repair an open in the FUEL_PUMP_RLY_OUT wire between PGM-FI main relay 2 and the fuel tank unit.

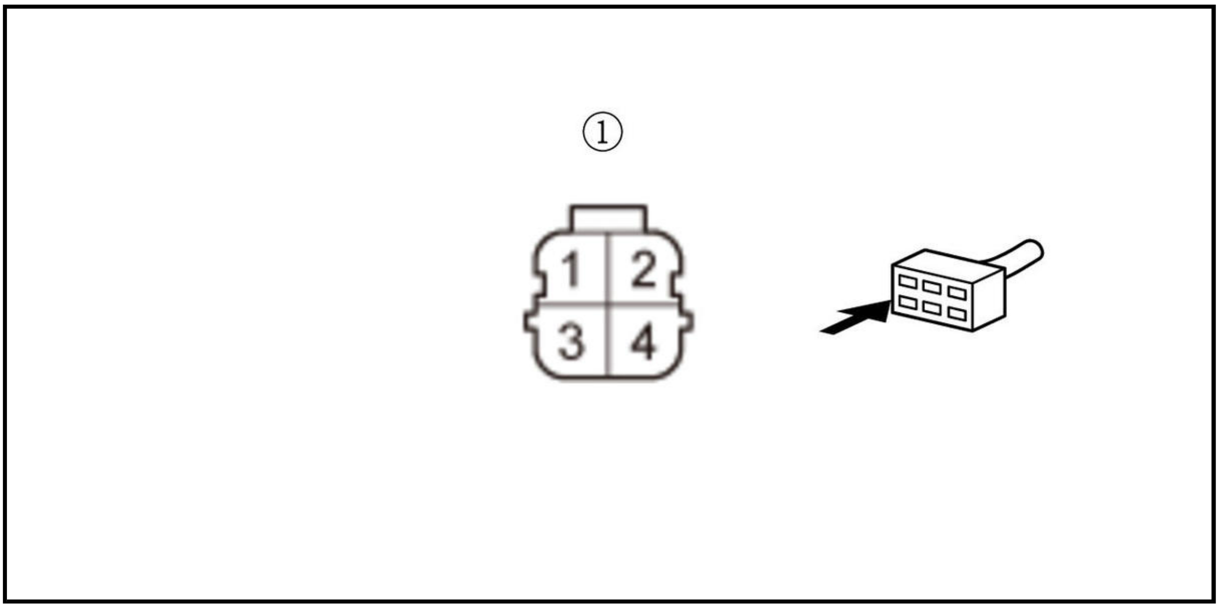
9. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Fuel tank unit 4P connector: disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. **Replace the fuel pump**.

NO

Repair an open in the GND wire between the fuel tank unit and G503.

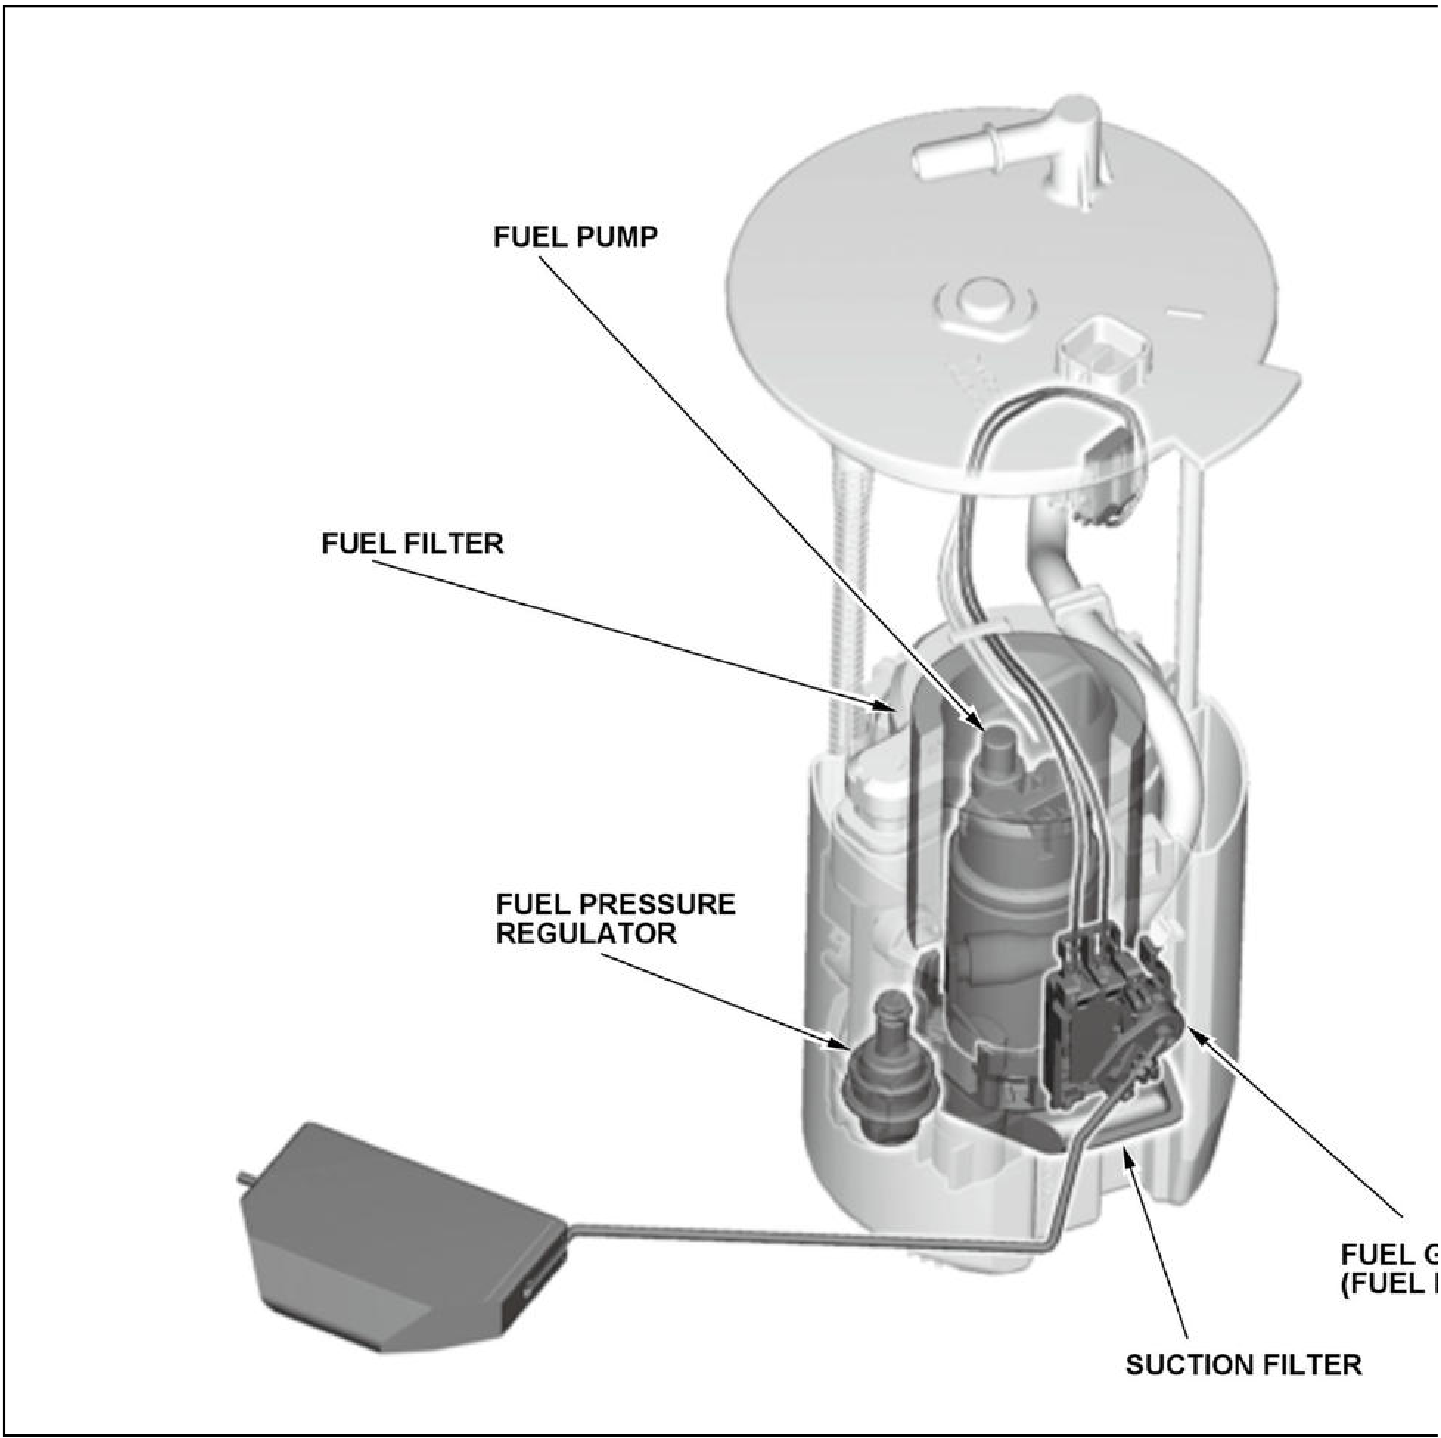
DESCRIPTION AND OPERATION

FUEL SUPPLY SYSTEM DESCRIPTION

Fuel Pump

The fuel pump consists of the following components.



FUEL PUMP
FUEL FILTER
FUEL PRESSURE REGULATOR
FUEL G
(FUEL I
SUCTION FILTER

High Pressure Fuel Pump

Outline

The high pressure fuel pump is driven mechanically by a foursquare cam installed on the camshaft. The pump pressurizes the fuel sent from the fuel tank to high pressu and the fuel rails to the fuel injectors. The powertrain control module (PCM) controls the fuel control solenoid to obtain the optimum fuel pressure for the driving condit pressure sensor.

Returnless Fuel System

The returnless fuel system incorporates the fuel pressure regulator into the fuel pump to remove the fuel return pipe and other parts. The fuel pressure regulator keeps th fuel line is no longer routed into the engine compartment, this prevents fuel temperature rise and evaporation of gas in the fuel tank.

IMPROVEMENT CONTROL IN PRACTICAL USE FUEL CONSUMPTION SYSTEM DESCRIPTION

Outline

The control system for improved fuel economy in actual traffic aims at disseminating eco-driving. It consists of an effective control system that is activated by operating mode. When the ECON mode is ON, the engine control system, the cruise control system*, the transmission control system, and the air conditioning system work to co negative effects of the driver's driving style in an attempt to improve fuel economy.

*: There are cases where it is not controlled depending on the vehicle model.

For locations of each component on vehicle, refer to Component Location Index

Change of ETCS system control

The opening of the throttle valve is changed by response of the accelerator pedal.

Transmission Control System

- Change in shift map allocation against accelerator full pedal depression
- Moderation of gear change responsiveness

Air Conditioning (A/C) System

- Switching to the recirculation mode
- Reduction in compressor operation frequency
- Lower flow rate

Ambient Meter Function

The ambient meter function evaluates the driver's driving from a fuel consumption perspective and displays its information via the ambient meter in the gauge control m

TROUBLESHOOTING

FUEL PUMP CIRCUIT TROUBLESHOOTING (1.5 L ENGINE)

Fuel Pump Circuit Troubleshooting

If you suspect a problem with the fuel pump, check that the fuel pump actually runs; when it is on, you will hear some noise if you listen to the fuel fill port. The fuel pu vehicle is turned to ON mode. If the fuel pump does not make noise, check as follows:

1. Determine possible failure area (FI MAIN RLY OUT line, others)

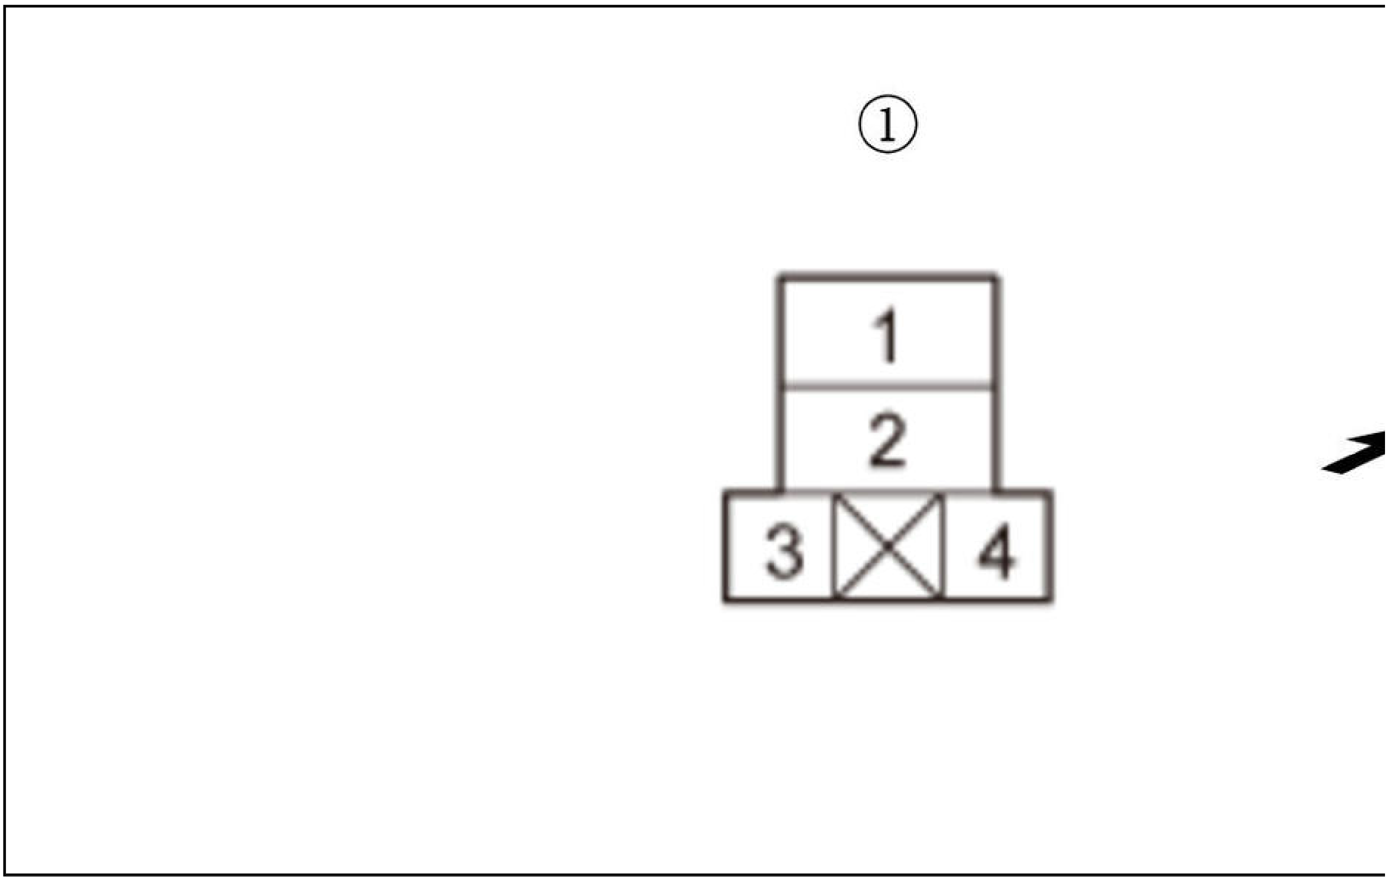
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove PGM-FI main relay 2 .

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 3.

NO

Go to step 2.

2. Open wire check (FI MAIN RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Relay circuit board connector C (18P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PGM-FI main relay 2: disconnected Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	PGM-FI main relay 2 4P socket (female terminals) No. 3: ②

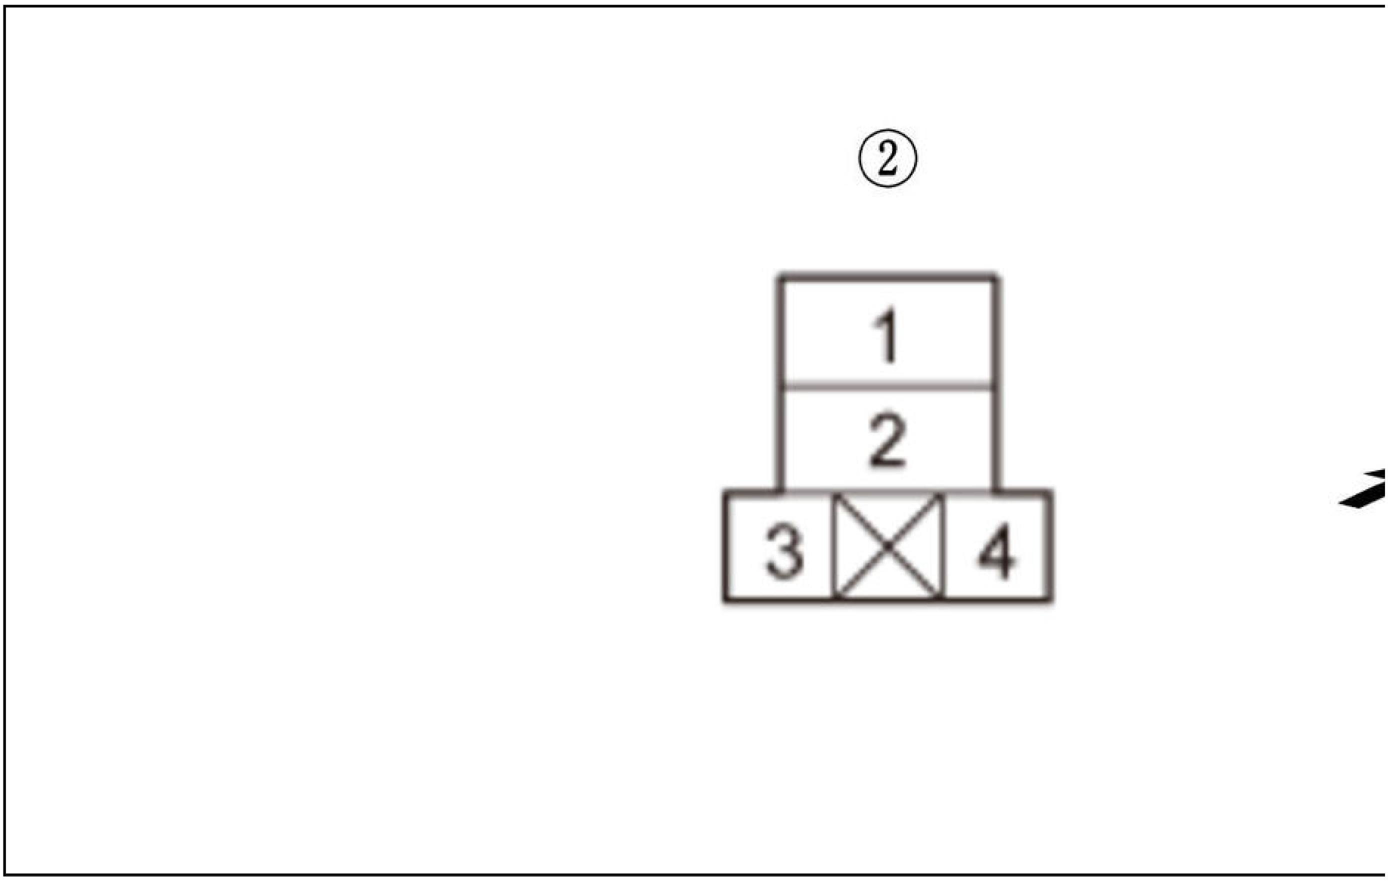
10



Is there continuity?

YES

Remove and test the relay circuit board , and replace it if needed.

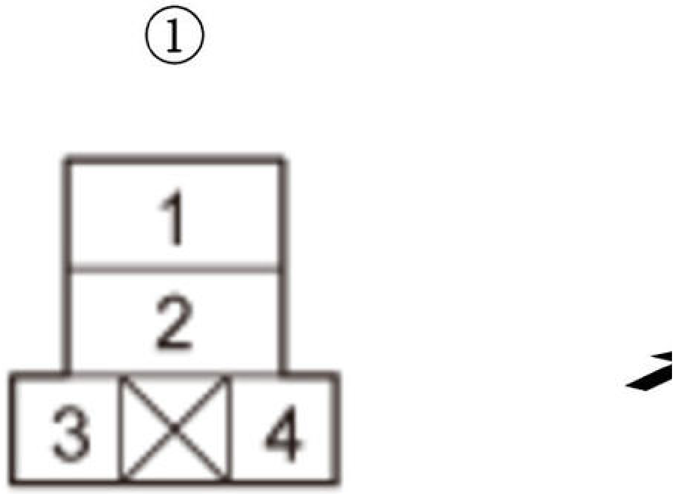
NO

Repair an open in the FI MAIN RLY OUT wire between the relay circuit board and PGM-FI main relay 2.

3. Open wire check (IG1 FUEL PUMP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

Check the No. D8 (15 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair an open in the IG1 FUEL PUMP wire between the No. D8 (15 A) fuse an **the under-dash fuse/relay box** .

4. Open wire check (FUEL PUMP RLY CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

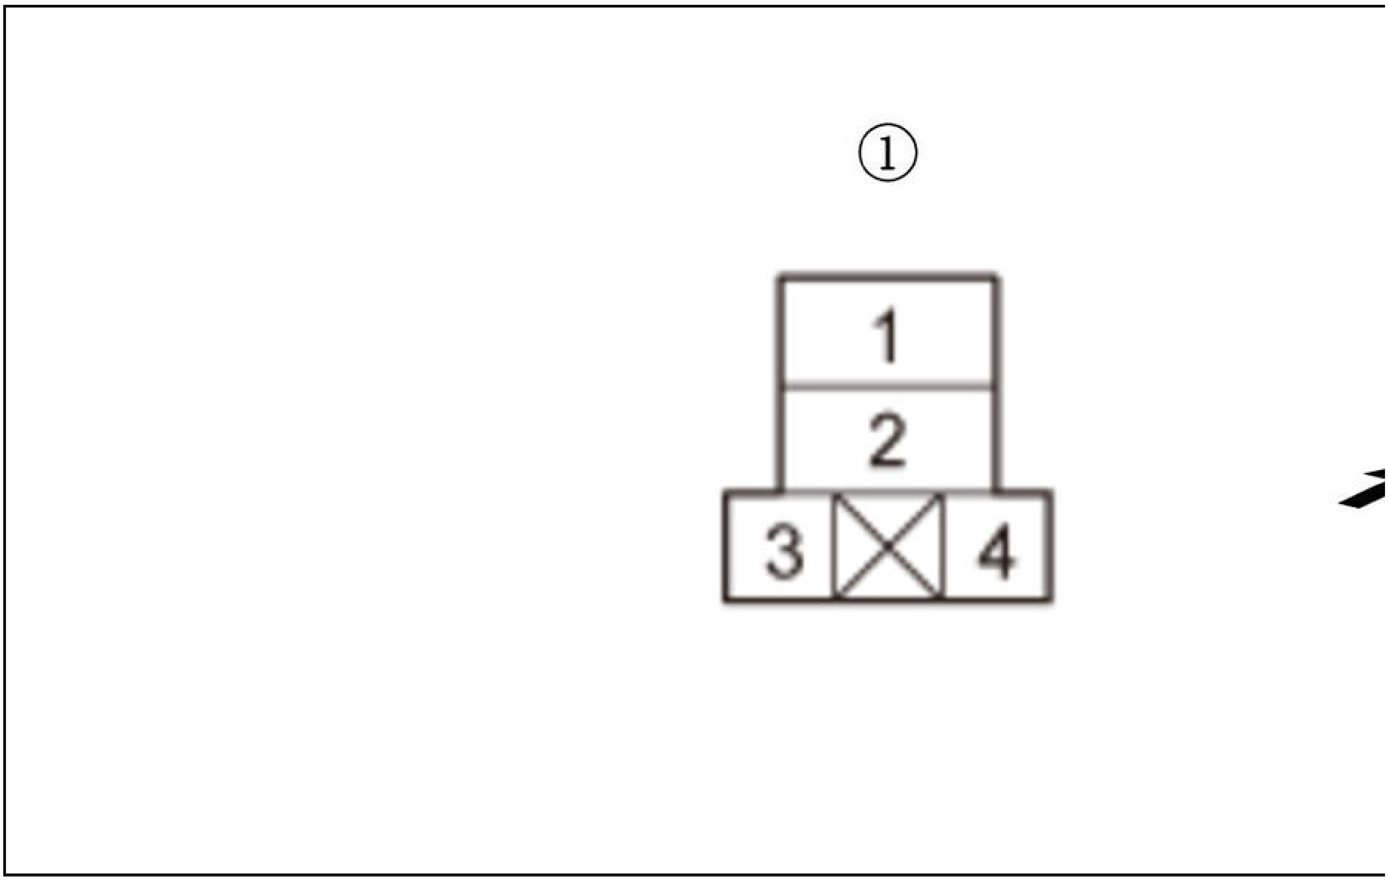
-3. Disconnect the following connector.

PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PGM-FI main relay 2: disconnected
B	PCM connector A (50P): disconnected

Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (50P) No. 11**



Is there continuity?

YES

The FUEL PUMP RLY CL- wire is OK. Go to step 5.

NO

Repair an open in the FUEL PUMP RLY CL- wire between the PCM (A11) and PGM-FI main relay 2.

5. Determine possible failure area (PGM-FI main relay 2, others)

-1. Reinstall PGM-FI main relay 2.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**PCM connector A (50P) No. 5**
Terminal B	Body ground

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
B	PCM connector A (50P) No. 5: jumped to body ground
Test point 1	**PCM connector A (50P) No. 11**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 6.

NO

Replace PGM-FI main relay 2.

6. PCM operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove PGM-FI main relay 2** .

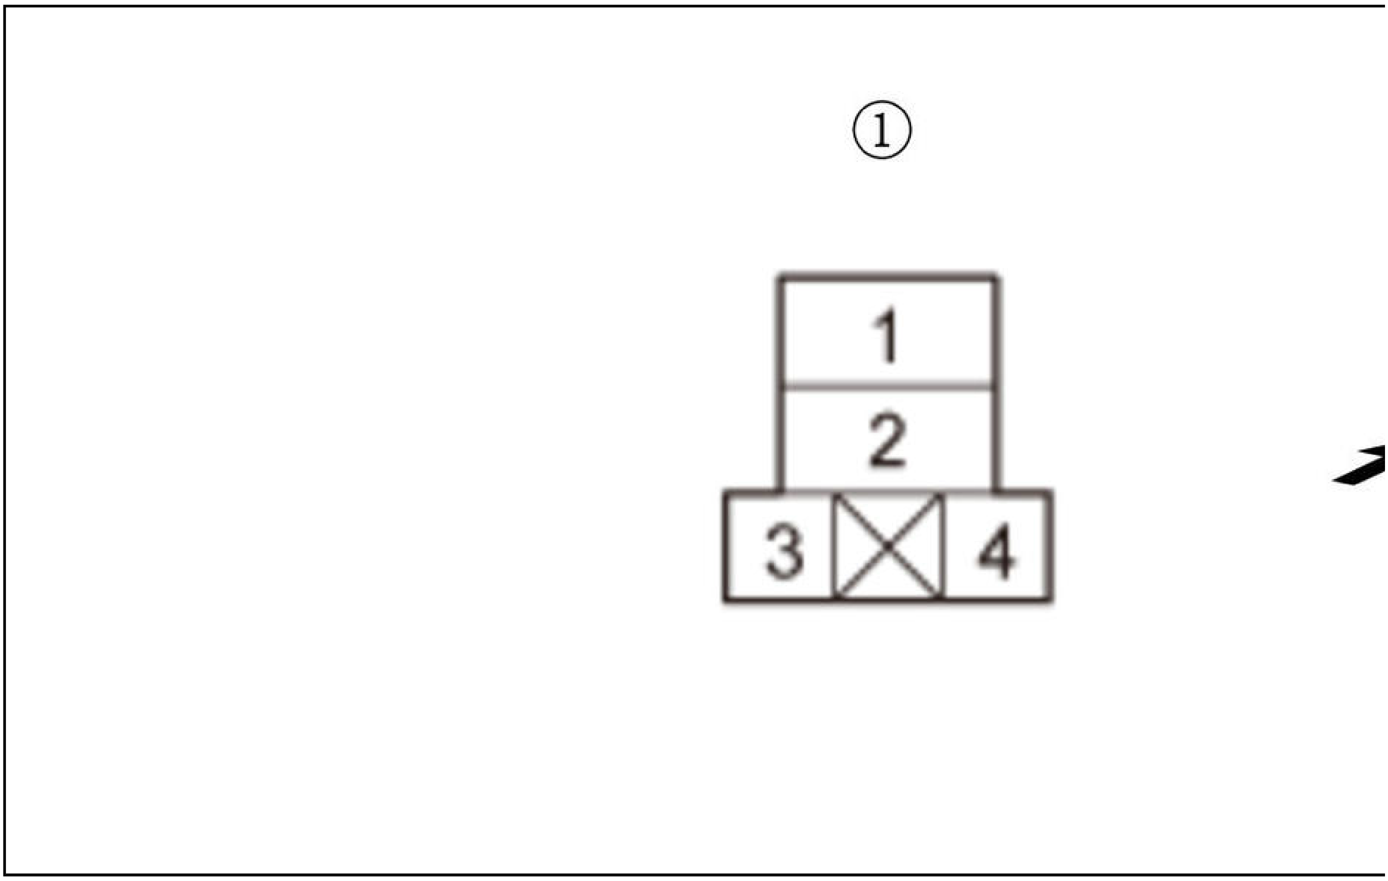
-3. Remove the jumper wire from PCM connector A (50P).

-4. Reconnect PCM connector A (50P).

-5. Exit the SCS mode with the HDS.

-6. Turn the vehicle to the ON mode, and measure the voltage between test points 1 and 2.

Test condition	Within 2 seconds after turning vehicle to ON mode
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 3: ①
Test point 2	PGM-FI main relay 2 4P socket (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 7.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the was substituted, **replace the original PCM** .

7. Determine possible failure area (FUEL PUMP RLY OUT line, GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

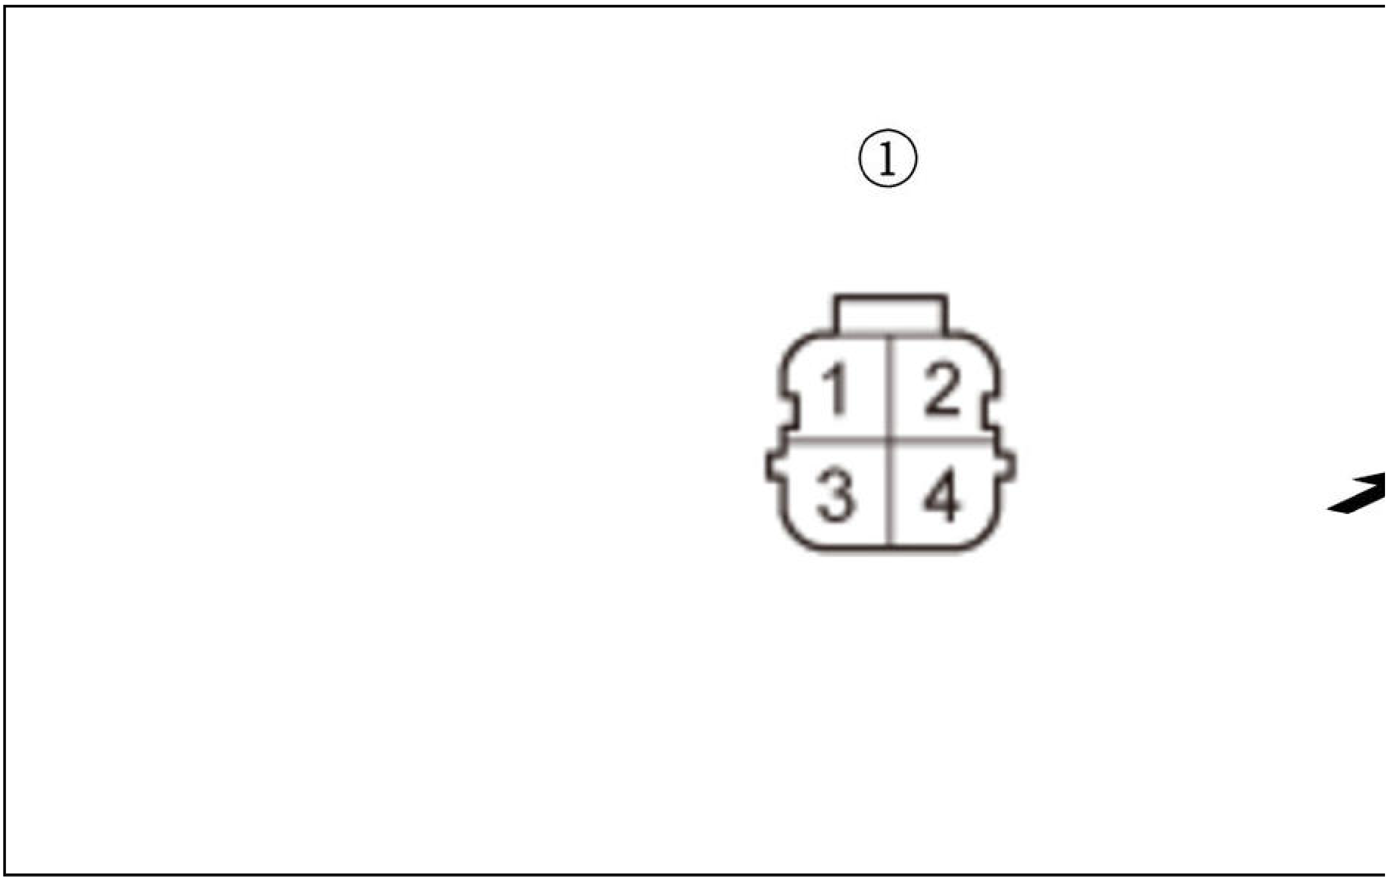
-2. Disconnect the following connector.

Fuel tank unit 4P connector

-3. Reinstall PGM-FI main relay 2.

-4. Turn the vehicle to the ON mode, and measure the voltage between test points 1 and 2.

Test condition	Within 2 seconds after turning vehicle to ON mode
B	Fuel tank unit 4P connector: disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 9.

NO

Go to step 8.

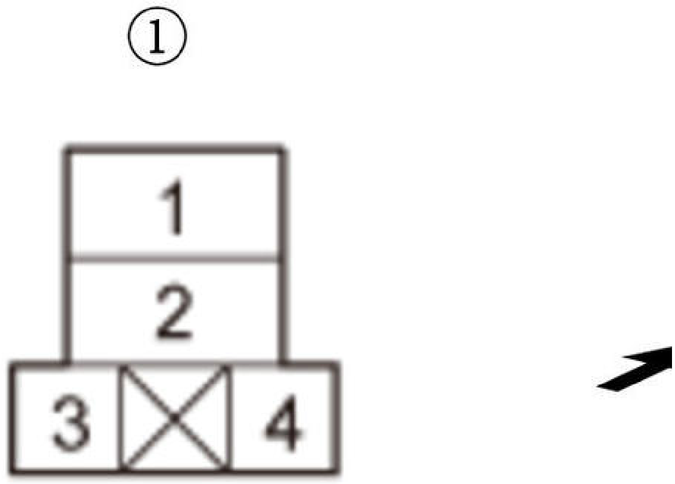
8. Open wire check (FUEL PUMP RLY OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove PGM-FI main relay 2.

-3. Connect terminals A and B with a jumper wire.

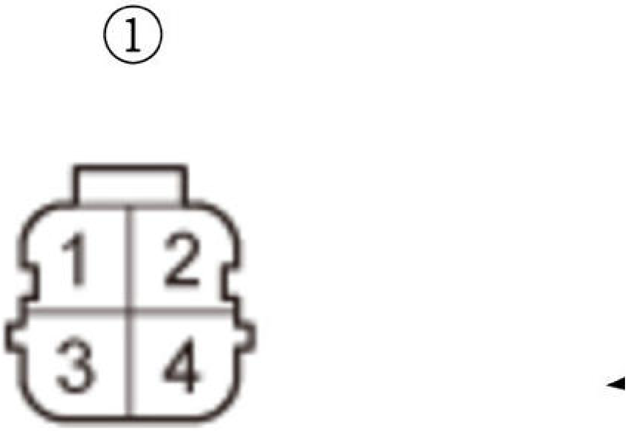
Terminal A	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Terminal B	PGM-FI main relay 2 4P socket (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Fuel tank unit 4P connector: disconnected
B	PGM-FI main relay 2 :disconnected
B	PGM-FI main relay 2 4P socket No. 1 and No. 2: jumped
Test point 1	Fuel tank unit 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The FUEL PUMP RLY OUT wire is OK. Replace PGM-FI main relay 2.

NO

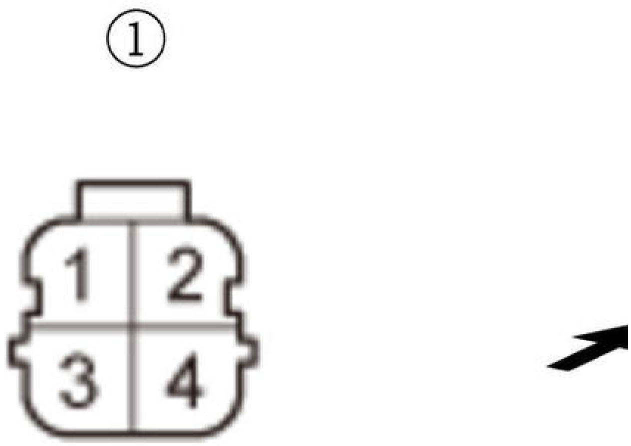
Repair an open in the FUEL PUMP RLY OUT wire between PGM-FI main relay 2 and the fuel tank unit.

9. Open wire check (GND line)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel tank unit 4P connector: disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. **Replace the fuel pump**.

NO

Repair an open in the GND wire between the fuel tank unit and G503.

FUEL PUMP CIRCUIT TROUBLESHOOTING (2.4 L ENGINE) (2017 2018 2019)

Fuel Pump Circuit Troubleshooting

If you suspect a problem with the fuel pump, check that the fuel pump actually runs; when it is on, you will hear some noise if you listen to the fuel fill port. The fuel pu vehicle is turned to ON mode. If the fuel pump does not make noise, check as follows:

1. Determine possible failure area (FI MAIN RLY OUT line, others)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. **Remove PGM-FI main relay 2** .

    -3. Turn the vehicle to the ON mode.

Remove and test the relay circuit board , and replace it if needed.

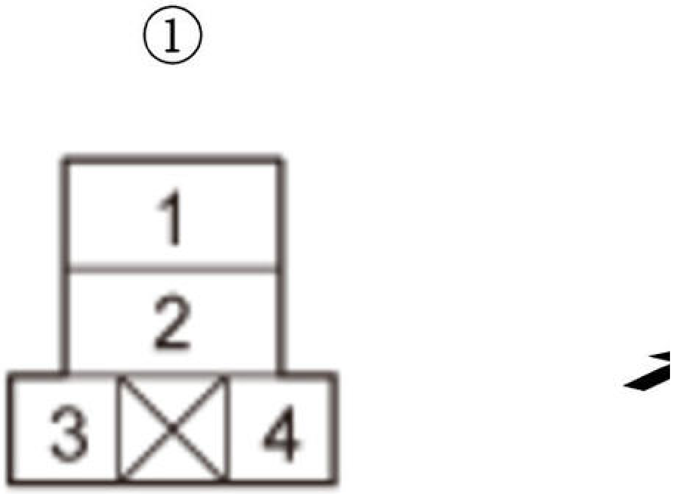
NO

Repair an open in the FI MAIN RLY OUT wire between the relay circuit board and PGM-FI main relay 2.

3. Open wire check (IG1 FUEL PUMP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

Check the No. D8 (15 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair an open in the IG1 FUEL PUMP wire between the No. D8 (15 A) fuse an
the under-dash fuse/relay box .

4. Open wire check (FUEL PUMP RLY CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

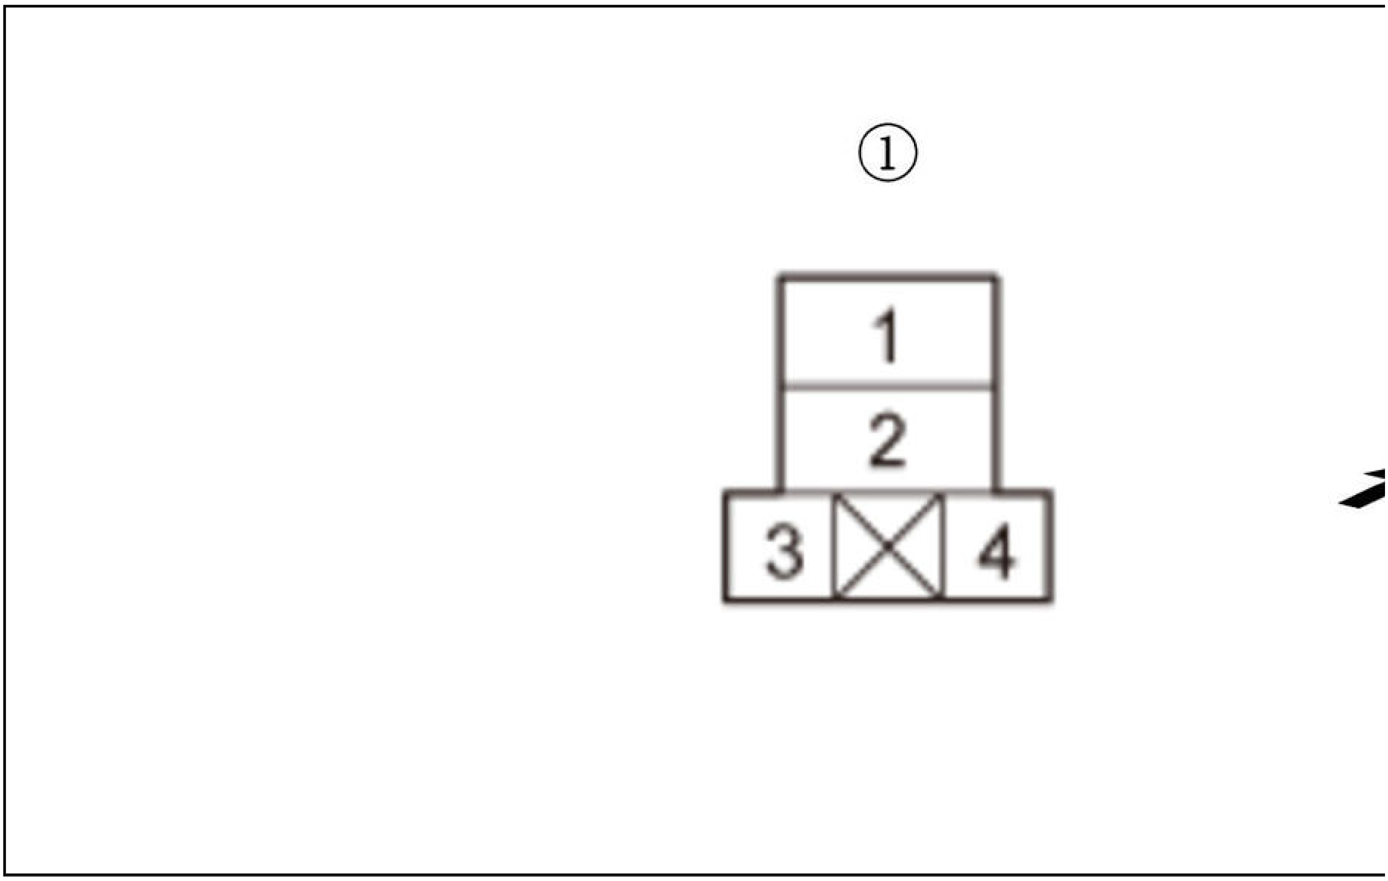
-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PGM-FI main relay 2: disconnected
B	PCM connector A (51P): disconnected

Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (51P) No. 14**



Is there continuity?

YES

The FUEL PUMP RLY CL- wire is OK. Go to step 5.

NO

Repair an open in the FUEL PUMP RLY CL- wire between the PCM (A14) and PGM-FI main relay 2.

5. Determine possible failure area (PGM-FI main relay 2, others)

-1. Reinstall PGM-FI main relay 2.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**PCM connector A (51P) No. 3**
Terminal B	Body ground

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (51P): disconnected
B	PCM connector A (51P) No. 3: jumped to body ground
Test point 1	**PCM connector A (51P) No. 14**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 6.

NO

Replace PGM-FI main relay 2.

6. PCM operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove PGM-FI main relay 2** .

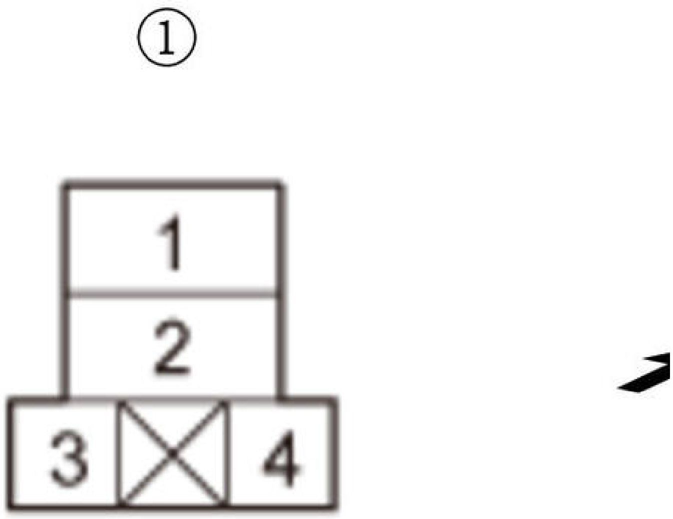
-3. Remove the jumper wire from PCM connector A (50P).

-4. Reconnect PCM connector A (51P).

-5. Exit the SCS mode with the HDS.

-6. Turn the vehicle to the ON mode, and measure the voltage between test points 1 and 2.

Test condition	Within 2 seconds after turning vehicle to ON mode
B	PGM-FI main relay 2: disconnected
Test point 1	PGM-FI main relay 2 4P socket (female terminals) No. 3: ①
Test point 2	PGM-FI main relay 2 4P socket (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 7.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the was substituted, **replace the original PCM** .

7. Determine possible failure area (FUEL PUMP RLY OUT line, GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Fuel tank unit 4P connector

-3. Reinstall PGM-FI main relay 2.

-4. Turn the vehicle to the ON mode, and measure the voltage between test points 1 and 2.

Test condition	Within 2 seconds after turning vehicle to ON mode

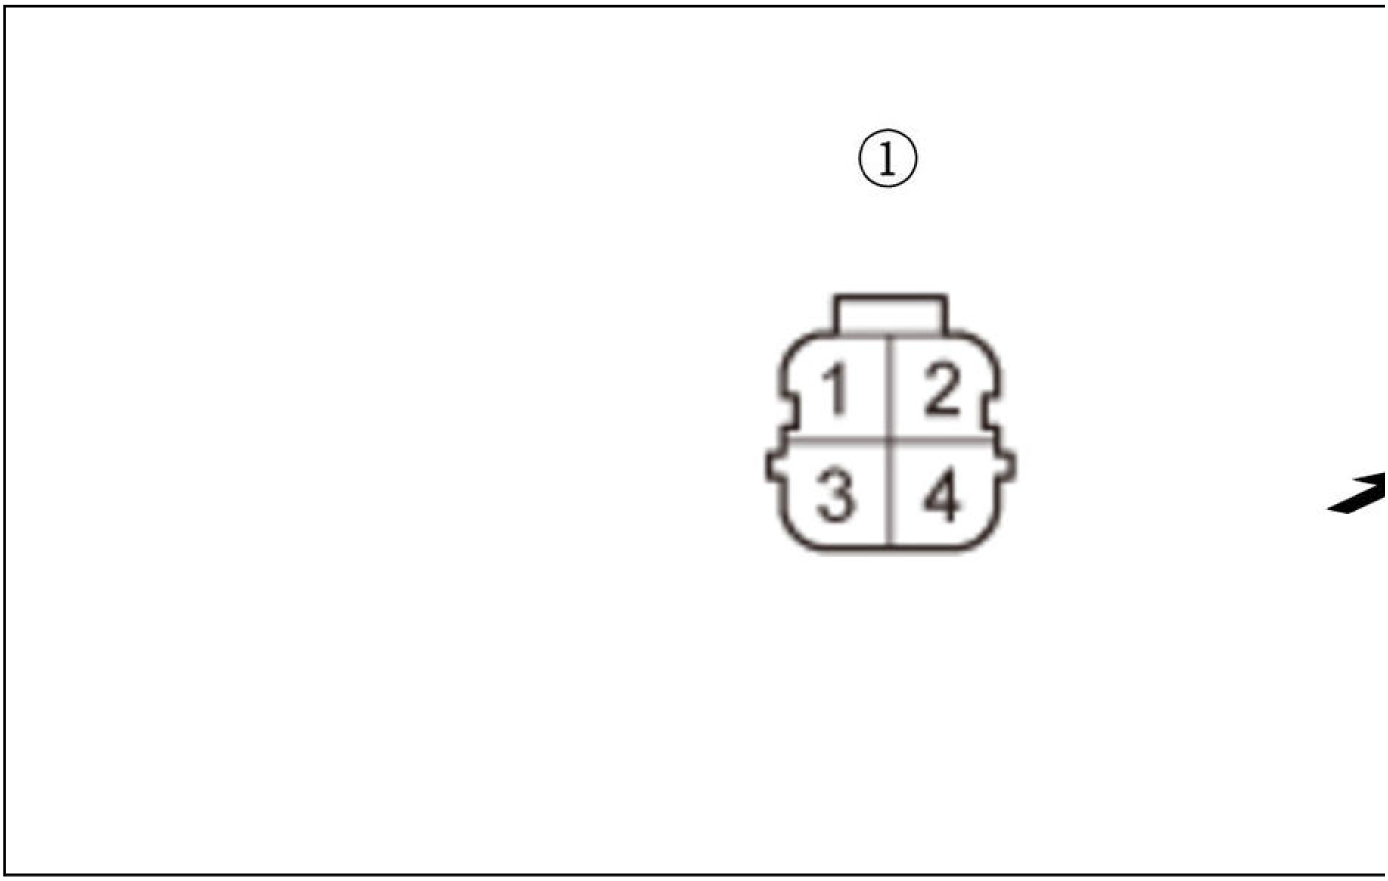
Test point 1	Fuel tank unit 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The FUEL PUMP RLY OUT wire is OK. Replace PGM-FI main relay 2.

NO

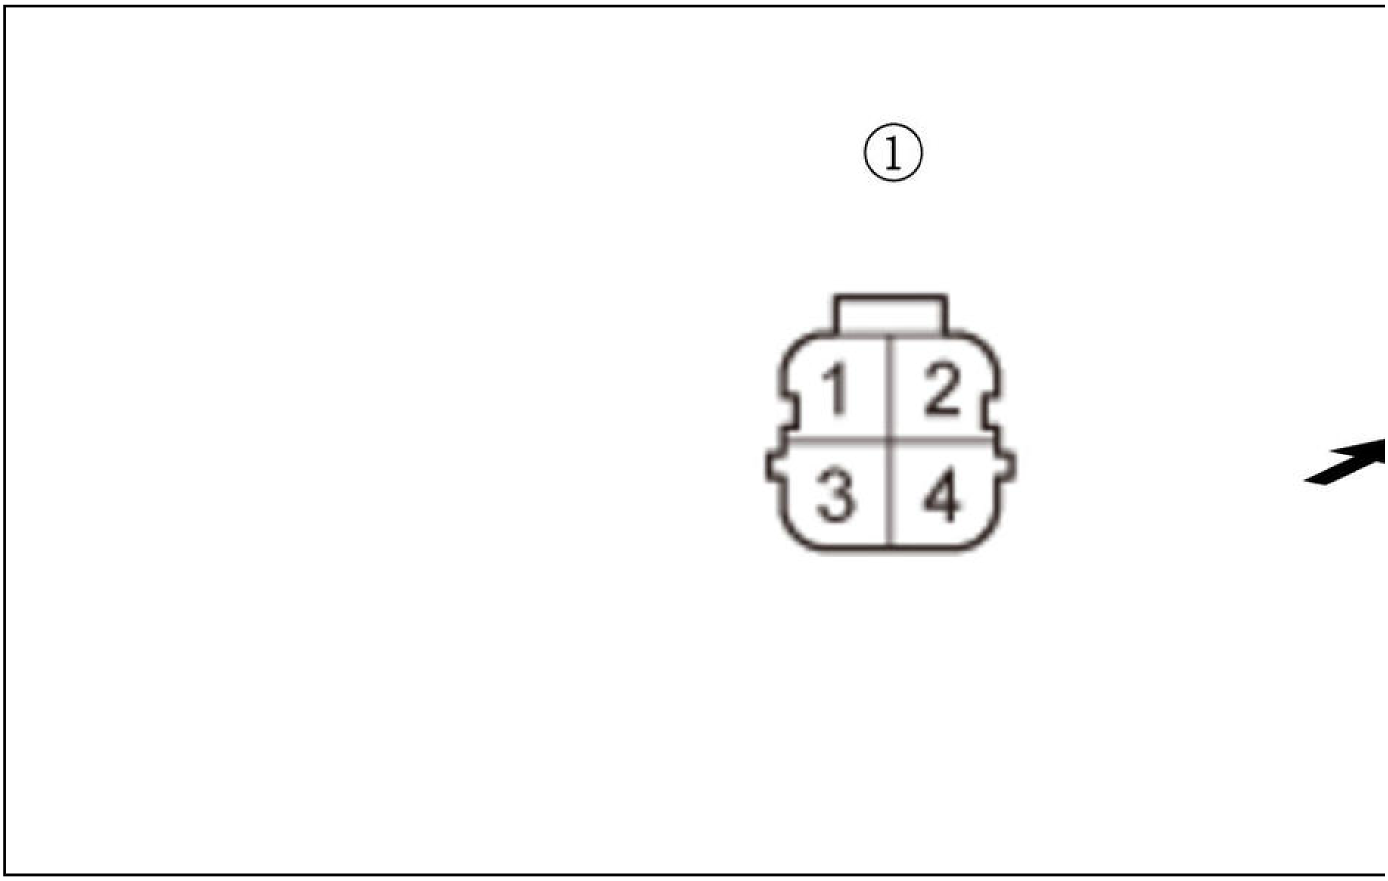
Repair an open in the FUEL PUMP RLY OUT wire between PGM-FI main relay 2 and the fuel tank unit.

9. Open wire check (GND line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel tank unit 4P connector: disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. **Replace the fuel pump**.

NO

Repair an open in the GND wire between the fuel tank unit and G503.

REPAIR PROCEDURES AND TEST

FUEL PRESSURE RELIEVING

Procedure

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.
- Before disconnecting fuel lines or hoses, relieve pressure from the system by disabling the fuel pump and disconnecting the fuel line/quick connect fitting in the e

1. Fuel Tank Pressure - Relieve (Mexico models)

1. Remove the fuel fill cap to relieve the pressure in the fuel tank.

2. Fuel Tank Pressure - Relieve (USA and Canada models)

	1. Lift up cargo lid. Remove the emergency fuel funnel (
	2. Insert the emergency fuel funnel (A) into the fuel filler

3. Fuel Pump - Stop (with HDS)

1. Turn the vehicle to the ON mode, but do not start the engine.

2. **Connect the HDS**

3. From the INSPECTION MENU of the HDS, select Fuel Pump OFF, then start the engine, and let it idle until it stalls.

NOTE:

- Do not allow the engine to idle above 1, 000 rpm or the PCM will continue to operate the fuel pump.
- A Pending or Confirmed DTC may be set during this procedure. Check for DTCs, and clear them as needed.

4. Turn the vehicle to the OFF (LOCK) mode.

4. Fuel Pressure - Relieve (without HDS)

1. **Remove PGM-FI main relay 2** .
2. Start the engine, and let it idle until it stalls.

NOTE: If any DTCs are stored, clear and ignore them.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Install PGM-FI main relay 2.

5. **12 Volt Battery Terminal - Disconnect**

FUEL TANK UNIT/FUEL FILTER REMOVAL, INSTALLATION, DISASSEMBLY, AND REASSEMBLY

Special Tools Required

☒	Replace

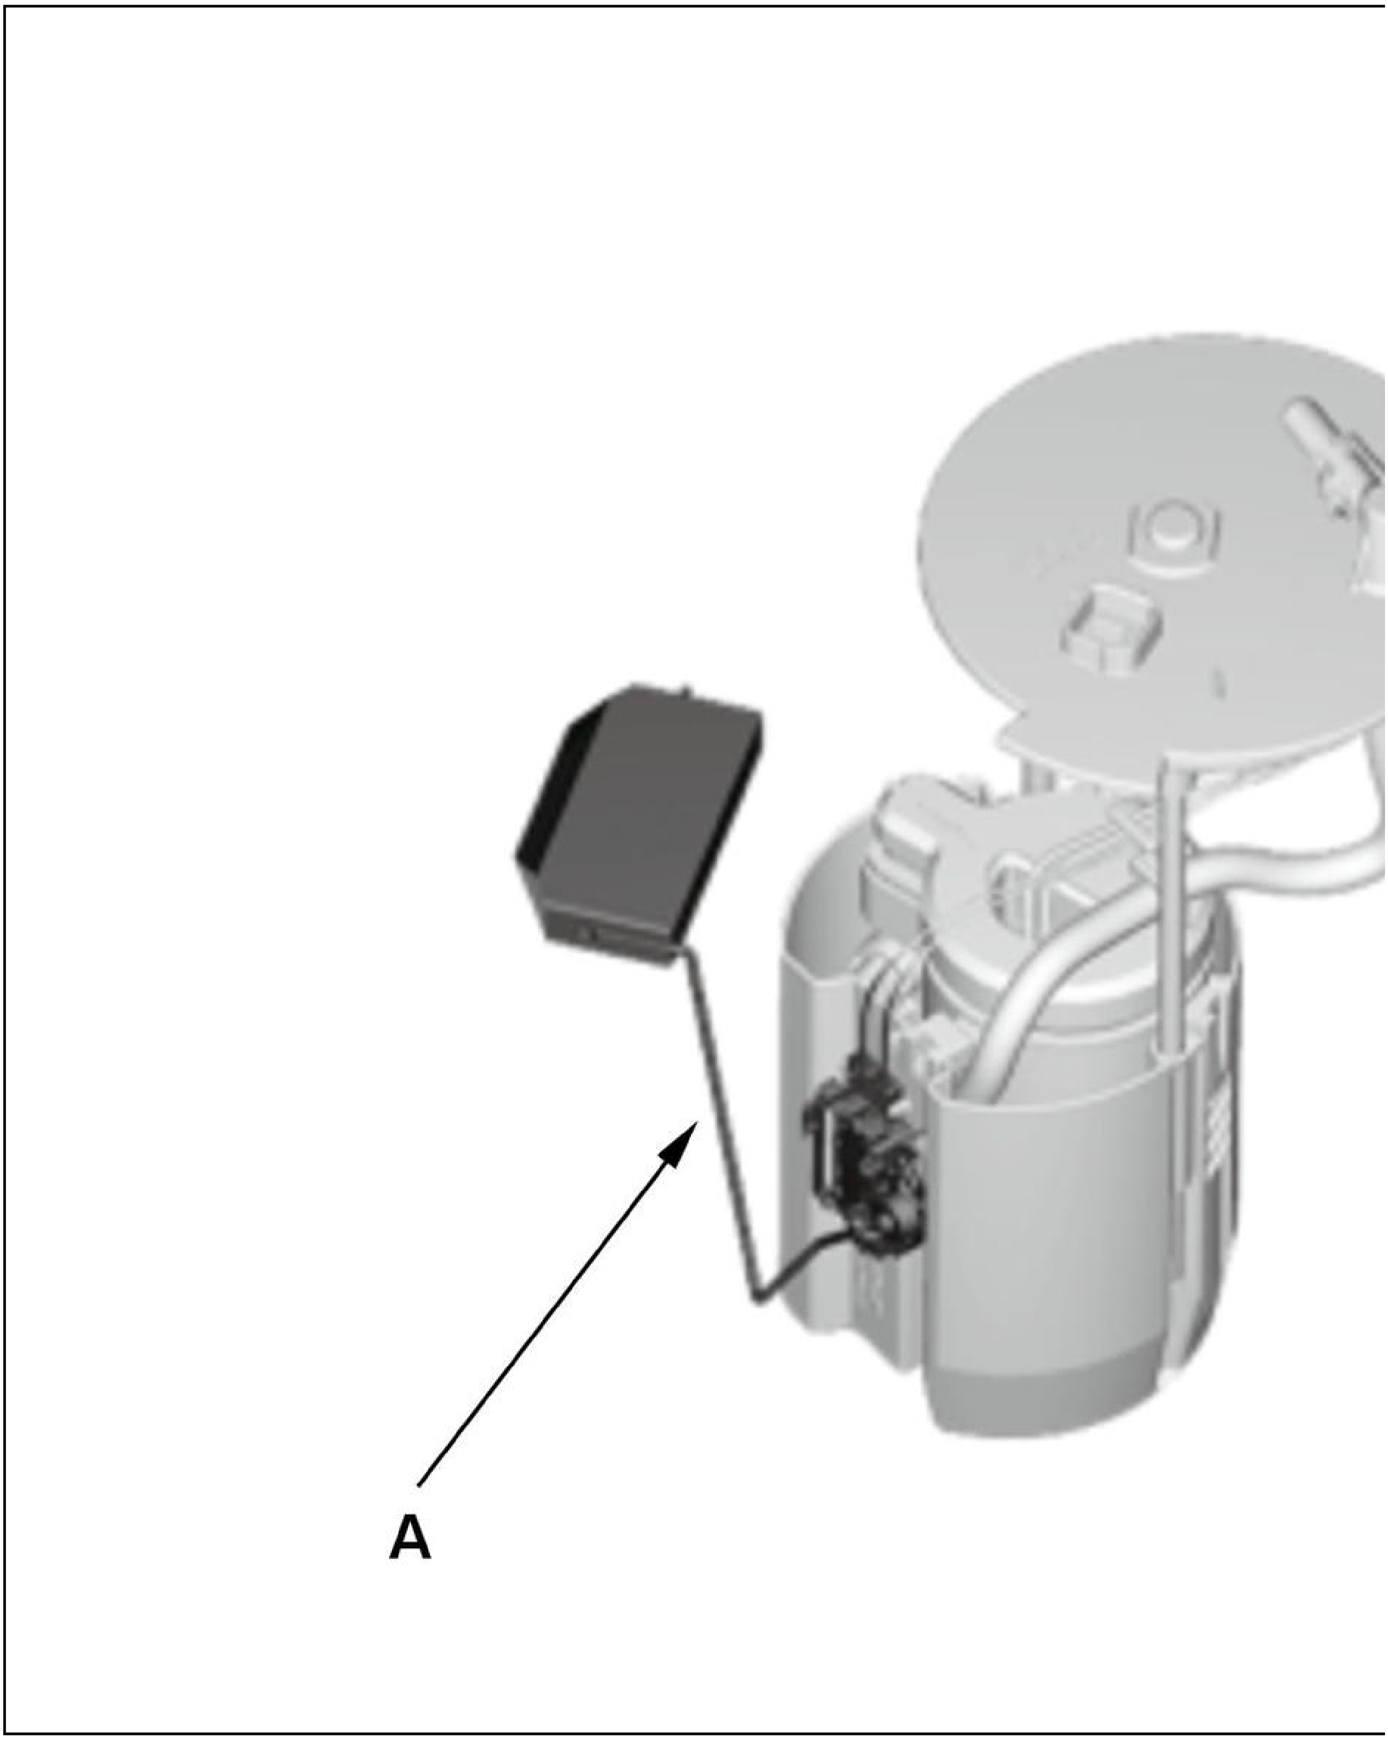
1. **Fuel Pressure - Relieve**
2. **Rear Seat Cushion - Lift**
3. Fuel Tank Unit Access Panel - Remove
4. Connector (Fuel Tank Unit) - Disconnect
5. Fuel Line Quick-Connect Fitting - Disconnect

	1. Place a rag or shop towel (A) over the quick-connect fi 2. **Disconnect the quick-connect fitting** from the fuel tank unit.

6. Fuel Tank Unit Cam Lock Ring - Unlock

	1. Set the fuel sender wrench as shown. 2. Turn the fuel tank unit cam lock ring (A) counterclockv **NOTE:** Try to keep the fuel sender wrench from floating

7. Fuel Tank Unit - Remove



NOTE: Be careful not to bend or twist the fuel level sensor arm (A) excessively.

Installation

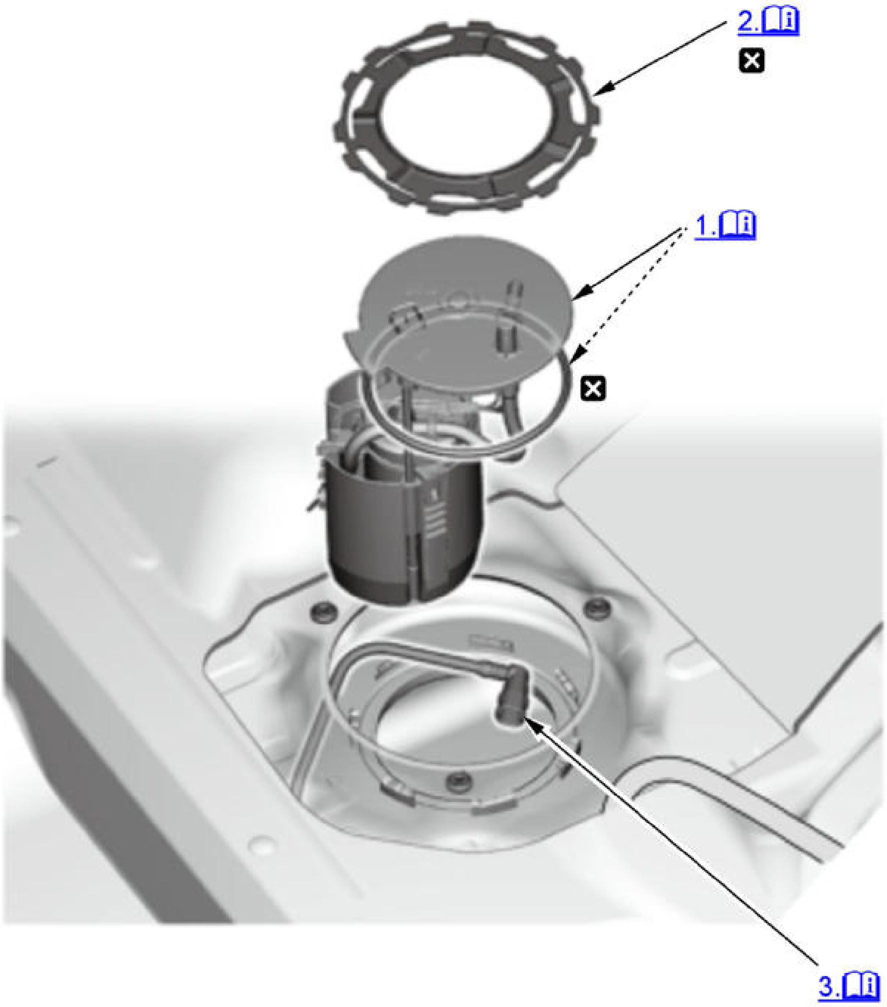
WARNING:

Flammable - Keep Fire Away

NOTE:

- 📖 Where icon is shown for further information continue to the information below.
- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

1



ℹ	Detailed information, notes, and precautions
☒	Replace

1. Fuel Tank Unit - Install

	**NOTE:** Be careful not to bend or twist the fuel level sens 1. Insert the fuel tank unit (B) partially into the fuel tank • Be careful not to damage the new O-ring. • Do not coat the base gasket with oil.
	2. Align the tab (A) of the fuel tank unit as shown, and te lock ring (B).

2. Fuel Tank Unit Cam Lock Ring - Lock

	1. Rotate the fuel tank unit cam lock ring (A) and slide th positioning edge (C) slightly as shown by hand. **NOTE:** Confirm the fuel cam lock ring is not floating.

	2. Using the fuel sender wrench, turn the fuel tank unit ca **NOTE:** - Try to keep the fuel sender wrench from floating. - Securely set the positioning edge (B) of the fuel tar on the fuel tank unit cam lock ring as shown.

3. Fuel Line Quick-Connect Fitting - Connect

	1. **Connect the quick-connect fitting (A)** to the fuel tank

4. Fuel Leak - Check

	1. Connect the fuel tank unit connector (A). 2. Turn the vehicle to the ON mode, but do not start the e seconds, the fuel line will be pressurized. Repeat this two 3. Install the access panel (B) to the floor.

Disassembly and Reassembly

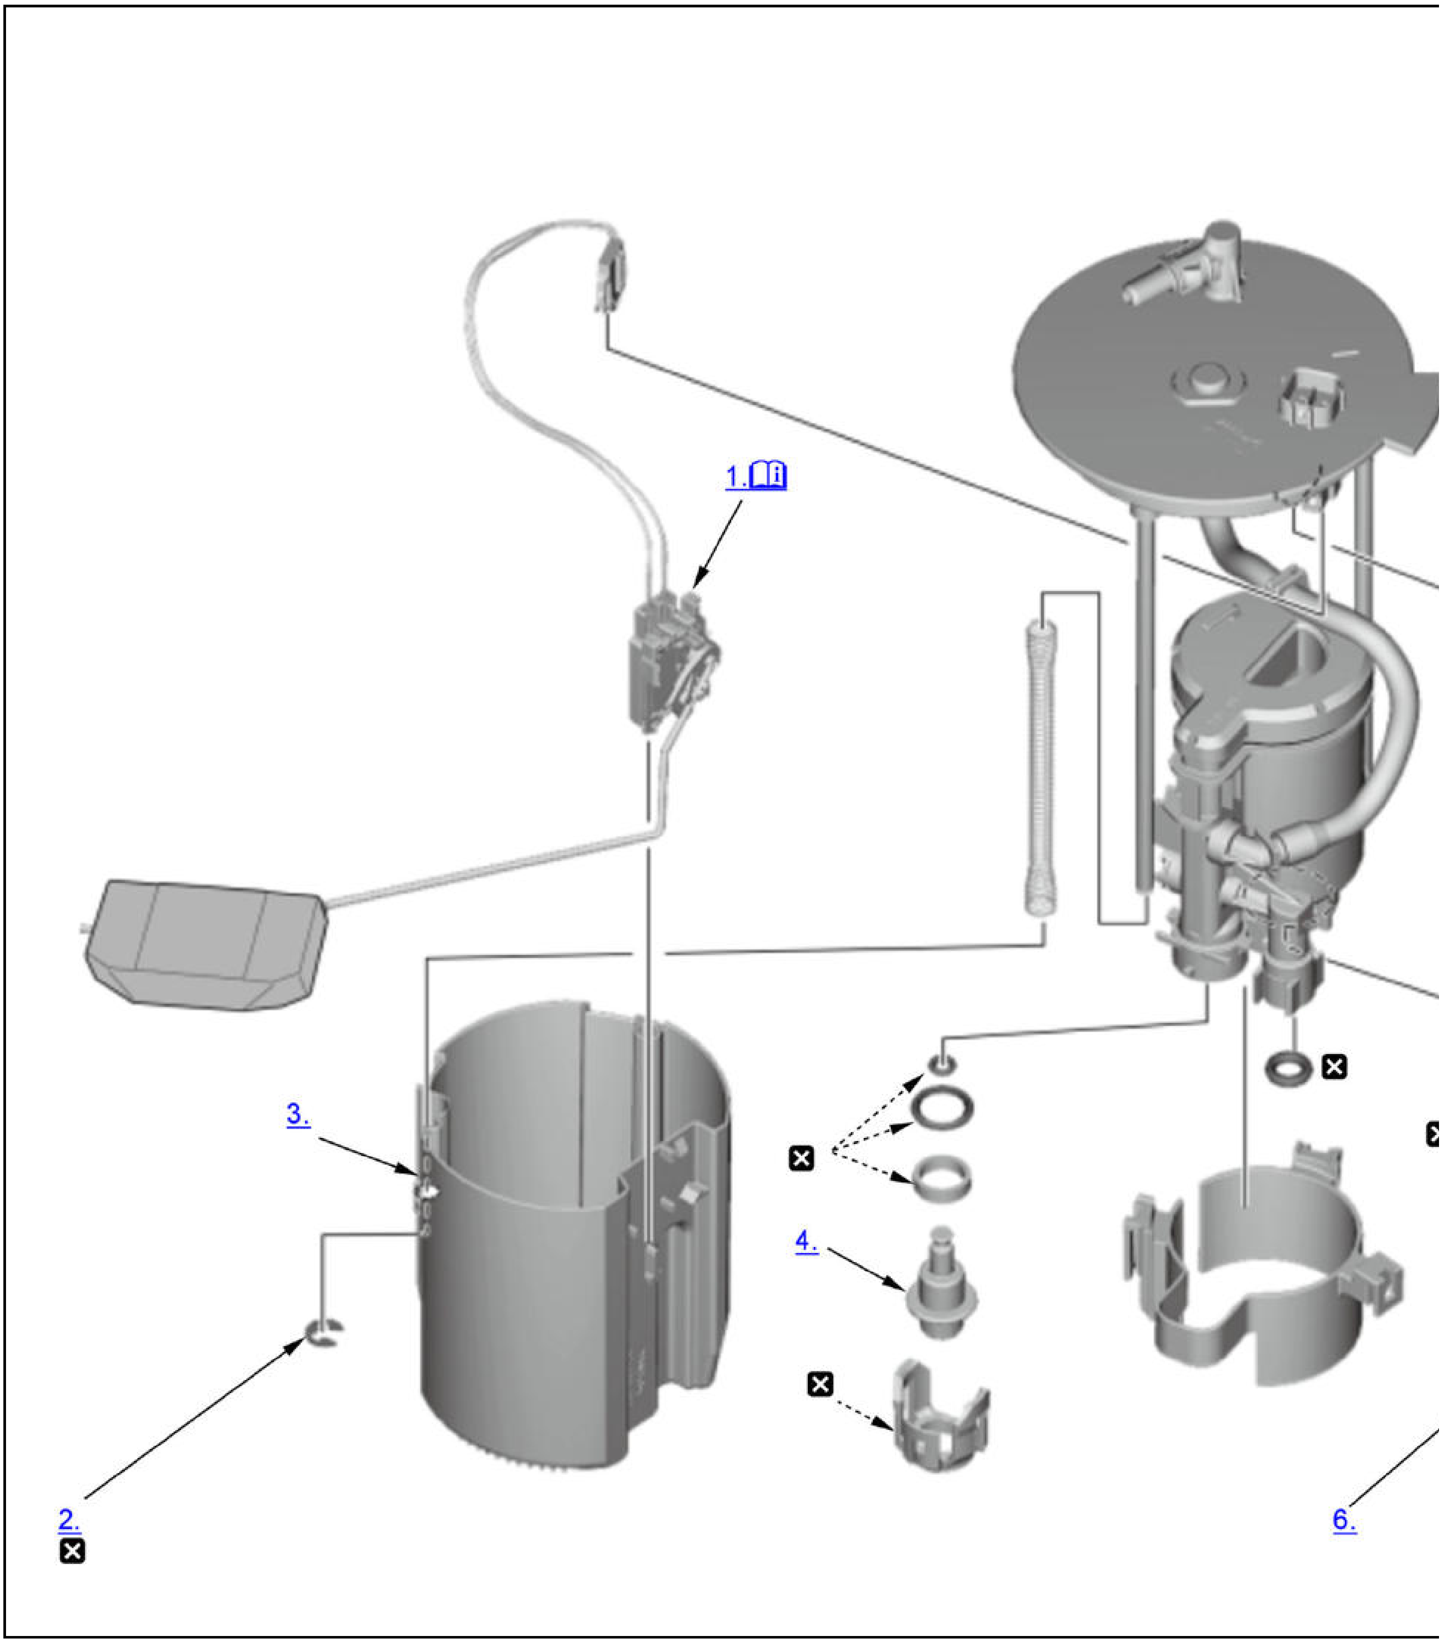
WARNING:

Flammable - Keep Fire Away

NOTE:

- ℹ Where icon is shown for further information continue to the information below.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.
- The fuel filter should be replaced whenever the fuel pressure drops below the specified value, after making sure that the fuel pump and the fuel pressure regulator

1



ℹ	Detailed information, notes, and precautions
☒	Replace

1. Fuel Gauge Sending Unit - Remove

   NOTE: Be careful not to bend or twist the fuel level sensor arm excessively.

2. E-Ring - Remove

3. Reservoir - Remove
4. Fuel Pressure Regulator - Remove
5. Fuel Pump Harness - Remove
6. Fuel Pump - Remove
7. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.
> **NOTE:**
> - Coat the O-rings with clean engine oil; do not use any other oil or fluid.
> - Do not pinch the O-rings during installation.
> - When installing the fuel level sensor unit, make sure the connection is secure and the connector is firmly locked into place. Be careful not to bend or twist i
> - When connecting the wire harness, make sure the connection is secure and the connectors are firmly locked into place.
> - Use all the new parts supplied in the replacement kit.

FUEL AND EMISSIONS SYSTEMS SERVICE PRECAUTIONS

Fuel Flow Line Disconnection

- Flammable - Keep fire away; Make no fires around the work area, and handle the fuel very carefully. Catching a fire to fuel will cause a serious accident.
- Relieve the fuel pressure before the fuel line disconnection to avoid a risk for fuel blowing from there.
- Disconnect the 12 volt battery negative terminal before the electric connector disconnection to reduce the risk of a fire caused by sparks coming off the connector
- Clean the contact area of the joint. Any dirt may cause fuel leakage by a misconnection.

Others

- Do not apply the brake fluid, engine coolant, plant-based oil, or alcohol-based oil to the O-ring. An undesignated fluid or oil may affect material deterioration or d
- Follow the instructions, or you will not be able to take a quality guarantee for the parts.

TEST

FUEL GAUGE SENDING UNIT TEST

Test

WARNING:

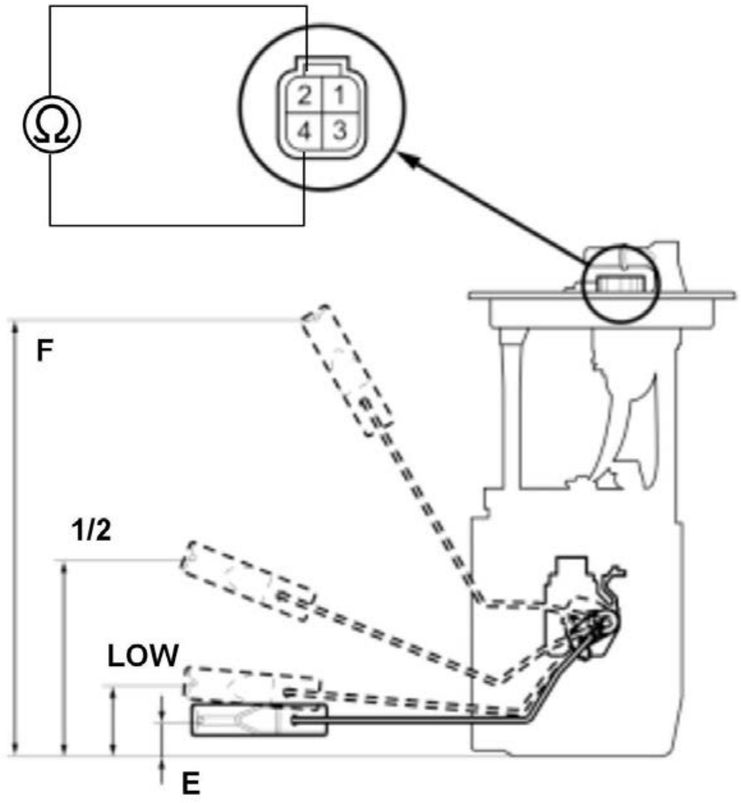
Flammable - Keep Fire Away

NOTE: Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.

1. **HDS - Connect**
2. DTC - Check

> 1. Check for DTCs with the HDS. If any of the following DTCs are indicated, troubleshoot the indicated DTCs.
> **NOTE:** If the PGM-FI system's DTC and the body electrical system's DTC are indicated at the same time, troubleshoot the PGM-FI system's DTC first.
> - PGM-FI system: P0462, P0463
> - Body electrical system: B1175, B1176

3. **Rear Seat Cushion - Lift**
4. **Fuel Tank Unit - Remove**
5. Fuel Gauge Sending Unit - Test



1. Measure the resistance between fuel tank unit 4P conne
the float at E (EMPTY), LOW (LOW FUEL INDICATOI
the following readings, **replace the fuel tank unit**.

USA and Canada models

Except USA and Canada models

2. Reconnect the fuel tank unit connector.

3. Remove the No. A18 (10 A) fuse in the under-hood fus
under-dash fuse/relay box for at least 10 seconds, then rei

4. Turn the vehicle to the ON mode.

5. Check that the pointer of the fuel gauge indicates F wit

- If the pointer of the fuel gauge does not indicate F,
- If the gauge is OK, the test is complete.

NOTE:

- The pointer of the fuel gauge returns to the bottom
the ACCESSORY or OFF (LOCK) mode, regardle
- Remove the No. A18 (10 A) fuse in the under-hood
the under-dash fuse/relay box for at least 10 second
take up to 20 minutes for the fuel gauge to indicate

Resistance(Ω)	19 to21	190.6 to 200.6	464.5 to 644.1

Float Position	F8.657 in(219.9 mm)	1/24.118 in(104.6 mm)	LOW1.331 in(33.8 mm)

Float Position	F8.815 in(223.9 mm)	1/23.929 in(99.8 mm)	LOW1.39 in(35.3 mm)
Resistance(Ω)	19 to21	193 to 203	464.4 to 656.6

FUEL PRESSURE TEST (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	GAUGE, FUEL PR. 100PSI 07406-004000C

Image	Description/Tool Number
	Fuel Pressure Gauge Attachment Set 07AAJ-S6MA150 or 07A

Test

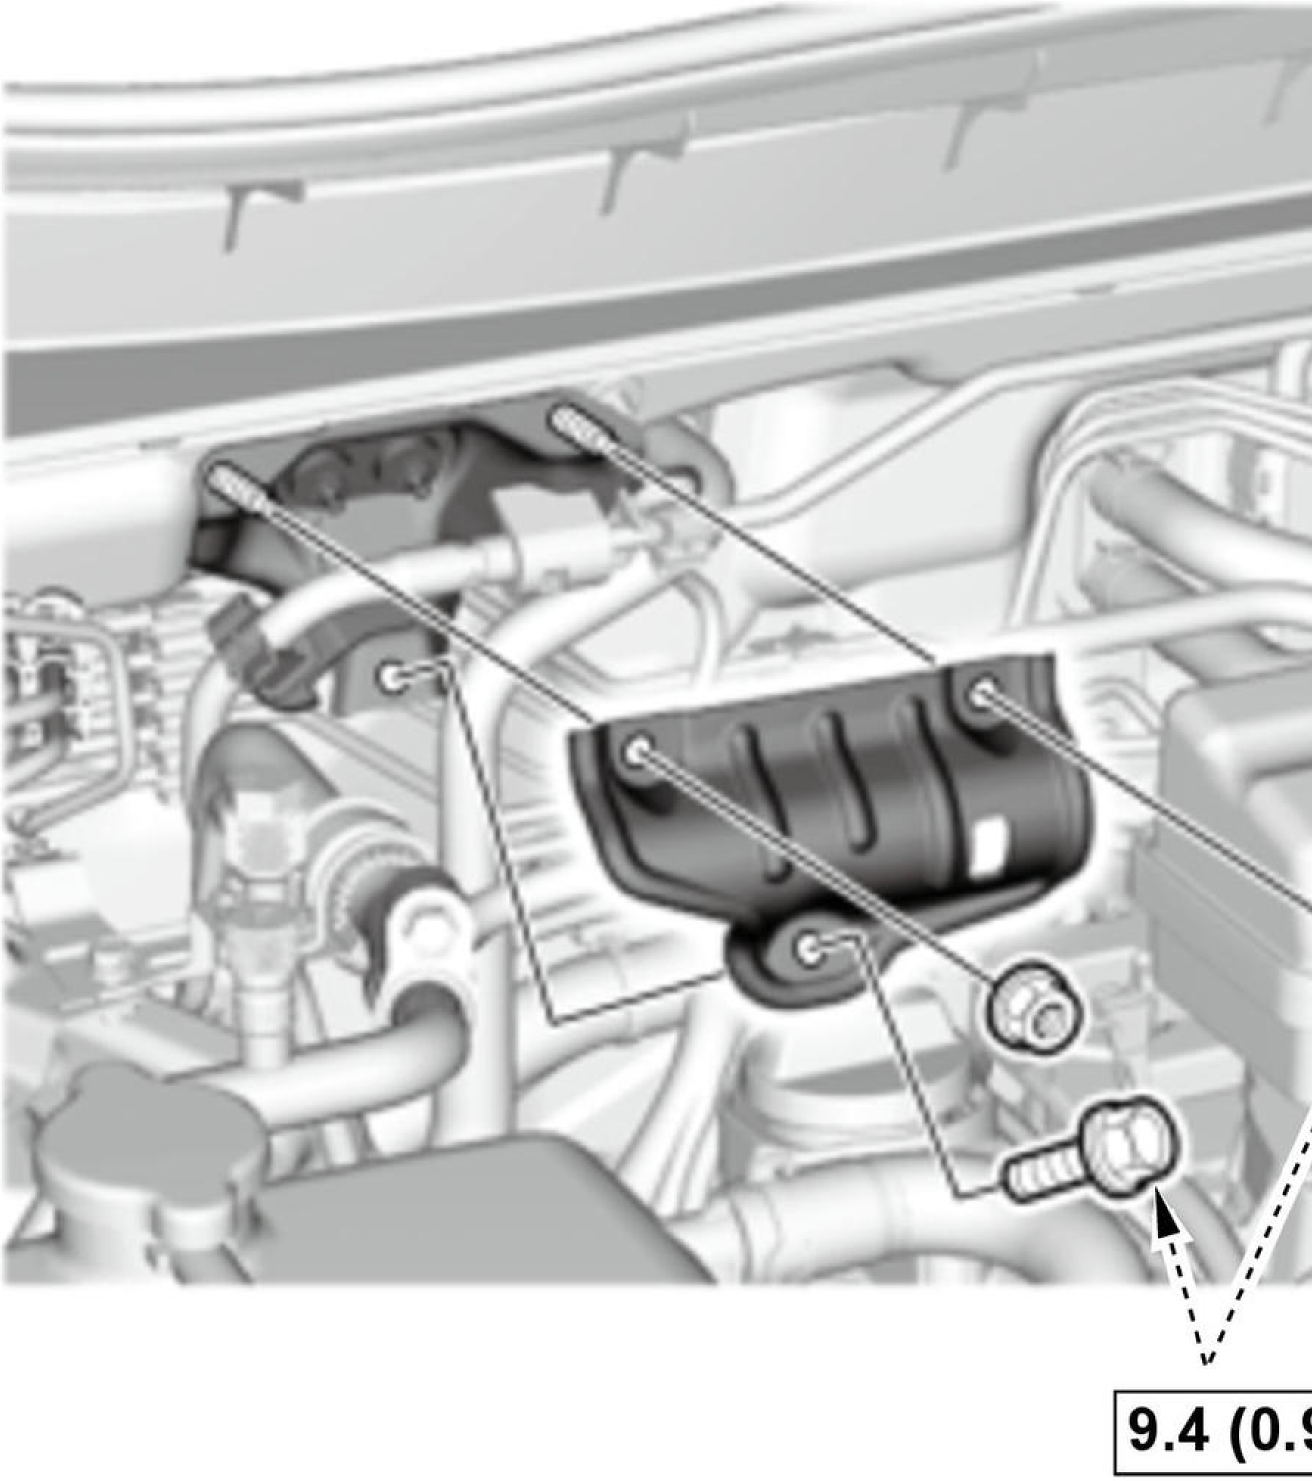
WARNING:

Flammable - Keep Fire Away

NOTE:

- **How to read the torque specifications** .
- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

1. **Fuel Pressure - Relieve**
2. Fuel Hose Cover - Remove



NOTE: This illustration shows an example only. Appearance and structure of the actual parts may depending on the model.

depending on the model.

3. Fuel Line - Disconnect

 NOTE: This illustration shows an example only. Appearance and structure of the actual parts may vary depending on the model.	1. **Remove the quick-connect fitting cover (A)** 2. Check the fuel quick-connect fitting (B) for dirt, and cl 3. Place a rag or shop towel over the quick-connect fitting .

4. Fuel Pressure - Test

 07406-004000C 07AAJ-S6MA150 or 07AAJ-S6MA151 Type 1 Type 2	**NOTE:** If you were referred to this procedure from a trou under the same conditions the malfunction occurred (engi 1. Attach the fuel pressure gauge set. Check for leaks witl 2. Start the engine, and let it idle. - If the engine starts, go to step 3 and read the fuel pı - If the pump does not run, **do the fuel pump circuit** 3. Read the fuel pressure gauge. The pressure should be: **psi)** - If the pressure is OK, the test is complete. - If the pressure is out of specification, **replace the f** then recheck the fuel pressure.

FUEL PRESSURE TEST (2.4 L ENGINE) (2017 2018 2019)

Special Tools Required

Image	Description/Tool Number
	GAUGE, FUEL PR. 100PSI 07406-004000C
	Fuel Pressure Gauge Attachment Set 07AAJ-S6MA150 or 07A

Test

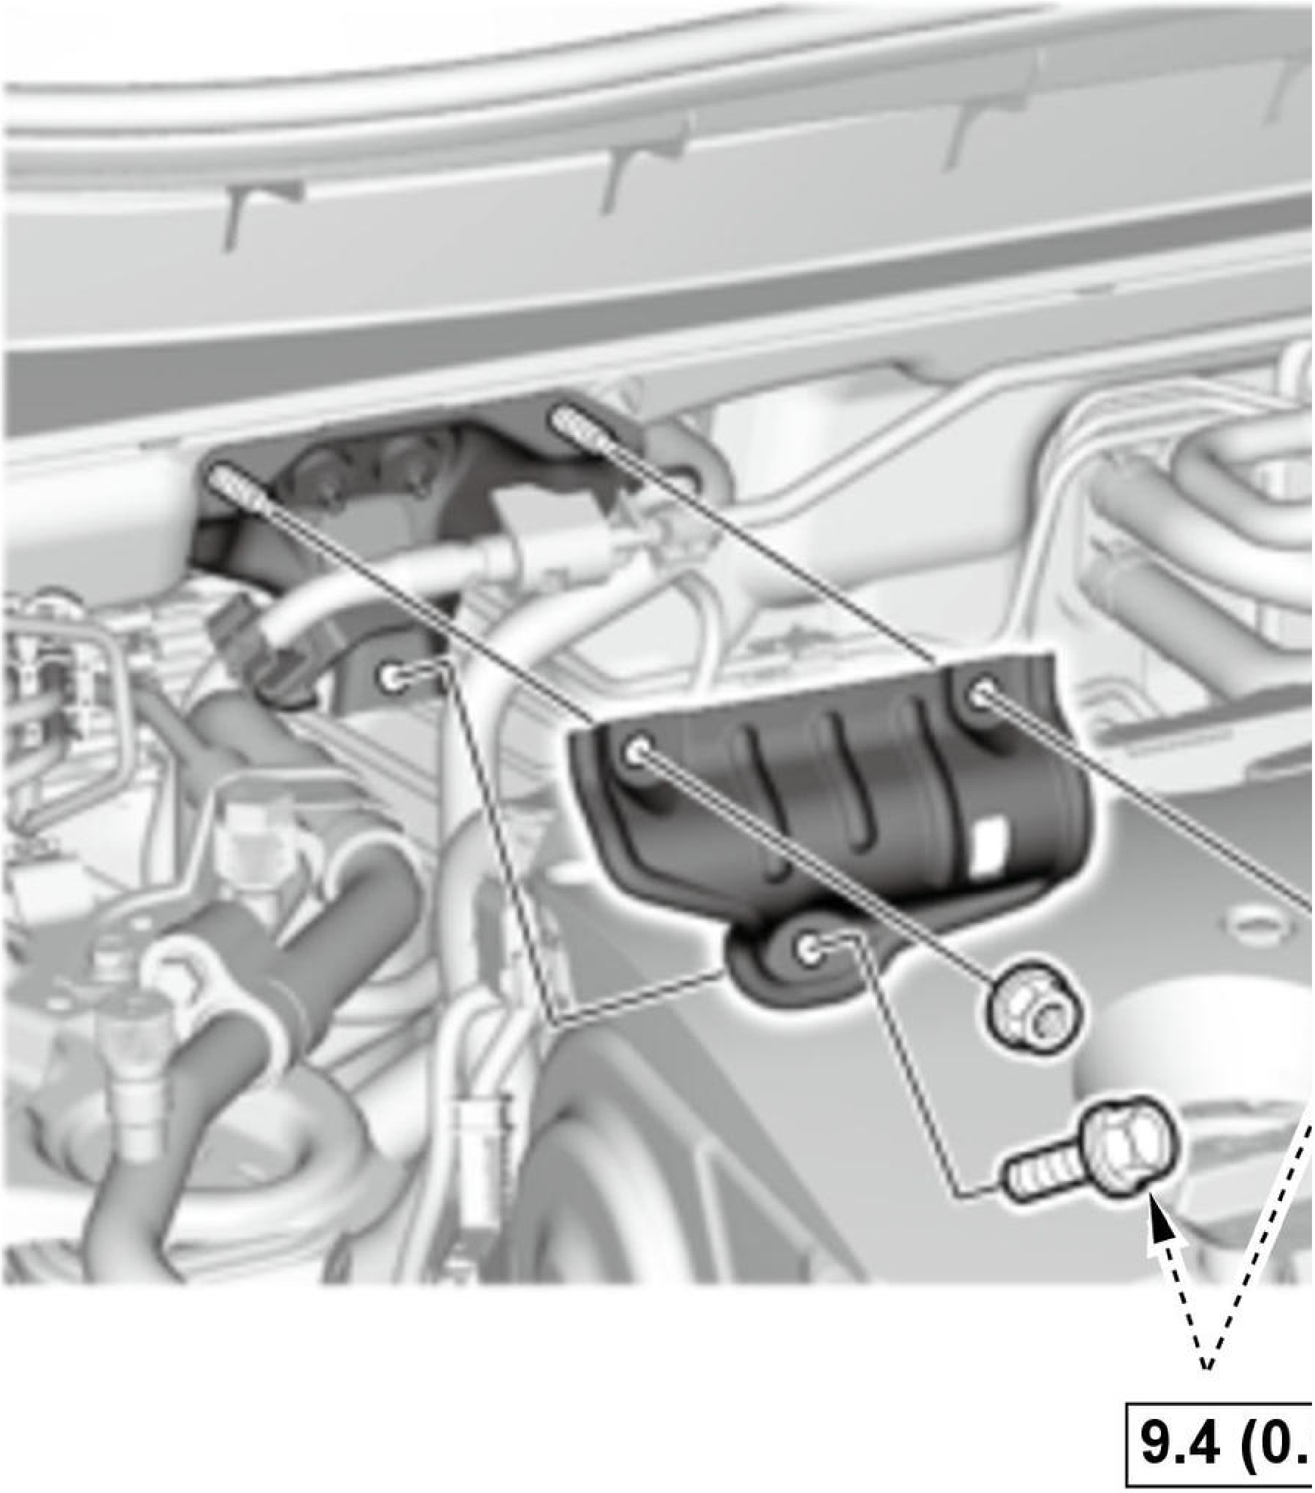
WARNING:

Flammable - Keep Fire Away

NOTE:

- **How to read the torque specifications** .
- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

1. **Fuel Pressure - Relieve**
2. Fuel Hose Cover - Remove



NOTE: This illustration shows an example only. Appearance and structure of the actual parts may depending on the model.

depending on the model.

3. Fuel Line - Disconnect

 NOTE: This illustration shows an example only. Appearance and structure of the actual parts may vary depending on the model.	1. **Remove the quick-connect fitting cover (A)** 2. Check the fuel quick-connect fitting (B) for dirt, and cl 3. Place a rag or shop towel over the quick-connect fitting .

4. Fuel Pressure - Test

 07406-004000C 07AAJ-S6MA150 or 07AAJ-S6MA151 Type 1 Type 2	**NOTE:** If you were referred to this procedure from a trou under the same conditions the malfunction occurred (engi 1. Attach the fuel pressure gauge set. Check for leaks witl 2. Start the engine, and let it idle. - If the engine starts, go to step 3 and read the fuel pı - If the pump does not run, **do the fuel pump circui** 3. Read the fuel pressure gauge. The pressure should be: : **psi)** - If the pressure is OK, the test is complete. - If the pressure is out of specification, **replace the f** then recheck the fuel pressure.

LOW FUEL INDICATOR TEST

Test

1. Low Fuel Indicator - Test

1. **Do the gauge control module self-diagnostic function** .
   - If the low fuel indicator flashes, go to step 2.
   - If the low fuel indicator does not flash, **replace the gauge control module** .

2. Check for body electrical system DTCs.
   - If any DTCs are indicated, do the indicated DTC's troubleshooting.
   - If no DTCs are indicated, go to step 3.

3. **Do the fuel gauge sending unit test**.

INSPECTION

FUEL LINE INSPECTION (1.5 L ENGINE)

Inspection

WARNING:

Flammable - Keep Fire Away

NOTE:

- **How to read the torque specifications** .

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Fuel may cause flammable gas leaks and may result in fire. Keep sparks, flame and cigarettes away.

1. Fuel Line - Inspect
    - Check the fuel system lines and hoses for damage, leaks, and deterioration. Replace any damaged parts.
    - Check all clamps, and make sure they are properly positioned and tightened.
    -
        - Make sure the clamps is in the position of its range shown.
        - Align the marks on the hoses and the pipes.
        - There should be no clearance between the hoses and the pipes.

Fuel Leak Check

2. Intake Air Resonator - Remove
3. Throttle Body - Move

NOTE:

- Do not disconnect the water bypass hoses.

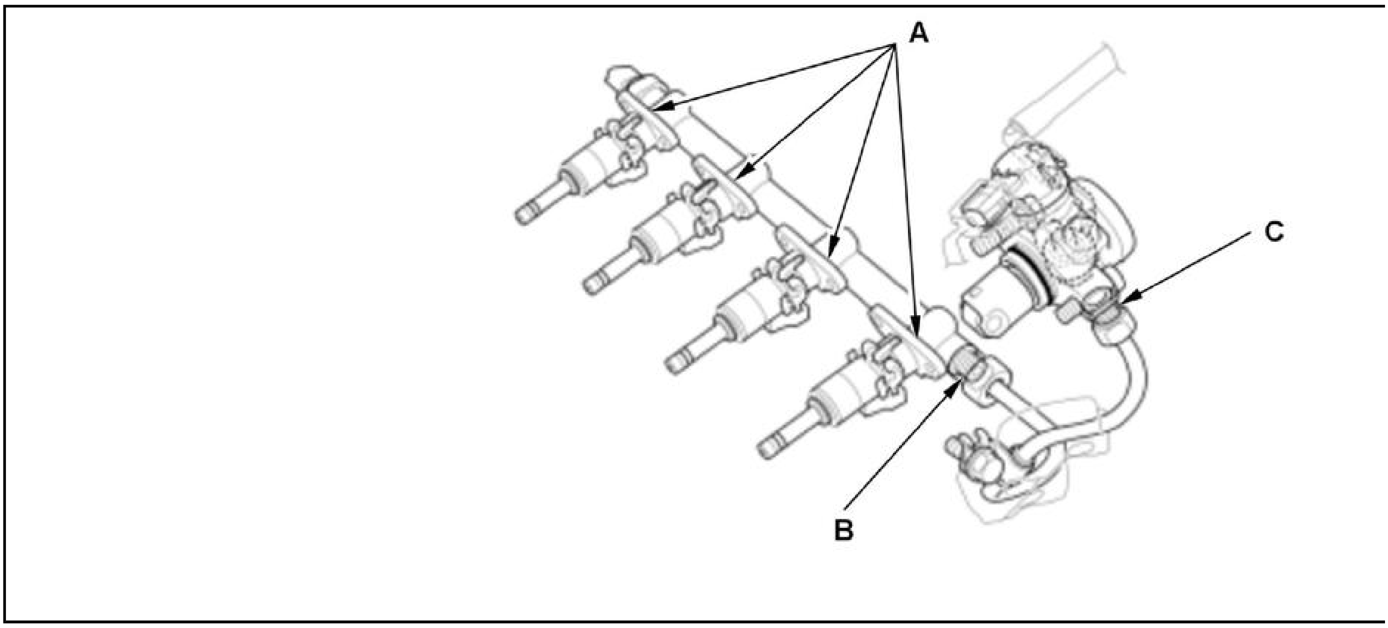
- Do not bend the water bypass hoses excessively.

4. Intake Manifold Bracket - Remove

	1. Remove the intake manifold bracket (A). 2. Move the high pressure fuel pump cover (B). **NOTE:** Do not disconnect the quick-connect fitting.

5. **Intake Manifold - Remove**
6. Fuel Leak - Check

   1. Apply Red Check Spray to the joint of the injectors (A), the fuel rail (B), and the high pressure fuel pump (C). Set the probe of the leak detector (Snap-on Com



2. **Install the intake manifold** and the **throttle body** with the gaskets that had use on them.

3. Turn the vehicle to the ON mode, but do not operate the starter. After the fuel pump runs for about 2 seconds, the low pressure fuel line will be pressurized. Rep fuel leakage.

4. Start the engine. Hold the engine speed at 4, 000 rpm for 1 minute, and stop the engine.

5. **Move the throttle body** , then **remove the intake manifold** .

NOTE:

- Do not disconnect the water bypass hoses.
- Do not bend the water bypass hoses excessively.

6. Check for fuel leakage to joint of the injectors, the fuel rail, and the high pressure fuel pump.

7. **Intake Manifold - Install**
8. Intake Manifold Bracket - Install

	1. Set the high pressure fuel pump cover (A). 2. Install the intake manifold bracket (B).

9. **Throttle Body - Install**
10. **Intake Air Resonator - Install**

FUEL LINE INSPECTION (2.4 L ENGINE) (2017 2018 2019)

P2138 (37)	---	Accelerator Pedal Position (APP) Sensor A/B (Throttle Position (TP) Sensor D/E) Incorrect
P2176 (40)	---	Throttle Actuator Control System Idle Position Not Learned
P2183 (192) *2	o	Engine Coolant Temperature (ECT) Sensor 2 Circuit Range/Performance Problem
P2184 (192)	o	Engine Coolant Temperature (ECT) Sensor 2 Circuit Low Voltage
P2185 (192)	o	Engine Coolant Temperature (ECT) Sensor 2 Circuit High Voltage
P2195 (48) *2	o	Air Fuel Ratio (A/F) Sensor (Sensor 1) Signal Stuck Lean
P219A (45) *2	o	Air-Fuel Ratio Variation of Cylinder
P2227 (13)	o	Barometric Pressure (BARO) Sensor Circuit Out of Range High
P2228 (13)	o	Barometric Pressure (BARO) Sensor Circuit Low Voltage
P2229 (13)	o	Barometric Pressure (BARO) Sensor Circuit High Voltage
P2237 (48)	o	Air Fuel Ratio (A/F) Sensor (Sensor 1) AFS Circuit High Voltage
P2238 (48)	o	Air Fuel Ratio (A/F) Sensor (Sensor 1) AFS+ Circuit Low Voltage
P2252 (48)	o	Air Fuel Ratio (A/F) Sensor (Sensor 1) AFS- Circuit Low Voltage
P2270 (63)	o	Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Circuit Signal Stuck Lean
P2422 (117) *2	o	Evaporative Emission (EVAP) Canister Vent Shut Valve Stuck Closed Malfunction
P2610 (132)	o	Powertrain Control Module (PCM) Ignition Off Internal Timer Malfunction
P2623 (197)	---	High Pressure Fuel Pump Spill Valve Malfunction
P2646 (22) *2	o	Rocker Arm Oil Pressure Switch Circuit Low Voltage
P2647 (22) *2	o	Rocker Arm Oil Pressure Switch Circuit High Voltage
P2648 (21)	---	Rocker Arm Oil Control Solenoid A Circuit Low Voltage
P2649 (21)	---	Rocker Arm Oil Control Solenoid A Circuit High Voltage
P2A00 (61)	o	Air Fuel Ratio (A/F) Sensor (Sensor 1) Circuit Range/Performance Problem
U0029 (126)	---	F-CAN Malfunction (BUS-OFF (Powertrain Control Module (PCM)))
U0114 *3	---	F-CAN Malfunction (Powertrain Control Module (PCM)-AWD Control Unit)

NOTE: The above DTCs are indicated when the PGM-FI system is selected with the HDS. Some automatic transmission DTCs cause the MIL to come on. If the MIL i FI system, select the A/T system, and check for automatic transmission DTCs.*1: These DTCs are indicated by a blinking MIL when the SCS line is jumped with the H blink when the SCS line is jumped; these DTCs are shown in the gauge display.

*2: USA models

*3: AWD

DTC(MIL indication *1)	Two Driver Cycle Detection	Detection Item
U0122	---	F-CAN Malfunction (Powertrain Control Module (PCM)-VSA Modulator-Control Unit)
U0128	---	F-CAN Malfunction (Powertrain Control Module (PCM)-Electric Parking Brake Control U
U0129	---	F-CAN Malfunction (Powertrain Control Module (PCM)-Electric Brake Booster)
U0131	---	F-CAN Malfunction (Powertrain Control Module (PCM)-EPS Control Unit)
U0155 (126)	---	F-CAN Malfunction (Powertrain Control Module (PCM)-Gauge Control Module)

NOTE: The above DTCs are indicated when the PGM-FI system is selected with the HDS. Some automatic transmission DTCs cause the MIL to come on. If the MIL i FI system, select the A/T system, and check for automatic transmission DTCs.*1: These DTCs are indicated by a blinking MIL when the SCS line is jumped with the H blink when the SCS line is jumped; these DTCs are shown in the gauge display.

*2: USA models

*3: AWD

GENERAL INFORMATION

FUEL LINE/QUICK-CONNECT FITTING PRECAUTIONS

WARNING:

Flammable - Keep Fire Away

NOTE:

- Refer to the **Fuel and Emissions Systems Service Precautions** before disconnecting the fuel line.
- Replace the fuel feed hose, fuel line, or the quick-connect fitting to new one if it is damaged.

When removing or installing the fuel feed hose/line, or when disconnecting or connecting the quick-connect fittings, pay attention to the following:

- No heat-resistance; Be careful not to damage them during welding or other heat-generating procedures.
- Not acid-proof; Do not touch them with a shop towel that was used for wiping 12 volt battery electrolyte or something similar.
- No stress-resistance; Be careful not to bend or twist the fuel feed hose/line excessively.

Retainer Replacement

A disconnected quick-connect fitting can be reconnected, but the retainer on the mating line cannot be reused once it has been removed from the line.

NOTE: Use the same manufacturer retainer and the same size retainer when the replacing the retainer.

Location	Manufacturer	Retainer color	Piping diameter	Remarks
Fuel feed hose (A)	Tokai	Blue Green	0.315 in (8.0 mm)	B
Fuel feed hose (B)	Tokai	Green	0.2500 in (6.35 mm)	B
Fuel tank unit (C)	Sanoh	White	0.374 in (9.5 mm)	B
Fuel feed hose (D)	Sanoh	White	0.315 in (8.0 mm)	B
EVAP canister (E)	Sanoh	White	0.472 in (12 mm)	USA and Canada mod
EVAP leak check module (F)	Yachiyo	Yellow	0.75 in (19 mm)	1.5 L engine (USA an

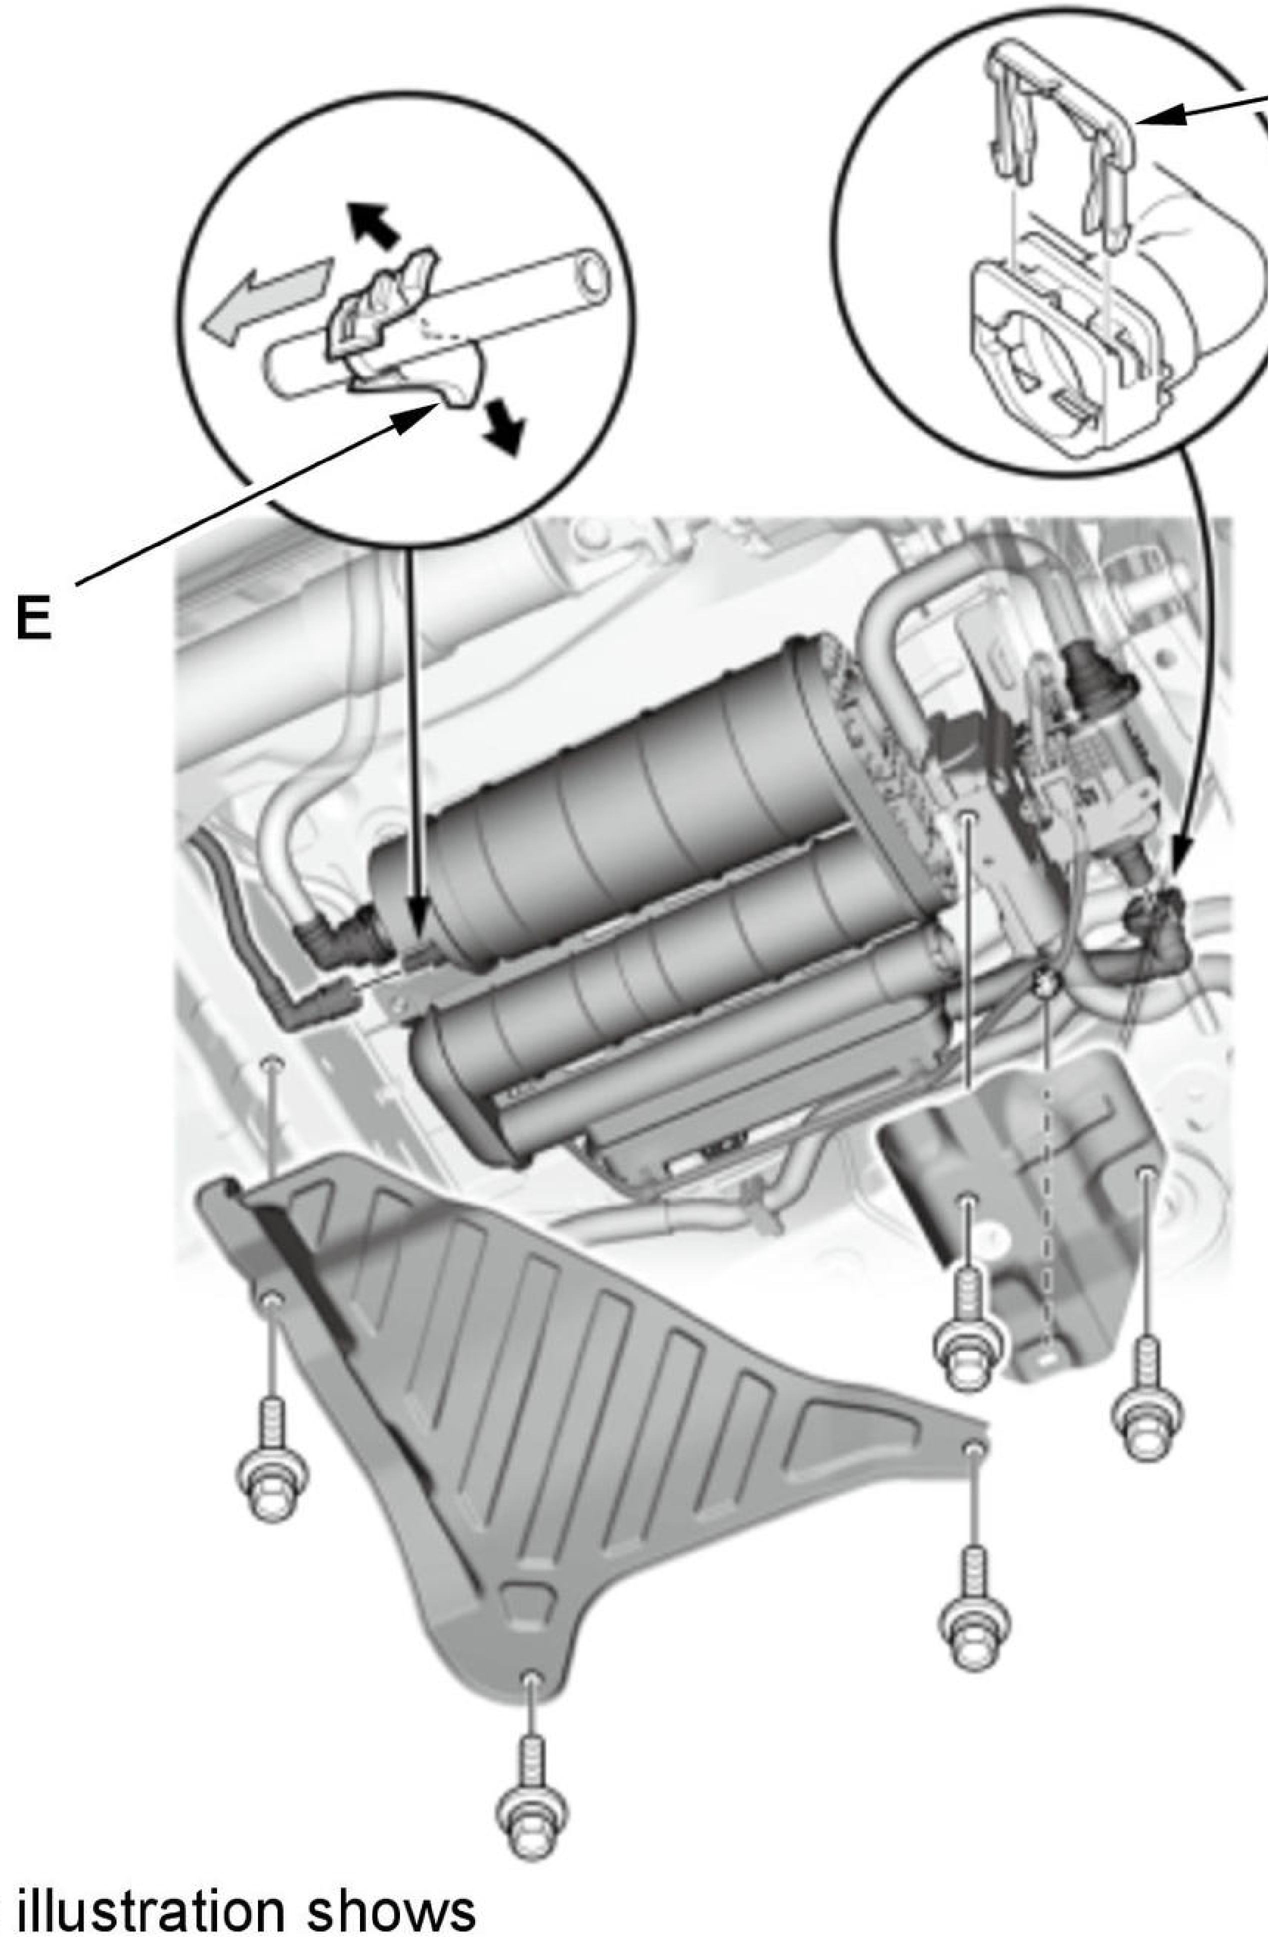
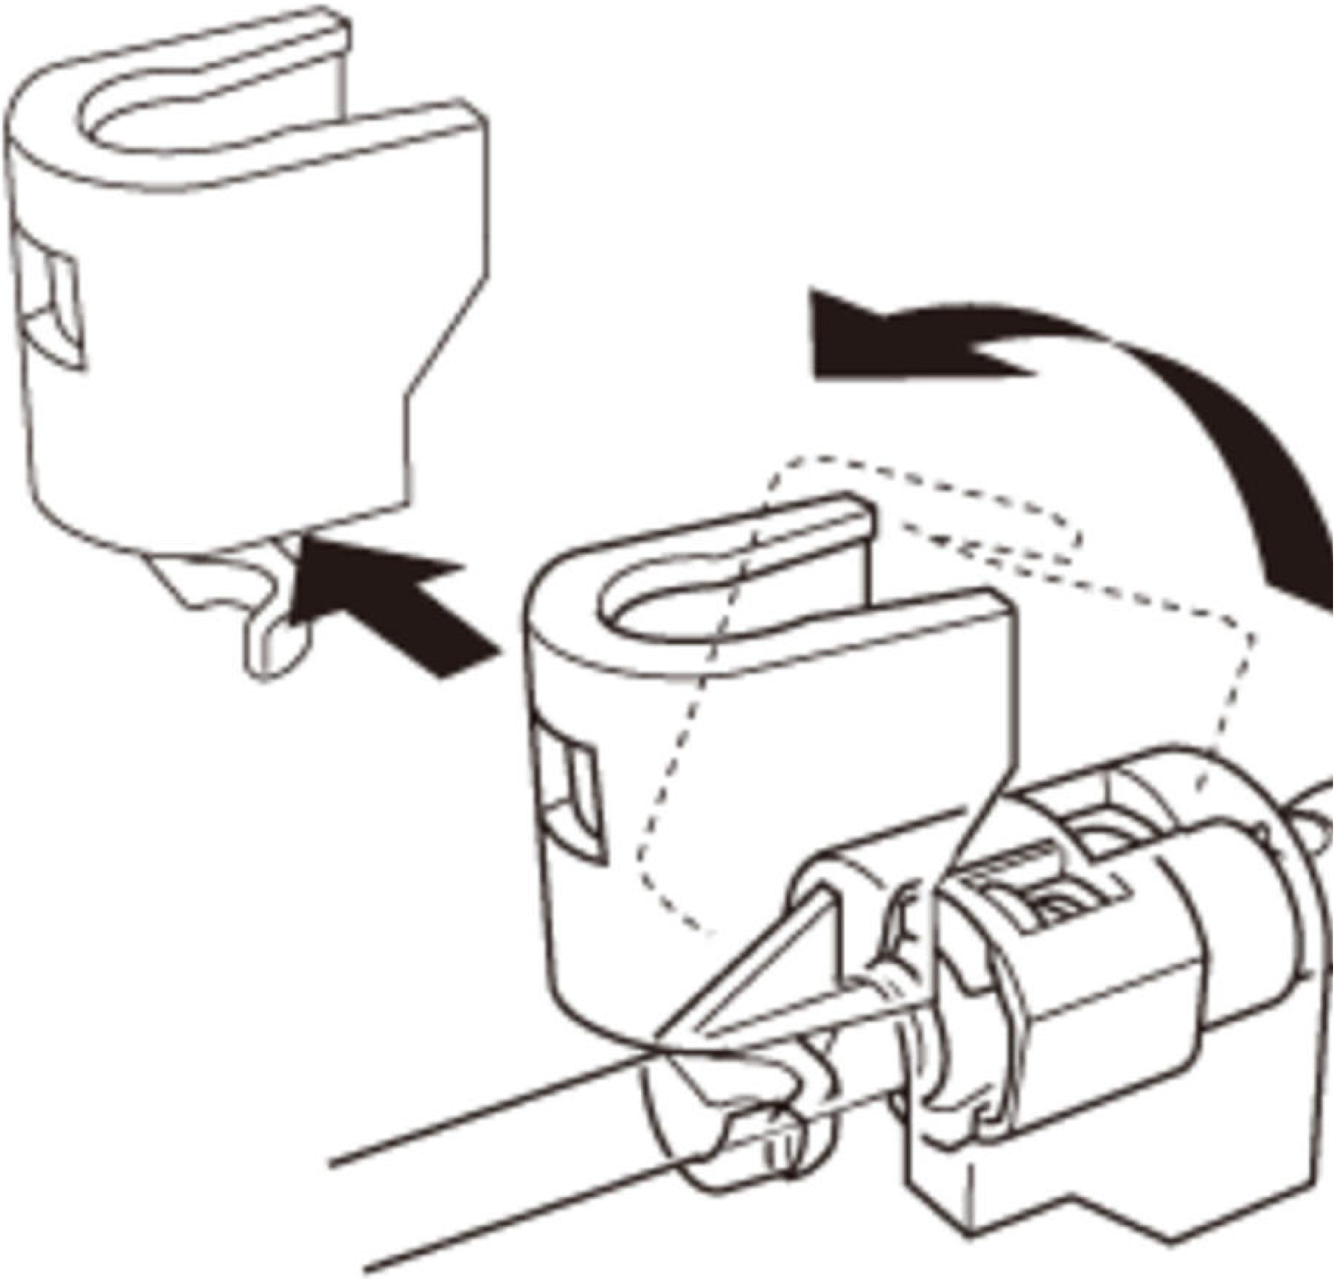
D



The illustration shows
1.5 L engine (USA and Canada models).

Fuel Line/Quick-Connect Fitting Removal

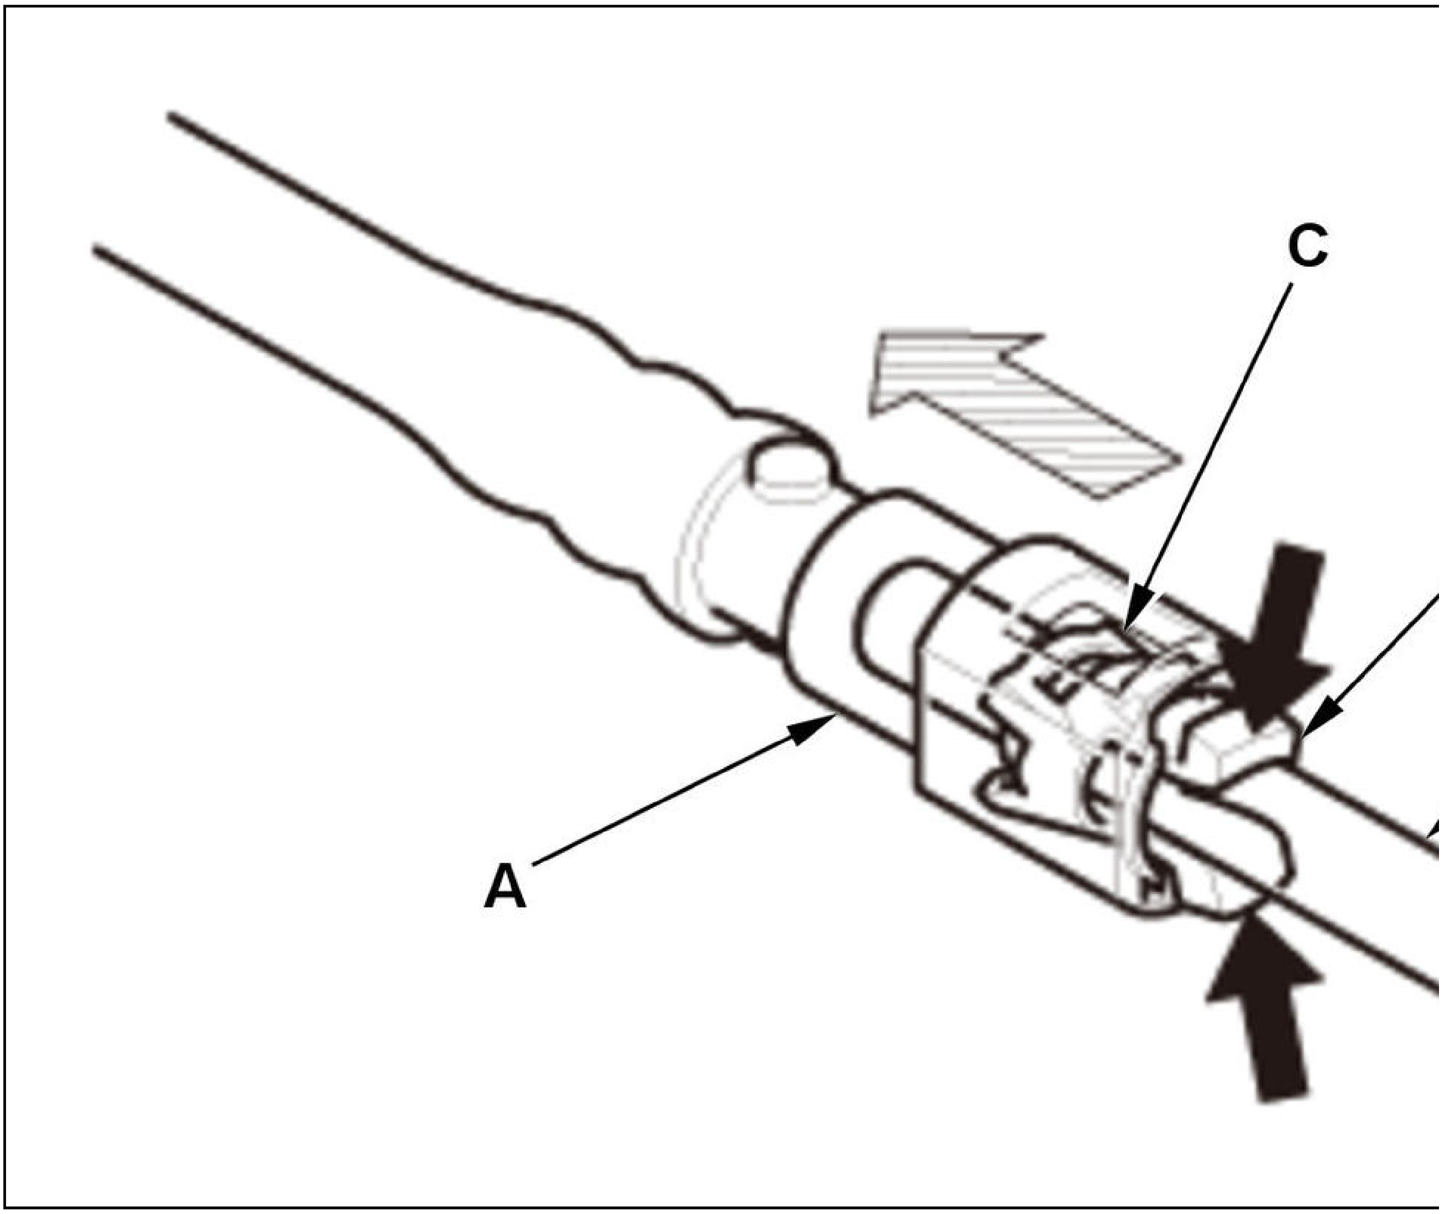
1. Remove the fuel line/quick-connect fitting cover (If equipped).



2. Check the fuel quick-connect fittings for dirt, and clean it if needed.

3. Place a rag or shop towel over the quick-connect fitting.

4. Hold the connector (A) with one hand, and squeeze the retainer tabs (B) with the other hand to release them from the locking tabs (C).



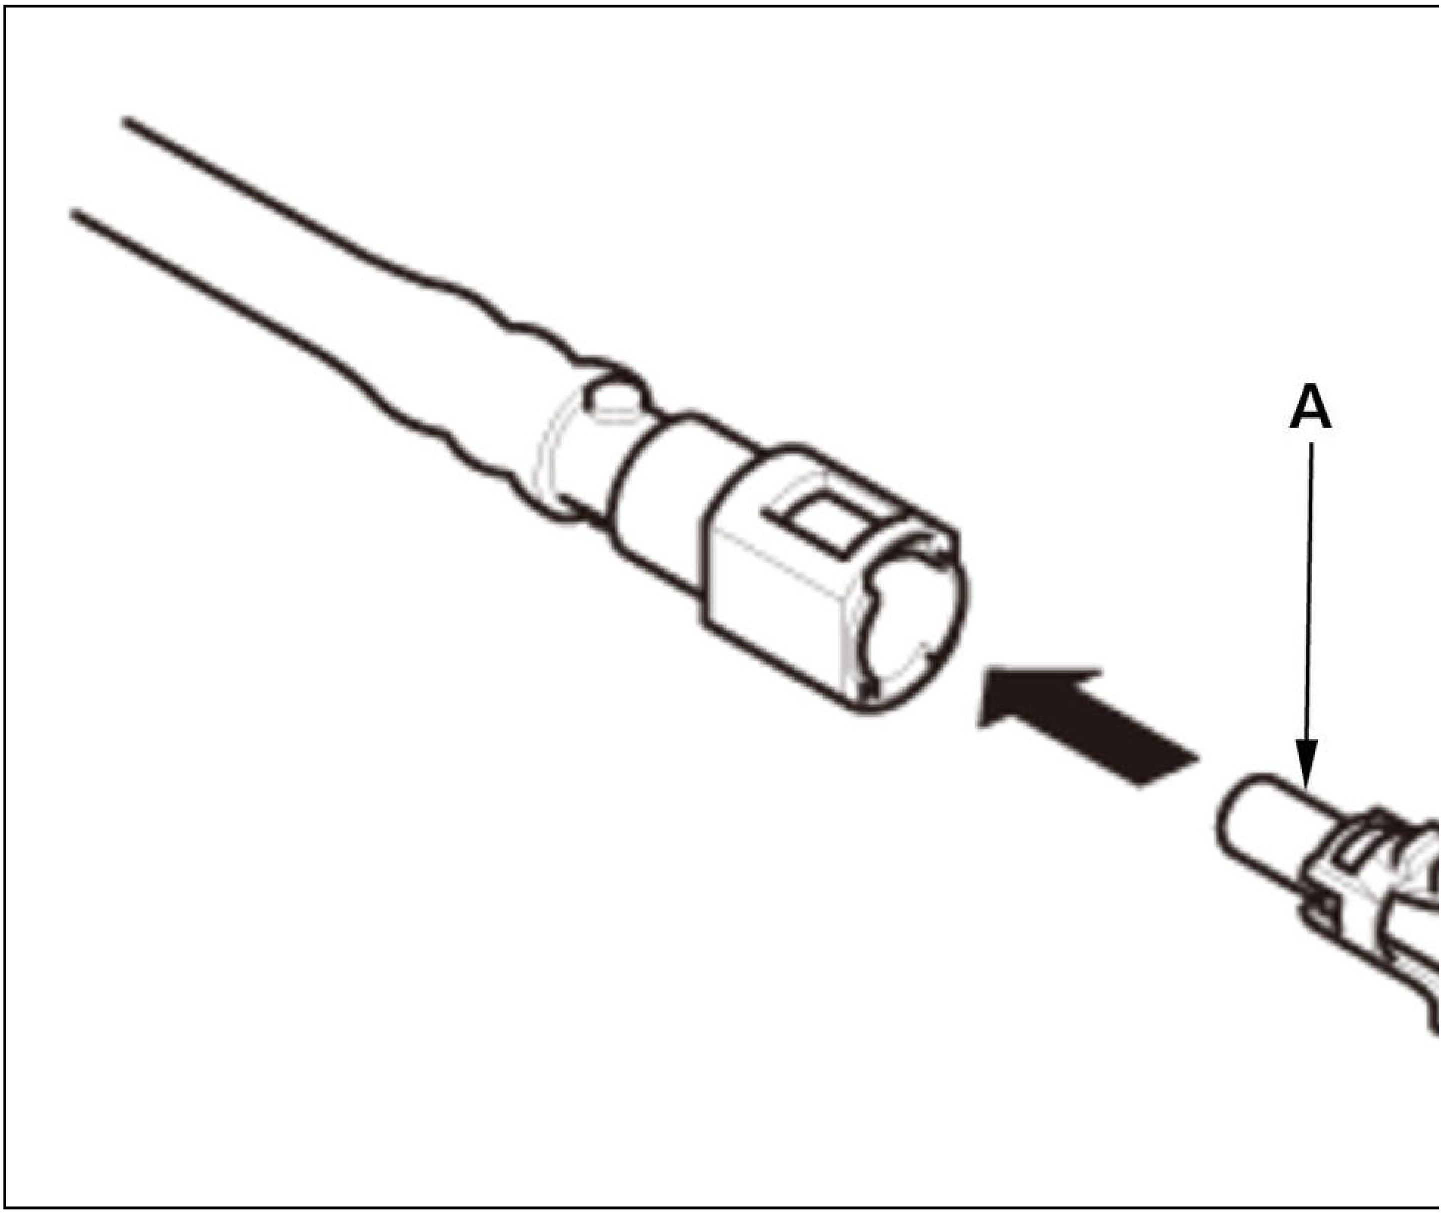
5. Pull the connector off.

NOTE:

- Be careful not to damage the line (D) or other parts. Do not use tools.
- If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.
- Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.

6. Check the contact area (A) of the line (B) for dirt or damage.

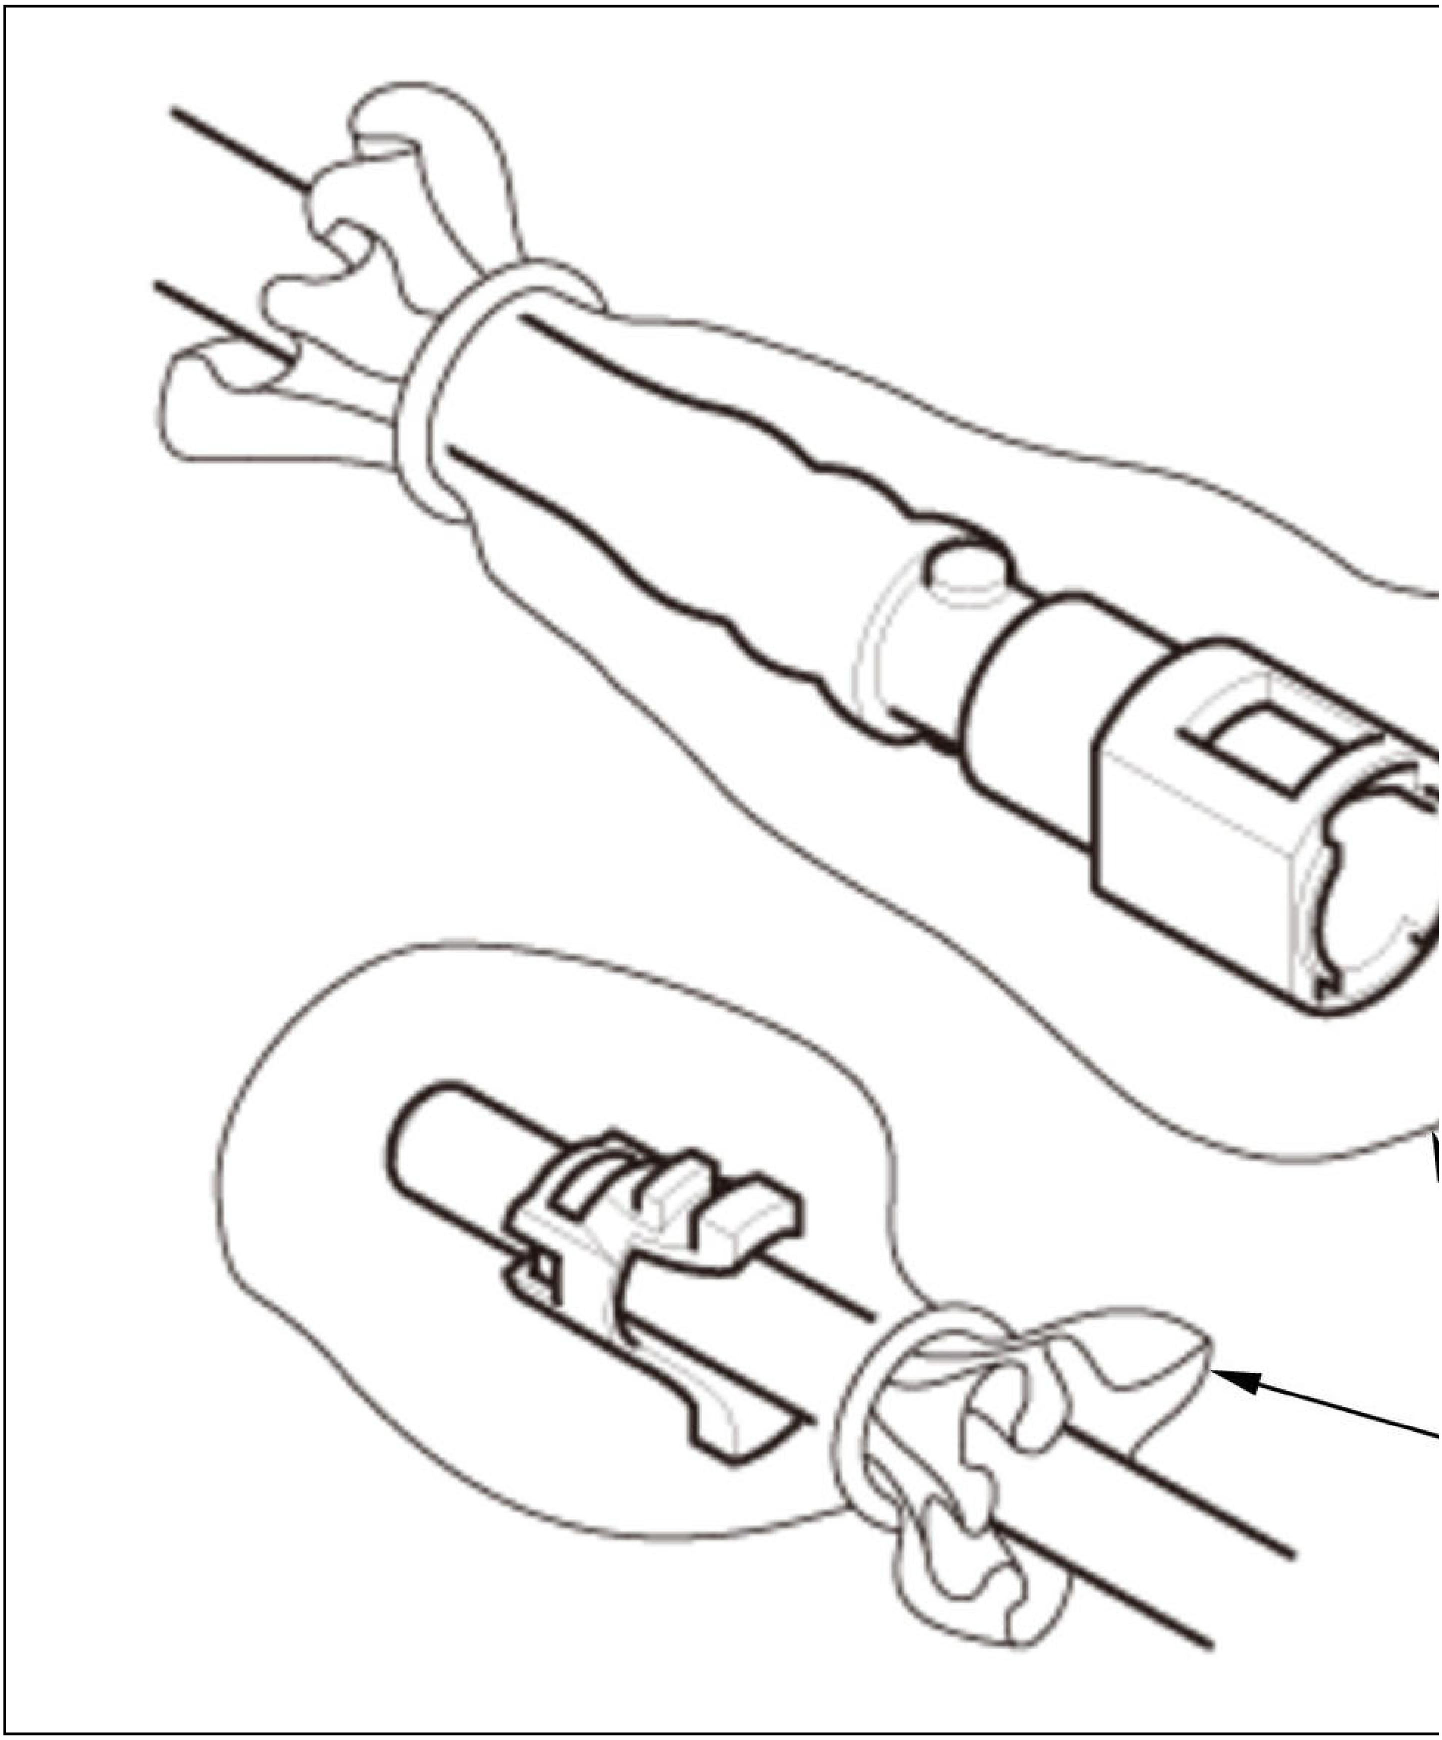
- If it is dirty, clean it.
- If it is rusty or damaged, replace the damaged fuel line or the damaged part.



7. To prevent damage and keep foreign matter out, cover the disconnected connector and line ends with plastic bags (A).

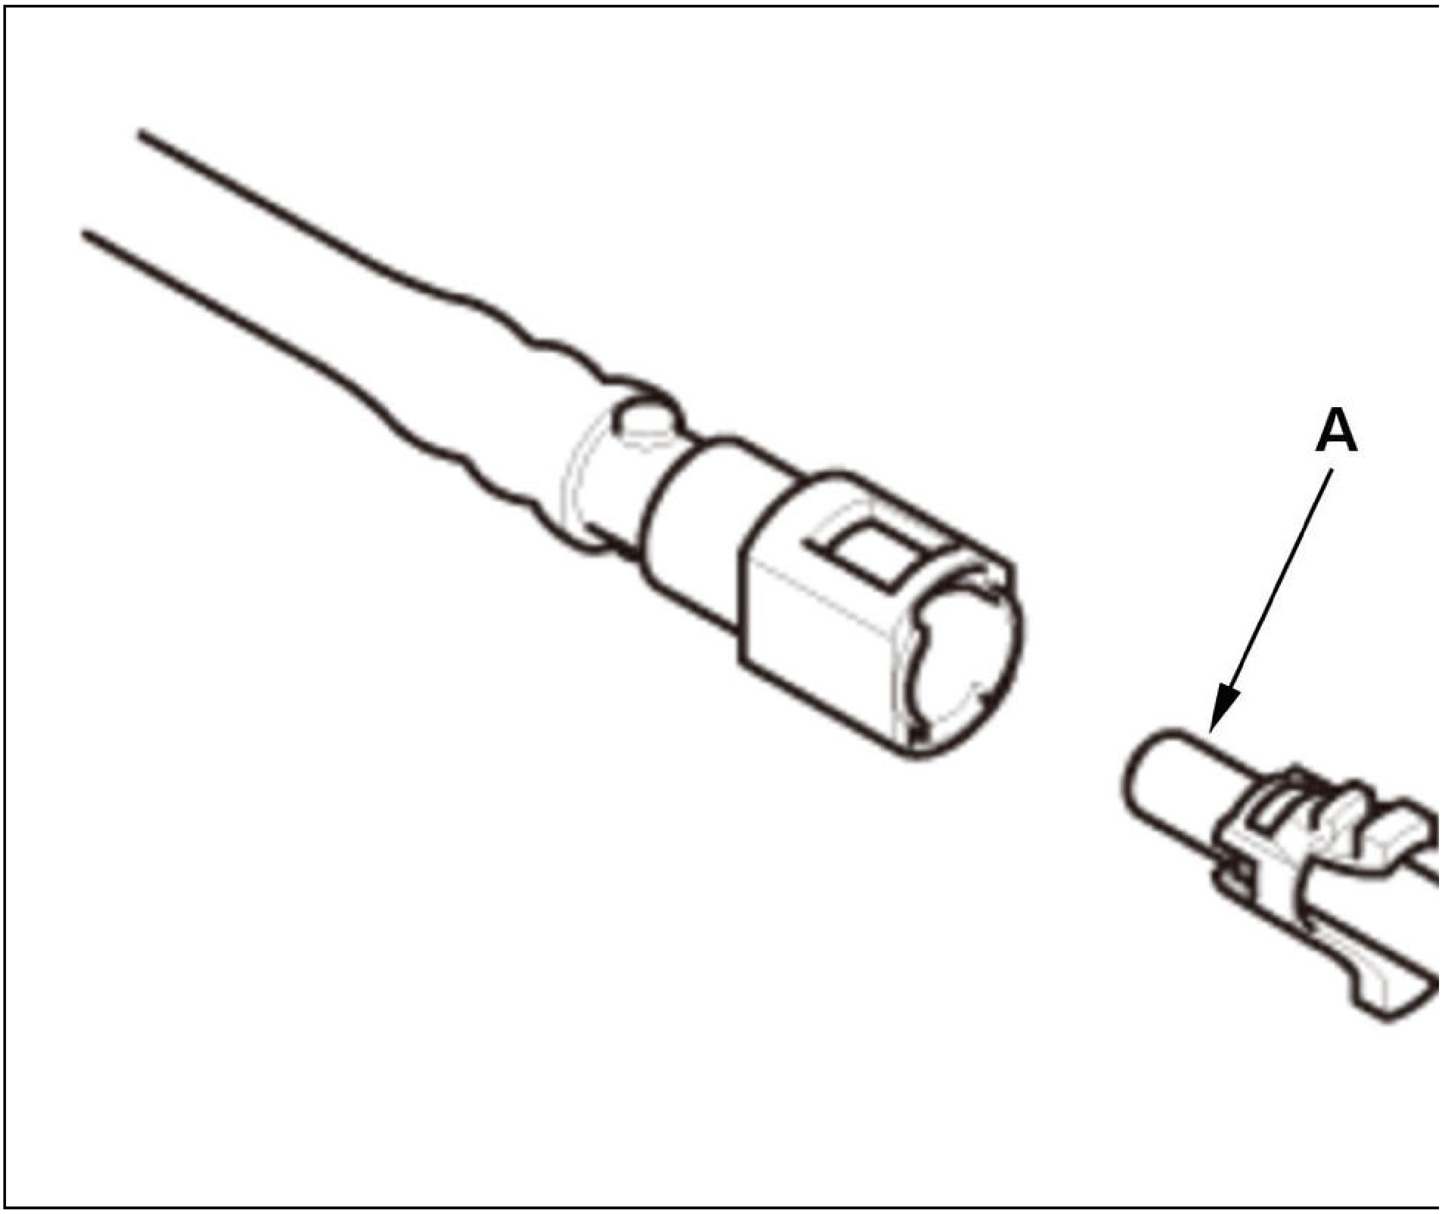
NOTE:

- The retainer cannot be reused once it has been removed from the line.
- Replace the retainer when:
-
    - replacing a new part that does not include the retainer. (a fuel line, a fuel tank unit etc.)
    - it has been removed from the line.
    - it is damaged.



Fuel Line/Quick-Connect Fitting Installation

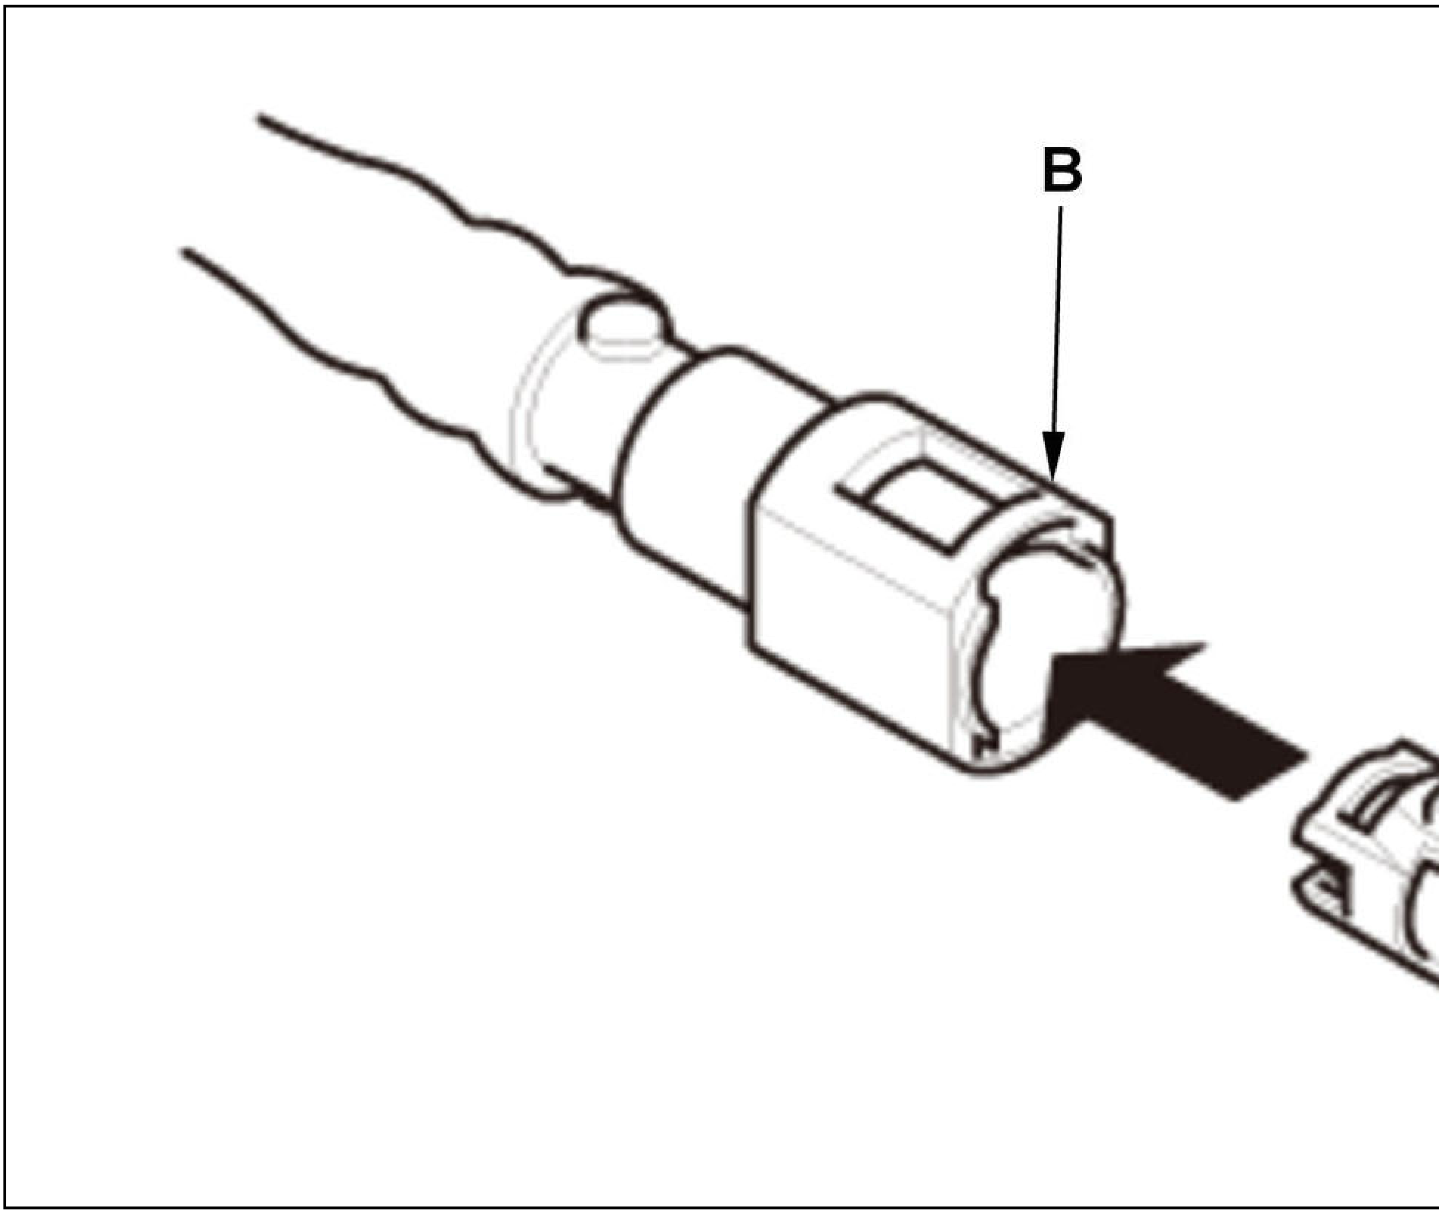
1. Check the contact area (A) of the line (B) for dirt or damage, and clean it if needed.



2. Insert a new retainer (A) into the connector (B) if the retainer is damaged, or after:

- replacing new part which does not pack with the suitable retainer. (a fuel line, a fuel tank unit etc.)
- removing the retainer from the line.

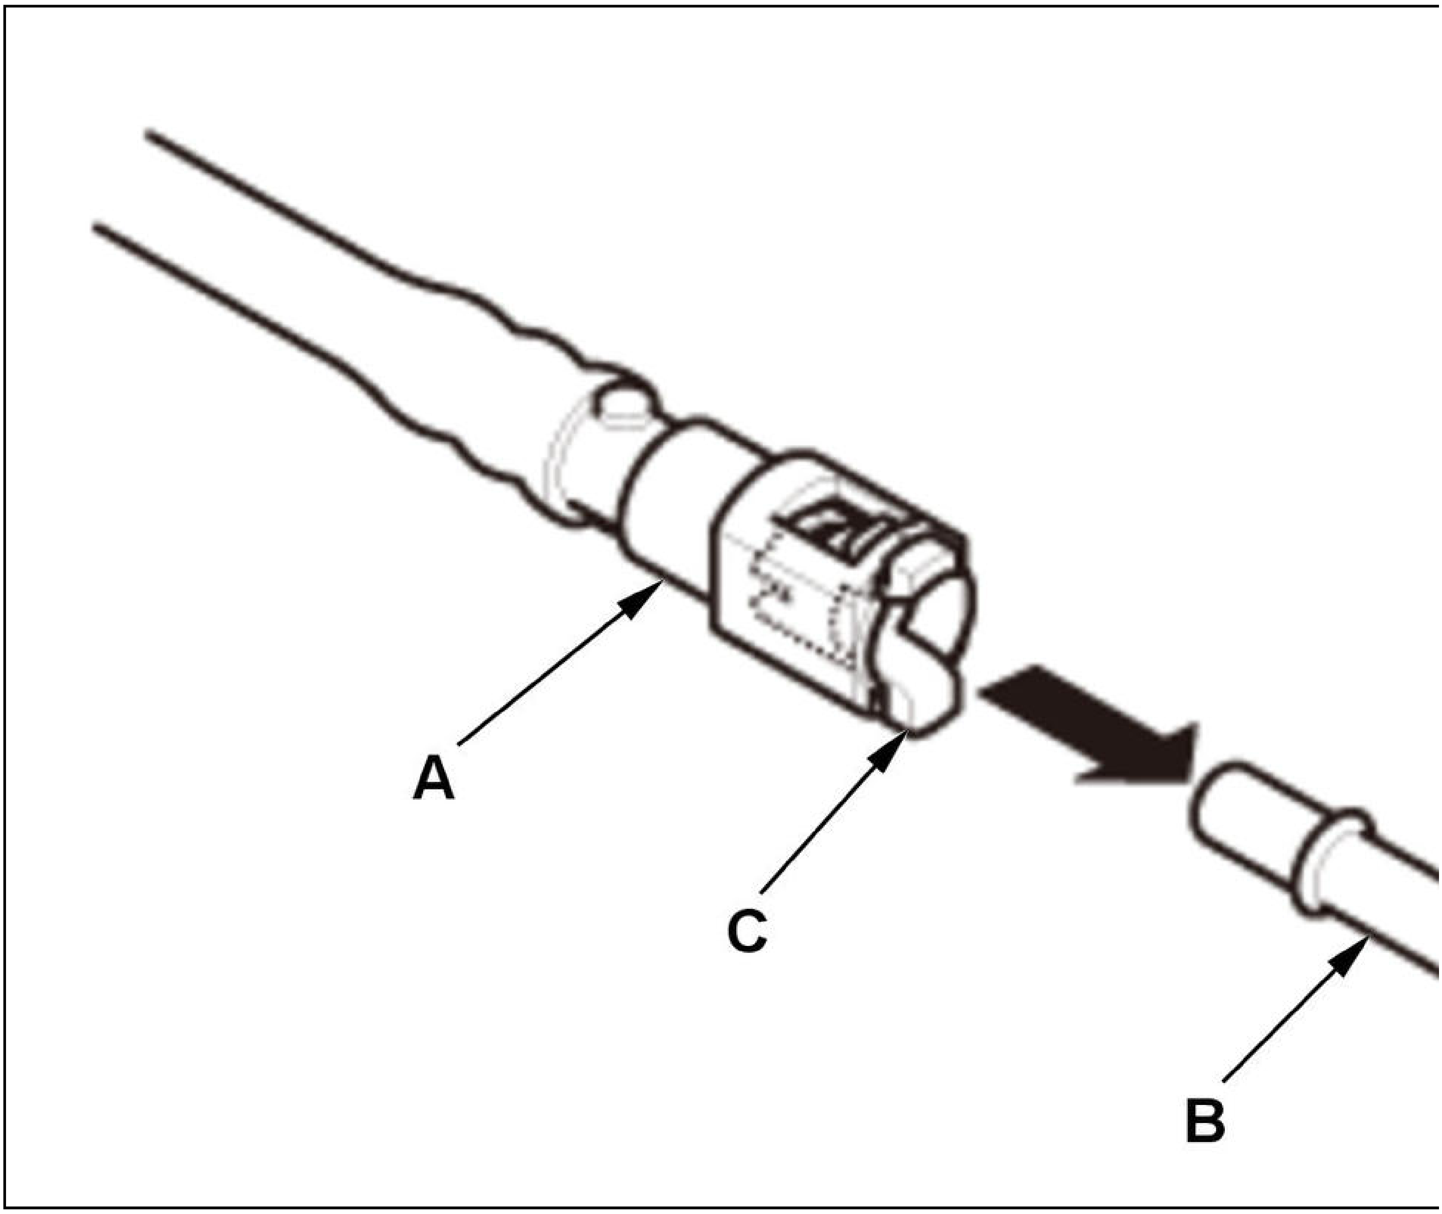
NOTE: Use the same manufacturer retainer and the same size retainer when the replacing the retainer.



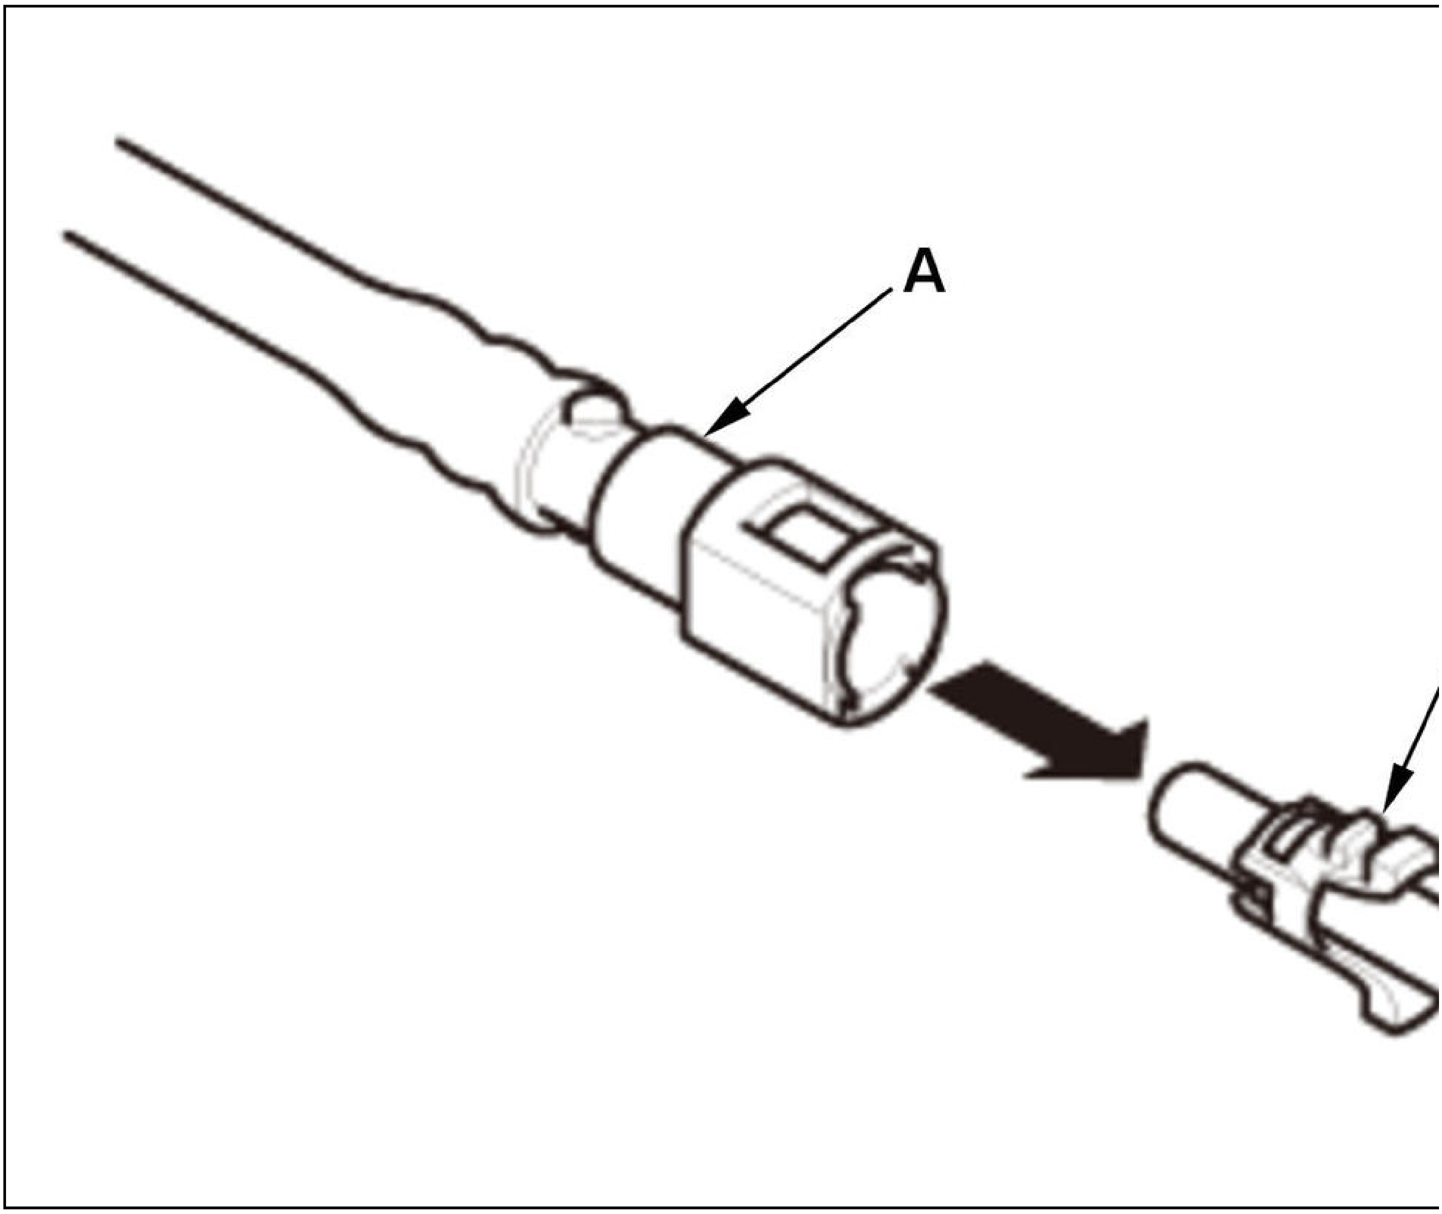
3. Before connecting a new fuel line/quick-connect fittings, remove the old retainer from the mating line.

4. Align the quick-connect fittings (A) with the line (B), and align the retainer (C) locking tabs with the connector grooves.

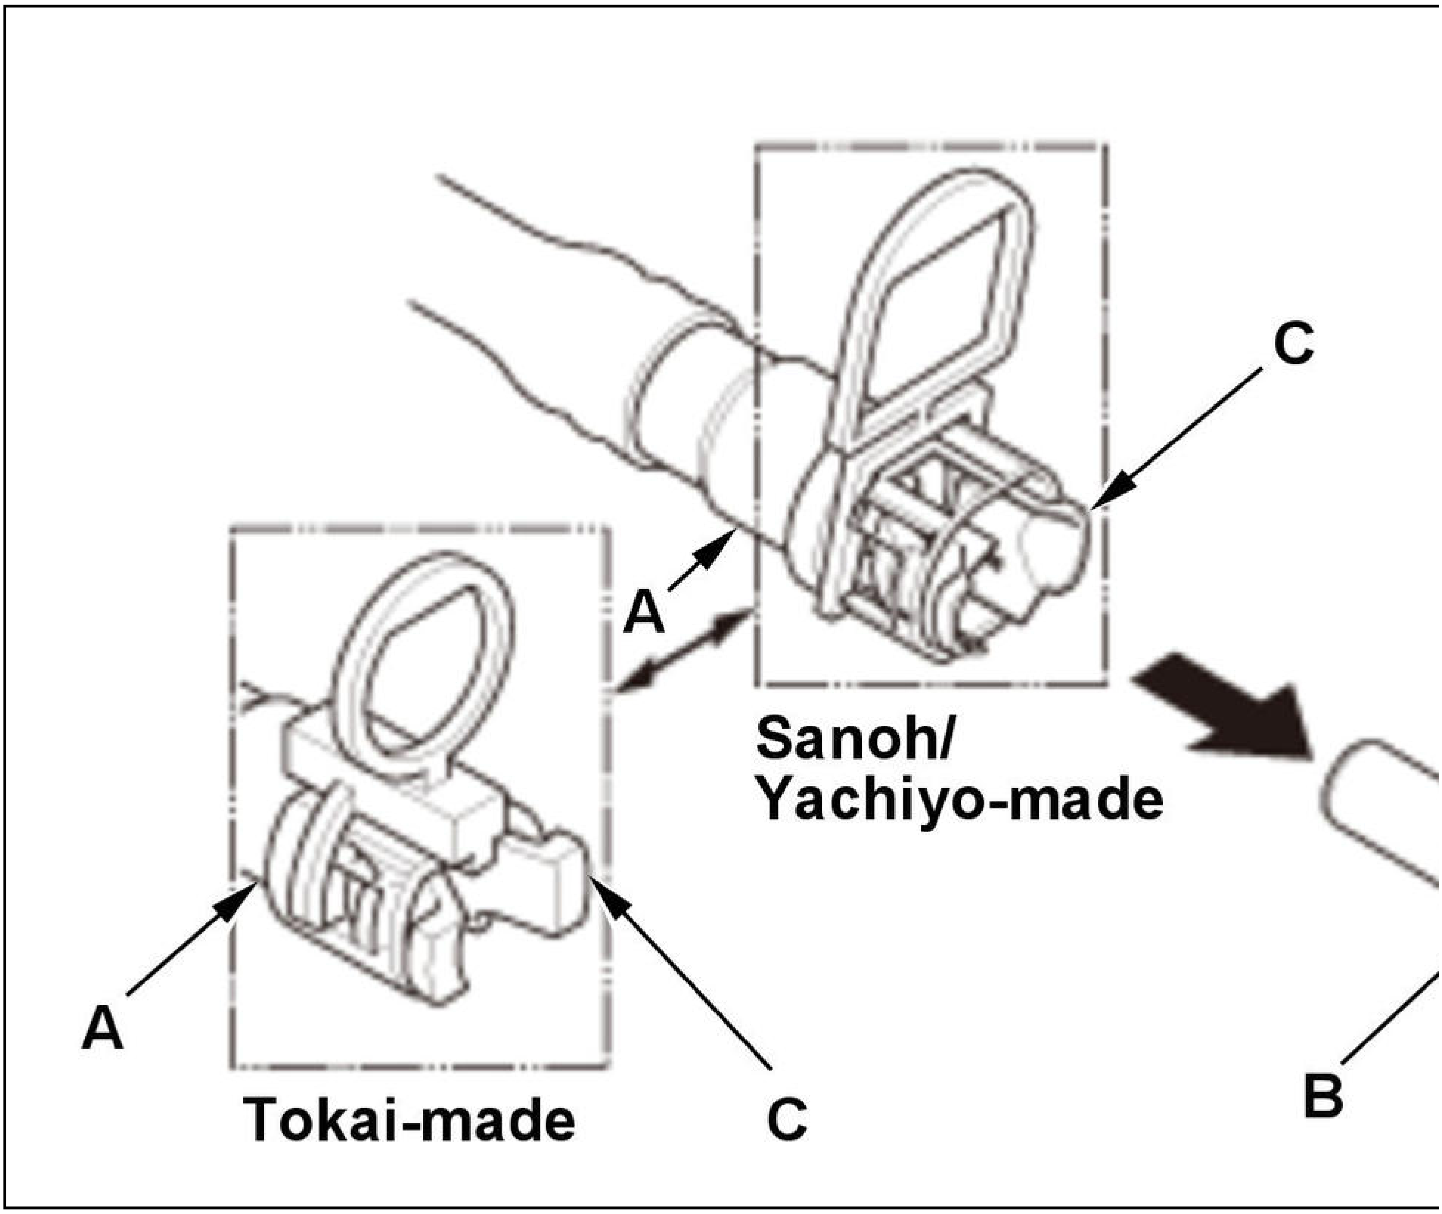
Connection with new retainer



Reconnection to existing retainer



Connection to new fuel line

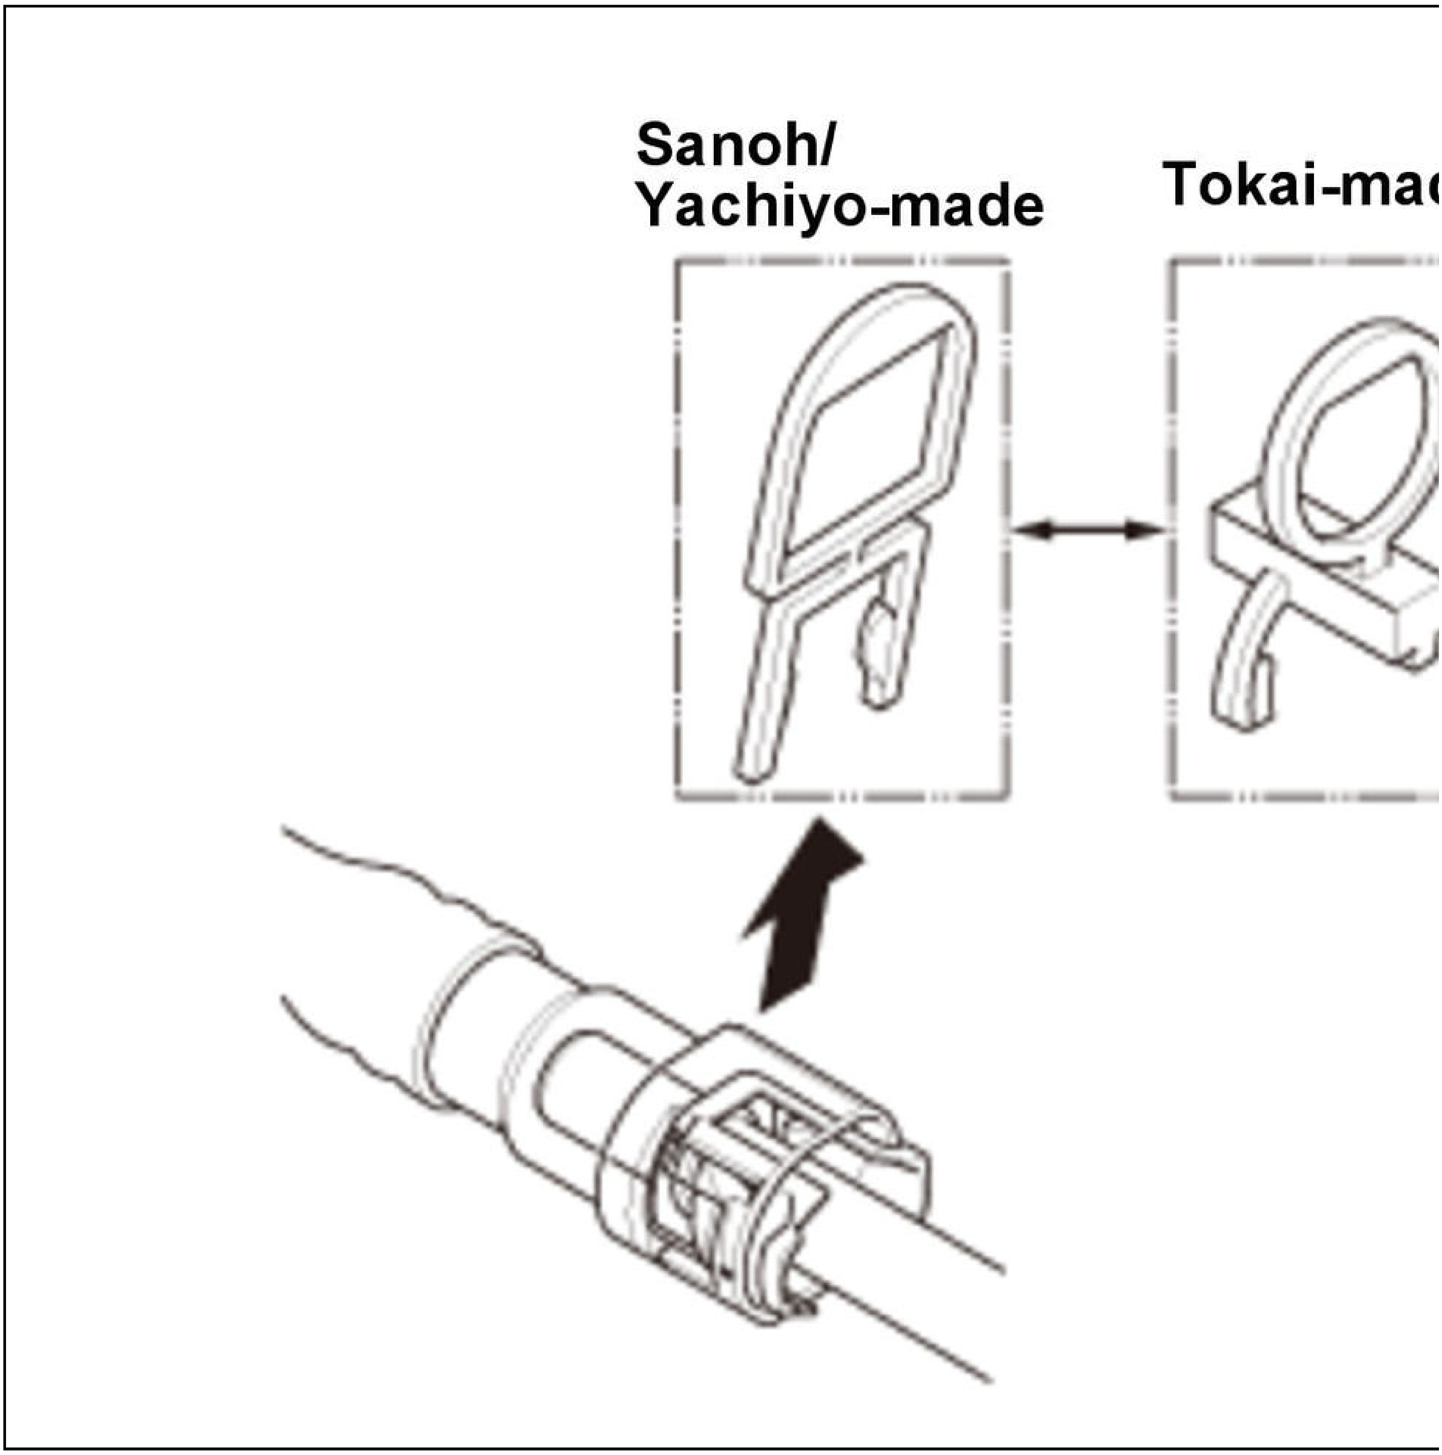


5. Press the quick-connect fittings onto the line until both retainer tabs lock with a clicking sound.

NOTE: If it is hard to connect, put a small amount of new engine oil on the line end.

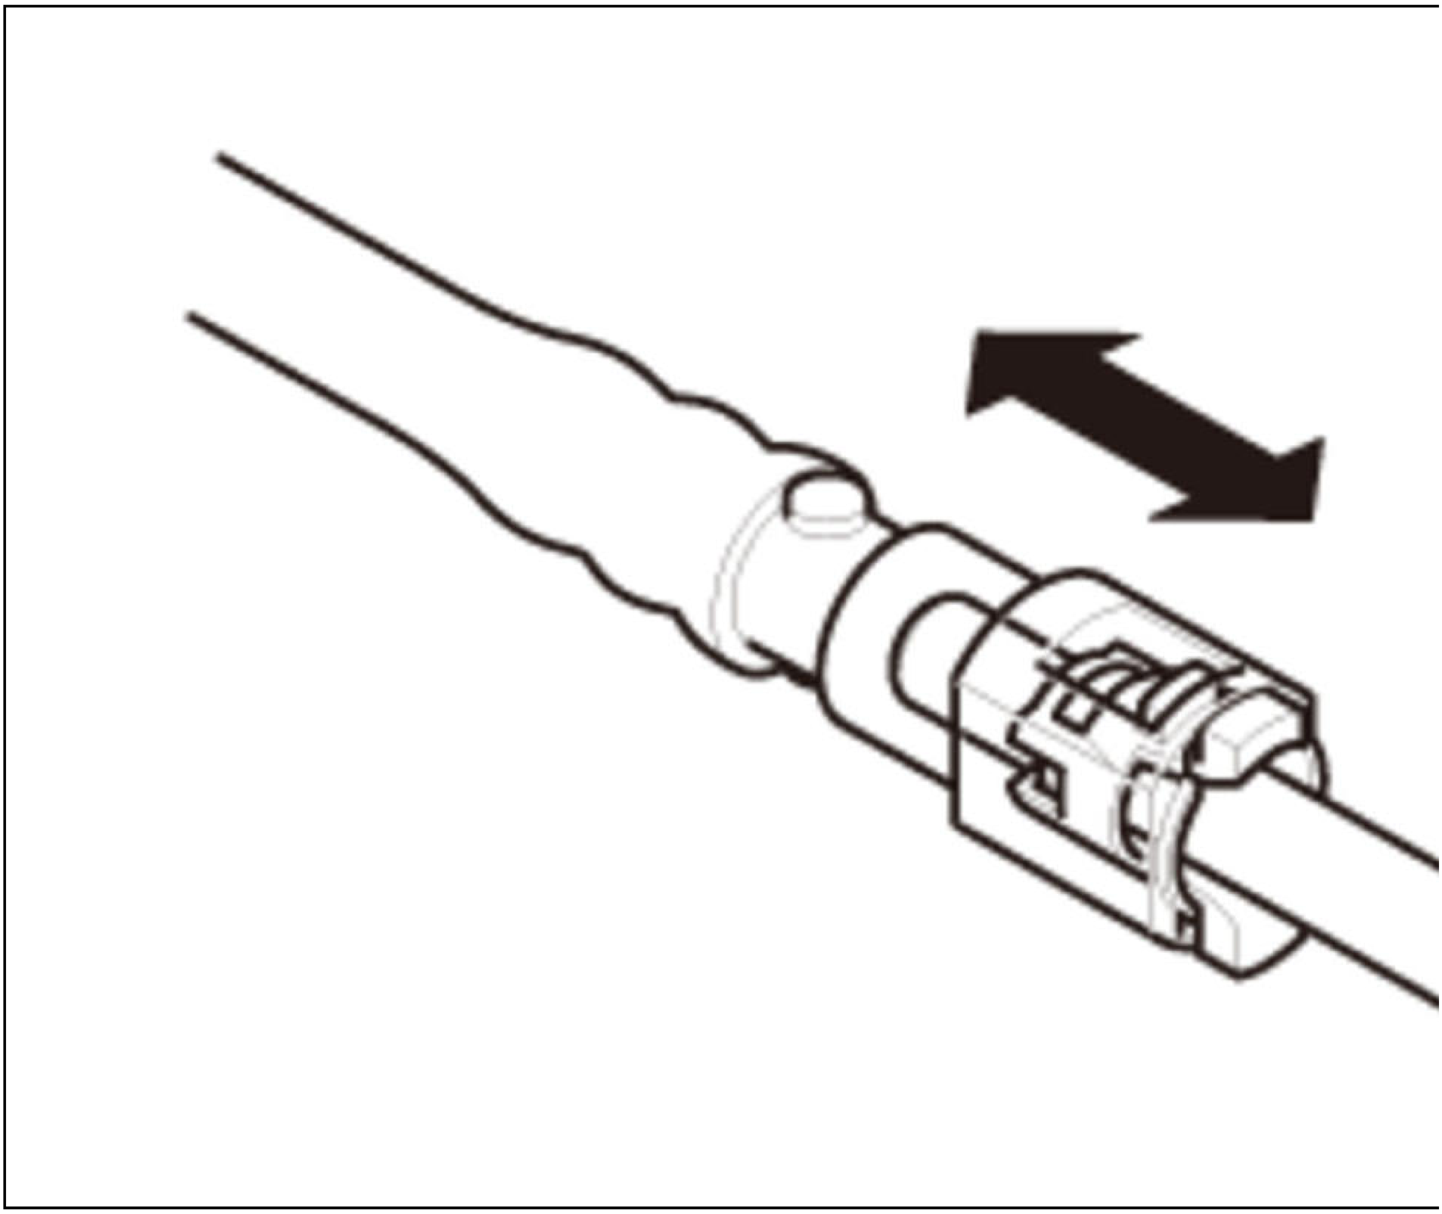
6. When replacing the fuel line with a new retainer as a set, make sure you remove the ring pull upwards after you confirm the connection is secure.

NOTE: Before you remove the ring pull, make sure the fuel line connection is secure. If the connection is not secure, the ring pull could break when you try to remove



Sanoh/
Yachiyo-made
Tokai-mac

7. Make sure the connection is secure and the tabs are firmly locked into place; check visually and also by pulling the connector.



8. Turn the vehicle to the ON mode, but do not start the engine. After the fuel pump runs for about 2 seconds, the fuel line will be pressurized. Repeat this two or three ti

9. Set the groove of the quick-connect fitting cover on the fuel line as shown, then install it. Make sure the cover is firmly locked in place.

SYMPTOM TROUBLESHOOTING

FUEL AND EMISSIONS SYSTEMS SYMPTOM TROUBLESHOOTING

Engine stalls - Diagnostic interview

Engine stalls - Diagnostic interview

- Date	B	B
B	B	B
- Place	B	B
B	B	B
1. Accessories/modifications	A: No modification	B: Modified
B		
2. Situation when occurred	Booming noise, vibration occurs when deceleration, stopping, engine stalls	
B		
3. Situation when occurred	Engine stalls without vibrations as if stopped by turning off the ignition switch	
B	B	
4. Situation when occurred	Outside temperature, engine temperature (cold/warmed-up), engine could restart right away or not, others	

Engine stalls condition - Possible cause pattern chart from diagnostic interview

B	Conditions when the engine stalls	Possible causes
Pattern 1	Accessories/modifications	"Hard to start engine" or "engine stall" sometimes occurs due to a fa duct, intake manifold, or exhaust system.(Intermittent failure may oc
Pattern 2	Booming noise, vibration occurs when deceleration, stopping, engine stalls	The following intermittent failures may exist. • Intermittent failure of PGM-FI main relay 2 • Faulty fuel supply (parameter ST FUEL TRIM) • Delay of VTEC, VTC system function (parameter VTEC) (onl • Delay of lock-up operation (parameter SLIP RATIO OF TORC
Pattern 3	Engine stalls without vibrations as if turning off the ignition switch	The following intermittent failures may exist. • Intermittent failure of ignition coil relay • Intermittent failure of PGM-FI main relay 1 • Intermittent failure of PGM-FI subrelay • Intermittent failure of ETCS control relay

Engine stalls (1.5 L Engine)

Engine stalls

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before beginning this troubleshooting, do a customer diagnostic interview.
-
  - When the symptom cannot be duplicated, you can do the troubleshooting using the on-board snapshot information in this procedure . Refer to the dia total mileage, and compare the total mileage which is estimated from the interview when a failure occurred and the parameter (total mileage) in the on-boar when the failure occurred corresponds with the date on which the on-board snapshot information was recorded. If it doesn't, the on-board snapshot informat
- Before beginning this troubleshooting:
-
  - Make sure the 12 volt battery is fully charged.
  - Make sure the fuel tank is at least 1/4 full.
  - Make sure the engine oil level is correct.
- After the troubleshooting, reset the PCM with the HDS to erase the on-board snapshot information recorded on the PCM.

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	**Confirmed DTC**
B	B

   DTC (PGM-FI)

   Are any Pending or Confirmed DTCs indicated?

   YES

   Go to the indicated DTCs troubleshooting.

   NO

   Go to step 2.

   NOTE: If the HDS does not communicate with the vehicle, go to the PCM power and ground circuit troubleshooting .

2. Body electrical system DTC check

   -1. Check for body electrical system DTCs with the HDS.

DTC Description	**DTC**
B	B

   DTC (Body Control Module)

   Are any DTCs indicated?

   YES

   Go to the troubleshooting for body electrical system DTC(s) .

   NO

   Go to step 3.

3. Problem verification:

   Set the HDS to record a SNAPSHOT of following parameters for 30 seconds.

- ENGINE SPEED
- MAF SENSOR
- ECT SENSOR 1
- BATTERY
- CKP NO PULSE
- CKP NOISE
- FUEL PRESSURE CONVERTED FROM PF SENSOR
- FUEL PRESSURE DIRECT INJECTION SYSTEM
- AF FB (ST FUEL TRIM)
- EVAP PC DUTY
- MISFIRE
- A/C CLUTCH
- PNP SWITCH
- SLIP RATIO OF TORQ OR STARTCLUTCH

Data List

-2. Begin the snapshot, then start the engine and let it idle without load (in P or N).

Did the engine stall?

YES

Go to step 5 (diagnosis by parameter (MAF SENSOR)).

NO

Go to step 4.

4. On-board snapshot check

-1. Check for a record of Engine Stall 2 in the on-board snapshot with the HDS.

On-board Snapshot

Is there an Engine Stall 2 record in the on-board snapshot?

YES

Go to step 5 (diagnosis by parameter (MAF SENSOR)).

NO

Go to step 17 (fuel system troubleshooting).

NOTE: If an engine stall on-board snapshot was not found, the snapshot may have been lost due to low 12 volt battery voltage or because of 12 volt battery disco

5. On-board snapshot check (MAF SENSOR):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

-2. Select the MAF SENSOR and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the MAF SENSOR pattern from the charts, and determ

Pattern	Symptom (Diagnosis by parameter)	Additio
Pattern 1	 Poor connection of MAF SENSOR	If the eng shows "0 faulty M. noise in t

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 2	 MAF SENSOR normal	When th SPEED,

Which pattern is indicated?

Pattern 1

Check MAF sensor/IAT sensor 1 for loose terminals or poor connections. If the terminals and connections are OK, **substitute a known-good MAF sensor/IAT s**

Pattern 2

Go to step 6 (diagnosis by parameter (ECT SENSOR 1)).

6. On-board snapshot check (ECT SENSOR 1):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

-2. Select the ECT SENSOR 1 and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare ECT SENSOR 1 pattern from the charts, and determin

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 1	 ECT SENSOR 1 high	When EC deg.C) or sensor 1 PCM ma operation
Pattern 2	 ECT SENSOR 1 normal	If actual ECT sens

Which pattern is indicated?

Pattern 1

Check for a short in the ECT sensor 1 circuit and a failure in ECT sensor 1.

Pattern 2

Go to step 7.

7. ECT sensor 1 check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Let the engine cool for 24 hours.

-3. Measure the ambient temperature of the engine with the thermometer.

-4. Turn the vehicle to the ON mode, but do not start the engine.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions
	Values
ECT SENSOR 1	B
ECT SENSOR 2	B

Are the values of ECT SENSOR 1, ECT SENSOR 2, and the ambient temperature almost the same?

YES

Go to step 8 (diagnosis by parameter (BATTERY)).

NO

If the value of ECT SENSOR 1 is much higher (or lower) than that of ECT SENSOR 2 and the ambient temperature, check for the ECT sensor 1 circuit and a fail

8. On-board snapshot check (BATTERY):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

Select the BATTERY and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the BATTERY pattern from the charts, and determine t

Pattern	Symptom (Diagnosis by parameter)	Additio
Pattern 1	 BATTERY voltage low	• Wl lov cau • Fo (fu
Pattern 2	 BATTERY voltage normal	If the BA engine st

Which pattern is indicated?

Pattern 1

Test the 12 volt battery , and check the 12 volt battery cables and terminals.

Pattern 2

Go to step 9 (diagnosis by parameter (CKP NO PULSE)).

9. On-board snapshot check (CKP NO PULSE):

   NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

   -1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

   On-board Snapshot

   -2. Select the CKP NO PULSE and ENGINE SPEED in the configuration list.

   Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the CKP NO PULSE pattern from the charts, and deter

Pattern	**Symptom (Diagnosis by parameter)**	**Addition**
Pattern 1	 Count is continuously up	When C receiving
Pattern 2	 Count is continuously not up	B

   Which pattern is indicated?

   Pattern 1

   Go to the troubleshooting for DTC P0335 .

   Pattern 2

   Go to step 10 (diagnosis by parameter (CKP NOISE)).

10. On-board snapshot check (CKP NOISE):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

    On-board Snapshot

    -2. Select the CKP NOISE and ENGINE SPEED in the configuration list.

    Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the CKP NOISE pattern from these charts, and determi

Pattern	Symptom (Diagnosis by parameter)	Additio
Pattern 1	 Count is continuously up	When CI receiving signal.
Pattern 2	 Count is continuously not up	B

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0339 .

Pattern 2

Go to step 11 (diagnosis by parameter (FUEL PRESSURE CONVERTED FROM PF SENSOR and FUEL PRESSURE DIRECT INJECTION SYSTEM)).

11. On-board snapshot or snapshot check (FUEL PRESSURE CONVERTED FROM PF SENSOR and FUEL PRESSURE DIRECT INJECTION SYSTEM):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

Select the FUEL PRESSURE CONVERTED FROM PF SENSOR, FUEL PRESSURE DIRECT INJECTION SYSTEM, and ENGINE SPEED in the configuratio

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the FUEL PRESSURE CONVERTED FROM PF SEN INJECTION SYSTEM patterns from these charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additio
Pattern 1	FUEL PRESSURE CONVERTED FROM PF SENSOR drops to almost 0 kPa before engine stalls 	If the FU SENSOR the engin - Fu - Fu - Sp - Fu - Fu - Hi

Which pattern is indicated?

1. Pattern 1

   Diagnostic procedure:

   - Check the fuel pump operation sound.
   - **Go to the fuel pressure test**.
   - **Go to the fuel pump circuit troubleshooting**.
   - **Test the relay circuit board (PGM-FI main relay 1 circuit)** .
   - **Test PGM-FI main relay 2** .
   - Check the following fuses:
   -
     - No. A7 (15 A) fuse (in the under-hood fuse/relay box)
     - No. D8 (15 A) fuse (in the under-dash fuse/relay box)

   Pattern 3

   Check the EVAP canister purge valve for leaks.

   Pattern 2 and 4

   Go to step 13 (diagnosis by parameter (MISFIRE)).

13. On-board snapshot check (MISFIRE):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

-2. Select the MISFIRE and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare those snapshots to the MISFIRE pattern from the chart

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Engine stalls after MISFIRE counts go up	When en the engin
Pattern 2	Normal when engine stalls with MISFIRE count remaining constant 	If the MI engine st

Which pattern is indicated?

Pattern 1

Diagnostic procedure:

- If misfire counts go up without storing misfire DTC P0300 - P0304, **go to the troubleshooting for DTC P0300 - P0304** .
- If the misfire count reaches the malfunction threshold, DTC P0300 - P0304 is stored. **Go to the troubleshooting for DTC P0300 - P0304** .

Pattern 2

Go to step 14 (diagnosis by parameter (A/C CLUTCH)).

14. On-board snapshot check (A/C CLUTCH):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

-2. Select the A/C CLUTCH and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the A/C CLUTCH pattern from the charts, and determi

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Engine stalls when A/C CLUTCH is ON.	If the eng compress by excess

Pattern	Symptom (Diagnosis by parameter)	Additio
Pattern 2	 Engine stalls during A/C CLUTCH is OFF.	If the eng compress cause of

Which pattern is indicated?

Pattern 1

Diagnostic procedure:

- Check for over-charge A/C refrigerant.
- Check for charging with the wrong refrigerant.
- Check for drag of the A/C compressor and A/C compressor clutch.

Pattern 2

Go to step 15 (diagnosis by parameter (PNP SWITCH)).

15. On-board snapshot check (PNP SWITCH):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

-2. Select the PNP SWITCH and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the PNP SWITCH pattern from the charts, and determi

Pattern	Symptom (Diagnosis by parameter)	Additio

Which pattern is indicated?

Pattern 1

Go to step 16 (diagnosis by parameter (SLIP RATIO OF TORQ OR STARTCLUTCH)).

Pattern 2

Go to step 17 (fuel system troubleshooting).

16. On-board snapshot check (SLIP RATIO OF TORQ OR STARTCLUTCH):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

    On-board Snapshot

    -2. Select the SLIP RATIO OF TORQ OR STARTCLUTCH, ENGINE SPEED, and VEHICLE SPEED in the configuration list.

    Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the SLIP RATIO OF TORQ OR STARTCLUTCH patt problem.

Pattern	**Symptom (diagnosis by parameter)**	**Additio**
Pattern 1	 Engine stall caused by lock-up	When en STARTC stopping.
Pattern 2	 Lock-up normal	Lock-up RATIO C the midd

    Which pattern is indicated?

    Pattern 1

    Go to the DCT systems symptom troubleshooting index for torque converter clutch does not disengage; engine stalls easily .

    Pattern 2

    Go to step 17 (fuel system troubleshooting).

17. Fuel pressure check (low pressure side)

    -1. **Do the fuel pressure test**.

    Is the fuel pressure OK?

    YES

    Go to step 18 (ignition system troubleshooting).

    NO

    Check for following parts:

    - **Fuel pump circuit**
    - **Fuel pressure regulator**
    - **Fuel filter**

18. Spark plug visual check

    -1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the spark plugs** .

-3. **Check the condition of the spark plug electrodes** .

NOTE: Make sure the spark plugs are the correct part number for the vehicle. If the plugs are aftermarket or they are not the correct part number, replace all of th

Is the electrode damaged or wet?

1. YES (wet)

   Check the following conditions. If those conditions do not apply, go to step 19.

   - In very cold conditions, multiple very short trips can cause the spark plug to foul. If this is the case, drive the vehicle a longer distance and recheck.
   - Incorrect or poor quality fuel can cause a wet spark plug. Replace the fuel and recheck.

   YES (damaged)

   Replace the damaged spark plugs , determine the cause of the spark plug damage.

   NO

   Go to step 19.

19. Determine possible failure area (ignition system, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Fit a spark plug to the ignition coil and ground it to the engine.

-3. Turn the vehicle to the ON mode.

-4. Select ALL INJECTORS STOP in the INSPECTION MENU with the HDS, and stop fuel injection from the injector.

ALL INJECTORS STOP

Crank the engine and watch for spark at the spark plugs.

Do the spark plugs sparkΩ

YES

Select PCM reset in the PGM-FI INSPECTION MENU to cancel ALL INJECTORS STOP with the HDS, then go to step 21 (engine compression troubleshooting

NO

Go to step 20.

20. Ignition coil power circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

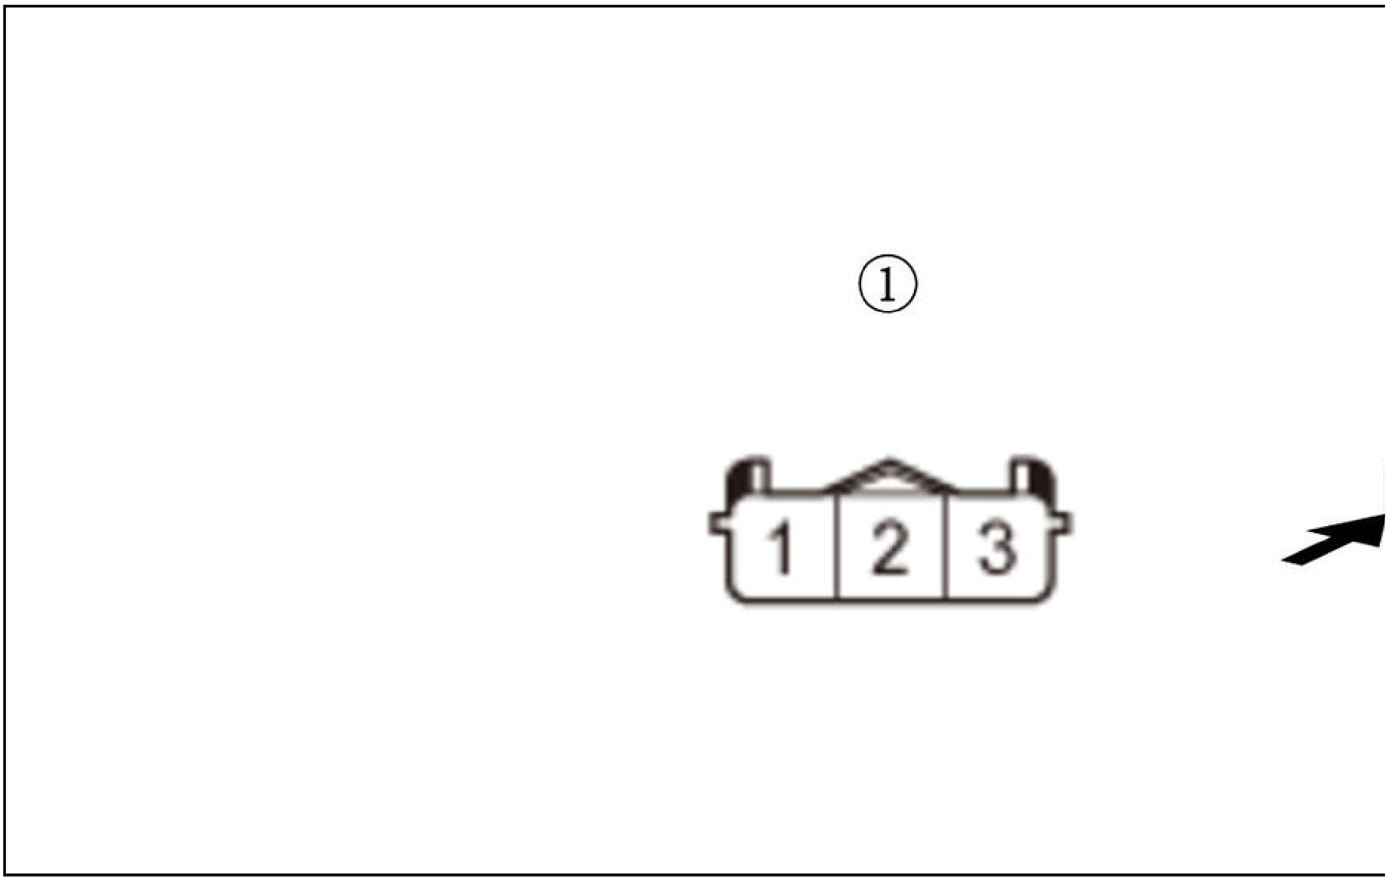
-2. Disconnect the following connector(s).

Ignition coil(s) 3P connector from the problem cylinder

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Ignition coil 3P connector (problem cylinder): disconnected
Test point 1	Ignition coil 3P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The ignition coil power circuit is OK. **Replace the ignition coil(s)** .

NO

Repair an open in the IG COIL RLY OUT/IG1(COIL)/IG1(IGN) wire between the relay circuit board and the ignition coil.

21. Engine compression check

-1. **Do an engine compression inspection** .

Is the engine compression OK?

YES

Go to step 22 (EVAP canister purge valve check).

NO

Check for wear or damage to these parts:

- Incorrect valve clearance
- Confirmation of cam timing
- Oil pressure relief valve
- Damage or worn cam lobes
- Damage or worn valve and seats
- Damage cylinder head gasket
- Damage or worn piston rings
- Damage or worn piston and cylinder bore

22. EVAP canister purge valve check

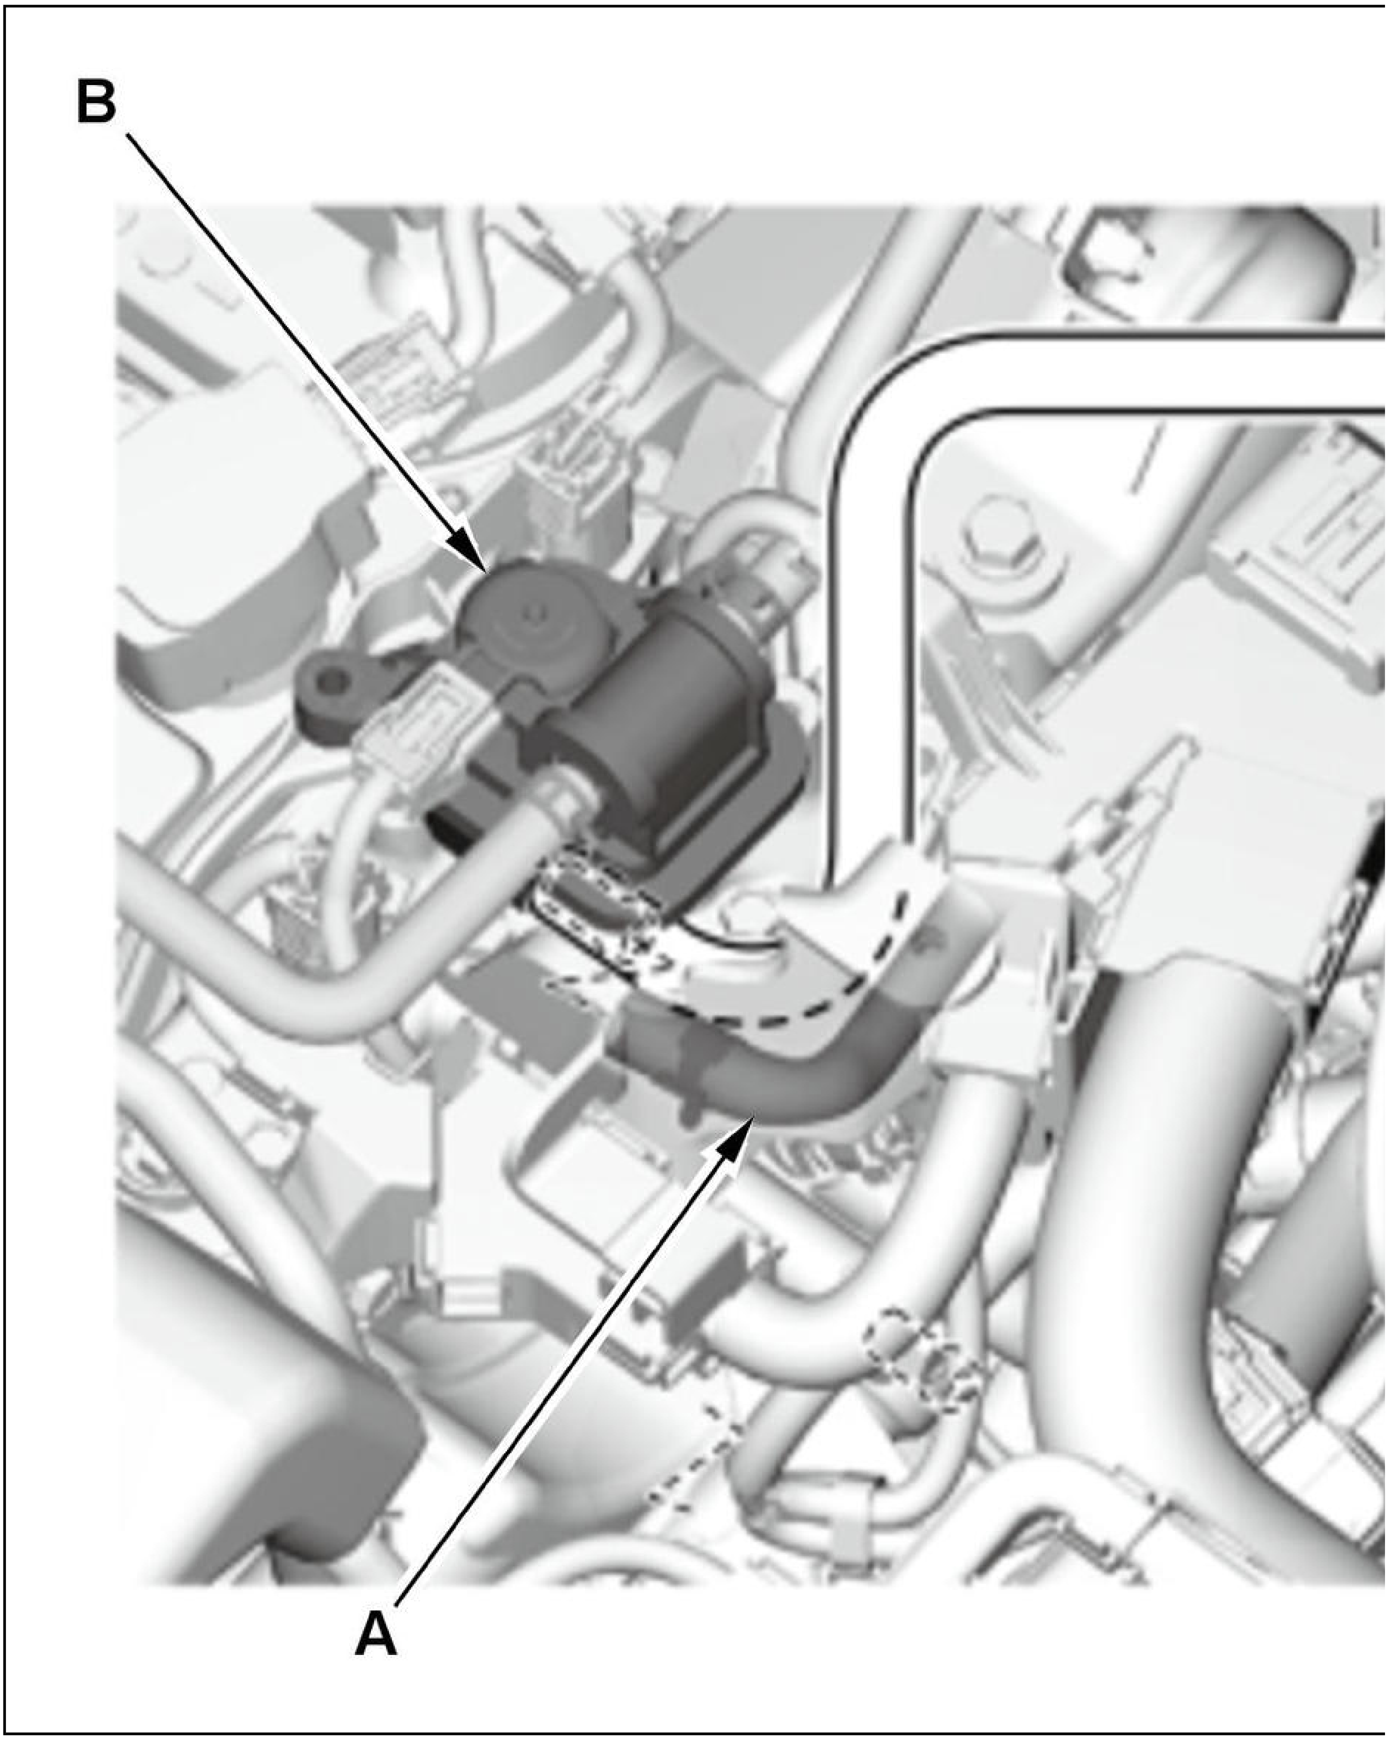
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP canister purge valve 2P connector

-3. **Remove the EVAP canister purge valve** with its vacuum hose connected.

-4. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 inHg



-5. Start the engine.

Does the vacuum pump indicate vacuum?

YES

When the climate is warm, fuel vapor from the canister line to the fuel tank enters intake manifold, enriching mixture (excessively rich), causing the engine to stal
canister purge valve .

NO (Reproducible failure)

Go to step 23 (fuse check).

NO (Intermittent failure)

Go to step 24 (relay check).

23. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuses.

Fuse	No. A7 (15 A) to relay circuit board (PGM-FI main relay 1 circuit)
	No. A15 (15 A) to relay circuit board (ignition coil relay circuit)
	No. A8 (15 A) to relay circuit board (PGM-FI subrelay circuit)
	No. A10 (20 A) to injector relay
Location	Under-hood fuse/relay box

Fuse	No. D8 (15 A) to PGM-FI main relay 2
Location	Under-dash fuse/relay box

Are the fuses OK?

YES

Go to step 24 (relay check).

NO

Replace the blown fuse(s).

24. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

Test the following relays:

NOTE: In situations where the failure is difficult to reproduce, the following relays may have an intermittent failure.

- **Relay circuit board (includes PGM-FI main relay 1 circuit, ignition coil relay circuit, PGM-FI subrelay circuit)**
- **PGM-FI main relay 2**
- **Injector relay**

Are the relay circuit board and the relays OK?

YES

Go to step 25 (power and ground terminal check).

NO

Replace any damaged relay(s).

25. Power and ground terminal check:

Check the corrosion and looseness at the following terminals:

- 12 volt battery terminals
- Ground cable terminals between the engine and the body ground, and the transmission and the body ground
- Engine wire harness ground (G101, G102)

Are the terminals OK?

YES

Go to step 26 (connector terminal check).

NO

Repair any terminal(s) as needed.

26. Connector terminal check:

Check the foreign objects clogged and corrosion at the following connector terminals:

- **PCM connectors**
-
    - FI MAIN RLY OUT, FI MAIN RLY CL-
    - FUEL PUMP RLY CL-
    - INJ RLY OUT
    - FI SUB RLY OUT, FI SUB RLY CL-, +B VBACT
    - GND2, FI ECU GND, GND3, GND4, INJ GND1, INJ GND2
    - INJH1, INJL1, INJH2, INJL2, INJH3, INJL3, INJH4, INJL4
    - IGN01, IGN02, IGN03, IGN04
    - HPUMP H, HPUMP L
    - TDCAM
    - CRKP
    - PB

        - FGP
        - TW
        - IPV
        - MTR1, MTR2, THL1, THL2
    - CMP sensor A
    - CKP sensor
    - Ignition coils
    - Injectors
    - High pressure fuel pump
    - ECT sensor 1
    - MAF sensor/IAT sensor 1
    - MAP sensor
    - Throttle body
    - EVAP canister purge valve
    - Fuel tank unit

    Are the terminals OK?

    YES

    Go to the diagnostic interview for engine stalls.

    NO

    Repair any terminal(s) as needed.

Engine stalls (2.4 L Engine) (2017 2018 2019)

Engine stalls

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before beginning this troubleshooting, do a customer diagnostic interview.
-
    - When the symptom cannot be duplicated, you can do the troubleshooting using the on-board snapshot information in this procedure . Refer to the dia total mileage, and compare the total mileage which is estimated from the interview when a failure occurred and the parameter (total mileage) in the on-boar when the failure occurred corresponds with the date on which the on-board snapshot information was recorded. If it doesn't, the on-board snapshot informat
- Before beginning this troubleshooting:
-
    - Make sure the 12 volt battery is fully charged.
    - Make sure the fuel tank is at least 1/4 full.
    - Make sure the engine oil level is correct.
- After the troubleshooting, reset the PCM with the HDS to erase the on-board snapshot information recorded on the PCM.

1. DTC check

    -1. Turn the vehicle to the ON mode.

    -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC
B	B

    DTC (PGM-FI)

    Are any Pending or Confirmed DTCs indicated?

    YES

    Go to the indicated DTC's troubleshooting.

    NO

    Go to step 2.

    NOTE: If the HDS does not communicate with the vehicle, go to the PCM power and ground circuit troubleshooting .

2. Body electrical system DTC check

    -1. Check for body electrical system DTCs with the HDS.

DTC Description	DTC
B	B

    DTC (Body Control Module)

    Are any DTCs indicated?

    YES

Go to the troubleshooting for body electrical system DTC(s) .

NO

Go to step 3.

3. Problem verification:

   Set the HDS to record a HIGH-SPEED SNAPSHOT of following parameters for 30 seconds.

   - ENGINE SPEED
   - MAF SENSOR
   - ECT SENSOR 1
   - BATTERY
   - CKP NO PULSE
   - CKP NOISE
   - FUEL PRESSURE CONVERTED FROM PF SENSOR
   - FUEL PRESSURE DIRECT INJECTION SYSTEM
   - AF FB (ST FUEL TRIM)
   - EVAP PC DUTY
   - MISFIRE
   - A/C CLUTCH
   - PNP SWITCH
   - SLIP RATIO OF TORQ OR STARTCLUTCH

   Data List

   -2. Begin the snapshot, then start the engine and let it idle without load (in P or N).

   Did the engine stall?

   YES

   Go to step 5 (diagnosis by parameter (MAF SENSOR)).

   NO

   Go to step 4.

4. On-board snapshot check

   -1. Check for a record of Engine Stall 2 in the on-board snapshot with the HDS.

   On-board Snapshot

   Is there an Engine Stall 2 record in the on-board snapshot?

   YES

   Go to step 5 (diagnosis by parameter (MAF SENSOR)).

   NO

   Go to step 17 (fuel system troubleshooting).

   NOTE: If an engine stall on-board snapshot was not found, the snapshot may have been lost due to low battery voltage or because of battery disconnection or rep

5. On-board snapshot check (MAF SENSOR):

   NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of reproducible failure.

   -1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

   On-board Snapshot

   -2. Select the MAF SENSOR and ENGINE SPEED in the configuration list.

   Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the MAF SENSOR pattern from the charts, and determ

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Poor connection of MAF SENSOR	If the eng shows "0 faulty M. noise in t
Pattern 2	 MAF SENSOR normal	When the SPEED,

Which pattern is indicated?

Pattern 1

Check the MAF sensor/IAT sensor for loose terminals or poor connections. If the terminals and connections are OK, **substitute a known-good MAF sensor/IAT**

Pattern 2

The MAF sensor/IAT sensor is OK. Go to step 6 (diagnosis by parameter (ECT SENSOR 1)).

6. On-board snapshot check (ECT SENSOR 1):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

-2. Select the ECT SENSOR 1 and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare ECT SENSOR 1 pattern from the charts, and determin

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 ECT SENSOR 1 high	When EC deg.C) or sensor 1 PCM ma operation

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 2	 ECT SENSOR 1 normal	If actual ECT sen

Which pattern is indicated?

Pattern 1

Check for a short in the ECT sensor 1 circuit and a failure in ECT sensor 1.

Pattern 2

Go to step 7.

7. ECT sensor 1 check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Let the engine cool for 24 hours.

-3. Measure the ambient temperature of the engine with the thermometer.

-4. Turn the vehicle to the ON mode, but do not start the engine.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions
	Values
ECT SENSOR 1	B
ECT SENSOR 2	B

Are the values of ECT SENSOR 1, ECT SENSOR 2, and the ambient temperature almost the same?

YES

ECT sensor 1 is OK. Go to step 8 (diagnosis by parameter (BATTERY)).

NO

If the value of ECT SENSOR 1 is much higher (or lower) than that of ECT SENSOR 2, and the ambient temperature, check for the ECT sensor 1 circuit and a fail

8. On-board snapshot check (BATTERY):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

Select the BATTERY and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the BATTERY pattern from the charts, and determine t

Which pattern is indicated?

Pattern 1

Diagnostic procedure:

- Check for over-charge A/C refrigerant.
- Check for charging with the wrong refrigerant.
- Check for drag of the A/C compressor and A/C compressor clutch.

Pattern 2

Go to step 15 (diagnosis by parameter (PNP SWITCH)).

15. On-board snapshot check (PNP SWITCH):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

-2. Select the PNP SWITCH and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the PNP SWITCH pattern from the charts, and determi

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 CVT is in-gear condition	In-gear c Engine st factor)

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 2	 CVT is N or P condition	N or P co engine st CVT is n

Which pattern is indicated?

Pattern 1

Go to step 16 (diagnosis by parameter (SLIP RATIO OF TORQ OR STARTCLUTCH)).

Pattern 2

Go to step 17 (fuel system troubleshooting).

16. On-board snapshot check (SLIP RATIO OF TORQ OR STARTCLUTCH):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Check for a record of Engine Stall 2 in the on-board snapshot or the recorded snapshot with the HDS.

    On-board Snapshot

    -2. Select the SLIP RATIO OF TORQ OR STARTCLUTCH, ENGINE SPEED, and VEHICLE SPEED in the configuration list.

    Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the SLIP RATIO OF TORQ OR STARTCLUTCH patt problem.

Pattern	Symptom (diagnosis by parameter)	Additior
Pattern 1	 Engine stall caused by lock up	When en STARTC stopping,
Pattern 2	 Lock up normal	Lock up RATIO C the midd

Which pattern is indicated?

Pattern 1

Go to the automatic transmission systems symptom troubleshooting index for torque converter clutch does not disengage .

Pattern 2

Go to step 17 (fuel system troubleshooting).

17. Fuel pressure check (low pressure side)

-1. Do the fuel pressure test.

Is the fuel pressure OK?

YES

Go to step 18 (ignition system troubleshooting).

NO

Check for following parts:

- Fuel pump circuit
- Fuel pressure regulator
- Fuel filter

18. Spark plug visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the spark plugs .

-3. Check the condition of the spark plug electrodes.

NOTE: Make sure the spark plugs are the correct part number for the vehicle. If the plugs are aftermarket or they are not the correct part number, replace all of th

Is the electrode damaged or wet?

1. YES (wet)

   Check the following conditions. If those conditions do not apply, go to step 19.

   - In very cold conditions, multiple very short trips can cause the spark plug to foul. If this is the case, drive the vehicle a longer distance and recheck.
   - Incorrect or poor quality fuel can cause a wet spark plug. Replace the fuel and recheck.

   YES (damaged)

   Replace the damaged spark plugs , determine the cause of the spark plug damage.

   NO

   Go to step 19.

19. Determine possible failure area (ignition system, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Fit a spark plug to the ignition coil and ground it to the engine.

-3. Turn the vehicle to the ON mode.

-4. Select ALL INJECTORS in the INSPECTION MENU with the HDS, and stop fuel injection from the injector.

ALL INJECTORS STOP

Crank the engine and watch for spark at the spark plugs.

Do the spark plugs sparkΩ

YES

The ignition system is OK. Select PCM reset in the PGM-FI INSPECTION MENU to cancel ALL INJECTORS with the HDS, then go to step 21 (engine compre

NO

Go to step 20.

20. Ignition coil power circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector(s).

Ignition coil(s) 3P connector from the problem cylinder

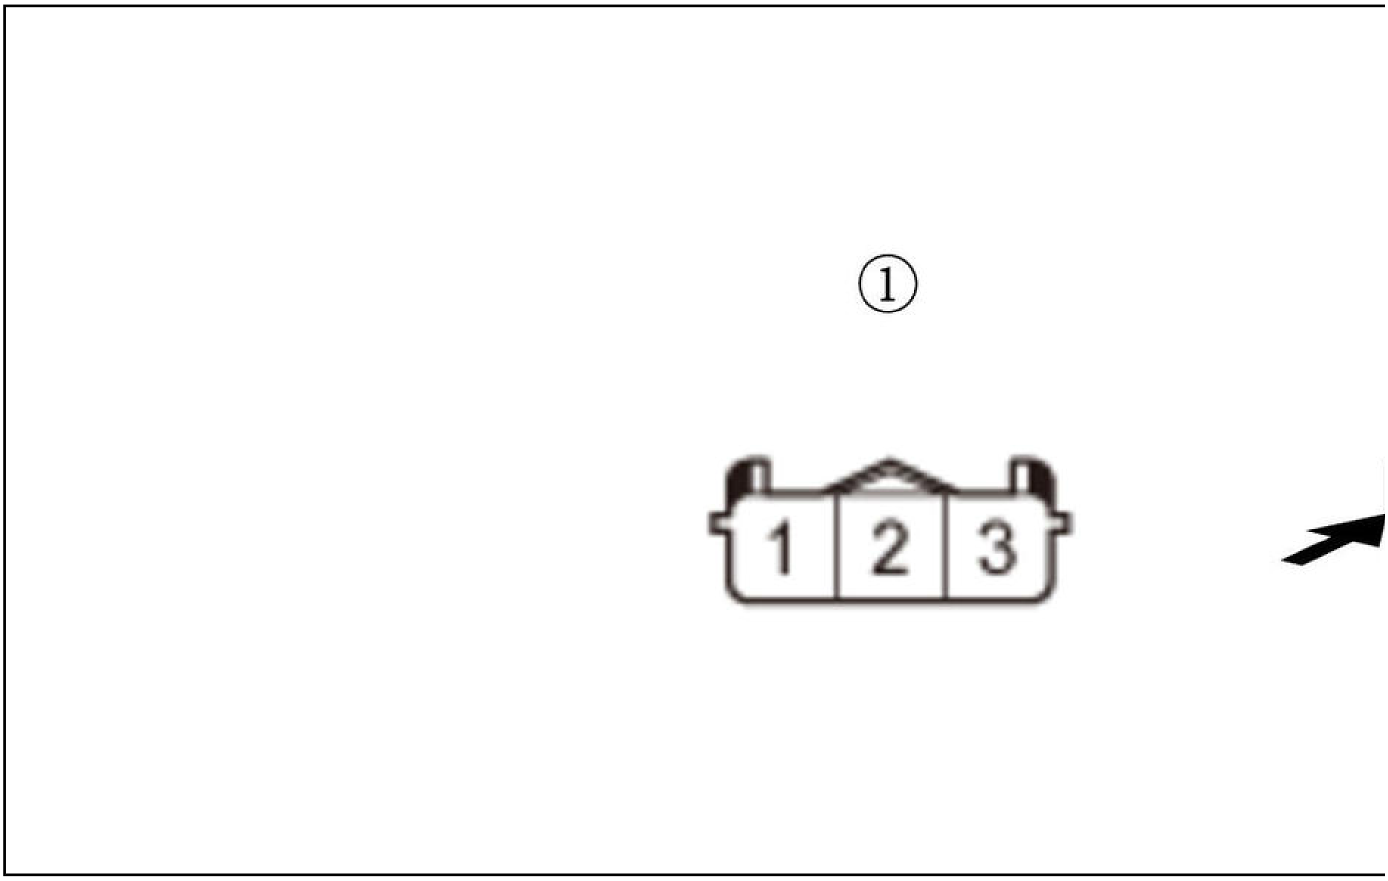
-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Ignition coil 3P connector (problem cylinder): disconnected

Test point 1	Ignition coil 3P connector (female terminal) No. 1: ①

Test point 2	Body ground



Is there battery voltage?

YES

The ignition coil power circuit is OK. **Replace the ignition coil(s)** .

NO

Repair an open in the IG COIL RLY OUT/IG1(COIL)/IG1(IGN) wire between the relay circuit board and the ignition coil.

21. Engine compression check

-1. **Do an engine compression inspection** .

Is the engine compression OK?

YES

Go to step 22 (EVAP canister purge valve check).

NO

Check for wear or damage to these parts:

- Incorrect valve clearance
- Confirmation of cam timing
- Oil pressure relief valve
- Damage or worn cam lobes
- Damage or worn valve and seats
- Damage cylinder head gasket
- Damage or worn piston rings
- Damage or worn piston and cylinder bore

22. EVAP canister purge valve check

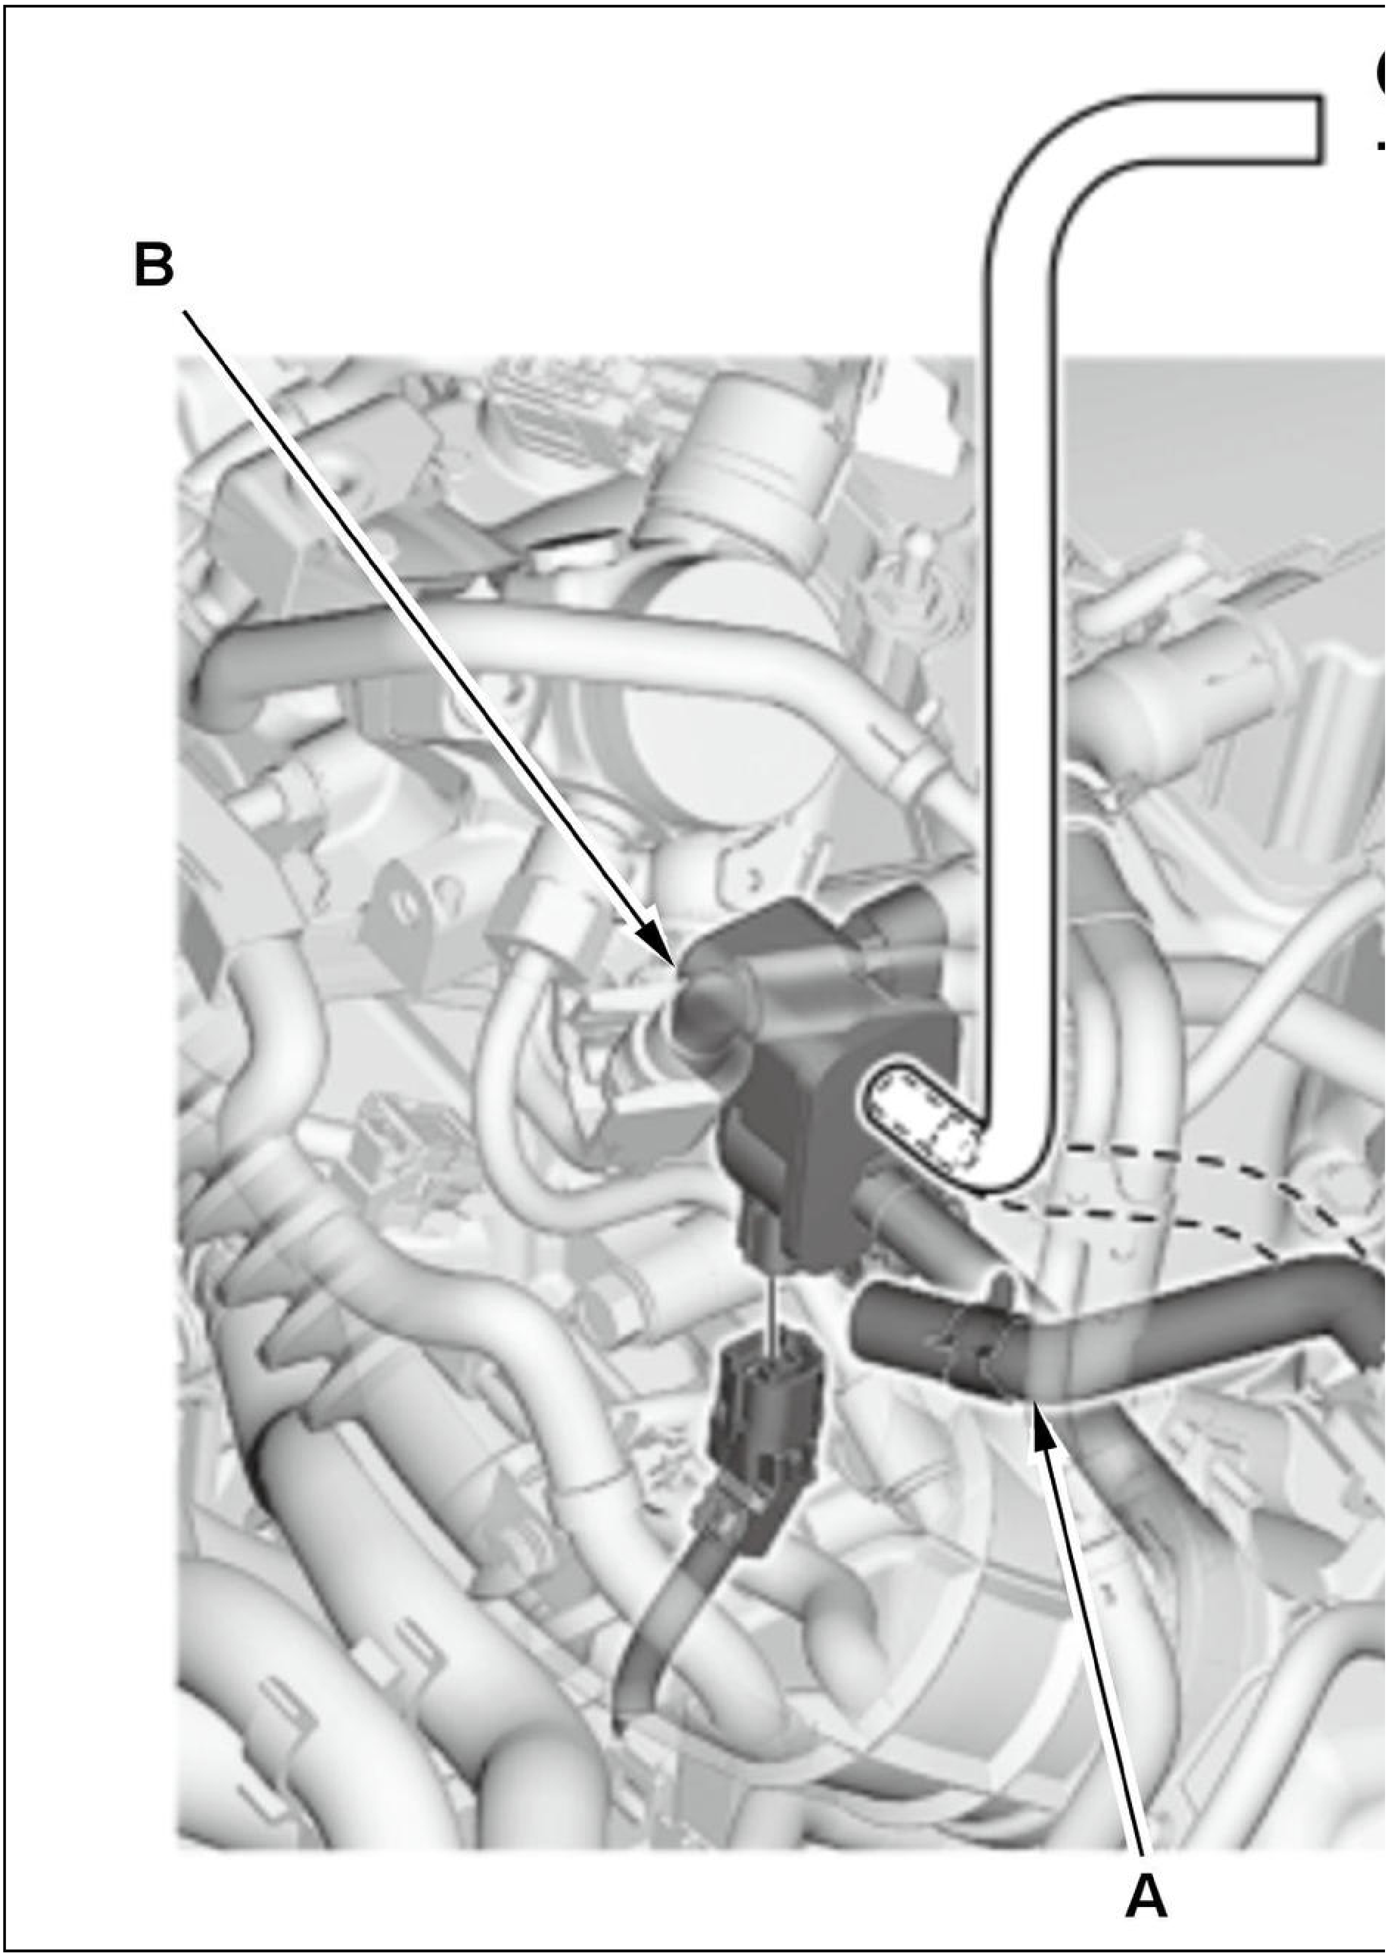
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the high pressure fuel pump cover and the fuel bracket.

-3. Disconnect the following connector.

EVAP canister purge valve 2P connector

-4. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 inHg (C) to the



-5. Start the engine.

Does the vacuum pump indicate vacuum?

YES

When the climate is warm, fuel vapor from the canister line to the fuel tank enters intake manifold, enriching mixture (excessively rich), causing the engine to stal
canister purge valve .

NO (Reproducible failure)

Go to step 23 (fuse check).

NO (Intermittent failure)

Go to step 24 (relay check).

23. Fuse check

-1. Check the following fuses.

Fuse	No. A7 (15 A) to relay circuit board (PGM-FI main relay 1 circuit)
	No. A15 (15 A) to relay circuit board (ignition coil relay circuit)
	No. A8 (15 A) to relay circuit board (PGM-FI subrelay circuit)
	No. A10 (20 A) to injector relay
Location	Under-hood fuse/relay box

Fuse	No. D8 (15 A) to PGM-FI main relay 2
Location	Under-dash fuse/relay box

Are the fuses OK?

YES

The fuses are OK. Go to step 24 (relay check).

NO

Replace the blown fuse(s).

24. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

Test the following relays:

NOTE: In situations where the failure is difficult to reproduce, the following relays may have an intermittent failure.

- **Relay circuit board (includes PGM-FI main relay 1 circuit, ignition coil relay circuit, PGM-FI subrelay circuit)**
- **PGM-FI main relay 2**
- **Injector relay**

Are the relay circuit board and the relays OK?

YES

Go to step 25 (power and ground terminal check).

NO

Replace any damaged relays.

25. Power and ground terminal check:

Check the corrosion and looseness at the following terminals:

- 12 volt battery terminals
- Ground cable terminals between the engine and the body ground, and the transmission and the body ground
- Engine wire harness ground (G101)

Are the terminals OK?

YES

Go to step 26 (connector terminal check).

NO

Repair any terminal(s) as needed.

26. Connector terminal check:

Check the foreign objects clogged and corrosion at the following connector terminals:

- **PCM connectors**
-
    - FI MAIN RLY OUT, FI MAIN RLY CL
    - VBDBW, DBW RLY
    - IG1 FUEL PUMP, FUEL PUMP RLY CL
    - INJ RLY OUT, INJ RLY CL
    - GND1, GND2, GND3, PGM, GND INJ1, GND INJ2
    - INJ H1, INJ L1, INJ H2, INJ L2, INJ H3, INJ L3, INJ H4, INJ L4

        - IGN01, IGN02, IGN03, IGN04
        - HPUMP H, HPUMP L
        - CAM
        - TDC
        - CRKN
        - PB
        - VGP, VGM
        - TW
        - PCS
        - MTR1, MTR2, THL1, THL2
    - CMP sensor A
    - CMP sensor B
    - CKP sensor
    - Ignition coils
    - Injectors
    - High pressure fuel pump
    - ECT sensor
    - MAF sensor
    - MAP sensor
    - Throttle body
    - EVAP canister purge valve
    - Fuel tank unit

Are the terminals OK?

YES

Go to the diagnostic interview for engine stalls.

NO

Repair any terminal(s) as needed.

Engine will not start, engine starts but stalls immediately, or engine is hard to start (1.5 L Engine)

Engine will not start, engine starts but stalls immediately, or engine is hard to start

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before beginning this troubleshooting, do a customer diagnostic interview.
-
    - When the symptom cannot be duplicated, you can do the troubleshooting using the on-board snapshot information in this procedure . Refer to the dia total mileage, and compare the total mileage which is estimated from the interview when a failure occurred and the parameter (total mileage) in the on-boar when the failure occurred corresponds with the date on which the on-board snapshot information was recorded. If it doesn't, the on-board snapshot informat
- Before beginning this troubleshooting:
-
    - Make sure the 12 volt battery is fully charged.
    - Make sure the fuel tank is at least 1/4 full.
    - Make sure the engine oil level is correct.
- After the troubleshooting, reset the PCM with the HDS to erase the on-board snapshot information recorded on the PCM.

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC
B	B

   DTC (PGM-FI)

   Are any Pending or Confirmed DTCs indicated?

   YES

   Go to the indicated DTCs troubleshooting.

   NO

   Go to step 2.

   NOTE: If the HDS does not communicate with the vehicle, go to the PCM power and ground circuit troubleshooting .

2. Body electrical system DTC check

   -1. Check for body electrical system DTCs with the HDS.

DTC Description	DTC
B	B

DTC (Body Control Module)

Are any DTCs indicated?

YES

Go to the troubleshooting for body electrical system DTC(s) .

NO

Go to step 3.

3. Immobilizer check

   -1. **Check the Immobilizer status log** .

   NOTE: When a status log count is found, it means the immobilizer system has kept the engine from starting in the past. The number of status log count shows ho starting in the past. If the immobilizer system has no status log count, the system is normal.

   Were any status log counts found?

   YES

   Check for probable cause of the status log .

   NO

   Go to step 4.

4. Problem verification (snapshot sampling):

   Set the HDS to record a SNAPSHOT of following parameters for 30 seconds.

   - IMMOBILIZER
   - ENGINE SPEED
   - BATTERY
   - ECT SENSOR 1
   - MAP SENSOR (HI RES)
   - MAF SENSOR
   - FUEL PRESSURE CONVERTED FROM PF SENSOR
   - FUEL PRESSURE DIRECT INJECTION SYSTEM
   - CMP B NO PULSE
   - CMP B NOISE
   - CKP NO PULSE
   - CKP NOISE

   Data List

   -2. Begin the snapshot, then try to start the engine.

   Is the engine hard to start?

   YES

   Go to step 6 (diagnosis by parameter troubleshooting).

   NO

   Go to step 5.

5. On-board snapshot check (Engine will not start)

   -1. Check the record of Hard to Start Engine in the on-board snapshot with the HDS.

   On-board Snapshot

   Is the Hard to Start Engine in the on-board snapshot recorded?

   YES

   Go to step 6 (diagnosis by parameter troubleshooting).

   NO

   Go to step 18 (fuel system troubleshooting).

   NOTE: In case of the following conditions, the on-board snapshot cannot be recorded.

   - The vehicle is turned to the OFF (LOCK) mode after starting the engine.
   - **Vehicle condition not in the on-board snapshot recoding zone of Hard to start engine** .
   - Low or dead 12 volt battery
   - Replacing the 12 volt battery

6. On-board snapshot or snapshot check (IMMOBILIZER):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

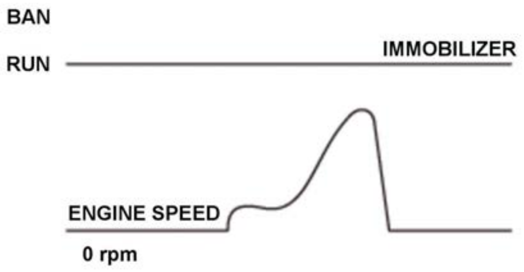
Select the IMMOBILIZER and ENGINE SPEED in the configuration list.

Compare the snapshot parameters observed while the engine was cranking, to those in the chart below, to determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 1	 IMMOBILIZER inhibit IMMOBILIZER inhibit 	When IM cranking IMMOB - Nc

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 2	 IMMOBILIZER permit Normal IMMOBILIZER permit Normal	IMMOB indicates

Pattern	Symptom (Diagnosis by parameter)	Addition
		



Which pattern is indicated?

Pattern 1

The immobilizer system has a failure. **Go to the immobilizer System Check** .

Pattern 2

Go to step 7 (diagnosis by parameter (ENGINE SPEED)).

7. On-board snapshot or snapshot check (ENGINE SPEED):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

-2. Select the ENGINE SPEED pattern chart in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 ENGINE SPEED when cranking is normal	B
Pattern 2	 ENGINE SPEED when cranking is low	When EN 12 volt b considere

Which pattern is indicated?

Pattern 1

Go to step 8 (diagnosis by parameter (BATTERY)).

Pattern 2

Diagnostic procedure:

- Test the 12 volt battery .
- Check the 12 volt battery cables and the connections.
- Check the starter .
- Check for engine friction.

8. On-board snapshot or snapshot check (BATTERY):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

Select the BATTERY and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the BATTERY pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 BATTERY voltage low when cranking	• Wl too en • Th rec
Pattern 2	 BATTERY voltage normal when cranking	To start t

Which pattern is indicated?

Pattern 1

Diagnostic procedure:

- Test the 12 volt battery .
- Check the 12 volt battery cables and the connections.

Pattern 2

Go to step 9 (diagnosis by parameter (ECT SENSOR 1)).

9. On-board snapshot or snapshot check (ECT SENSOR 1):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

-2. Select the ECT SENSOR 1 and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the ECT SENSOR 1 pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additio
Pattern 1	 ECT SENSOR 1 high when cranking	When EC deg.C) o low), EC compens warmed (not a fa
Pattern 2	 ECT SENSOR 1 normal when cranking	If actual indicated sensor 1

Which pattern is indicated?

Pattern 1

Check for a short in the ECT sensor 1 circuit and a failure in ECT sensor 1.

Pattern 2

Go to step 10.

10. ECT sensor 1 check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Let the engine cool for 24 hours.

-3. Measure the ambient temperature of the engine with the thermometer.

-4. Turn the vehicle to the ON mode, but do not start the engine.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions
	Values
ECT SENSOR 1	B
ECT SENSOR 2	B

Are the values of ECT SENSOR 1, ECT SENSOR 2, and the ambient temperature almost the same?

YES

Go to step 11 (diagnosis by parameter (MAP SENSOR (HI RES))).

NO

If the value of ECT SENSOR 1 is much higher (or lower) than that of ECT SENSOR 2 and the ambient temperature, check for the ECT sensor 1 circuit and a fail

11. On-board snapshot or snapshot check (MAP SENSOR (HI RES)):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

-2. Select the MAP SENSOR (HI RES) and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the MAP SENSOR (HI RES) pattern to the pattern from the chart below, and

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	MAP SENSOR detects no change of pressure when cranking 	When M when cra be clogg fuel injec signal wh
Pattern 2	Normal when MAP SENSOR detects vacuum when cranking 	When M cranking pressure

Which pattern is indicated?

Pattern 1

Check the pressure measurement port of the MAP sensor for clogging, foreign objects, etc.

Pattern 2

Go to step 12 (diagnosis by parameter (MAF SENSOR)).

12. On- board snapshot or snapshot check (MAF SENSOR):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or the snapshot with the HDS.

On-board Snapshot

-2. Select the MAF SENSOR and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the MAF SENSOR pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Poor connection of MAF SENSOR	Complet indicates becomes there may connecto

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 2	 MAF SENSOR output incorrect	When M after star port may a poor co

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 3	 MAF SENSOR Normal	When M ENGINE MAF ser

Which pattern is indicated?

Pattern 1 and 2

Check for poor connections or loose terminals at MAF sensor/IAT sensor 1.

Pattern 3

Go to step 13 (diagnosis by parameter (FUEL PRESSURE CONVERTED FROM PF SENSOR and FUEL PRESSURE DIRECT INJECTION SYSTEM)).

13. On-board snapshot or snapshot check (FUEL PRESSURE CONVERTED FROM PF SENSOR and FUEL PRESSURE DIRECT INJECTION SYSTEM):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

Select the FUEL PRESSURE CONVERTED FROM PF SENSOR, the FUEL PRESSURE DIRECT INJECTION SYSTEM, and ENGINE SPEED in the configu

Check the recorded snapshot or on-board snapshot parameters while the engine is cranking, then compare the FUEL PRESSURE CONVERTED FROM PF SENS INJECTION SYSTEM patterns from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	The FUEL PRESSURE CONVERTED FROM PF SENSOR is low (almost 0 kPa) when cranking 	If the FU SENSOR may exis • Fu • Fu • Sp • Fu • Fu • Hi

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 2	Normal when the FUEL PRESSURE CONVERTED FROM PF SENSOR follows the FUEL PRESSURE DIRECT  INJECTION SYSTEM when cranking	If the FU SENSOR PRESSU cranking Fuel pres

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0087 .

Pattern 2

Go to step 14 (diagnosis by parameter (CMP B NO PULSE)).

14. On-board snapshot or snapshot check (CMP B NO PULSE):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

-2. Select the CMP B NO PULSE and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the CMP B NO PULSE pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Count is continuously up	When C cranking is not rec be ignite
Pattern 2	 Count is continuously not up	Count is

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0340 . If the CMP B NO PULSE count reaches the malfunction threshold, DTC P0340 will set. Check for poor connection

Pattern 2

Go to step 15 (diagnosis by parameter (CMP B NOISE)).

15. On-board snapshot or snapshot check (CMP B NOISE):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

    On-board Snapshot

    -2. Select the CMP B NOISE and ENGINE SPEED in the configuration list.

    Check the recorded snapshot parameters while the engine is cranking, then compare the CMP B NOISE pattern from the chart, and determine the problem.

Pattern	**Symptom (Diagnosis by parameter)**	**Additio**
Pattern 1	 Count is continuously up	When C there is n has noise ignited a
Pattern 2	 Count is continuously not up	Count is

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0344 . If the CMP B NOISE count reaches the malfunction threshold, DTC P0344 will set. Check for poor connections an

Pattern 2

Go to step 16 (diagnosis by parameter (CKP NO PULSE)).

16. On-board snapshot or snapshot check (CKP NO PULSE):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

    On-board Snapshot

    -2. Select the CKP NO PULSE and ENGINE SPEED in the configuration list.

    Check the recorded snapshot parameters while the engine is cranking, then compare the CKP NO PULSE pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Count is continuously up	When th cranking pulse.
Pattern 2	 Count is continuously not up	Count is

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0335 . If the CKP NO PULSE count reaches the malfunction threshold, DTC P0335 will set. Check for poor connections a

Pattern 2

Go to step 17 (diagnosis by parameter (CKP NOISE)).

17. On-board snapshot or snapshot check (CKP NOISE):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

-2. Select the CKP NOISE and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the CKP NOISE pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Count is continuously up	When th cranking pulse.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 2	 Count is continuously not up	Count is

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0339 . If the CKP NOISE count reaches the malfunction threshold, DTC P0339 will set. Check for poor connections and lc check for aftermarket accessories.

Pattern 2

Go to step 18 (fuel system troubleshooting).

18. Fuel pressure check (low pressure side)

-1. **Do the fuel pressure test**.

Is the fuel pressure OK?

YES

Go to step 19 (ignition system troubleshooting).

NO

Check the following parts:

- **Fuel pump circuit**
- **Fuel pressure regulator**
- **Fuel filter**

19. Spark plug visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the spark plugs** .

-3. Check the condition of the spark plug electrodes.

NOTE: Make sure the spark plugs are the correct part number for the vehicle. If the plugs are aftermarket or they are not the correct part number, replace all of th

Is the electrode damage or wet?

1. YES (wet)

   Check the following conditions. If those conditions do not apply, go to step 20.

   - In very cold conditions, multiple very short trips can cause the spark plug to foul. If this is the case, drive the vehicle a longer distance and recheck.
   - Incorrect or poor quality fuel can cause a wet spark plug. Replace the fuel and recheck.

   YES (damaged)

   Replace the damaged spark plug(s) , determine the cause of the spark plug damage.

   NO

   Go to step 20.

20. Determine possible failure area (ignition system, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Fit a spark plug to the ignition coil and ground it to the engine.

-3. Turn the vehicle to the ON mode.

-4. Select ALL INJECTORS STOP in the INSPECTION MENU with the HDS, and stop fuel injection from the injector.

ALL INJECTORS STOP

Crank the engine and watch for spark at the spark plug.

Does the spark plug sparkΩ

YES

Select PCM reset in the PGM-FI INSPECTION MENU to cancel ALL INJECTORS STOP with the HDS, then go to step 22 (engine compression troubleshooting

NO

Go to step 21.

21. Ignition coil power circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

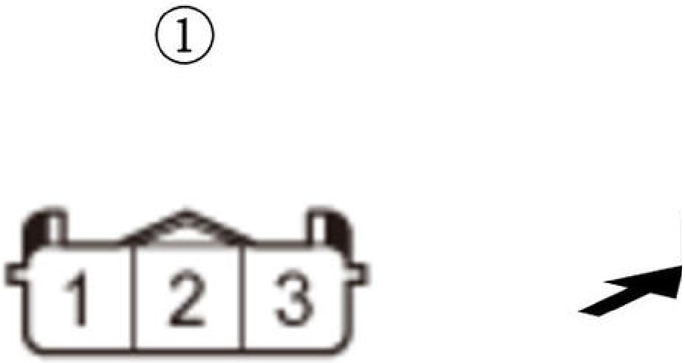
-2. Disconnect the following connector(s).

Ignition coil(s) 3P connector from the problem cylinder

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Ignition coil 3P connector: disconnected
Test point 1	Ignition coil 3P connector (female terminal) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The ignition coil power circuit is OK. **Replace the ignition coil(s)** .

NO

Repair an open in the IG COIL RLY OUT/IG1(COIL)/IG1(IGN) wire between the ignition coil relay circuit and the ignition coil.

22. Engine compression check

-1. **Do an engine compression inspection** .

Is engine compression OK?

YES

Go to step 23 (EVAP canister purge valve check).

NO

Check for wear or damage to these parts:

- Incorrect valve clearance
- Confirmation of cam timing
- Oil pressure relief valve
- Damage or worn cam lobes
- Damage or worn valve and seats
- Damage cylinder head gasket
- Damage or worn piston rings
- Damage or worn piston and cylinder bore

23. EVAP canister purge valve check

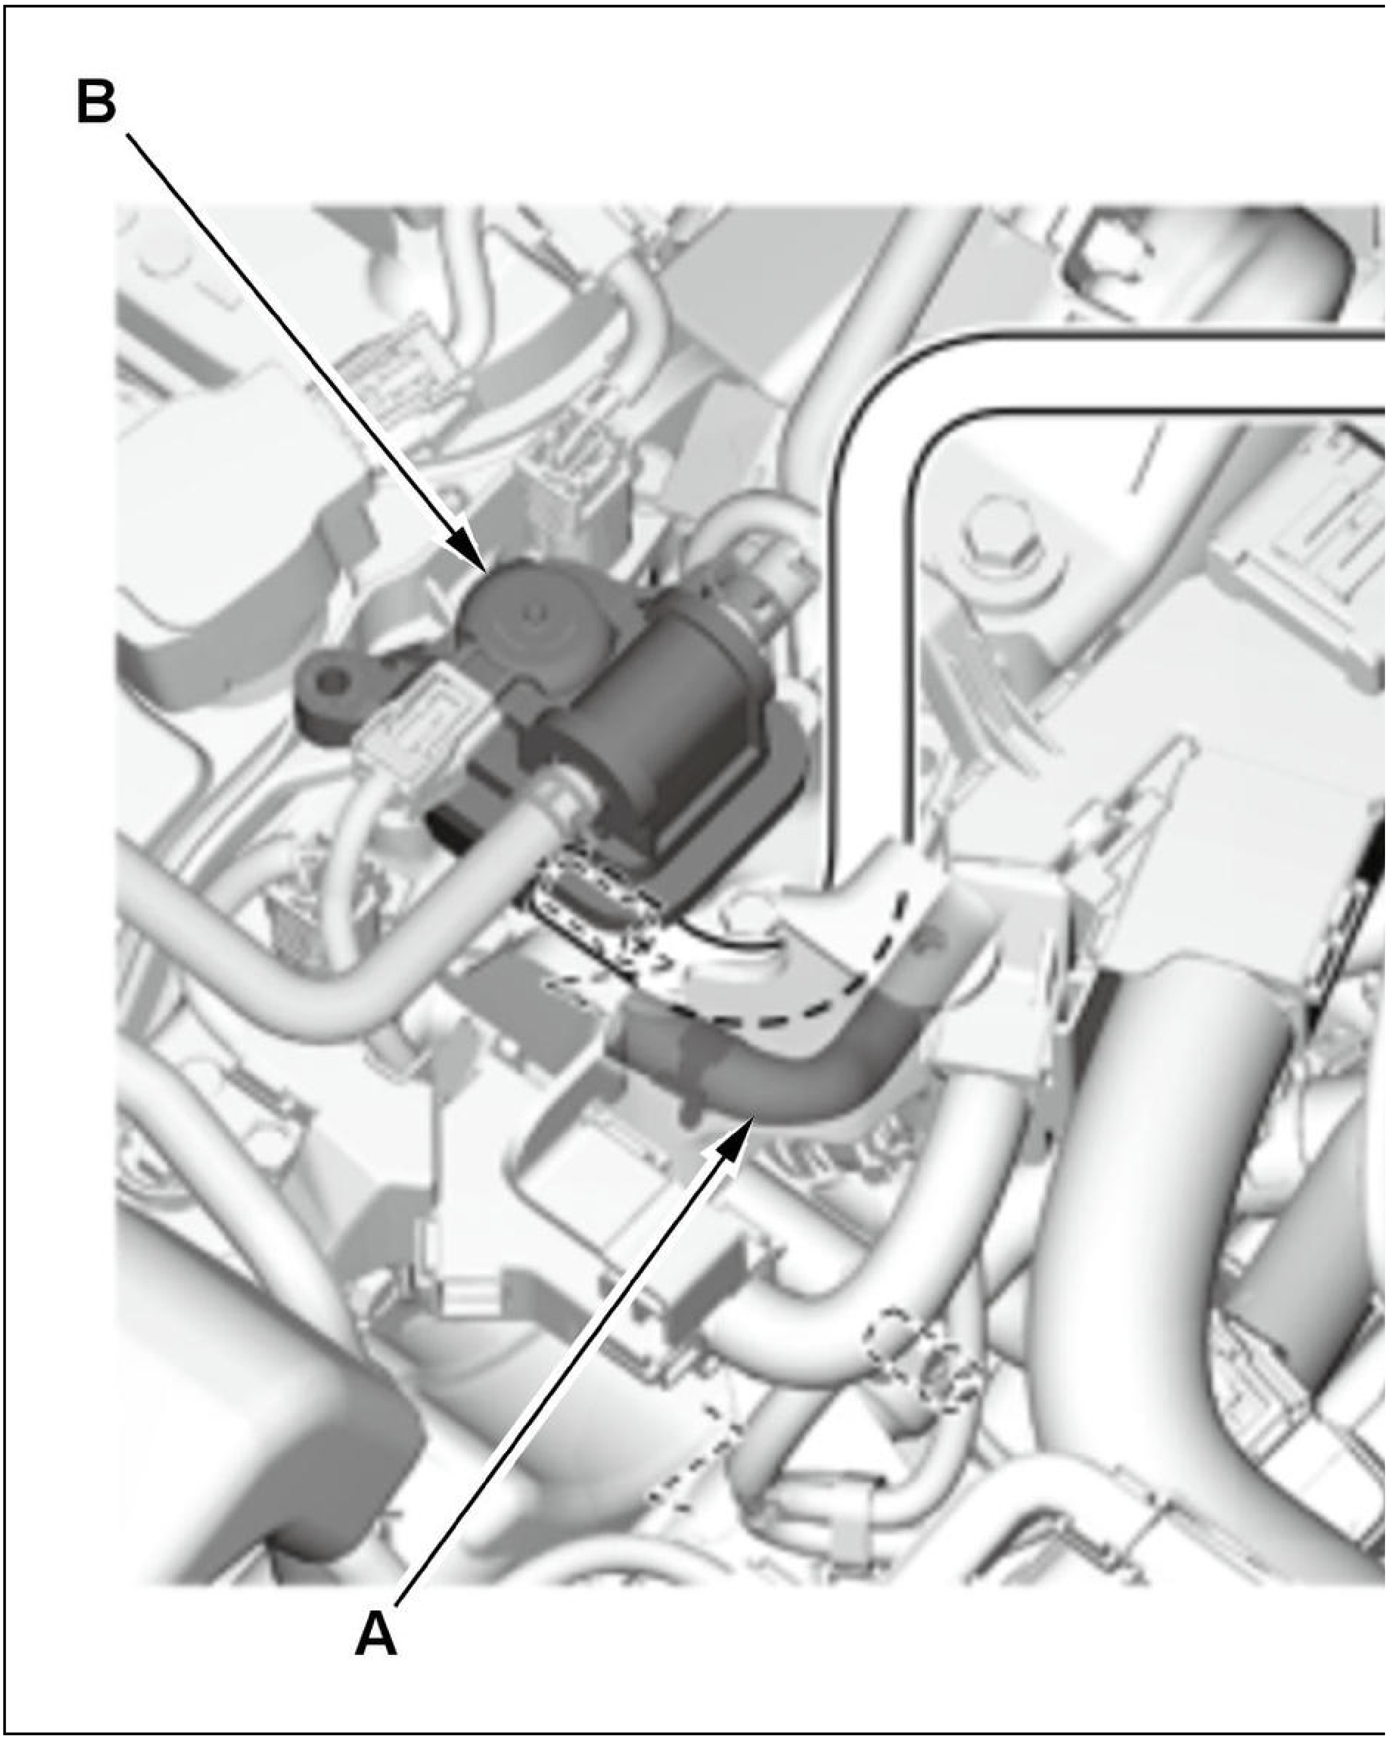
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP canister purge valve 2P connector

-3. **Remove the EVAP canister purge valve** with its vacuum hose connected.

-4. Disconnect the vacuum hose (purge line) (A) from the EVAP canister purge valve (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 inI



-5. Start the engine.

Does the vacuum pump indicate vacuum?

YES

Replace the EVAP canister purge valve .

NO (Reproducible failure)

Go to step 24 (fuse check).

NO (Intermittent failure)

Go to step 25 (relay check).

24. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuses.

Fuse	No. A7 (15 A) to relay circuit board (PGM-FI main relay 1 circuit) No. A15 (15 A) to relay circuit board (ignition coil relay circuit) No. A8 (15 A) to relay circuit board (PGM-FI subrelay circuit) No. A10 (20 A) to injector relay
Location	Under-hood fuse/relay box

Fuse	No. D8 (15 A) to PGM-FI main relay 2
Location	Under-dash fuse/relay box

Are the fuses OK?

YES

Go to step 25 (relay check).

NO

Replace the blown fuse(s).

25. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

Test the following relays:

NOTE: In situations where the failure is difficult to reproduce, the following relays may have an intermittent failure.

- **Relay circuit board (includes PGM-FI main relay 1 circuit, ignition coil relay circuit, PGM-FI subrelay circuit)**
- **PGM-FI main relay 2**
- **Injector relay**

Are the relay circuit board and the relays OK?

YES

Go to step 26 (power and ground terminal check).

NO

Replace any damaged relays.

26. Power and ground terminal check:

Check the corrosion and looseness at the following terminals:

- 12 volt battery terminals
- Ground cable terminals between the engine and the body ground, and the transmission and the body ground
- Engine wire harness ground (G101, G102)

Are the terminals OK?

YES

Go to step 27 (connector terminal check).

NO

Repair any terminal(s) as needed.

27. Connector terminal check:

Check the foreign objects clogged and corrosion at the following connector terminals:

- **PCM connectors**
-
    - FI MAIN RLY OUT, FI MAIN RLY CL
    - FUEL PUMP RLY CL
    - INJ RLY OUT
    - FI SUB RLY OUT, FI SUB RLY CL-, +B VBACT
    - GND2, FI ECU GND, GND3, GND4, INJ GND1, INJ GND2
    - INJH1, INJL1, INJH2, INJL2, INJH3, INJL3, INJH4, INJL4
    - IGN01, IGN02, IGN03, IGN04
    - HPUMP H, HPUMP L
    - TDCAM
    - CRKP
    - PB
    - FGP

    - TW
    - IPV
    - MTR1, MTR2, THL1, THL2
- CMP sensor A
- CKP sensor
- Ignition coils
- Injectors
- High pressure fuel pump
- ECT sensor 1
- MAF sensor/IAT sensor 1
- MAP sensor
- Throttle body
- EVAP canister purge valve
- Fuel tank unit

Are the terminals OK?

YES

Go to the diagnostic interview for hard to start engine.

NO

Repair any terminal(s) as needed.

Engine will not start, engine starts but stalls immediately, or engine is hard to start (2.4 L Engine) (2017 2018 2019)

Engine will not start, engine starts but stalls immediately, or engine is hard to start

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before beginning this troubleshooting, **do a customer diagnostic interview**.
-
    - When the symptom cannot be duplicated, **you can do the troubleshooting using the on-board snapshot information in this procedure** . Refer to the dia
total mileage, and compare the total mileage which is estimated from the interview when a failure occurred and the parameter (total mileage) in the on-boar
when the failure occurred corresponds with the date on which the on-board snapshot information was recorded. If it doesn't, the on-board snapshot informat
- Before beginning this troubleshooting:
-
    - Make sure the 12 volt battery is fully charged.
    - Make sure the fuel tank is at least 1/4 full.
    - Make sure the engine oil level is correct.
- After the troubleshooting, **reset the PCM with the HDS** to erase the on-board snapshot information recorded on the PCM.

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC
B	B

DTC (PGM-FI)

Are any Pending or Confirmed DTCs indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

NOTE: If the HDS does not communicate with the vehicle, **go to the PCM power and ground circuit troubleshooting** .

2. Body electrical system DTC check

-1. Check for body electrical system DTCs with the HDS.

DTC Description	DTC
B	B

DTC (Body Control Module)

Are any DTCs indicated?

YES

Go to the troubleshooting for body electrical system DTC(s) .

NO

Go to step 3.

3. Immobilizer system check

-1. **Check the immobilizer status log** .

NOTE: When a status log count is found, it means the immobilizer system has kept the engine from starting in the past. The number of status log count shows ho starting in the past. If the immobilizer system has no status log count, the system is normal.

Were any status log counts found?

YES

Check for probable cause of the status log .

NO

Go to step 4.

4. Problem verification (snapshot sampling):

Set the HDS to record a HIGH-SPEED SNAPSHOT of following parameters for 30 seconds.

- IMMOBILIZER
- ENGINE SPEED
- BATTERY
- ECT SENSOR 1
- MAP SENSOR
- MAF SENSOR
- FUEL PRESSURE CONVERTED FROM PF SENSOR
- FUEL PRESSURE DIRECT INJECTION SYSTEM
- CMP B NO PULSE
- CMP B NOISE
- CKP NO PULSE
- CKP NOISE

Data List

-2. Begin the snapshot, then try to start the engine.

Is the engine hard to start?

YES

Go to step 6 (diagnosis by parameter troubleshooting).

NO

Go to step 5.

5. On-board snapshot check (Engine will not start)

-1. Check the record of Hard to Start Engine in the on-board snapshot with the HDS.

On-board Snapshot

Is the Hard to Start Engine in the on-board snapshot recorded?

YES

Go to step 6 (diagnosis by parameter troubleshooting).

NO

Go to step 18 (fuel system troubleshooting).

NOTE: In case of the following conditions, the on-board snapshot cannot be recorded.

- The vehicle is turned to the OFF (LOCK) mode after starting the engine.
- **Vehicle condition not in the on-board snapshot recoding zone of Hard to start engine** .
- Low or dead 12 volt battery
- Replacing the 12 volt battery

6. On-board snapshot or snapshot check (IMMOBILIZER):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

Select the IMMOBILIZER and ENGINE SPEED in the configuration list.

Compare the snapshot parameters observed while the engine was cranking, to those in the chart below, to determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 1	 IMMOBILIZER inhibit IMMOBILIZER inhibit 	When IM cranking IMMOB • Nc

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 2	 IMMOBILIZER permit Normal IMMOBILIZER permit Normal 	IMMOB indicates

Which pattern is indicated?

Pattern 1

The immobilizer system has a failure. **Go to the immobilizer System Check** .

Pattern 2

The immobilizer system is OK. Go to step 7 (diagnosis by parameter (ENGINE SPEED)).

7. On-board snapshot or snapshot check (ENGINE SPEED):

   NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

   -1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

   On-board Snapshot

   -2. Select the ENGINE SPEED pattern chart in the configuration list.

   Check the recorded snapshot parameters while the engine is cranking, then compare the pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 ENGINE SPEED when cranking is normal	B
Pattern 2	 ENGINE SPEED when cranking is low	When EN 12 volt b considere

   Which pattern is indicated?

   Pattern 1

   The engine cranking speed is OK. Go to step 8 (diagnosis by parameter (BATTERY)).

   Pattern 2

   Diagnostic procedure:

   - **Test the 12 volt battery** .
   - Check the 12 volt battery cables and the connections.
   - **Check the starter** .
   - Check for engine friction.

8. On-board snapshot or snapshot check (BATTERY):

   NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

   -1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

   On-board Snapshot

   Select the BATTERY and ENGINE SPEED in the configuration list.

   Check the recorded snapshot parameters while the engine is cranking, then compare the BATTERY pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additio
Pattern 1	 BATTERY voltage low when cranking	• W to en • Th re
Pattern 2	 BATTERY voltage normal when cranking	To start t

Which pattern is indicated?

Pattern 1

Diagnostic procedure:

- Test the 12 volt battery .
- Check the 12 volt battery cables and the connections.

Pattern 2

The 12 volt battery is OK. Go to step 9 (diagnosis by parameter (ECT SENSOR 1)).

9. On-board snapshot or snapshot check (ECT SENSOR 1):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

-2. Select the ECT SENSOR 1 and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the ECT SENSOR 1 pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additio
Pattern 1	 ECT SENSOR 1 high when cranking	When EC deg.C) o low), EC compens warmed (not a fa

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 2	 ECT SENSOR 1 normal when cranking	If actual indicated sensor 1

Which pattern is indicated?

Pattern 1

Check for a short in the ECT sensor 1 circuit and a failure in ECT sensor 1.

Pattern 2

Go to step 10.

10. ECT sensor 1 check

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Let the engine cool for 24 hours.

    -3. Measure the ambient temperature of the engine with the thermometer.

    -4. Turn the vehicle to the ON mode, but do not start the engine.

    -5. Check the parameter(s) below with the HDS.

	Current conditions
Signal	**Values**
ECT SENSOR 1	B
ECT SENSOR 2	B

    Are the values of ECT SENSOR 1, ECT SENSOR 2, and the ambient temperature almost the same?

    YES

    ECT sensor 1 is OK. Go to step 11 (diagnosis by parameter (MAP SENSOR)).

    NO

    If the value of ECT SENSOR 1 is much higher (or lower) than that of ECT SENSOR 2, and the ambient temperature, check for the ECT sensor 1 circuit and a fail

11. On-board snapshot or snapshot check (MAP SENSOR):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

    On-board Snapshot

    -2. Select the MAP SENSOR and ENGINE SPEED in the configuration list.

    Check the recorded snapshot parameters while the engine is cranking, then compare the MAP SENSOR pattern to the pattern from the chart below, and determine

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 1	MAP SENSOR detects no change of pressure when cranking  	When M when cra be clogg fuel injec signal wl
Pattern 2	Normal when MAP SENSOR detects vacuum when cranking  	When M cranking pressure

Which pattern is indicated?

Pattern 1

Check the pressure measurement port of the MAP sensor for clogging, foreign objects, etc.

Pattern 2

The MAP sensor is OK. Go to step 12 (diagnosis by parameter (MAF SENSOR)).

12. On-board snapshot or snapshot check (MAF SENSOR):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

-2. Select the MAF SENSOR and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the MAF SENSOR pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 1	 Poor connection of MAF SENSOR	Complet indicates becomes there ma connecto

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 2	 MAF SENSOR output incorrect	When M after star port may a poor co

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 3	 MAF SENSOR Normal	When M ENGINE MAF ser

Which pattern is indicated?

Pattern 1 and 2

Check for loose terminals or a poor connection at the MAF sensor/IAT sensor.

Pattern 3

The MAF sensor/IAT sensor is OK. Go to step 13 (diagnosis by parameter (FUEL PRESSURE CONVERTED FROM PF SENSOR and FUEL PRESSURE DIRE

13. On-board snapshot or snapshot check (FUEL PRESSURE CONVERTED FROM PF SENSOR and FUEL PRESSURE DIRECT INJECTION SYSTEM):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

Select the FUEL PRESSURE CONVERTED FROM PF SENSOR, the FUEL PRESSURE DIRECT INJECTION SYSTEM, and ENGINE SPEED in the configu

Check the recorded snapshot or on-board snapshot parameters while the engine is cranking, then compare the FUEL PRESSURE CONVERTED FROM PF SENS INJECTION SYSTEM patterns from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	The FUEL PRESSURE CONVERTED FROM PF SENSOR is low (almost 0 kPa) when cranking 	If the FU SENSOF may exis - Fu - Fu - Sp - Fu - Fu - Hi

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 2	Normal when the FUEL PRESSURE CONVERTED FROM PF SENSOR follows the FUEL PRESSURE DIRECT  INJECTION SYSTEM when cranking	If the FU SENSOR PRESSU cranking Fuel pres

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0087 .

Pattern 2

The fuel pressure is OK. Go to step 14 (diagnosis by parameter (CMP B NO PULSE)).

14. On-board snapshot or snapshot check (CMP B NO PULSE):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

-2. Select the CMP B NO PULSE and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the CMP B NO PULSE pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Count is continuously up	When C cranking is not rec be ignite
Pattern 2	 Count is continuously not up	Count is

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0365 . If the CMP B NO PULSE count reaches the malfunction threshold, DTC P0365 will set. Check for poor connection

Pattern 2

Go to step 15 (diagnosis by parameter (CMP B NOISE)).

15. On-board snapshot or snapshot check (CMP B NOISE):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

    On-board Snapshot

    -2. Select the CMP B NOISE and ENGINE SPEED in the configuration list.

    Check the recorded snapshot parameters while the engine is cranking, then compare the CMP B NOISE pattern from the chart, and determine the problem.

Pattern	**Symptom (Diagnosis by parameter)**	**Additior**
Pattern 1	 Count is continuously up	When C there is n has noise ignited a
Pattern 2	 Count is continuously not up	Count is

    Which pattern is indicated?

    Pattern 1

    Go to the troubleshooting for DTC P0369 . If the CMP B NOISE count reaches the malfunction threshold, DTC P0369 will set. Check for poor connections an

    Pattern 2

    CMP sensor B is OK. Go to step 16 (diagnosis by parameter (CKP NO PULSE)).

16. On-board snapshot or snapshot check (CKP NO PULSE):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

    On-board Snapshot

    -2. Select the CKP NO PULSE and ENGINE SPEED in the configuration list.

    Check the recorded snapshot parameters while the engine is cranking, then compare the CKP NO PULSE pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Count is continuously up	When th cranking pulse.
Pattern 2	 Count is continuously not up	Count is

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0335 . If the CKP NO PULSE count reaches the malfunction threshold, DTC P0335 will set. Check for poor connections a

Pattern 2

Go to step 17 (diagnosis by parameter (CKP NOISE)).

17. On-board snapshot or snapshot check (CKP NOISE):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Select the Hard to Start Engine in the on-board snapshot or snapshot with the HDS.

On-board Snapshot

-2. Select the CKP NOISE and ENGINE SPEED in the configuration list.

Check the recorded snapshot parameters while the engine is cranking, then compare the CKP NOISE pattern from the chart, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Addition
Pattern 1	 Count is continuously up	When th cranking pulse.

Pattern	Symptom (Diagnosis by parameter)	Additior
Pattern 2	 Count is continuously not up	Count is

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0339 . If the CKP NOISE count reaches the malfunction threshold, DTC P0339 will set. Check for poor connections and l check for aftermarket accessories.

Pattern 2 (Intermittent failure)

The CKP sensor is OK. Go to step 18 (fuel system troubleshooting).

18. Fuel pressure check (low pressure side)

-1. **Do the fuel pressure test**.

Is the fuel pressure OK?

YES

Go to step 19.

NO

Check the following parts:

- **Fuel pump circuit**
- **Fuel pressure regulator**
- **Fuel filter**

19. Spark plug visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the spark plugs** .

-3. Check the condition of the spark plug electrodes.

NOTE: Make sure the spark plugs are the correct part number for the vehicle. If the plugs are aftermarket or they are not the correct part number, replace all of th

Is the electrode damage or wet?

1. YES (wet)

   Check the following conditions. If those conditions do not apply, go to step 20.

   - In very cold conditions, multiple very short trips can cause the spark plug to foul. If this is the case, drive the vehicle a longer distance and recheck.
   - Incorrect or poor quality fuel can cause a wet spark plug. Replace the fuel and recheck.

   YES (damaged)

   Replace the damaged spark plugs , determine the cause of the spark plug damage.

   NO

   Go to step 20.

20. Determine possible failure area (ignition system, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Fit a spark plug to the ignition coil and ground it to the engine.

-3. Turn the vehicle to the ON mode.

-4. Select ALL INJECTORS STOP in the INSPECTION MENU with the HDS, and stop fuel injection from the injector.

ALL INJECTORS STOP

Crank the engine and watch for spark at the spark plug.

Does the spark plug sparkΩ

YES

The ignition system is OK. Select PCM reset in the PGM-FI INSPECTION MENU to cancel ALL INJECTORS STOP with the HDS, then go to step 22 (engine c

NO

Go to step 21.

21. Ignition coil power circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector(s).

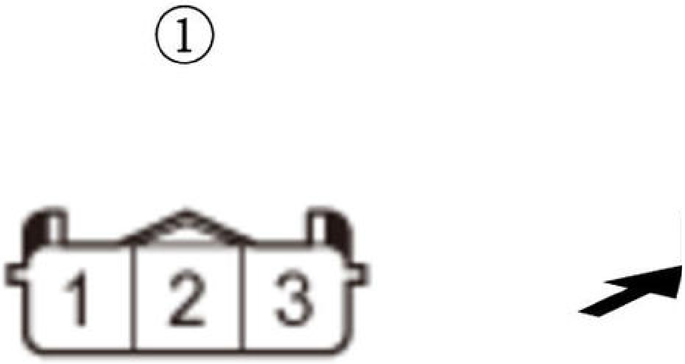
Ignition coil(s) 3P connector from the problem cylinder

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Ignition coil 3P connector: disconnected
Test point 1	Ignition coil 3P connector (female terminal) No. 1: ①

Test point 2	Body ground



Is there battery voltage?

YES

The ignition coil power circuit is OK. **Replace the ignition coil(s)** .

NO

Repair an open in the IG COIL RLY OUT/IG1(COIL)/IG1(IGN) wire between the ignition coil relay circuit and the ignition coil.

22. Engine compression check

-1. Do an engine compression inspection.

Is engine compression OK?

YES

Go to step 23 (EVAP canister purge valve check).

NO

Check for wear or damage to these parts:

- Incorrect valve clearance
- Confirmation of cam timing
- Oil pressure relief valve
- Damage or worn cam lobes
- Damage or worn valve and seats
- Damage cylinder head gasket
- Damage or worn piston rings
- Damage or worn piston and cylinder bore

23. EVAP canister purge valve check

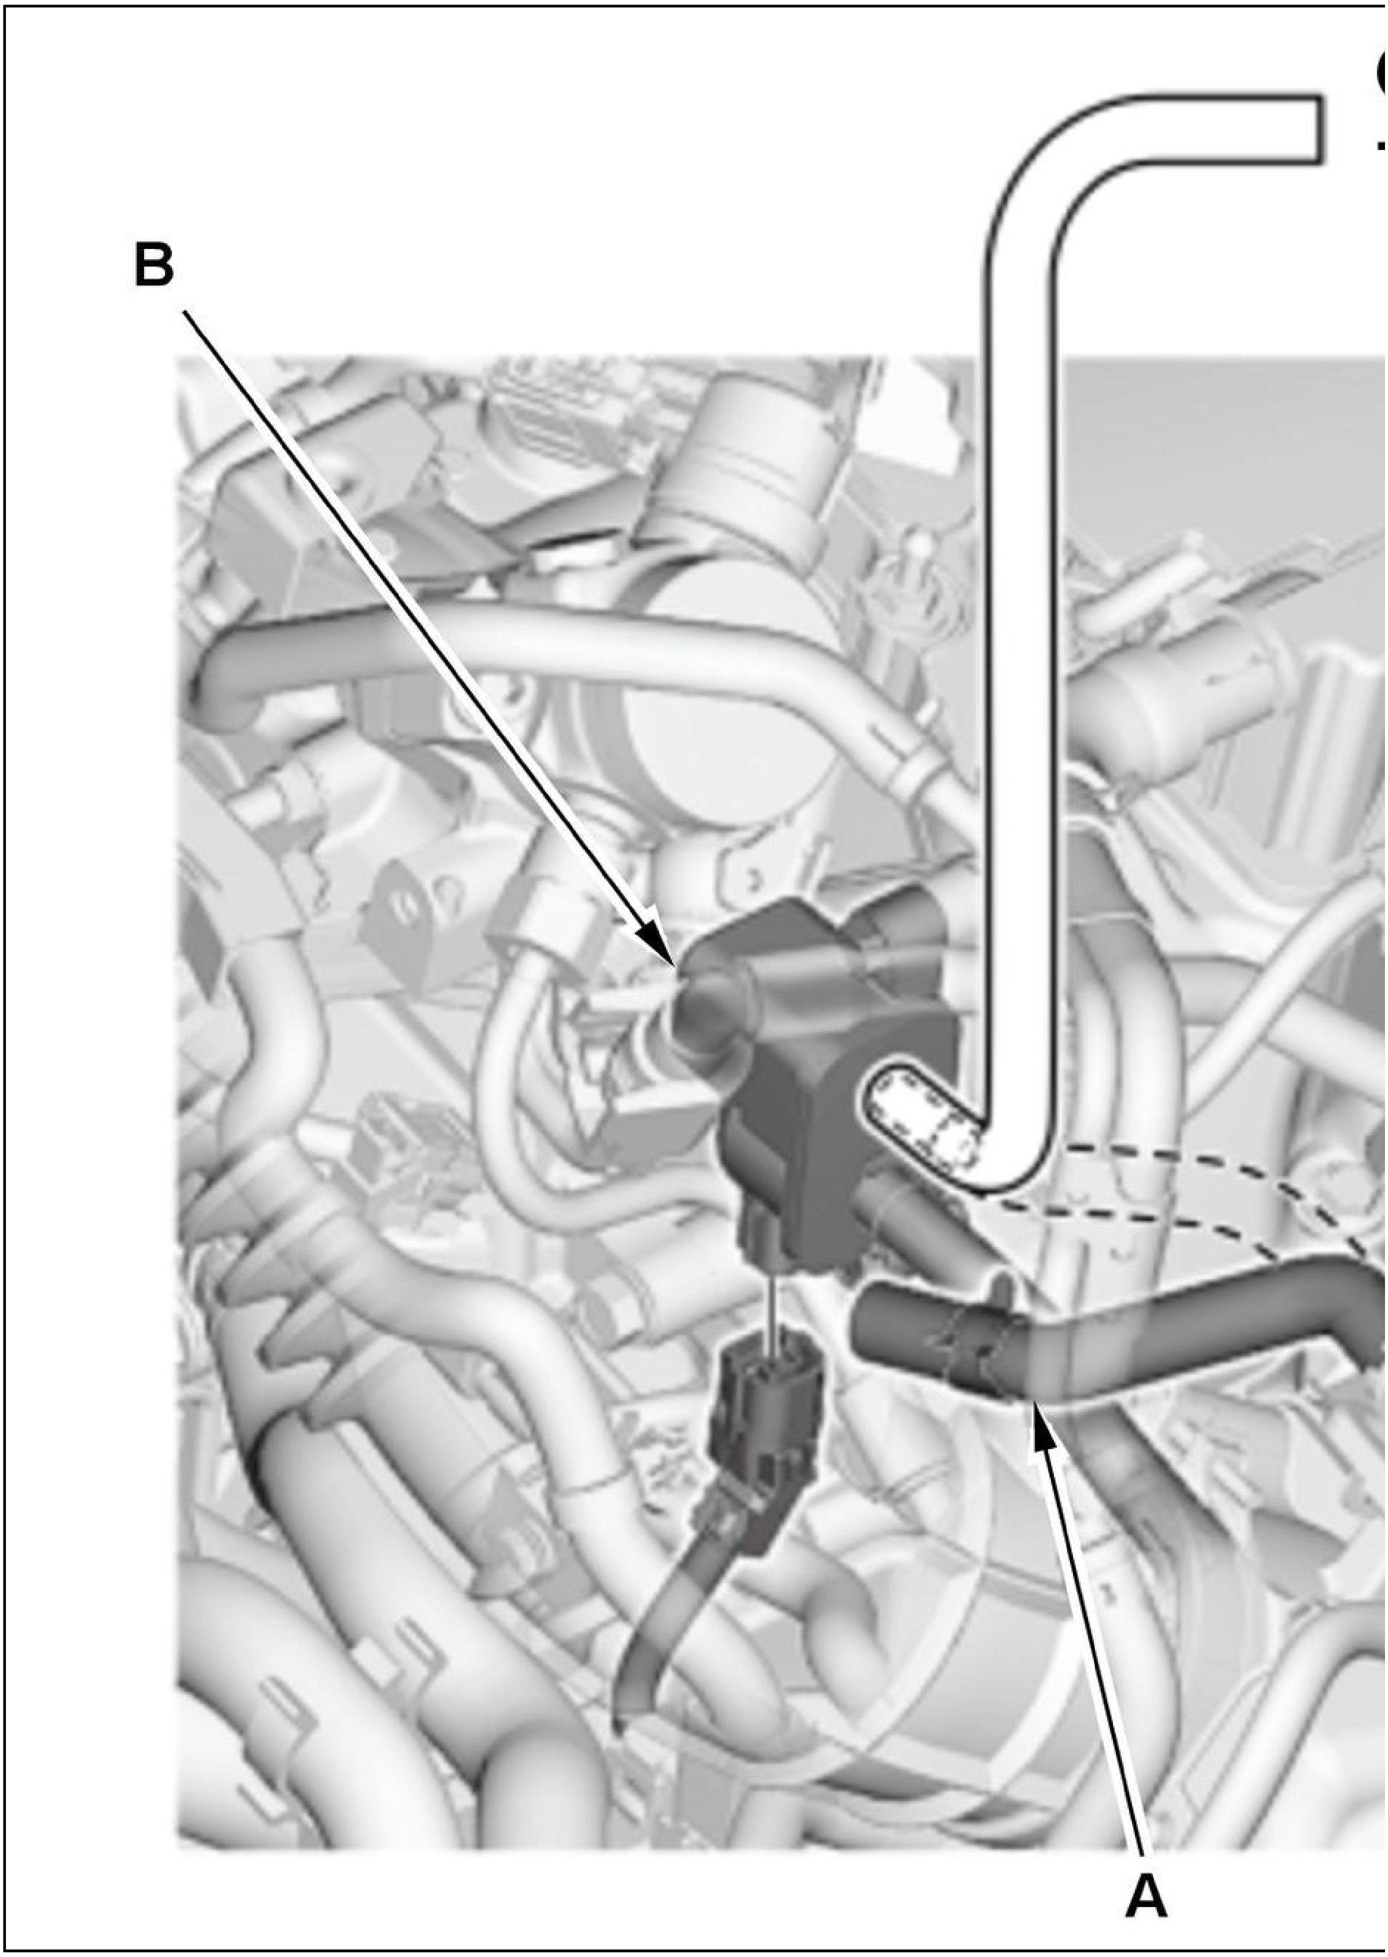
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the high pressure fuel pump cover and the fuel bracket.

-3. Disconnect the following connector.

EVAP canister purge valve 2P connector

-4. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) in the engine compartment, and connect the vacuum pump/gauge, 0-30 inHg (C) to t



-5. Start the engine.

Does the vacuum pump indicate vacuum?

YES

Replace the EVAP canister purge valve .

NO (Reproducible failure)

Go to step 24 (fuse check).

NO (Intermittent failure)

Go to step 25 (relay check).

24. Fuse check

-1. Check the following fuses.

Fuse	No. A7 (15 A) to relay circuit board (PGM-FI main relay 1 circuit) No. A15 (15 A) to relay circuit board (ignition coil relay circuit) No. A8 (15 A) to relay circuit board (PGM-FI subrelay circuit) No. A10 (20 A) to injector relay
Location	Under-hood fuse/relay box

Fuse	No. D8 (15 A) to PGM-FI main relay 2
Location	Under-dash fuse/relay box

Are the fuses OK?

YES

The fuses are OK. Go to step 25 (relay check).

NO

Replace the blown fuse(s).

25. Relay check:

Test the following relays:

NOTE: In case the failure is not reproduced, the following relays may have an intermittent failure.

- Relay circuit board (includes PGM-FI main relay 1 circuit, ignition coil relay circuit, PGM-FI subrelay circuit)
- PGM-FI main relay 2
- Injector relay

Are the relay circuit board and the relays OK?

YES

Go to step 26 (power and ground terminal check).

NO

Replace any damaged relays.

26. Power and ground terminal check:

Check the corrosion and looseness at the following terminals:

- 12 volt battery terminals
- Ground cable terminals between the engine and the body ground, and the transmission and the body ground
- Engine wire harness ground (G101, G102)

Are the terminals OK?

YES

Go to step 27 (connector terminal check).

NO

Repair any terminal(s) as needed.

27. Connector terminal check:

Check the foreign objects clogged and corrosion at the following connector terminals:

- PCM connectors
-
    - FI MAIN RLY OUT, FI MAIN RLY CL-
    - VBDBW, DBW RLY-
    - IG1 FUEL PUMP, FUEL PUMP RLY CL-
    - INJ RLY OUT, INJ RLY CL-
    - GND1, GND2, GND3, PGM, GND INJ1, GND INJ2
    - INJ H1, INJ L1, INJ H2, INJ L2, INJ H3, INJ L3, INJ H4, INJ L4
    - IGN01, IGN02, IGN03, IGN04
    - HPUMP H, HPUMP L
    - CAM

    - TDC
    - CRKN
    - PB
    - VGP, VGM
    - TW
    - PCS
    - MTR1, MTR2, THL1, THL2
- CMP sensor A
- CMP sensor B
- CKP sensor
- Ignition coils
- Injectors
- High pressure fuel pump
- ECT sensor
- MAF sensor
- MAP sensor
- Throttle body
- EVAP canister purge valve
- Fuel tank unit

Are the terminals OK?

YES

Go to the diagnostic interview for hard to start engine.

NO

Repair any terminal(s) as needed.

Hard to start engine - Diagnostic interview

Hard to start engine-Diagnostic interview

• Date	
• Place	
• How often does it occur?	() times/day
1. Weather when occurred	A: Warm (temp:) B: Sunny C: Cloudy D: Rainy
2. Situation when occurred	A: After an overnight parking, () nights B: Tends to occur about 3 hours after stopping engine C: Parking hours irrelevant
3. Weather when occurred • Fuel when occurred	A: Cold (temp:) : Filled () months before occurrence
4. Use of specified fuel	A: Used specified fuel only B: Used ethanol-mixed fuel C: Gasoline additive
5. How the starter motor turned when the problem occurred B • Cranking operation B • Cranking (Without keyless access system)	A: Starter motor turned weaker than usual B: Spinning of starter motor irrelevant A: Keep cranking until the engine starts B: Stop cranking after several seconds: () sec A: Turn on starter motor immediately after turning the ignition sw B: Turn on starter motor several seconds after turning the ignition confirming that the check engine indicator goes off)
6. Ground where occurred • Fuel level when occurred	A: Level, B: Downhill, C: Uphill A: Full, B: Half full, C: Only a little
7. Aftermarket accessory	A: Modified, B: No modification

Hard-to start condition - Possible cause pattern chart from diagnostic interview

B	Conditions when hard-to-start occurred	Possible causes
Pattern 1	• When in warm climate • Tends to occur about 3 hours after stopping engine	Check for the EVAP canister purge valve.
Pattern 2	Weather when occurred: Windy	When wind is blowing into the exhaust system, the exhaust gas can chamber and/or intake manifold, causing long crank times.
Pattern 3	• Weather when occurred: Cold • Fuel filled two months before occurrence	• If summer fuel is used during cold weather, long crank times r • When using fuel that is more than a couple months old (stale f with fresh fuel.
Pattern 4	• Use of non-specified fuel • Ethanol mixed, use of additive	• When ethanol fuel or fuel other than specified is mixed, engin • Poor fuel quality may cause a hard-to-start condition.

Pattern 5	• Immediately crank after turning the vehicle to the ON mode • Starter motor spins weaker than usual	• There may be a delay until the fuel pump can generate sufficie pressure when starting. • When the battery is weak, it takes a long time until the fuel pu prescribed level, causing slow start in some cases.
Pattern 6	• Vehicle parked on an uphill or downhill slope • When fuel level is low	When the vehicle is parked on an uphill or downhill slope, and the fu cannot pickup and pressurize the fuel properly, causing a hard-to-sta
Pattern 7	• Check for modification in ignition system, intake duct, intake manifold, exhaust system • Inspect amount of oil/fluid/gas (engine oil, ATF, A/C refrigerant)	Hard-to-start engine or engine stall may occur due to modified igniti manifold, exhaust system, use of non-specified engine oil or ATF, or ATF (temporary failure may occur due to modification).

SYMPTOM TROUBLESHOOTING INDEX

FUEL AND EMISSIONS SYSTEMS SYMPTOM TROUBLESHOOTING INDEX (KA/KC)

Symptom Troubleshooting Index

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom cause.

Symptom	Diagnostic procedure	Also cl
Engine will not start (MIL works OK, no DTCs set)	• Troubleshoot the engine will not start, engine starts but stalls immediately, or engine is hard to start. • Do the CVT system symptom troubleshooting .	B
Engine will not start and HDS does not communicate with the PCM(MIL comes on and stays on, no DTCs set)	PCM power and ground circuit troubleshooting .	B
MIL comes on and stays on, or never comes on at all, no DTCs set	Troubleshoot the MIL circuit .	B
Engine will not start (MIL works OK, no DTCs set, security indicator stays on or flashes)	• Without keyless access system: Check the immobilizer system . • With keyless access system: Check the keyless access system .	B
Engine starts but stalls immediately (MIL works OK, no DTCs set, security indicator stays on or flashes)	• Without keyless access system: Check the immobilizer system . • With keyless access system: Check the keyless access system .	B
Engine is hard to start (MIL works OK, no DTCs set)	• Troubleshoot the engine will not start, engine starts but stalls immediately, or engine is hard to start. • Do the CVT system symptom troubleshooting .	B
Cold fast idle too low (MIL works OK, no DTCs set)	• Do the PCM idle learn procedure . • Check the idle speed . • Do the carbon accumulation check .	B
Cold fast idle too high (MIL works OK, no DTCs set)	• Do the PCM idle learn procedure . • Check the idle speed .	Intake
Idle speed fluctuates (MIL works OK, no DTCs set)	• Do the PCM idle learn procedure . • Check the idle speed . • Check the fuel pressure. • Do the carbon accumulation check . • Troubleshoot the A/C signal circuit . • Check the A/C refrigerant amount . **NOTE:** Turning the A/C to ON under the conditions that the A/C refrigerant amount is out of specification (excessive or too little) may cause the idle speed fluctuation.	• I • I
After warming up, idle speed is below specifications without load (MIL works OK, no DTCs set)	Do the carbon accumulation check .	Incorre adjustn
After warming up, idle speed is above specifications without load (MIL works OK, no DTCs set)	Inspect the APP sensor .	Intake

INSPECTION

IGNITION TIMING INSPECTION (1.5 L ENGINE)

Inspection

1. HDS - Connect
2. DTC - Check

   NOTE: If a DTC is present, diagnose and repair the cause before continuing with this inspection.

3. Engine - Warm Up

1. Start the engine. Hold the engine speed at 3, 000 rpm with no load (in P or N) until the cooling fan comes on, then let it idle.

4. Idle Speed - Check
5. SCS - Short

1. Turn the vehicle to the OFF (LOCK) mode. 2. Jump the SCS line with the HDS.

6. Ignition Timing - Inspect

	1. Start the engine. 2. Connect the timing light to the service loop (white tape).

	3. Aim the light toward the pointer (A) on the cam chain case. Check the ignition timing under a no load condition (headlights, blower fan, rear window defogger, and air conditioner are turned off). **Ignition Timing** 4. If the ignition timing differs from the specification, check the camshaft timing . If the camshaft timing is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM , then recheck. If the system works properly, and the PCM was substituted, replace the original PCM .	5. Disconnect the HDS and the timing light.

4 +/-2 deg. BTDC (RED mark (B)) at idle in P or N

IGNITION TIMING INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Inspection

1. HDS DLC - Connect
2. DTC - Check

NOTE: If a DTC is present, diagnose and repair the cause before continuing with this inspection.

3. Engine - Warm Up

1. Start the engine. Hold the engine speed at 3, 000 min -1 (rpm) with no load (in P or N) until the radiator fan comes on, then let it idle.

4. Idle Speed - Check
5. SCS - Short

1. Turn the vehicle to the OFF (LOCK) mode. 2. Jump the SCS line with the HDS, and wait more than 1 minute.

6. Ignition Timing - Inspect

	1. Start the engine. 2. Connect the timing light to the service loop (white tape).

	3. Aim the light toward the pointer (A) on the cam chain case. Check the ignition timing under a no load condition (headlights, blower fan, rear window defogger, and air conditioner are turned off). 4. If the ignition timing differs from the specification, **check the camshaft timing** . If the camshaft timing is OK, **update the PCM** if it does not have the latest software, or **substitute a known-good PCM** , then recheck. If the system works properly, and the PCM was substituted, **replace the original PCM** . 5. Disconnect the HDS and the timing light.

Ignition Timing
8 +/-2 deg. BTDC (RED mark (B)) at idle in P or N

SPARK PLUG INSPECTION (1.5 L ENGINE)

Inspection

1. **Ignition Coil and Spark Plug - Remove**
2. Spark Plug - Inspect

 Worn or deformed electrodes · Improper gap · Oil-fouling · Carbon deposits · Cracked center electrode insulator Damaged gasket Cracked insulator	1. Inspect the electrodes and the ceramic insulator. • Burned or worn electrodes may be caused by these conditions: • • - Advanced ignition timing • - Loose spark plug • - Plug heat range too hot • - Insufficient cooling • Fouled plugs may be caused by these conditions: • • - Retarded ignition timing • - Oil in combustion chamber • - Incorrect spark plug gap

	- - Plug heat range too cold - - Excessive idling/low speed running - - Clogged air cleaner element - - Deteriorated ignition coils

	2. Replace the plug at the specified interval, or if the center electrodes (A) is rounded, or if the spark plug gap (B) is out of specification. **NOTE:** - **Do not adjust the gap of iridium tip plugs.** - **Do not use plug cleaner.**

Electrode Gap	
Standard (New):	
B	**0.70-0.75 mm (0.0276-0.0295 in)**

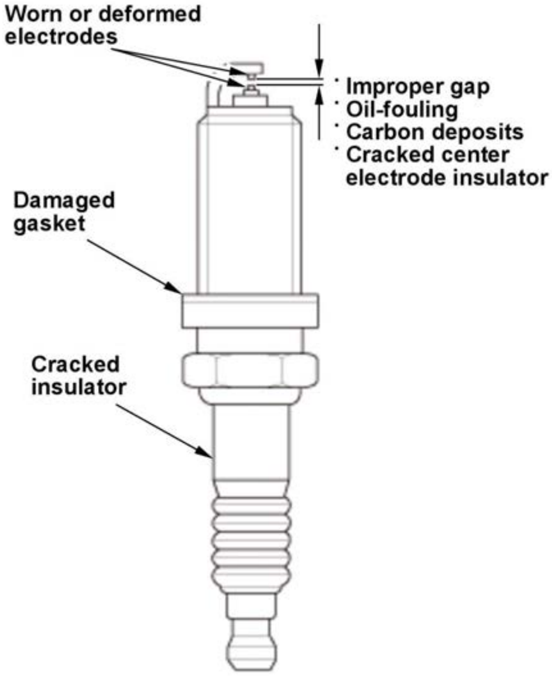
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SPARK PLUG INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Inspection

1. Ignition Coil and Spark Plug - Remove
2. Spark Plug - Inspect



Worn or deformed electrodes
· Improper gap
· Oil-fouling
· Carbon deposits
· Cracked center electrode insulator
Damaged gasket
Cracked insulator

1. Inspect the electrodes and the ceramic insulator.

- Burned or worn electrodes may be caused by these conditions:
-
  - -

    Advanced ignition timing
  - -

    Loose spark plug
  - -

    Plug heat range too hot
  - -

    Insufficient cooling
- Fouled plugs may be caused by these conditions:
-
  - -

    Retarded ignition timing
  - -

    Oil in combustion chamber
  - -

    Incorrect spark plug gap
  - -

    Plug heat range too cold
  - -

    Excessive idling/low speed running
  - -

    Clogged air cleaner element
  - -

    Deteriorated ignition coils

 	2. Replace the plug at the specified interval, or if the center electrodes (A) is rounded, or if the spark plug gap (B) is out of specification, or if the spark plug electrode is dirty or contaminated. Use only the spark plugs listed. **NOTE:** - **Do not adjust the gap of iridium tip plugs.** - **Do not use plug cleaner.**

Electrode Gap	
Standard (New):	**1.0-1.1 mm (0.039-0.043 in)**

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

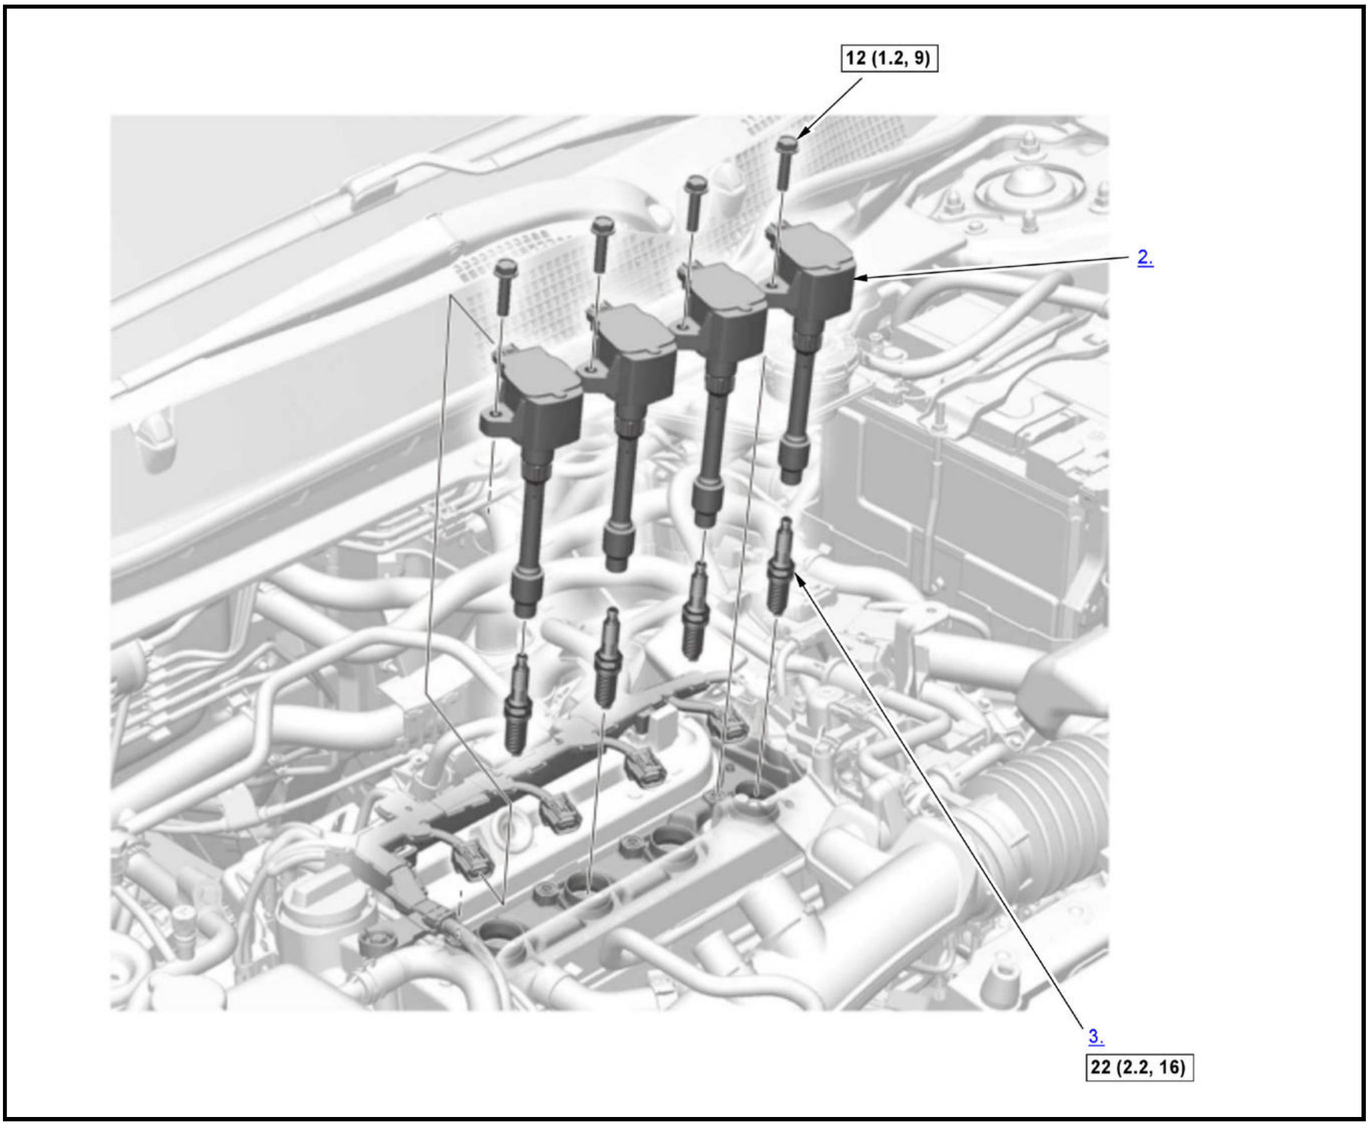
REMOVAL AND INSTALLATION

IGNITION COIL AND SPARK PLUG REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal and Installation

1



☐	Torque: N.m (kgf.m, lbf.ft)

1. Resonator - Remove

   NOTE: Remove the necessary part(s).

2. Ignition Coil - Remove
3. Spark Plug - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

When installing the spark plugs, apply a small amount of anti-seize compound to the spark plug threads, and screw the spark plugs into the cylinder head, finger-tight, then tighten the spark plugs to the specified torque.

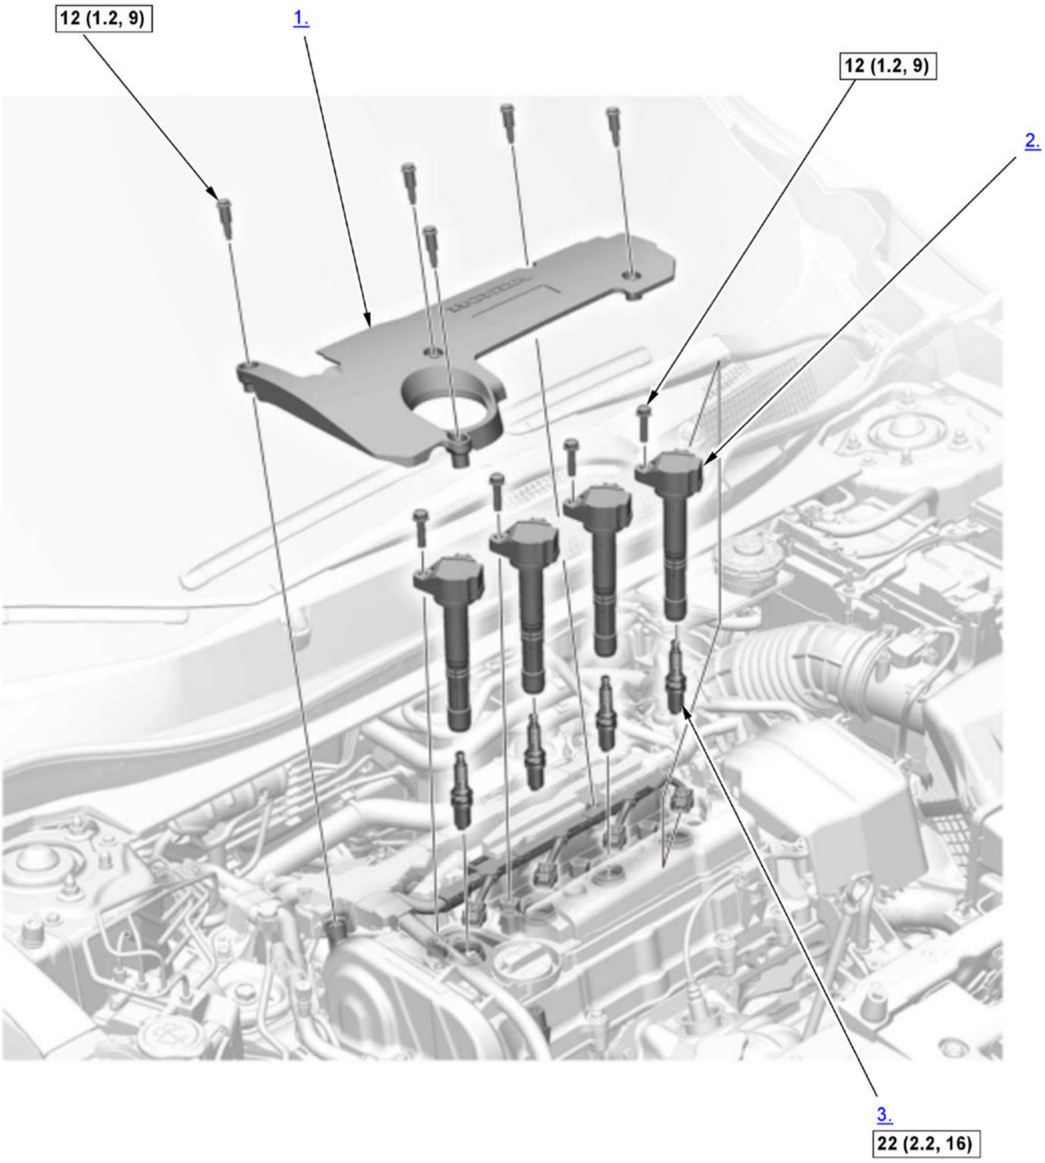
5. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the spark plugs, reset the Maintenance Minder with the gauge (see "Resetting the Maintenance Minder").

IGNITION COIL AND SPARK PLUG REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

1



☐	Torque: N.m (kgf.m, lbf.ft)

1. Engine Cover - Remove
2. Ignition Coil - Remove
3. Spark Plug - Remove
4. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.
>
> **NOTE:**
>
> **When installing the spark plugs, apply a small amount of anti-seize compound to the spark plug**

threads, and screw the spark plugs into the cylinder head, finger-tight, then tighten the spark plugs to the specified torque.

5. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the spark plugs, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder").

REMOVAL, INSTALLATION & INSPECTION

IGNITION COIL AND SPARK PLUG REMOVAL, INSTALLATION, AND INSPECTION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

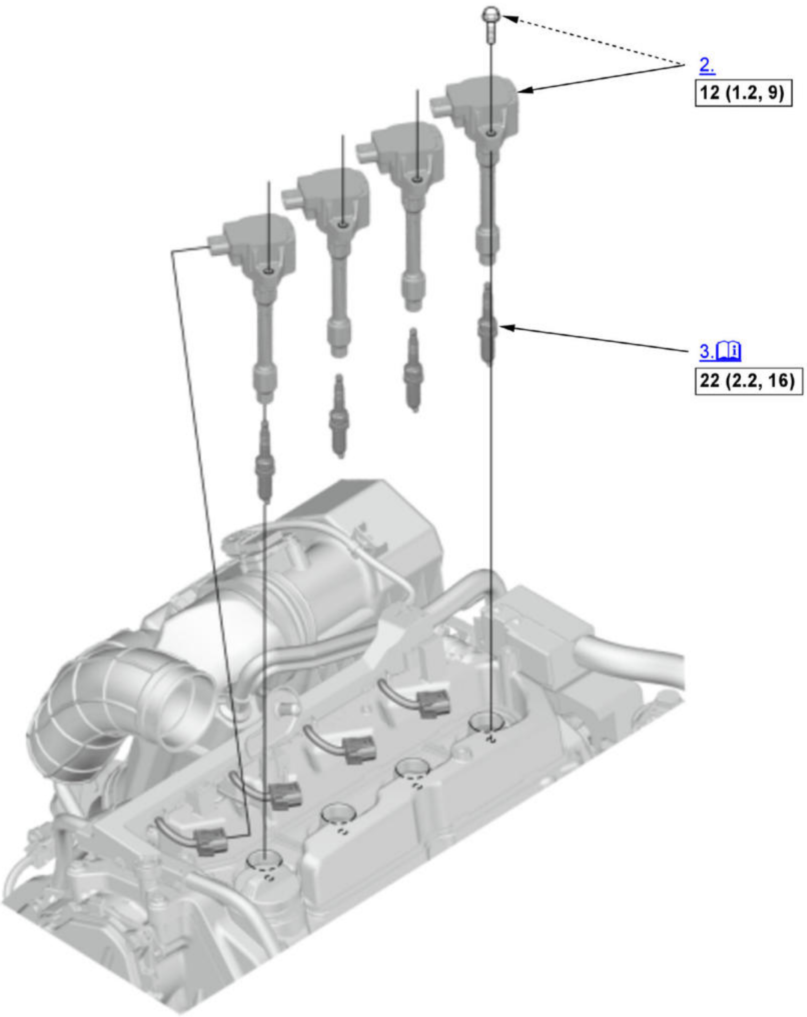


Fig. 1: Ignition Coil And Spark Plug Replacement Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

1. Intake Air Resonator - Remove
2. Ignition Coil - Remove
3. Spark Plug - Remove

Note for installation

Screw the spark plugs into the cylinder head, finger-tight, then tighten the spark plugs to the specified torque.

4. All Removed Parts - Install

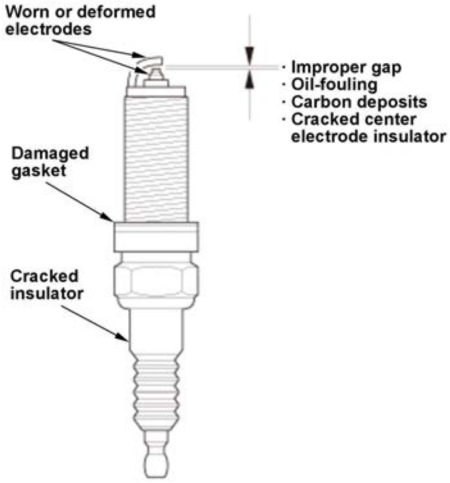
1. Install the parts in the reverse order of removal.

5. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the spark plugs, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder").

Inspection

1. Spark Plug - Inspect



NOTE:

- Do not adjust the spark plug gap, because the electrode may be damaged.
- Replace the spark plug according to the maintenance schedule.
- Replace the spark plug with a spark plug from another cylinder if abnormality is suspected, and confirm the change in circumstances.
- Measure the iridium plug gap with the plug gap gauge (wire type).
- Do not use a wire brush or scrape the iridium electrode since this will damage the electrode.

1. Inspect the electrodes and the ceramic insulator.

- Burned or worn electrodes may be caused by these conditions:
-
    - Advanced ignition timing
    - Loose spark plug
    - Plug heat range too hot
    - Insufficient cooling
- Fouled plugs may be caused by these conditions:
-
    - Retarded ignition timing
    - Oil in combustion chamber
    - Incorrect spark plug gap
    - Plug heat range too cold
    - Excessive idling/low speed running
    - Clogged air cleaner element
    - Deteriorated ignition coils

Electrode Gap (New)	
Standard (New):	**1.0-1.1 mm (0.039-0.043 in)**

INSPECTION

IGNITION TIMING INSPECTION

Inspection

NOTE: If a DTC is present, diagnose and repair the cause before continuing with this inspection.

1. HDS - Connect
2. Engine - Warm Up

1. Enter the maintenance mode, then start the engine . Hold the engine speed at 3000 RPM with no load (P or N) until the cooling fan(s) comes on, then let it idle.

3. Idle Speed - Check
4. SCS - Short

1. Jump the SCS line with the HDS.

5. Ignition Timing - Inspect

	1. Enter the maintenance mode, then start the engine . 2. Connect the timing light to the No. 1 ignition coil harness (white tape).

	3. Aim the light toward the pointer (A) on the oil pump. Check the ignition timing under a no load condition (headlights, blower fan, rear window defogger, and air conditioner are turned off). 4. If the ignition timing differs from the specification, check the camshaft timing . If the camshaft timing is OK, update the PCM if it does not have the latest software, or substitute a known-good PCM , then recheck. If the system works properly, and the PCM was substituted, replace the original PCM 5. Exit the SCS mode with the HDS.

	6. Disconnect the HDS and the timing light.

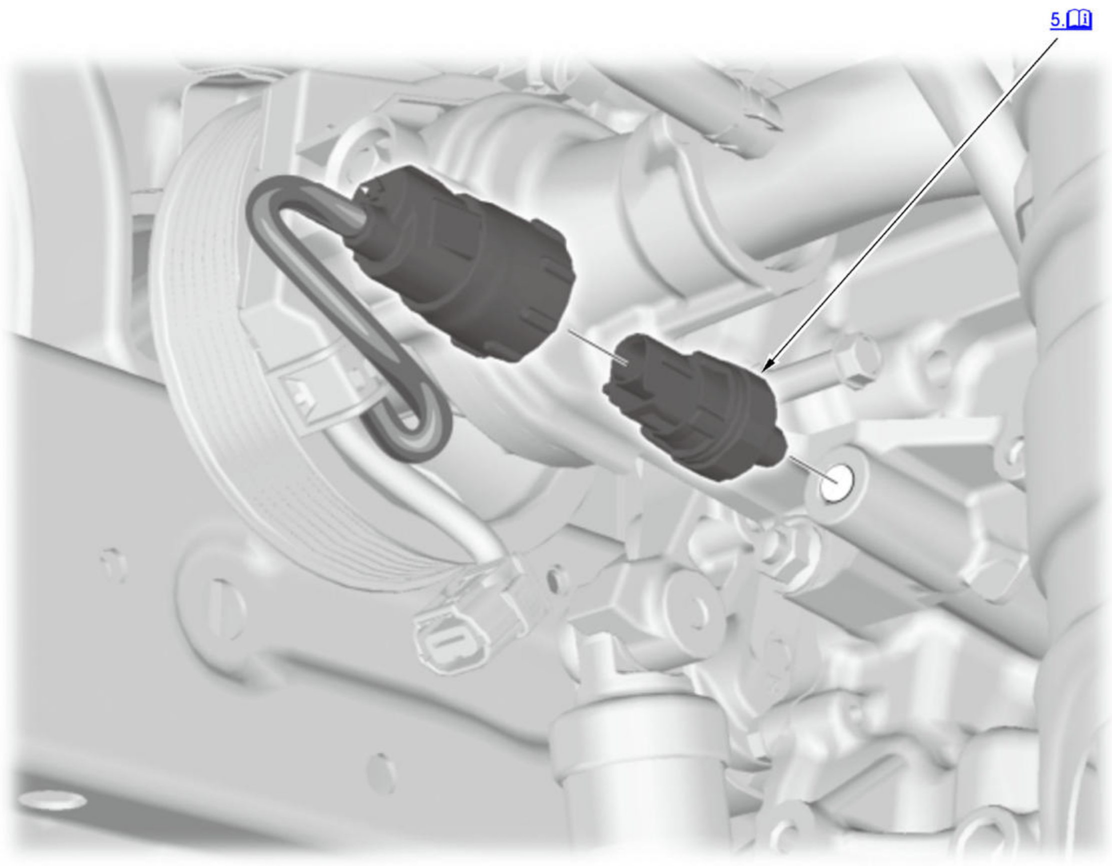
REMOVAL & INSTALLATION TEST

ENGINE OIL PRESSURE SWITCH REMOVAL, INSTALLATION, AND TEST (1.5 L ENGINE)

Removal

NOTE: ℹ Where icon is shown, further information shown below.

1



ℹ	Detailed information, notes, and precautions

1. **Right Front Wheel - Remove**
2. **Engine Undercover - Remove**
3. **Drive Belt - Remove**
4. **A/C Compressor - Move**

   NOTE:

   - Do not disconnect the suction hose and the discharge hose.
   - Do not bend the suction hose and the discharge hose excessively.
   - Hang the A/C compressor with a wire tie.

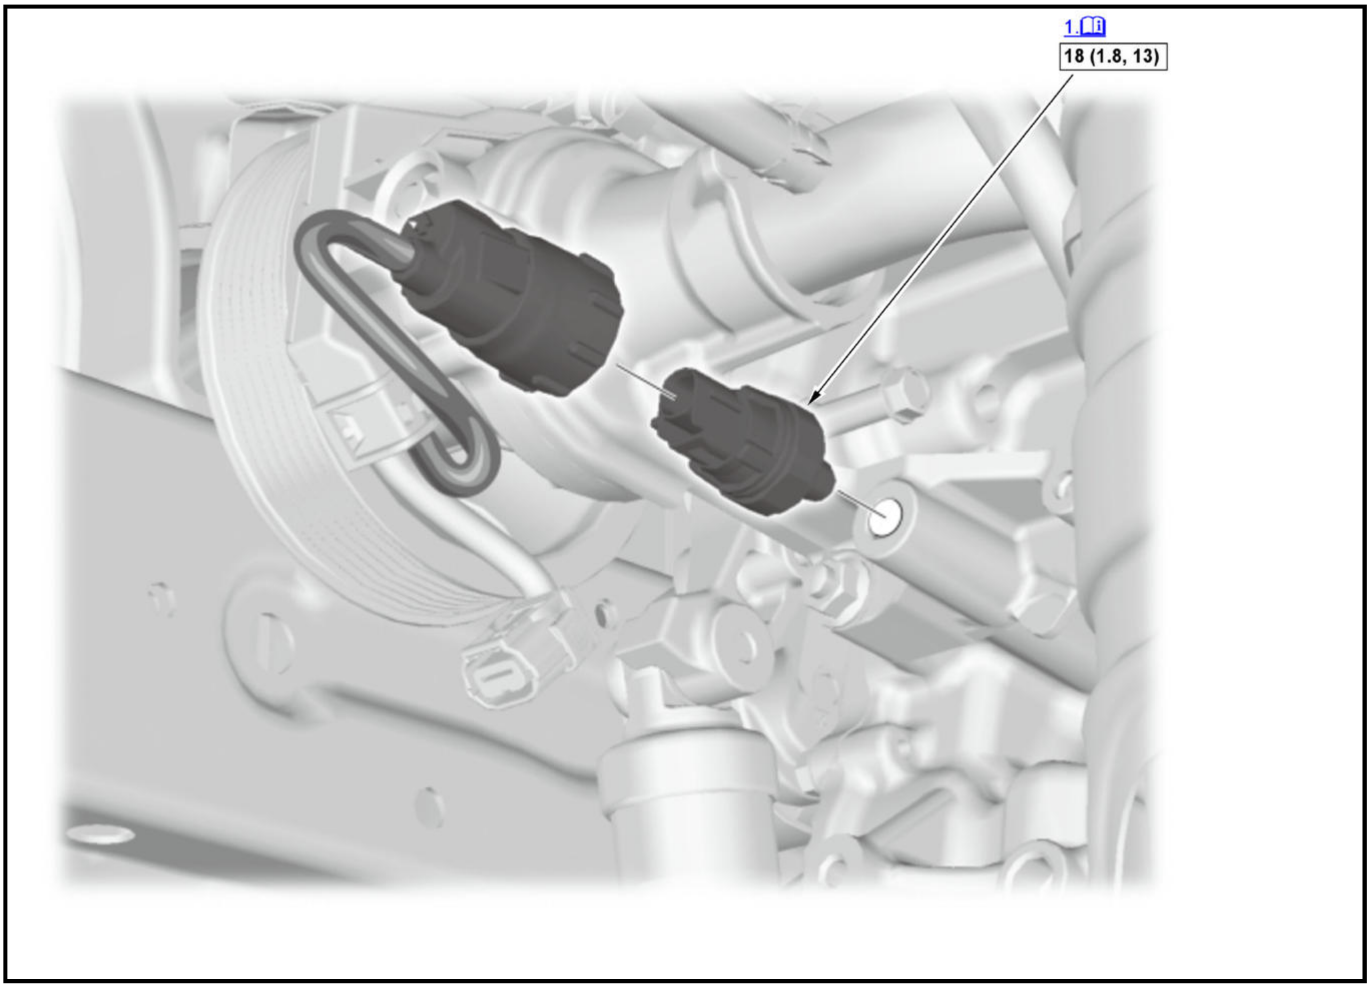
5. Oil Pressure Switch - Remove

NOTE: Remove any old liquid gasket from the oil pressure switch and the oil pressure switch mounting hole.

Installation

NOTE: ⓘ Where icon is shown, further information shown below.

1



ⓘ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)

1. Oil Pressure Switch - Install

1. Apply liquid gasket (P/N 08718-0003, 08718-0004, or 087180009) to the oil pressure switch threads. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **Using too much liquid gasket may cause**

- **liquid gasket to enter the oil passage or the end of the oil pressure switch.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

2. Install the oil pressure switch.

2. A/C Compressor - Install
3. Drive Belt - Install
4. Engine Undercover - Install
5. Right Front Wheel - Install

Test

1. Right Front Wheel - Remove
2. Engine Undercover - Remove
3. Oil Pressure Switch - Test

	1. Disconnect the connector (A). 2. Check for continuity between the oil pressure switch terminal (B) and the engine (ground). There should be continuity with the engine stopped. There should be no continuity with the engine running.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

ENGINE OIL PRESSURE SWITCH REMOVAL, INSTALLATION, AND TEST (2.4 L ENGINE) (2017 2018 2019)

Removal

NOTE: ℹ Where icon is shown, further information shown below.

1

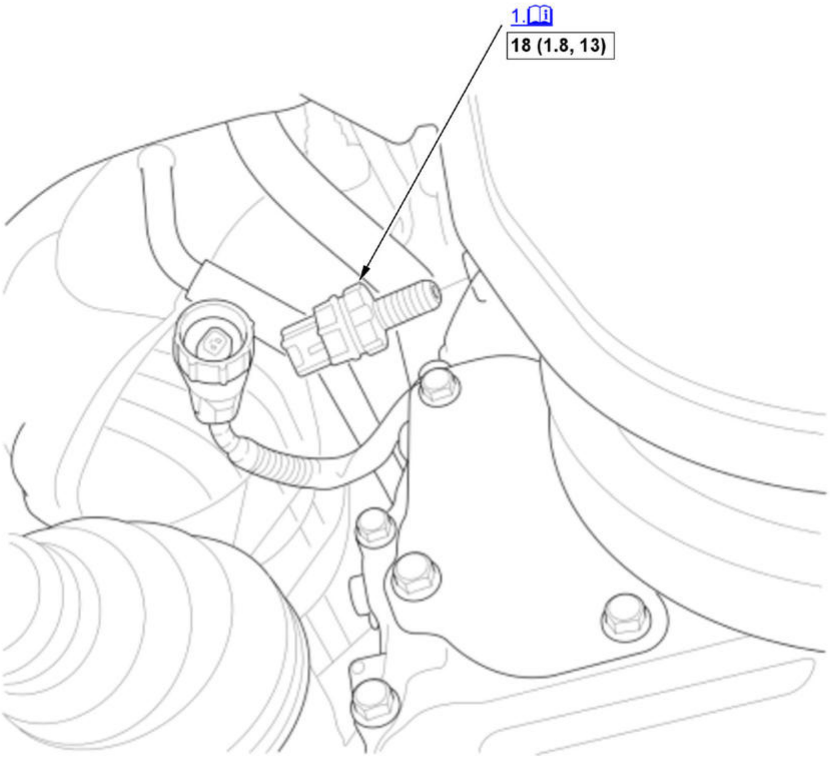
1. Oil Pressure Switch - Remove

NOTE: Remove any old liquid gasket from the oil pressure switch and the switch mounting hole.

Installation

NOTE: ℹ Where icon is shown, further information shown below.

1



ℹ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)

1. Oil Pressure Switch - Install

1. Apply liquid gasket (P/N 08718-0003, 08718-0004, or 08718- 0009) to the oil pressure switch threads. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **Using too much liquid gasket may cause liquid gasket to enter the oil passage or the end of the oil pressure switch.**

- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

2. Install the oil pressure switch.

Test

1. Oil Pressure Switch - Test

	1. Disconnect the connector (A). 2. Check for continuity between the oil pressure switch terminal (B) and the engine (ground). There should be continuity with the engine stopped. There should be no continuity with the engine running. 3. Connect the connector.

REMOVAL AND INSTALLATION

ENGINE OIL FILTER/OIL FILTER FEED PIPE REMOVAL AND INSTALLATION (1.5 L ENGINE)

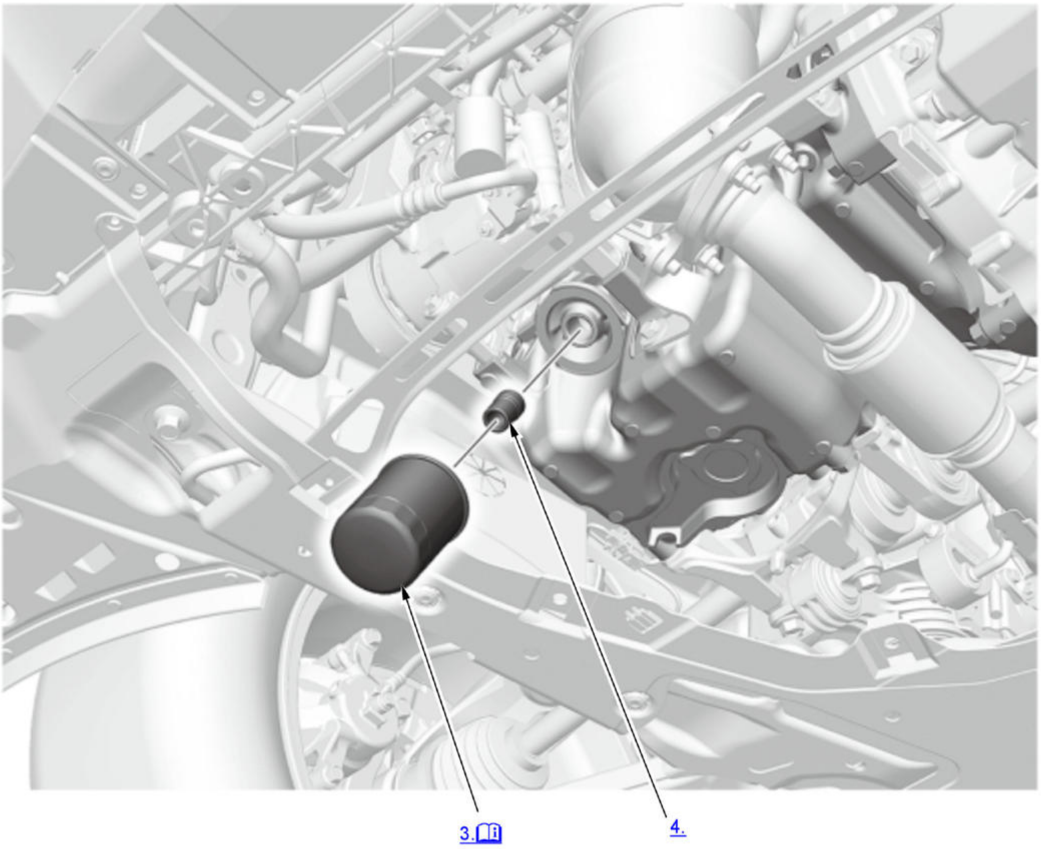
Special Tools Required

Image	Description/Tool Number
	Oil Filter Wrench 07AAA-PLCA100

Removal

NOTE: 🕮ⅰ Where icon is shown, further information shown below.

1



🕮ⅰ	Detailed information, notes, and precautions

1. **Vehicle - Lift**
2. **Engine Undercover Lid - Remove**
3. Oil Filter - Remove

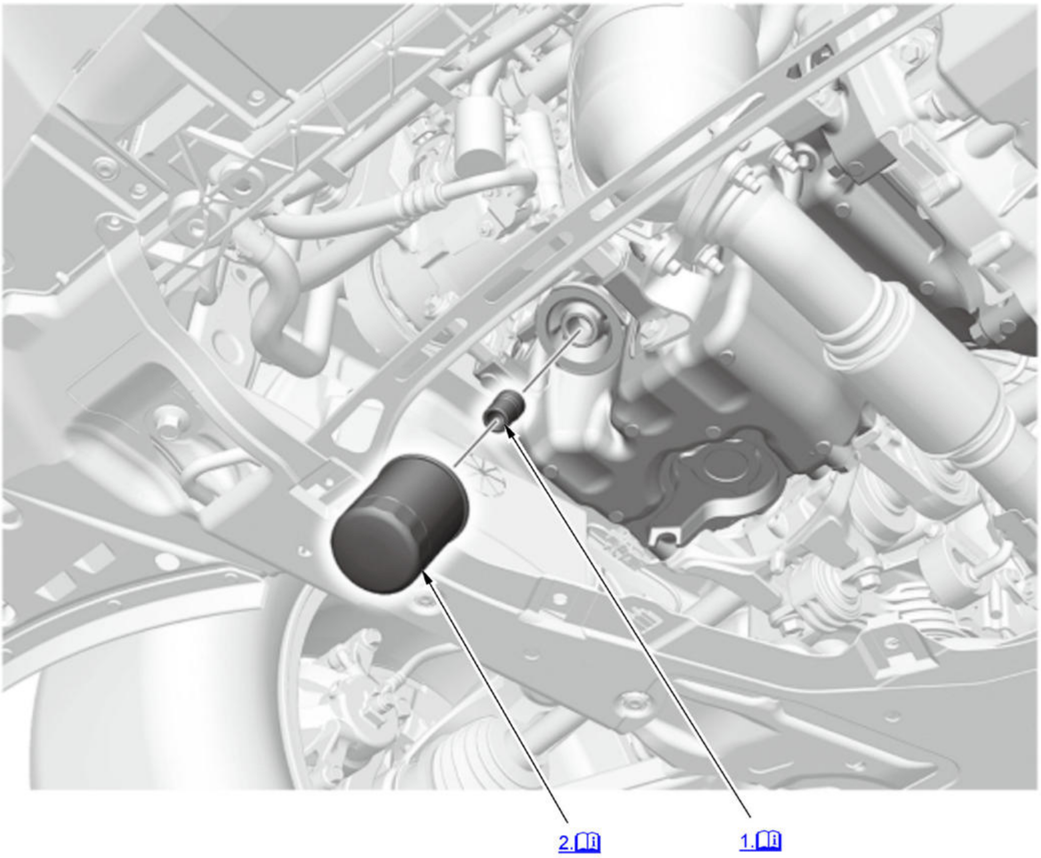
	1. Remove the oil filter with the oil filter wrench.

4. Oil Filter Feed Pipe - Remove

Installation

NOTE: ℹ Where icon is shown, further information shown below.

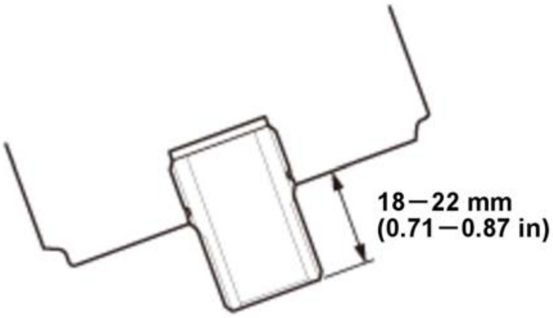
1



ℹ	Detailed information, notes, and precautions

1. Oil Filter Feed Pipe - Install

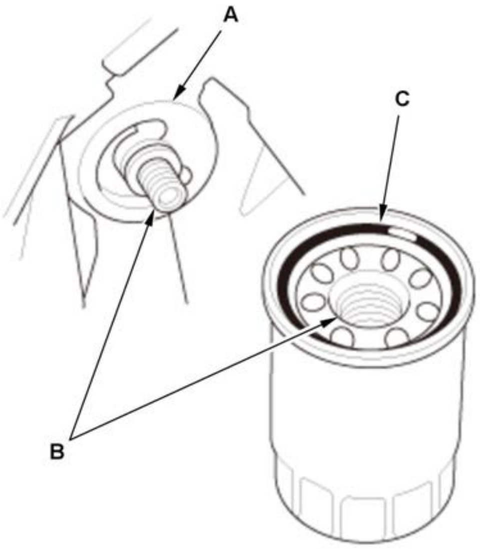
	1. Install the two 20 x 1.5 mm nuts (A) onto the oil filter feed pipe. Hold one nut with a wrench, then use a second wrench to tighten the other nut. 2. Apply new engine oil to the oil filter feed pipe threads.



3. Install the oil filter feed pipe in its specified height range shown.

4. Remove the nuts from the oil filter feed pipe.

2. Oil Filter - Install



1. Inspect the oil filter to make sure the rubber seal is not stuck to the oil filter seating surface (A) of the oil pan.

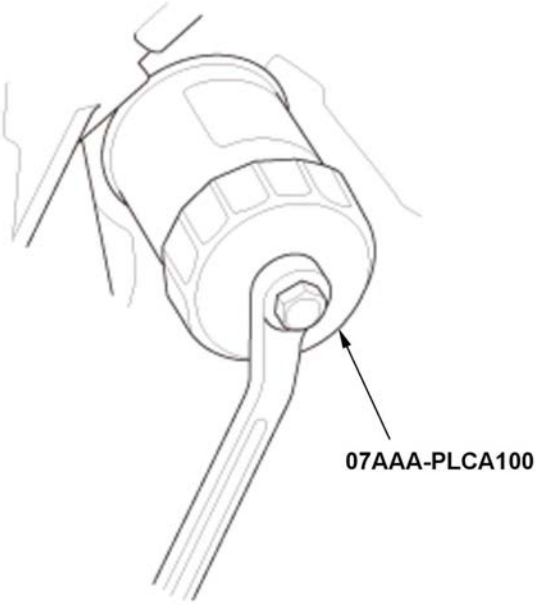
2. Inspect the threads (B) and the rubber seal (C) on the new oil filter.

3. Clean the oil filter seating surface of the oil pan.

4. Apply a light coat of new engine oil to the oil filter rubber seal.

NOTE:

Use only filters with a built-in bypass system.



5. Install the oil filter by hand.

6. After the rubber seal seats, tighten the oil filter clockwise with the oil filter wrench.

Tightening Torque:	**12 N.m (1.2 kgf.m, 9 lbf.ft)**

Tighten:	**3/4 Turn Clockwise**

	7. If four numbers or marks (1 to 4 or Δ to ΔΔΔΔ) are printed around the outside of the oil filter, use the following procedure to tighten the oil filter. - Spin the filter on until its seal lightly seats against the oil pan, and note which number or mark is at the bottom. - Tighten the filter by turning it clockwise three numbers or marks from the one you noted. For example, if mark Δ is at the bottom when the seal is lightly seated, tighten the oil filter until the mark ΔΔΔΔ comes around to the bottom.

Number or Mark when rubber seal is seated	1 or Δ	2 or ΔΔ	3 or ΔΔΔ	4 or ΔΔΔΔ
Number or Mark after tightening	4 or ΔΔΔΔ	1 or Δ	2 or ΔΔ	3 or ΔΔΔ

3. Oil Filter After Install - Check

1. After installation, **fill the engine with engine oil to the specified level** , run the engine for more than 3 minutes, then check for oil leakage.

4. **Engine Undercover Lid - Install**
5. Maintenance Minder - Reset (With Maintenance Minder System)

1. USA models: If the Maintenance Minder required to replace the oil filter, **reset the Maintenance Minder with the gauge**

(see "Resetting the Maintenance Minder").

2. Canada models: If the Maintenance Minder required to replace the oil filter, **reset the Maintenance Minder with the gauge**

(see "Resetting the Maintenance Minder"). If the Maintenance Minder did not require to replace the oil filter, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

6. Engine Oil Monitor - Reset (Without Maintenance Minder System)

ENGINE OIL FILTER/OIL FILTER FEED PIPE REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

Special Tools Required

Inspection

Balancer Shaft

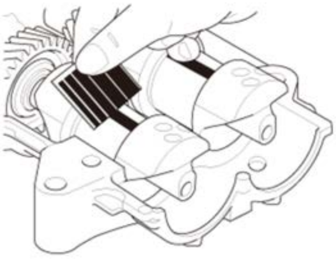
1. Oil Pump Balancer Shaft End Play - Inspect

	1. Zero the dial indicator against the end of the front balancer shaft, then push the front balancer shaft back and forth and read the end play.

Balancer Shaft End Play	
Standard (New):	**0.070-0.120 mm (0.00276-0.00472 in)**

Service Limit:	**0.135 mm (0.00531 in)**

2. Oil Pump Housing - Remove
3. Baffle Plate - Remove
4. Upper Balancer Shaft Holder - Remove
5. Front Balancer Shaft and Rear Balancer Shaft - Remove
6. Balancer Shaft Bearing Half - Remove
7. Oil Pump Balancer Shaft - Inspect



1. Clean both balancer shaft No. 1 and No. 2 journals and the bearing halves with a clean shop towel, then place both balancer shafts into the balancer shaft holder.

2. Place one strip of plastigage across each No. 1 and No. 2 journal.

3. Reinstall the bearings and the upper balancer shaft holder, then tighten the bolts.

NOTE:

Do not rotate the balancer shafts during inspection.

4. Remove the upper balancer shaft holder and the bearings again, and measure the widest part with the plastigage. If the balancer shaft No. 1 and No. 2 journals oil clearance is out-of-tolerance, install new bearings, and recheck. If it is still out-of-tolerance, replace the balancer shafts.

No. 1 Journal Oil Clearance:	
Standard (New):	**0.050-0.082 mm (0.00197-0.00323 in)**
Service Limit:	**0.100 mm (0.00394 in)**
No. 2 Journal Oil Clearance:	
Standard (New):	**0.060-0.120 mm (0.00236-0.00472 in)**
Service Limit:	**0.150 mm (0.00591 in)**

8. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

REMOVAL AND INSTALLATION

ENGINE OIL FILTER/OIL FILTER FEED PIPE REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	Oil Filter Wrench 07AAA-PLCA100

Removal

Procedure

NOTE: Numbered call-outs in figure pertain to list numbers in following procedure.

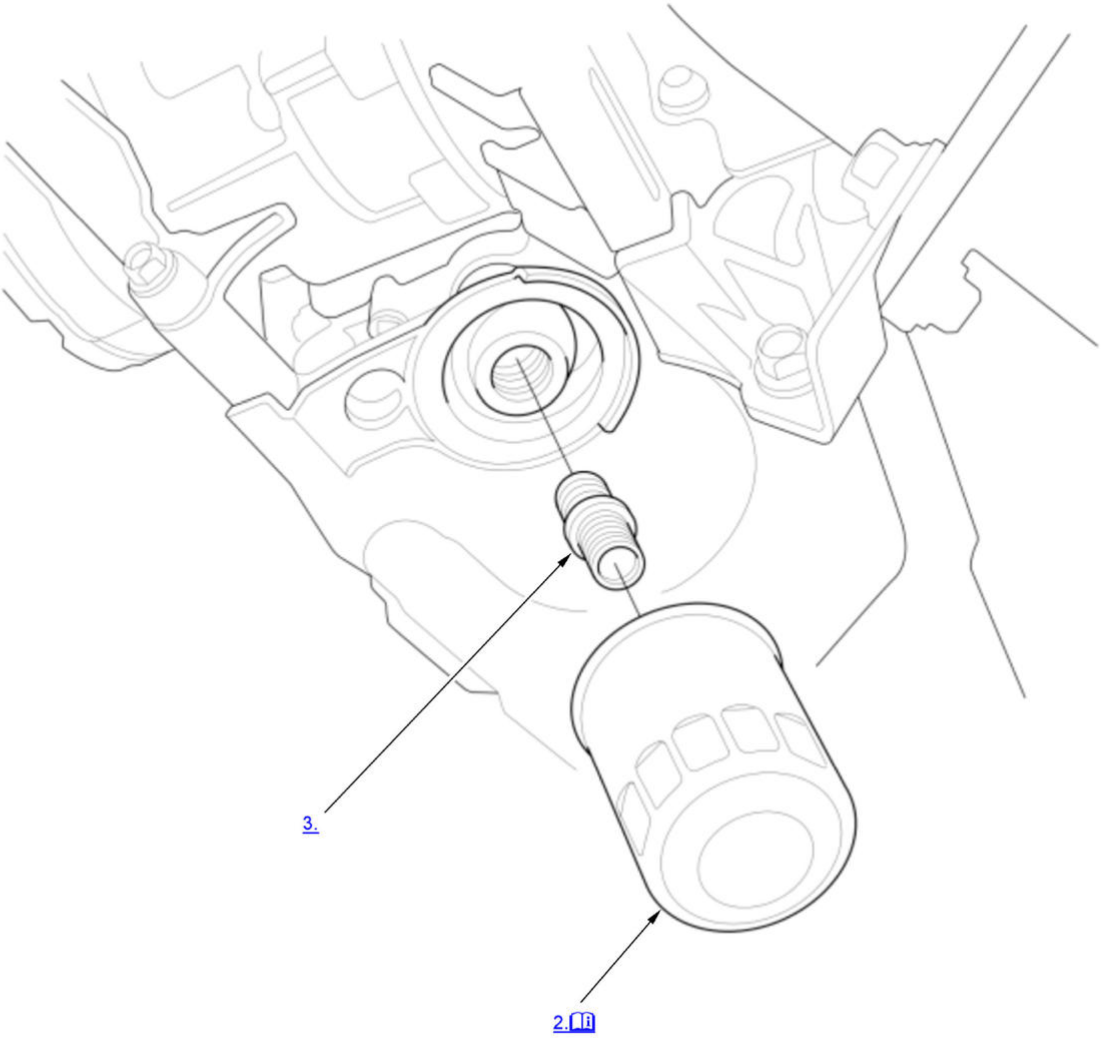


Fig. 1: Engine Oil Filter/Oil Filter Feed Pipe Replacement Components
Courtesy of HONDA, U.S.A., INC.

1. Engine Undercover Lid - Remove
2. Engine Oil Filter - Remove

	1. Remove the oil filter with the oil filter wrench.

3. Oil Filter Feed Pipe - Remove

Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

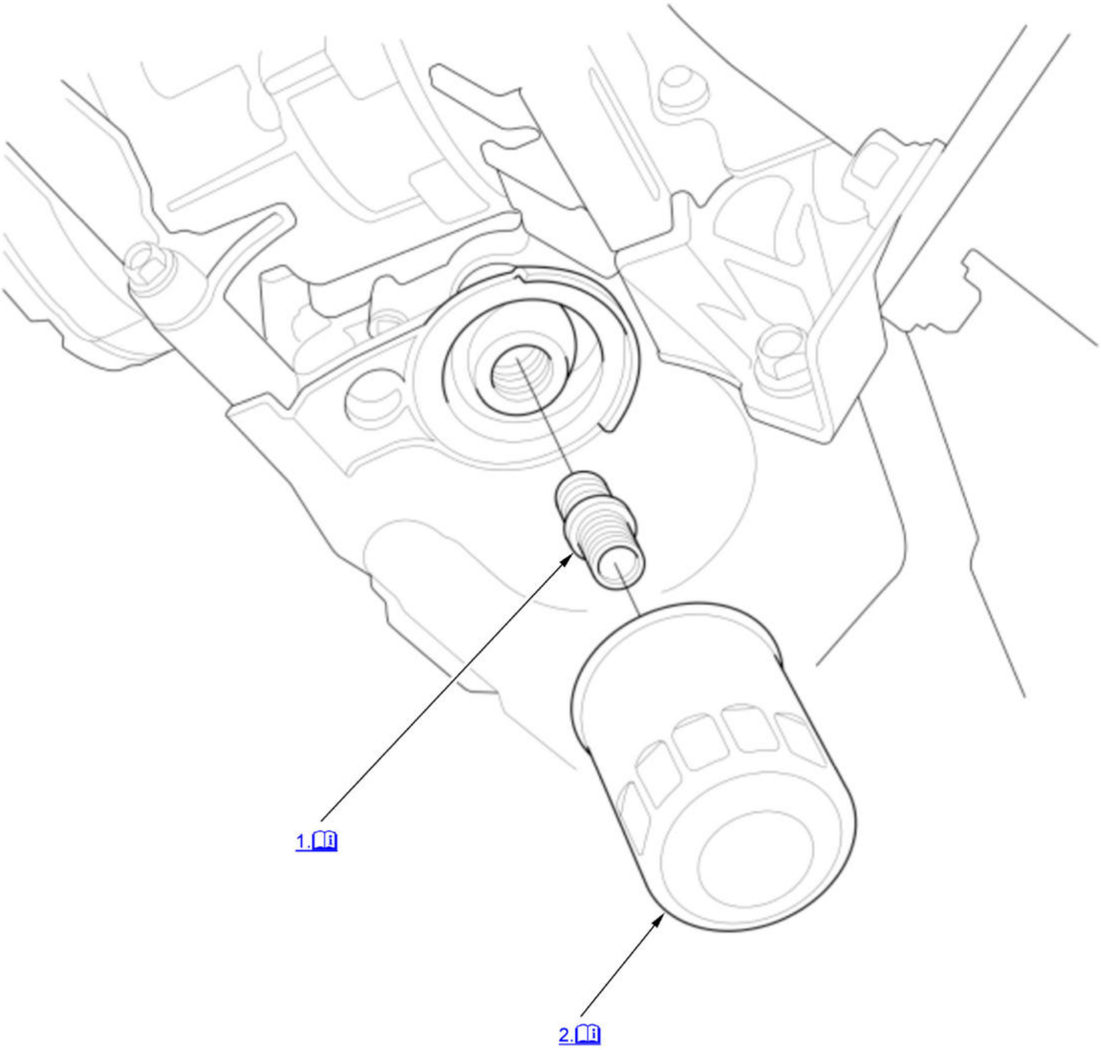

Fig. 2: Engine Oil Filter/Oil Filter Feed Pipe Replacement Components
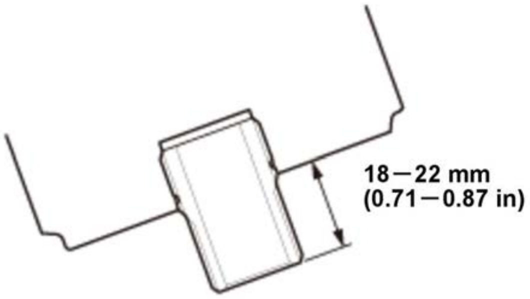
Courtesy of HONDA, U.S.A., INC.

1. Oil Filter Feed Pipe - Install

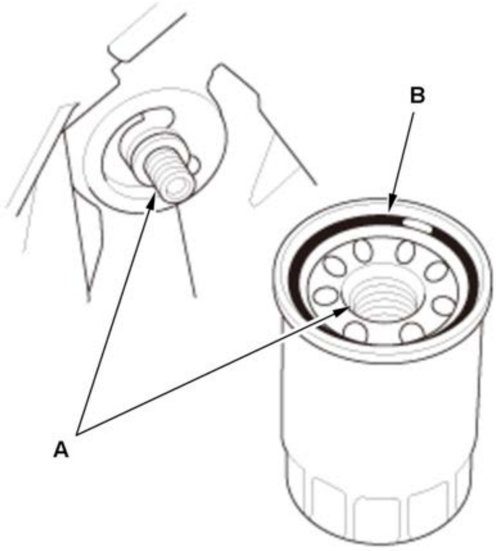
	1. Install the two 20 x 1.5 mm nuts (A) onto the oil filter feed pipe. Hold the nut with a wrench, then tighten the other nut. 2. Apply new engine oil to the oil filter feed pipe threads.



3. Make sure the oil filter feed pipe installed height is in its specified range shown.

4. Remove the nuts from the oil filter feed pipe.

2. Engine Oil Filter - Install



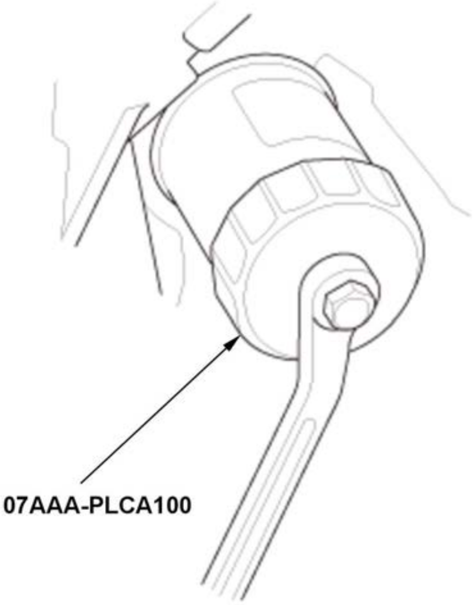
1. Inspect the oil filter to make sure the rubber seal is not stuck to the oil filter seating surface of the engine.

2. Inspect the threads (A) and the rubber seal (B) on the new filter.

3. Clean the seat on the oil pan.

4. Apply a light coat of new engine oil to the oil filter rubber seal.

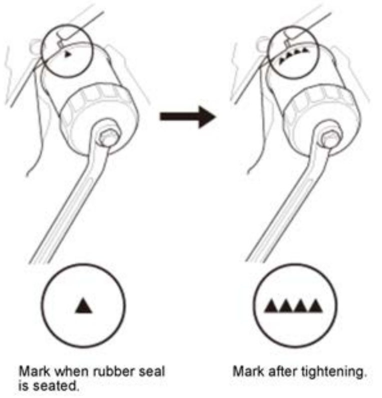
NOTE: Use only filters with a built-in bypass system.



5. Install the oil filter by hand.

6. After the rubber seal seats, tighten the oil filter clockwise with the oil filter wrench.

Tighten:	**3/4 Turn Clockwise**
Tightening Torque:	**12 N.m (1.2 kgf.m, 9 lbf.ft)**



7. If four numbers or marks (1 to 4 or ↓ to ↓↓↓↓) are printed around the outside of the filter, use the following procedure to tighten the filter:

- Spin the filter on until its seal lightly seats against the oil pan, and note which number or mark is at the bottom.
- Tighten the filter by turning it clockwise three numbers or marks from the one you noted. For example, if mark ↓ is at the bottom when the seal is lightly seated, tighten the filter until the mark ↓↓↓↓ comes around to the bottom.

Number or Mark when rubber seal is seated	1 or ↓	2 or ↓↓	3 or ↓↓↓	4 or ↓↓↓↓
Number or Mark after tightening	4 or ↓↓↓↓	1 or ↓	2 or ↓↓	3 or ↓↓↓

3. Engine Oil Filter After Install - Check

1. After installation, **enter the maintenance mode, then start the engine** . Run the engine for more than 3 minutes, then **check the oil level** and the oil leakage.

4. **Engine Undercover Lid - Install**
5. Maintenance Minder - Reset

1. USA models: If the Maintenance Minder requires the oil filter to be replaced, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder").

2. Canada models: If the Maintenance Minder requires the oil filter to be replaced, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder"). If the Maintenance Minder did not require the oil filter to be replaced, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

REPLACEMENT

ENGINE OIL REPLACEMENT (1.5 L ENGINE)

Replacement

NOTE: How to read the torque specifications .

1. Engine - Warm Up

1. Start the engine. Hold the engine speed at 3, 000 rpm with no load (in P or N) until the cooling fan comes on, then turn off the engine.

2. Vehicle - Lift
3. Engine Undercover Lid - Remove
4. Engine Oil - Drain

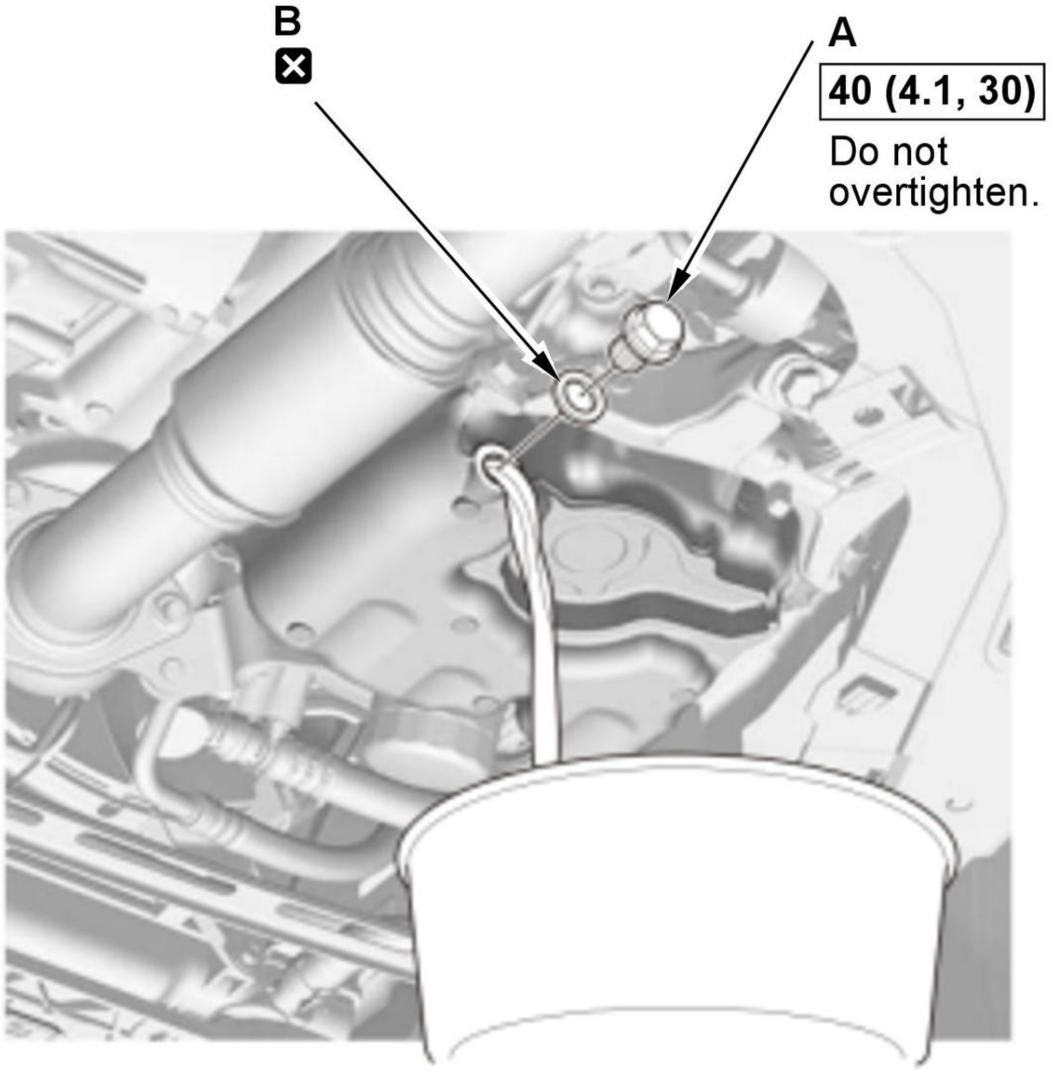


Fig. 1: Engine Oil Drain Bolt With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	1. Remove the drain bolt (A), and drain the engine oil. 2. Reinstall the drain bolt with a new washer (B) and torque to specification.

5. Engine Oil - Refill

	1. Refill the engine with the recommended engine oil .

After Engine Overhaul:	**4.0 L (4.2 US qt)**

Capacity	
At Oil Change:	**3.2 L (3.4 US qt)**
At Oil Change including Filter:	**3.5 L (3.7 US qt)**

6. Engine Oil Level - Check

1. Run the engine for more than 3 minutes, then **check the engine oil level** and the oil leakage.

7. **Engine Undercover Lid - Install**
8. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the engine oil, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder"). If the Maintenance Minder did not require to replace the engine oil, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

9. Engine Oil Monitor - Reset (Without Maintenance Minder System)

ENGINE OIL REPLACEMENT (2.4 L ENGINE) (2017 2018 2019)

Replacement

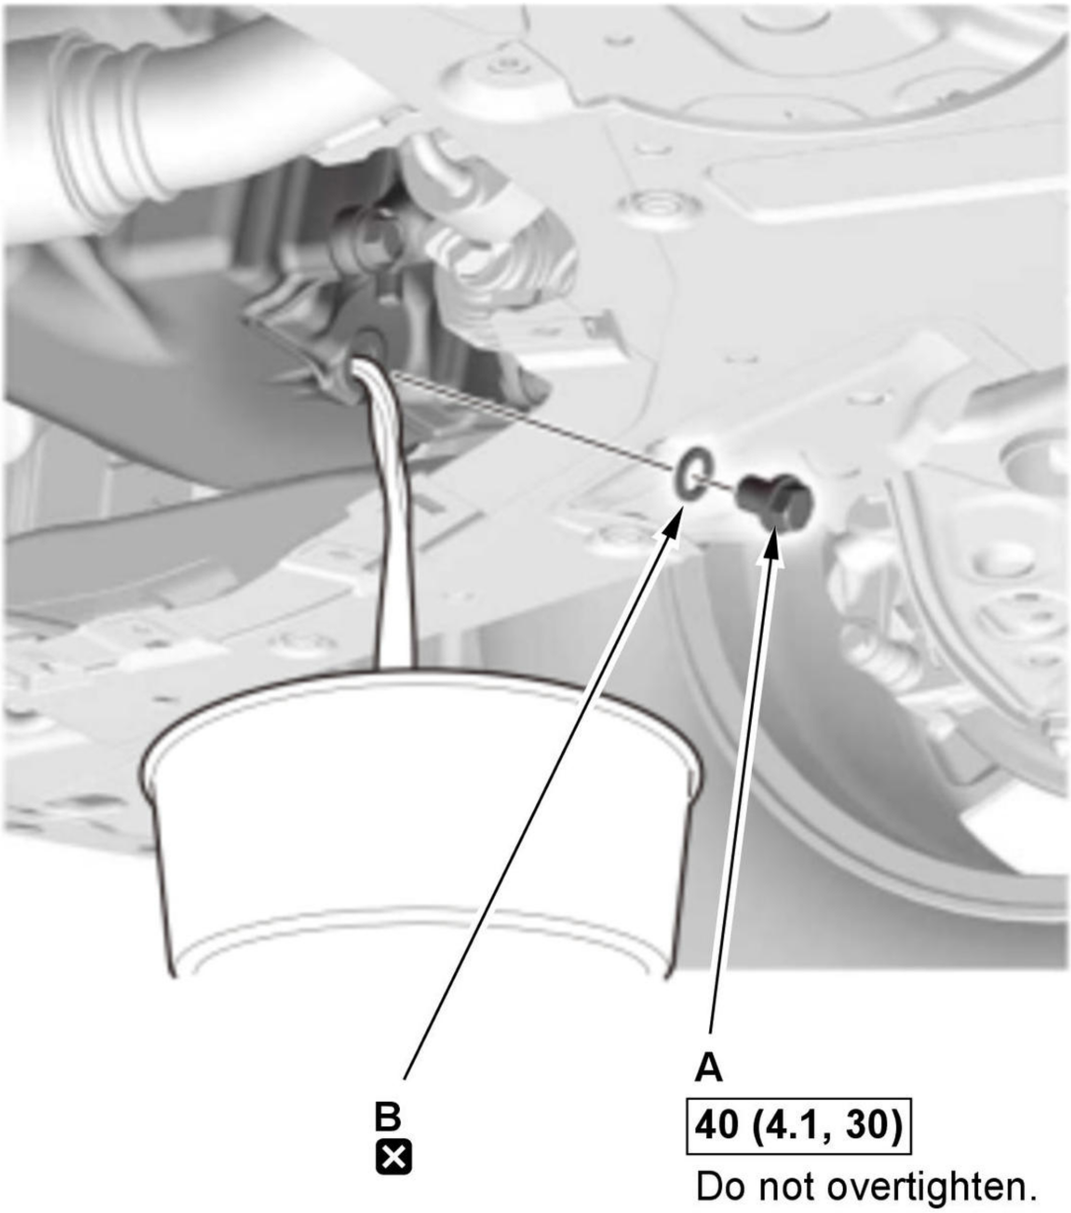
NOTE: **How to read the torque specifications** .

1. Engine - Warm Up

1. Allow the engine to reach operating temperature (fan comes on at least twice).

2. **Vehicle - Lift**
3. **Engine Undercover Lid - Remove**

4. Engine Oil - Drain



A
40 (4.1, 30)
Do not overtighten.
B
☒

Fig. 2: Engine Oil Drain Bolt With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	1. Remove the drain bolt (A), and drain the engine oil. 2. Reinstall the drain bolt with a new washer (B) and torque to specification.

5. Engine Oil - Refill

	1. Refill the engine with **the recommended engine oil** .

After Engine Overhaul:	**5.4 L (5.7 US qt)**

Capacity	
At Oil Change:	**4.2 L (4.4 US qt)**
At Oil Change including Filter:	**4.4 L (4.6 US qt)**

6. Engine Oil Level - Check

1. Run the engine for more than 3 minutes, then **check the oil level** and the oil leakage.

7. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

8. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the engine oil, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder"). If the Maintenance Minder did not require to replace the engine oil, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

PULLEY END CRANKSHAFT OIL SEAL REPLACEMENT - IN CAR (2.4 L ENGINE) (2017 2018 2019)

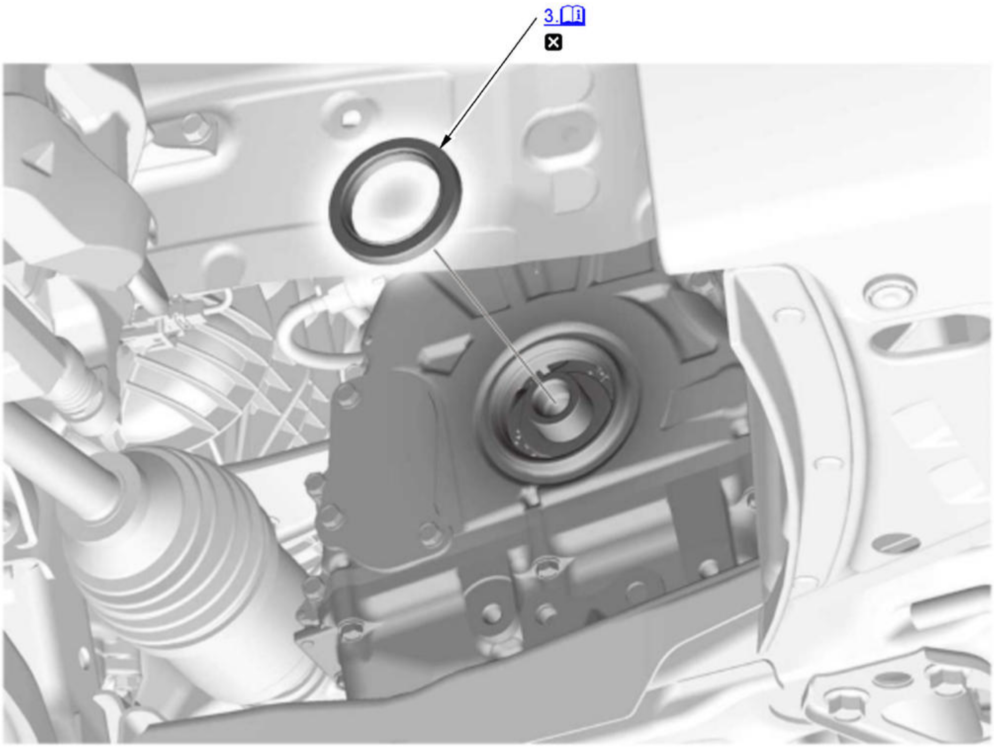
Special Tools Required

Image	Description/Tool Number
	Driver Handle, 15 x 135L 07749-0010000

Image	Description/Tool Number
	Hub Dis/Assembly Tool, 42 mm 07GAF-SD40200

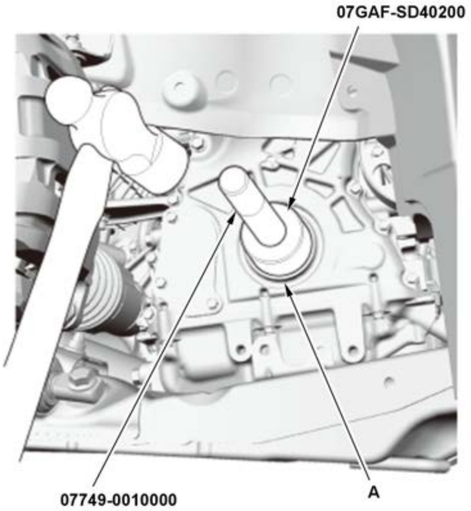
Replacement

NOTE: ℹ Where icon is shown, further information shown below.



ℹ	Detailed information, notes, and precautions
☒	Replace

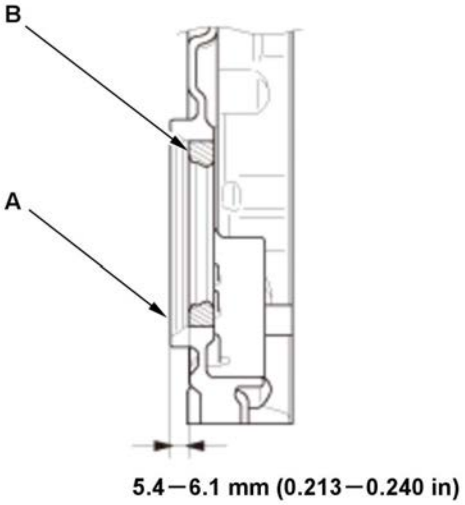
1. Crankshaft Pulley - Remove
2. Pulley End Crankshaft Oil Seal - Remove
3. Pulley End Crankshaft Oil Seal - Install



1. Clean and dry the crankshaft oil seal housing.

2. Apply a light coat of new engine oil to the lip of the pulley end crankshaft oil seal.

3. Using the driver handle, 15 x 135L and the hub dis/assembly tool, 42 mm, drive in the new pulley end crankshaft oil seal (A) squarely into the chain case to the specified installed height.



4. Measure the distance between the chain case surface (A) and the oil seal (B).

5. Clean the excess oil off the crankshaft, and check that the oil seal lip is not distorted.

Oil Seal Installed Height:
5.4-6.1 mm (0.213-0.240 in)

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Engine Oil Monitor System

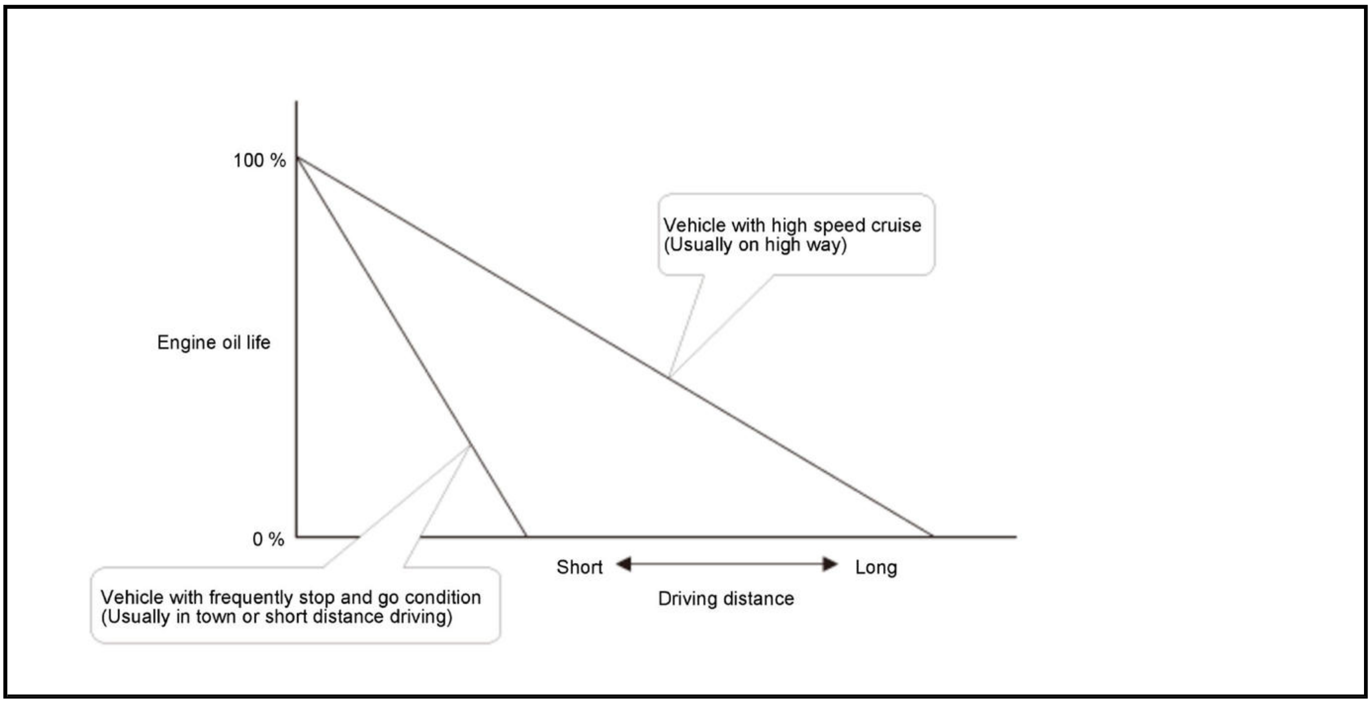
General Description

The engine oil monitor system shows a driver when the engine oil and/or the engine oil filter should be replaced by indicating a caution on the gauge control module which means the period of time when they should be replaced.

- Item A: Replace engine oil.
- Item B: Replace engine oil and engine oil filter.

The engine oil monitor system helps keep the engine in good condition. The PCM calculates a current driving condition, an engine load, and an appropriate engine oil replacement period, then, according to the result of the calculations, it displays a caution on the gauge control module .

NOTE: The illustration shows an image.



Fail-Safe Action

If the PCM stores engine system DTC (s), it will not be able to properly calculate the current driving condition because of the fail-safe action. Instead, the PCM calculates a temporary driving condition in theory and results in a replacement period earlier than normal with a caution display on the gauge control module .

ENGINE LUBRICATION SYSTEM DESCRIPTION (2.4 L ENGINE) (2017 2018 2019)

Overview

The lubrication method is a pressurized circulation type and it employs the full-flow filtering system. In the full-flow filtering system, all the oil supplied to the engine by the oil pump normally passes through the oil filter. It has excellent cleaning action.

CHECK

ENGINE OIL LEVEL CHECK (1.5 L ENGINE)

Check

1. Engine Oil Level - Check

	1. Park the vehicle on level ground, and start the engine. Hold the engine speed at 3, 000 rpm with no load (in P or N) until the cooling fan comes on, then turn off the engine, and wait more than 3 minutes. 2. Remove the dipstick, and wipe off the dipstick, then reinstall the dipstick. 3. Remove the dipstick, and check the engine oil level. It should be between the upper mark (A) and the lower mark (B). 4. If the engine oil level is near or below the lower mark check for oil leaks, and add the engine oil to bring it to the upper mark.

ENGINE OIL LEVEL CHECK (2.4 L ENGINE) (2017 2018 2019)

Check

1. Engine Oil Level - Check

	1. Park the vehicle on level ground, and start the engine. Hold the engine speed at 3, 000 rpm with no load (in P or N) until the radiator fan comes on, then turn off the engine, and wait more than 3 minutes. 2. Remove the dipstick, and wipe off the dipstick, then reinstall the dipstick. 3. Remove the dipstick. 4. Check the engine oil level. It should be between the upper mark (A) and the lower mark (B). 5. If the engine oil level is near or below the lower mark check for oil leaks, and **add the engine oil** to bring it to the upper mark.

TEST

ENGINE OIL PRESSURE TEST (1.5 L ENGINE)

Special Tools Required

Image	Description/Tool Number
	Oil Pressure Gauge Attachment PT1/8 07510-MA70000
	Oil Pressure Gauge 07506-3000001

Test

If the low oil pressure indicator stays on with the engine running, **check the engine oil level**. If the oil level is correct, go to the next procedure.

1. Oil Pressure Switch - Remove
2. Oil Pressure Gauge - Install

	1. Install the oil pressure gauge attachment PT1/8 and the oil pressure gauge to the oil pressure switch mounting hole.

3. A/C Compressor - Install
4. Drive Belt - Install
5. Engine Oil Pressure - Test

2. Allow the engine to reach operating temperature (cooling fan comes on at least twice). The pressure should be:

Engine Oil Temperature:	**176 deg. F (80 deg. C)**

Engine Oil Pressure:

At Idle:	**90 kPa (0.92 kgf/cm 2, 13.1 psi) min.**
At 3, 000 rpm:	**280 kPa (2.86 kgf/cm 2, 40.6 psi) min.**

3. If the oil pressure is not within specifications, inspect these items:

- Oil filter blocked or plugged.
- Oil strainer blocked or plugged.
- Inspect the oil pump relief valve.

4. Remove the oil pressure gauge attachment PT1/8 and the oil pressure gauge.

6. All Removed Parts - Install

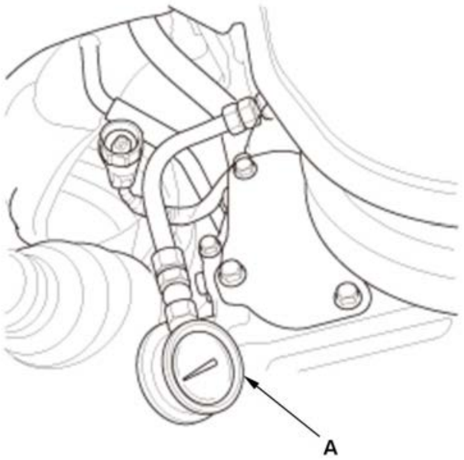
1. Install the parts in the reverse order of removal.

ENGINE OIL PRESSURE TEST (2.4 L ENGINE) (2017 2018 2019)

Test

If the low oil pressure indicator stays on with the engine running, check the engine oil level. If the oil level is correct.

1. Oil Pressure Switch - Remove
2. Engine Oil Pressure - Test



1. Install the oil pressure gauge (A).

2. Start the engine. Shut it off immediately if the gauge registers no oil pressure. Repair the problem before continuing.

3. Allow the engine to reach operating temperature (fan comes on at least twice). The pressure should be:

4. If oil pressure is out of specifications, inspect these items:

- Oil filter blocked or plugged.
- Oil strainer blocked or plugged.
- **Inspect the oil pressure relief valve** .

Engine Oil Temperature:	**176 deg. F (80 deg. C)**
Engine Oil Pressure:	B
At Idle:	**70 kPa (0.71 kgf/cm 2, 10.1 psi)**
At 3, 000 min -1 (rpm):	**300 kPa (3.06 kgf/cm 2, 43.5 psi)**

3. Oil Pressure Gauge and Oil Pressure Gauge Attachment - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SYMPTOM TROUBLESHOOTING

ENGINE LUBRICATION SYSTEM SYMPTOM TROUBLESHOOTING - LOW OIL PRESSURE INDICATOR DOES NOT COME ON WITH THE VEHICLE IN THE ON MODE

Low oil pressure indicator does not come on with the vehicle in the ON mode

1. Gauge control module test

   -1. Connect the HDS to the DLC .

-2. **Check for DTCs** . If a DTC is present, diagnose, and repair the cause before continuing with this test.

DTC (PGM-FI)

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
OIL PRESSURE SWITCH	ON	B	B	B

Do the current condition (s) match the threshold?

YES

Replace the gauge control module .

NO

Go to step 2.

2. Oil pressure switch test

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the oil pressure switch** .

Is the oil pressure switch OK?

YES (1.5 L engine)

Go to step 3.

YES (2.4 L engine)

Go to step 4.

NO

Replace the oil pressure switch .

3. Open wire check (ENG OPSW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

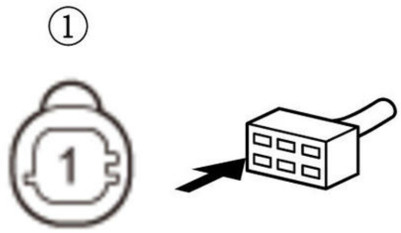
-3. Disconnect the following connectors.

PCM connector E (80P)
Oil pressure switch 1P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P): disconnected
	Oil pressure switch 1P connector: disconnected
Test point 1	**PCM connector E (80P) No. 58**

Test point 2	Oil pressure switch 1P connector (female terminals) No. 1: ①
B	



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the PCM was substituted, and the symptom/indication goes away, **replace the original PCM** .

NO

Repair an open in the ENG OPSW wire between the oil pressure switch and the PCM.

4. Open wire check (ENG OP SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

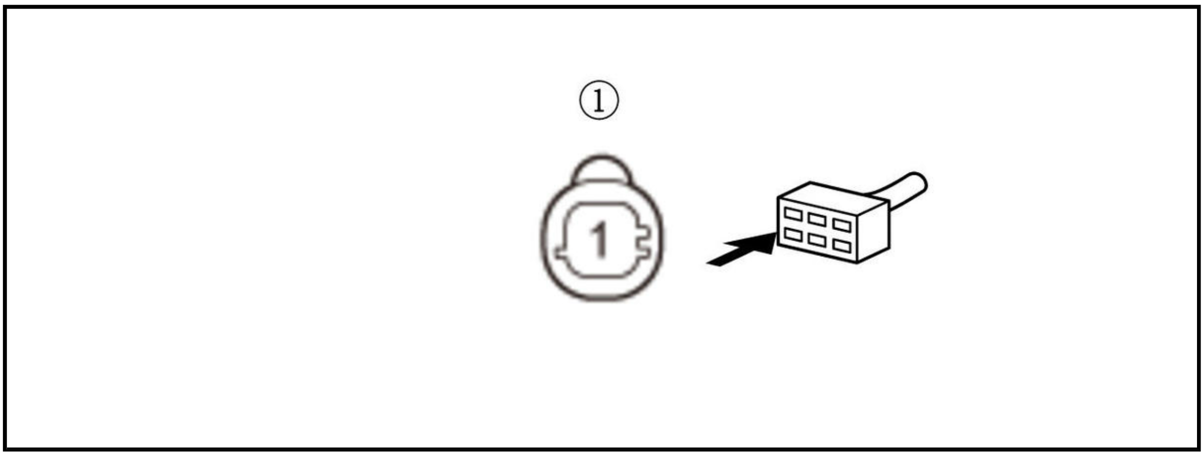
-3. Disconnect the following connectors.

PCM connector B (51P)

Oil pressure switch 1P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector B (51P): disconnected
	Oil pressure switch 1P connector: disconnected
Test point 1	**PCM connector B (51P) No. 34**
Test point 2	Oil pressure switch 1P connector (female terminals) No. 1: ①
B	



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the PCM was substituted, and the symptom/indication goes away, **replace the original PCM** .

NO

Repair an open in the ENG OP SW wire between the oil pressure switch and the PCM.

ENGINE LUBRICATION SYSTEM SYMPTOM TROUBLESHOOTING - LOW OIL PRESSURE INDICATOR STAYS ON

Low oil pressure indicator stays on

1. Gauge control module test

-1. **Connect the HDS to the DLC** .

-2. **Check for DTCs** . If a DTC is present, diagnose, and repair the cause before continuing with this test.

DTC (PGM-FI)

-3. Start the engine, and check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
OIL PRESSURE SWITCH	OFF	B	B	B

Do the current condition (s) match the threshold?

YES

Replace the gauge control module .

NO

Go to step 2.

2. Oil pressure switch test

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the oil pressure switch** .

Is the oil pressure switch OK?

YES (1.5 L engine)

Go to step 3.

YES (2.4 L engine)

Go to step 4.

NO

Do the oil pressure test. If the oil pressure is OK, replace the oil pressure switch .

3. Shorted wire check (ENG OPSW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

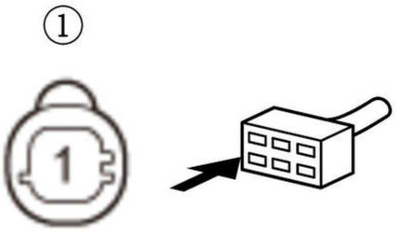
NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connectors.

PCM connector E (80P)
Oil pressure switch 1P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P) : disconnected
	Oil pressure switch 1P connector: disconnected
Test point 1	Oil pressure switch 1P connector (female terminals) No. 1: ①
Test point 2	Body ground
B	



Is there continuity?

YES

Repair a short to ground in the ENG OPSW wire between the oil pressure switch and the PCM.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the PCM was substituted, and the symptom/indication goes away, **replace the original PCM** .

4. Shorted wire check (ENG OP SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

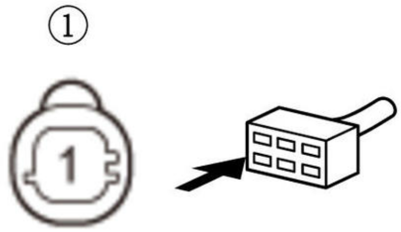
NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connectors.

PCM connector B (51P)
Oil pressure switch 1P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector B (51P): disconnected
	Oil pressure switch 1P connector: disconnected
Test point 1	Oil pressure switch 1P connector (female terminals) No. 1: ①
Test point 2	Body ground
B	



Is there continuity?

YES

Repair a short to ground in the ENG OP SW wire between the oil pressure switch and the PCM.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the PCM was substituted, and the symptom/indication goes away, **replace the original PCM** .

SYMPTOM TROUBLESHOOTING INDEX

ENGINE LUBRICATION SYSTEM SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
Excessive engine oil consumption	• Check for oil leaks. • Check for worn valve guide (s); or worn valve seal (s) . • Check for a damaged or worn piston ring (s) . • Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.) .	Check the maintenance records as engine oil that is worn out burns off at a higher rate
Low oil pressure indicator does not come on with the vehicle in the ON mode	Do the symptom troubleshooting for low oil pressure indicator does not come on with the vehicle in the ON mode.	An open in the wire between the PCM and the oil pressure switch
Low oil pressure indicator stays on	• Check the engine oil level. • Do the symptom troubleshooting for low oil pressure indicator stays on.	A wire shorted to ground between the PCM and the oil pressure switch

REMOVAL & INSTALLATION INSPECTION

ENGINE OIL JET REMOVAL, INSTALLATION, AND INSPECTION (1.5 L ENGINE)

Removal and Installation

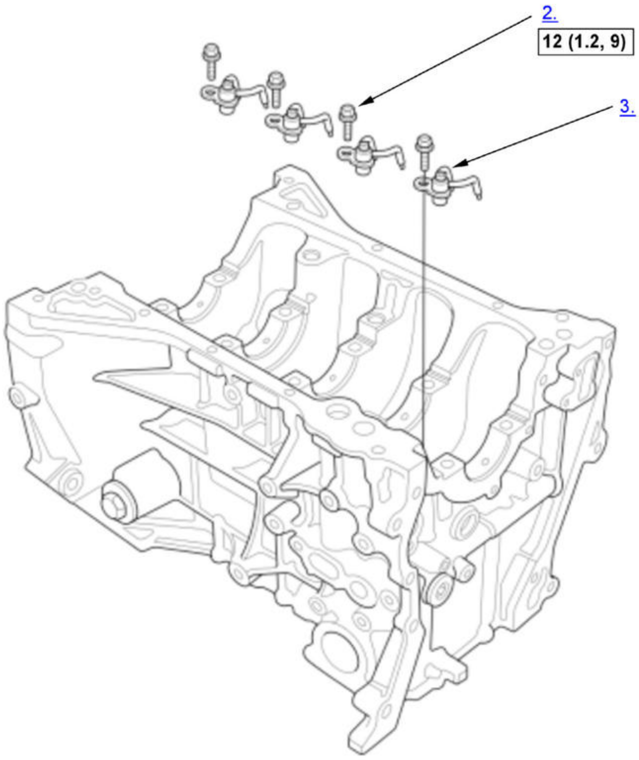


Fig. 3: Engine Oil Jet Bolt With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

□	Torque: N.m (kgf.m, lbf.ft)

1. Crankshaft - Remove

2. Oil Jet Bolt - Remove
3. Oil Jet - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Inspection

1. Oil Jet - Inspect

	1. Make sure that a 1.0 mm (1/32 in) diameter pin will go through the nozzle hole (A) (1.2 mm (0.047 in) diameter). **NOTE:** Replace the oil jet, if the nozzle is damaged or bent. 2. Make sure that a 1.8 mm (1/16 in) diameter pin will go through the oil intake (B) (2.0 mm (0.079 in) diameter), and the check ball (C) moves smoothly and has a stroke of about 2.0 mm (0.079 in). **NOTE:** Be careful not to damage the check ball.

ENGINE OIL PUMP CHAIN REMOVAL, INSTALLATION, AND INSPECTION (2.4 L ENGINE) (2017 2018 2019)

Special Tools Required

Image	Description/Tool Number
	Universal Lifting Eyelet 07AAK-SNAA120
	Engine Support Hanger, A and Reds AAR-T1256*

*: Available through the Honda Tool and Equipment Program 888-424-6857.

Removal

1. **Cam Chain - Remove**
2. Universal Lifting Eyelet - Attach

	1. Remove the alternator mounting bolt.

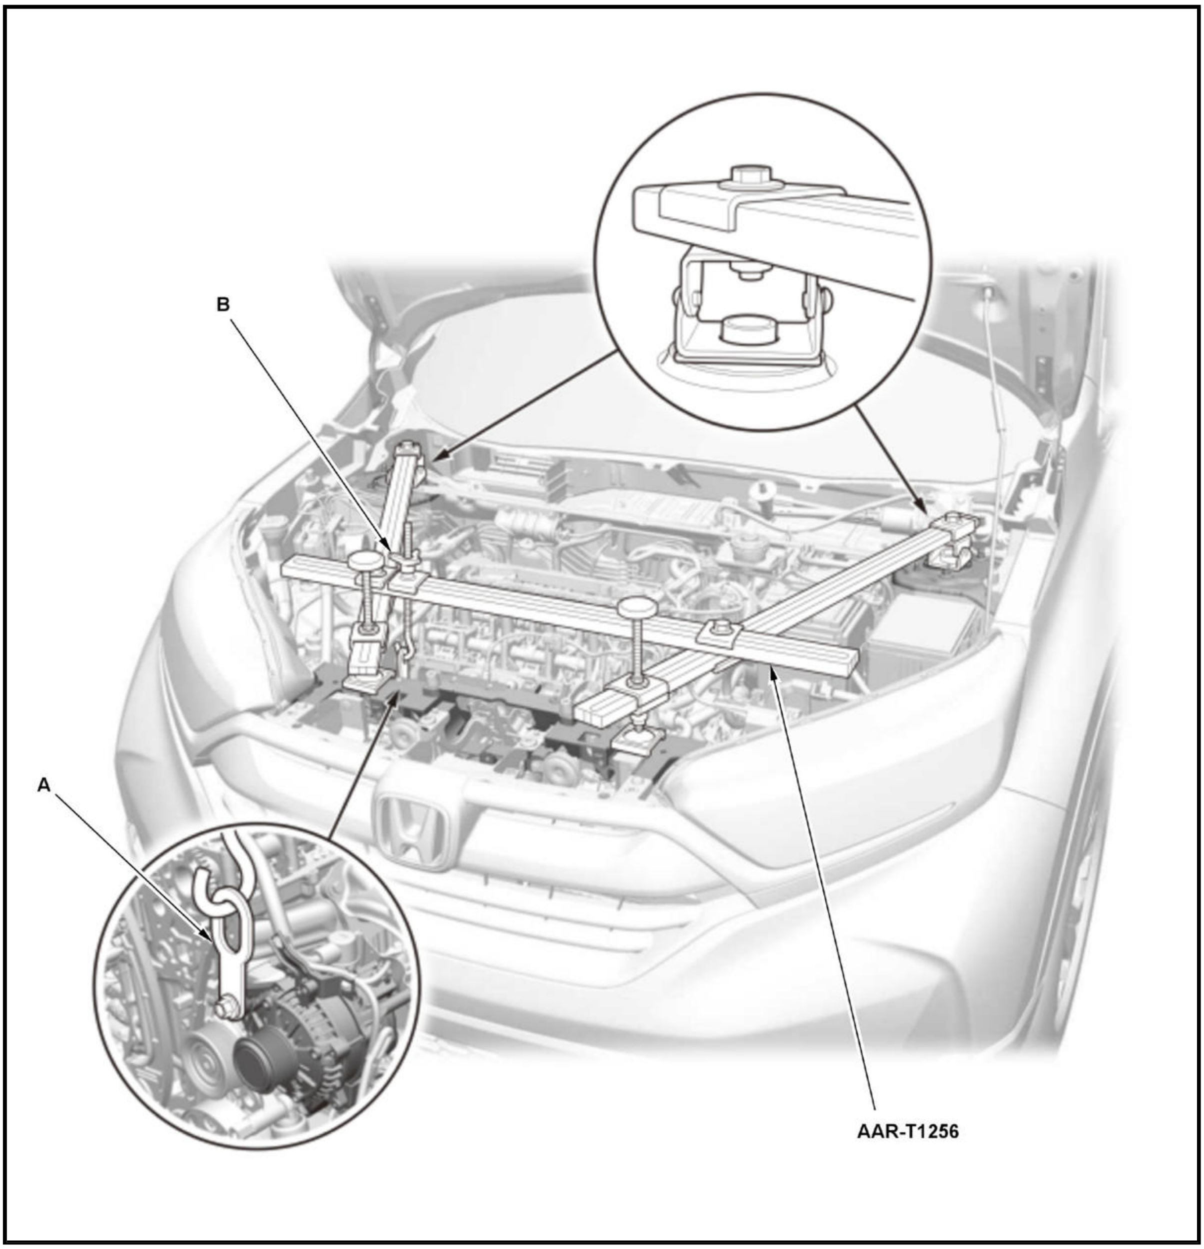
	2. Attach the universal lifting eyelet to the alternator.

3. **Center Cowl Cover - Remove**
4. **Front Bulkhead Cover - Remove**
5. **Radiator Cap Base - Move**

   NOTE: Do not disconnect the hose.

6. Engine Support Hanger - Install

   1. Install the engine support hanger as shown.



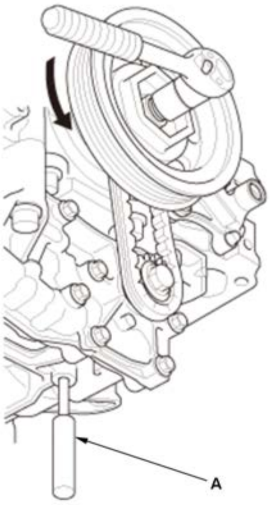
2. Attach the hook to the slotted hole in the universal lifting eyelet (A).

3. Tighten the wing nut (B) by hand, and lift and support the engine/transmission.

NOTE:

- Be careful when working around the windshield.
- Be careful not to damage the hood opener cable when installing the engine support hanger at the front bulkhead.

7. **Oil Pan - Remove**
8. Oil Pump Chain Tensioner - Remove

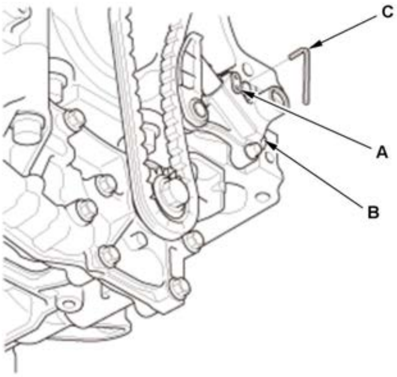


1. Loosely install the crankshaft pulley.

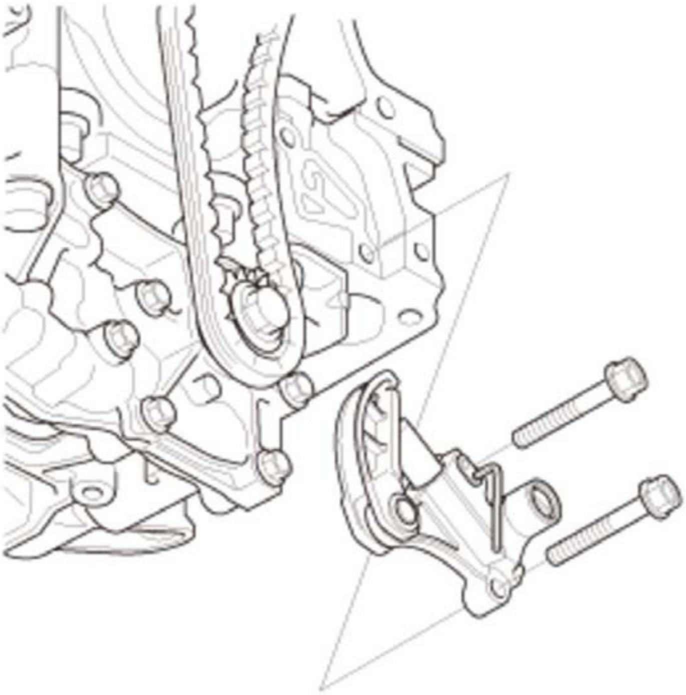
2. To hold the front balancer shaft, insert a 6 mm long pin punch (A) (Snap-on PPC108LA or equivalent) into the maintenance hole in the balancer shaft holder and through the front balancer shaft.

3. Turn the crankshaft counterclockwise to compress the oil pump chain.

4. Remove the crankshaft pulley.

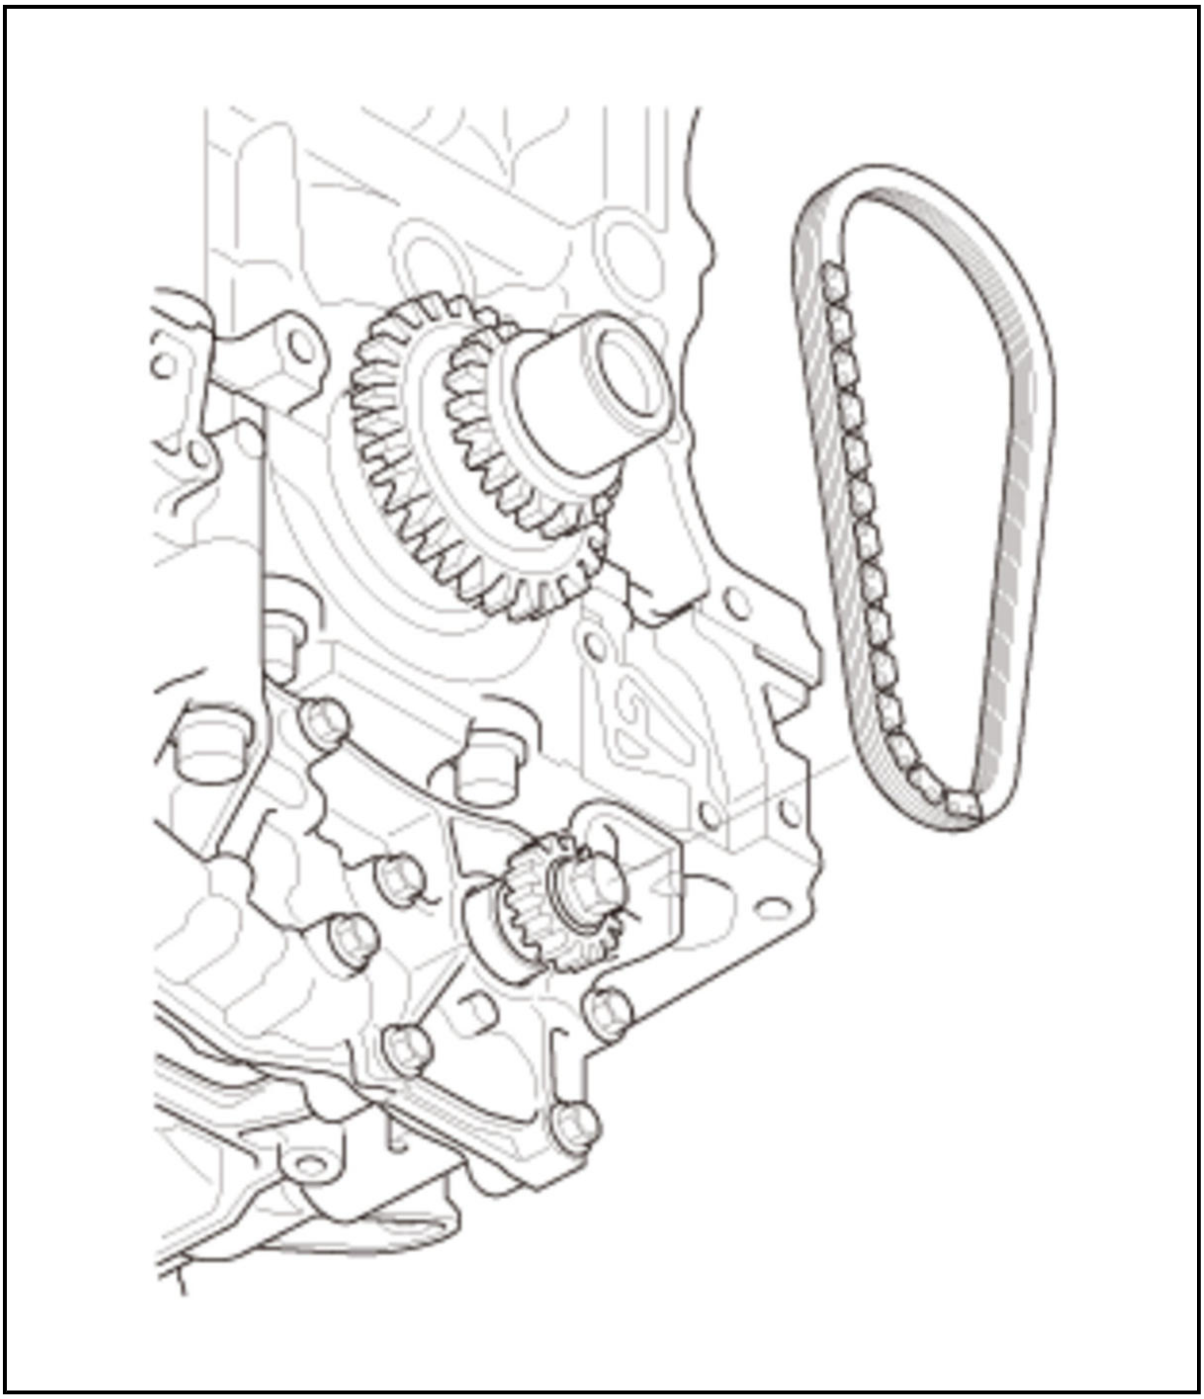


5. Align the holes on the lock (A) and the oil pump chain auto-tensioner (B), then insert a 2.0 mm (5/64 in) diameter pin (C) into the holes. Turn the crankshaft clockwise to secure the pin.



6. Remove the oil pump chain auto-tensioner.

9. Oil Pump Chain - Remove



Installation

NOTE: **How to read the torque specifications** .

1. Oil Pump Chain - Install

	1. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the engine block.
	2. Install the oil pump chain on the crankshaft sprocket with the colored link plate (A) aligned with the TDC mark (B) on the crankshaft sprocket.
	3. Set the oil pump chain on the oil pump chain sprocket (A) with the punch mark (B) aligned with the center of the two colored link plate (C).

2. Oil Pump Chain Auto-Tensioner - Install

	1. Turn the plate (A) counterclockwise, to release the lock, then push the oil pump chain arm (B), and set the first cam (C) to the first edge of the rack (D). Insert a 2.0 mm (5/64 in) diameter pin (E) into the hole (F). **NOTE:** If the oil pump chain auto-tensioner is not set up as described, the oil pump chain auto-tensioner will become damaged.

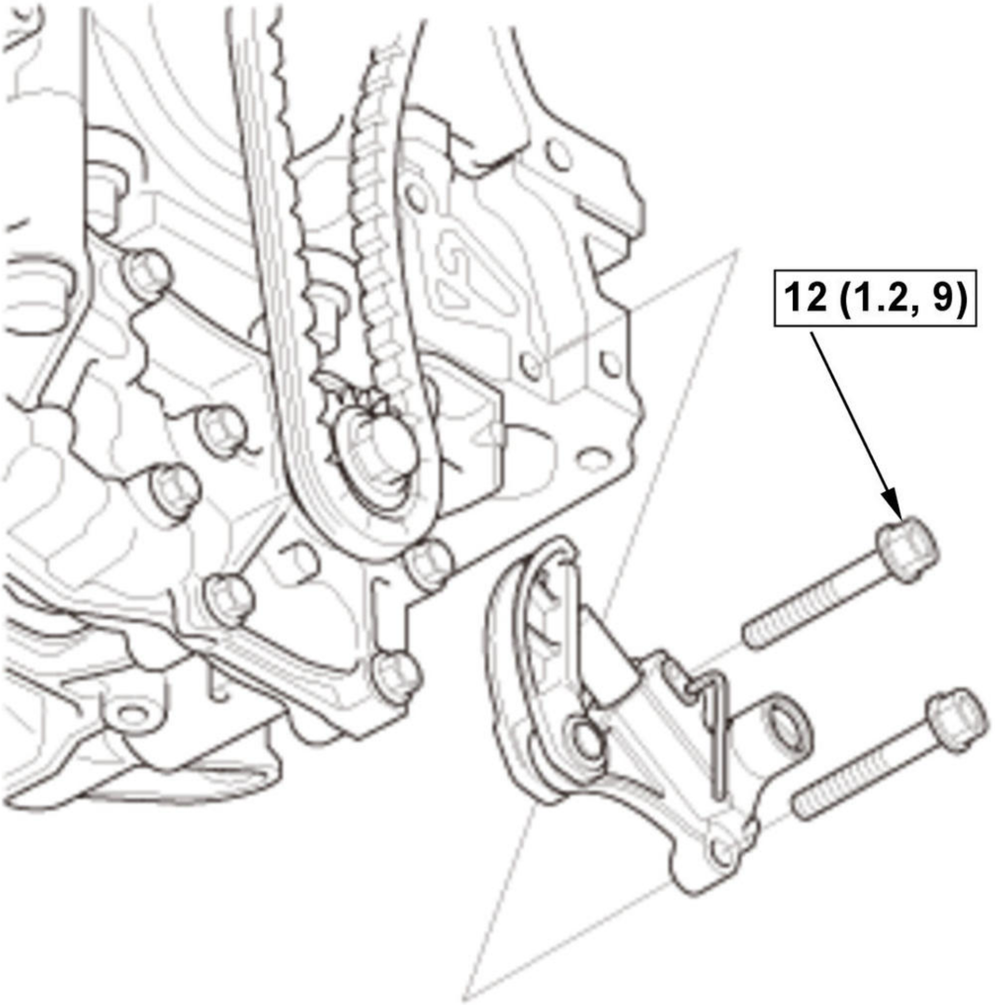


Fig. 4: Oil Pump Chain Auto-Tensioner With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

B	2. Install the oil pump chain auto-tensioner.

	3. Remove the pin (A) from the oil pump chain auto-tensioner.

3. **Oil Pan - Install**
4. Engine - Support

1. Lift and support the engine with a jack and a wood block under the oil pan.

5. Engine Support Hanger and Universal Lifting Eyelet - Remove
6. **Radiator Cap Base - Install**
7. **Front Bulkhead Cover - Install**
8. **Center Cowl Cover - Install**
9. Alternator Mounting Bolt - Install

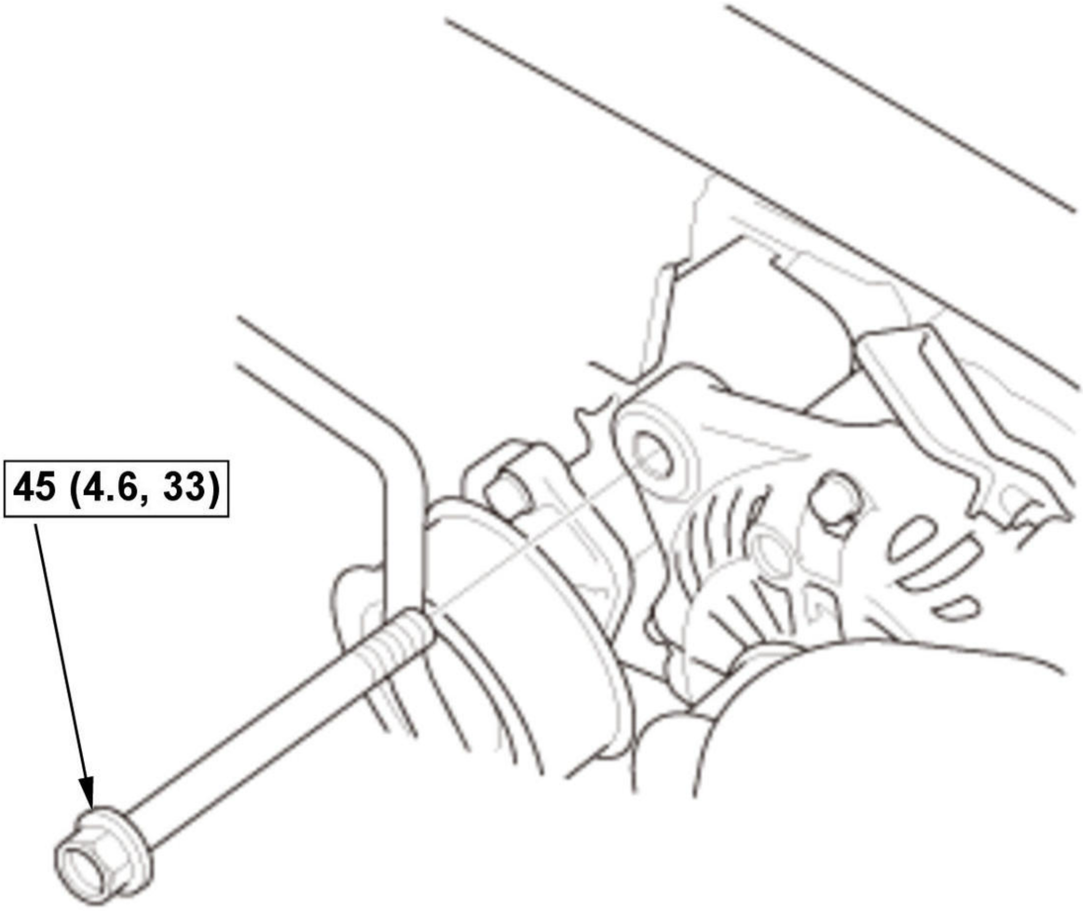

Fig. 5: Alternator Mounting Bolt Torque Specifications
Courtesy of HONDA, U.S.A., INC.

10. Cam Chain - Install

Inspection

1. Cam Chain Case - Remove
2. Oil Pump Chain - Inspect

	1. Measure the oil pump chain rod length. If the length is over the service limit, replace the oil pump chain.

Oil Pump Chain Auto-Tensioner Rod Length	
Service Limit:	**10.4 mm (0.409 in)**

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

EXCESSIVE ENGINE OIL CONSUMPTION

Diagnostic procedure

- Check for oil leaks.
- Check for worn valve guide (s); or worn valve seal (s) .
- Check for a damaged or worn piston ring (s) .
- Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.) .

Also check for

Check the maintenance records as engine oil that is worn out burns off at a higher rate

LOW OIL PRESSURE INDICATOR DOES NOT COME ON WITH THE VEHICLE IN THE ON MODE

Diagnostic procedure

- Do the symptom troubleshooting for low oil pressure indicator does not come on with the vehicle in the ON mode.

Also check for

An open in the wire between the PCM and the oil pressure switch

LOW OIL PRESSURE INDICATOR STAYS ON

Diagnostic procedure

- **Check the engine oil level**.
- **Do the symptom troubleshooting for low oil pressure indicator stays on**.

Also check for

A wire shorted to ground between the PCM and the oil pressure switch

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

EXCESSIVE ENGINE OIL CONSUMPTION

Diagnostic procedure

- Check for oil leaks.
- Check for worn valve guide(s) or worn valve seal(s) .
- Check for a damaged or worn piston ring(s) .
- Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.) .

Also check for

Check the maintenance records as engine oil that is worn out burns off at a higher rate

LOW OIL PRESSURE INDICATOR DOES NOT COME ON WITH THE VEHICLE IN THE ON MODE

Diagnostic procedure

- Do the symptom troubleshooting for Low oil pressure indicator does not come on with the vehicle in the ON mode.

Also check for

An open in the wire between the PCM and the engine oil pressure sensor

LOW OIL PRESSURE INDICATOR STAYS ON

Diagnostic procedure

- Check the engine oil level.
- Do the symptom troubleshooting for Low oil pressure indicator stays on.

Also check for

A wire shorted to ground between the PCM and the engine oil pressure sensor

SYMPTOM TROUBLESHOOTING INDEX

ENGINE LUBRICATION SYSTEM SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
Excessive engine oil consumption	• Check for oil leaks. • Check for worn valve guide(s) or worn valve seal(s) . • Check for a damaged or worn piston ring(s) . • Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.) .	Check the maintenance records as engine oil that is worn out burns off at a higher rate
Low oil pressure indicator does not come on with the vehicle in the ON mode	Do the symptom troubleshooting for Low oil pressure indicator does not come on with the vehicle in the ON mode.	An open in the wire between the PCM and the engine oil pressure sensor
Low oil pressure indicator stays on	• Check the engine oil level. • Do the symptom troubleshooting for Low oil pressure indicator stays on.	A wire shorted to ground between the PCM and the engine oil pressure sensor

ENGINE LUBRICATION SYSTEM SYMPTOM TROUBLESHOOTING

LOW OIL PRESSURE INDICATOR DOES NOT COME ON WITH THE VEHICLE IN THE ON MODE

1. DTC check

-1. Connect the HDS to the DLC .

-2. Check for DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

DTC (PGM-FI)

Is there any DTC indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 2.

2. Gauge control module check

-1. Do the gauge control module self-diagnostic function .

Is the gauge control module OK?

YES

Replace the engine oil pressure sensor .

NO

Replace the gauge control module .

LOW OIL PRESSURE INDICATOR STAYS ON

1. Engine oil level check

-1. Connect the HDS to the DLC .

-2. Check for DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

DTC (PGM-FI)

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Check the engine oil level.

Is the engine oil level normal?

YES

Go to step 3.

NO

Add engine oil to the normal level, then go to step 2.

2. Low oil pressure indicator check

   -1. **Enter the maintenance mode, then start the engine** .

   Does the low oil pressure indicator go off?

   YES

   Check the following items:

   - Check for oil leaks.
   - **Check for worn valve guide(s)** or **worn valve seal(s)** .
   - **Check for damaged or worn piston ring(s)** .
   - **Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.)** .

   NO

   Go to step 3.

3. Oil pressure test

   -1. **Do the oil pressure test**.

   Does the oil pressure OK?

   YES

   Go to step 4.

   NO

   Check the following items. If its does not blocked or plugged, **replace the oil pump** .

   - Oil filter blocked or plugged.
   - Oil strainer blocked or plugged.

4. Determine possible failure area (gauge control module, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode, and check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ROCKER ARM OIL PRESSURE SENSOR	Lower than 19.0	kPa	B	B
	Lower than 0.194	kgf/cm^2		
	Lower than 2.76	psi		

Do the current condition(s) match the threshold?

YES

Go to step 6.

NO

Go to step 5.

5. Gauge control module check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

SCS Short

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Turn the vehicle to the ON mode.

Does the low oil pressure indicator go off?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the symptom/indication goes away with a known-good PCM, **replace the original PCM** .

NO

Replace the gauge control module .

6. Engine oil pressure sensor check

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAP SENSOR	Lower than 19.9	kPa	B	B
	Lower than 0.203	kgf/cm^2		
	Lower than 2.89	psi		
BARO SENSOR	Lower than 19.9	kPa	B	B
	Lower than 0.203	kgf/cm^2		
	Lower than 2.89	psi		

Do the current condition(s) match the threshold?

YES

Replace the engine oil pressure sensor .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the symptom/indication goes away with a known-good PCM, **replace the original PCM** .

SERVICING

ENGINE OIL LEVEL CHECK AND REPLACEMENT

Check

1. Engine Oil Level - Check

	1. Park the vehicle on level ground, and **enter the maintenance mode, then start the engine** . Hold the engine speed at 3000 RPM with no load (in P or N) until the cooling fan(s) comes on, then turn the vehicle to the OFF (LOCK) mode, and wait more than 3 minutes. 2. Remove the dipstick, and wipe off the dipstick, then reinstall the dipstick. 3. Remove the dipstick. 4. Check the engine oil level. It should be between the upper mark (A) and the lower mark (B). 5. If the engine oil level is near or below the lower mark check for oil leaks, and add the engine oil to bring it to the upper mark.

Replacement

NOTE: **How to read the torque specifications** .

1. Engine - Warm Up

1. **Enter the maintenance mode, then start the engine** . Allow the engine to reach operating temperature (fan comes on at least twice).

2. **Vehicle - Lift**
3. Engine Oil - Drain

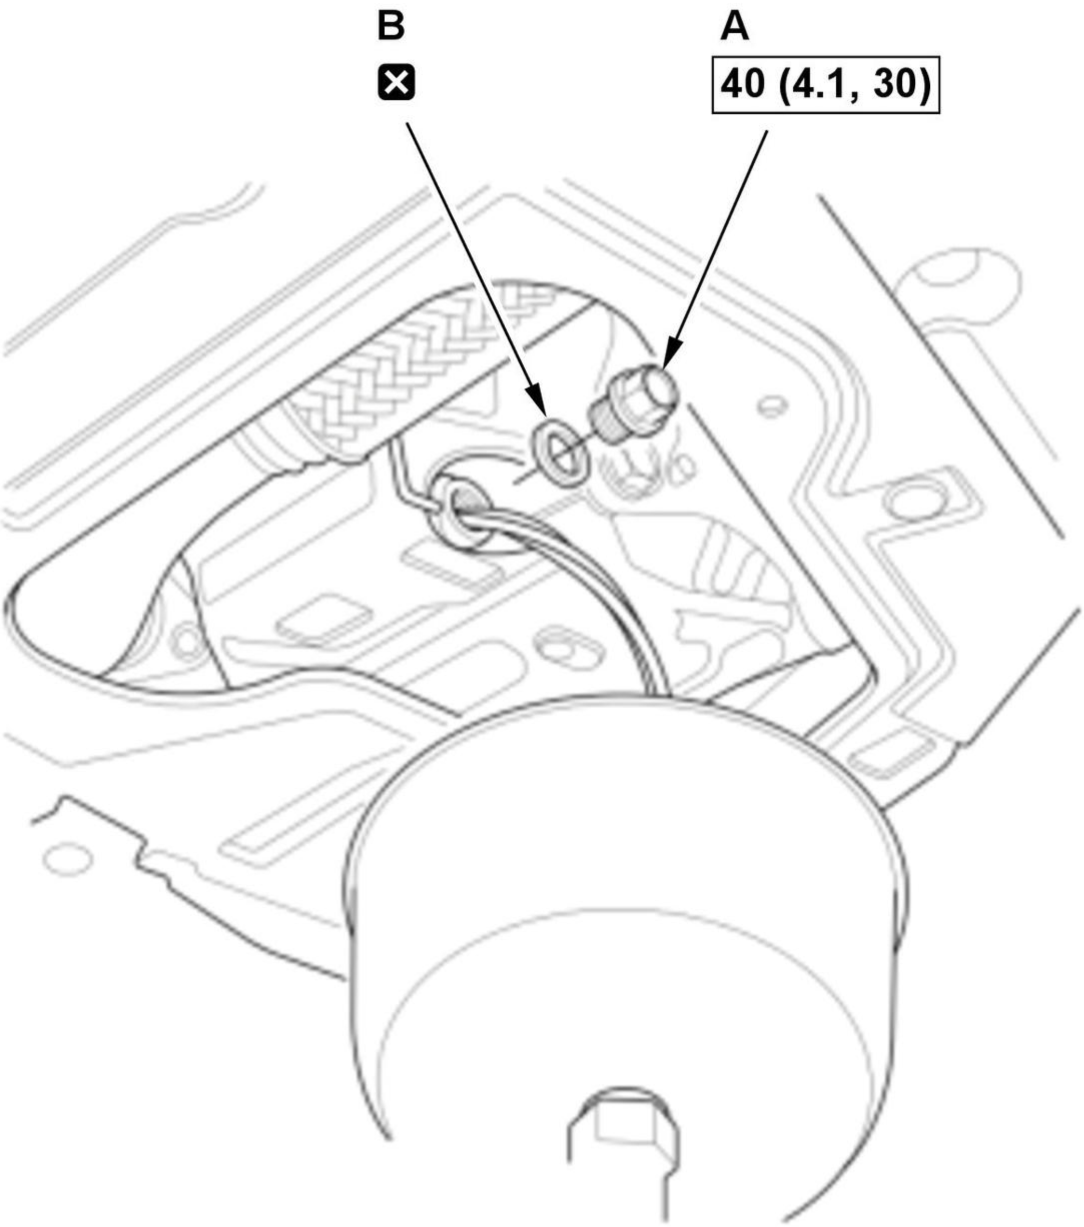

Fig. 1: Engine Oil Drain Plug Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the drain bolt (A), and drain the engine oil.

2. Reinstall the drain bolt with a new washer (B) and torque to specification.

4. Engine Oil - Refill

	1. **Refill the engine with the recommended engine oil** .

Capacity	
At Oil Change:	**3.5 L (3.7 US qt)**
At Oil Change including Filter:	**3.8 L (4.0 US qt)**
After Engine Overhaul:	**4.5 L (4.8 US qt)**

5. Engine Oil Level - Check

1. **Enter the maintenance mode, then start the engine** . Run the engine for more than 3 minutes, then check the oil level and the oil leakage.

6. Maintenance Minder - Reset

1. If the Maintenance Minder required to replace the engine oil, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder"). If the Maintenance Minder did not require to replace the engine oil, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

TEST

ENGINE OIL PRESSURE TEST

Test

NOTE:

- A Pending or Confirmed DTC may be set during this procedure. Check for DTCs, and clear them as needed.
- If the low oil pressure indicator stays on with the engine running, **check the engine oil level**. If the oil level is correct:

1. **Engine Oil Pressure Sensor - Remove**
2. Engine Oil Pressure - Test

 	1. Install an oil pressure gauge (A). 2. **Enter the maintenance mode, then start the engine** . Shut it off immediately if the gauge registers no oil pressure. Repair the problem before continuing. 3. Warm up the engine by raising the engine speed around 3000 min^{-1} (RPM) until the cooling fan(s) comes on. The pressure should be: 4. If oil pressure is out of specifications, inspect these items: • Oil filter blocked or plugged. • Oil strainer blocked or plugged. 5. Remove the oil pressure gauge.

Engine Oil Temperature:	**176B°F (80B°C)**
Engine Oil Pressure:	
At Idle (1200 RPM):	**168.7 kPa (1.720 kgf/cm^2 , 24.46 psi) min.**
At 2000 RPM:	**217.7 kPa (2.220 kgf/cm^2 , 31.58 psi)**

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

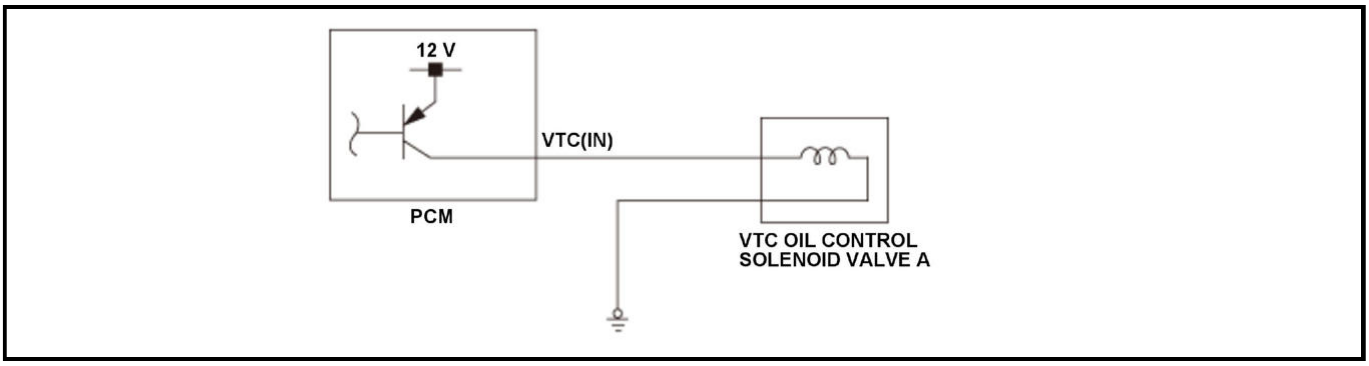
ADVANCED DIAGNOSTICS

DTC P0010 (1.5 L ENGINE)

DTC P0010: Variable Valve Timing Control (VTC) Oil Control Solenoid Valve A Malfunction

General Description



The variable valve timing control (VTC) system consists of the VTC actuator A, the VTC oil control solenoid valve A, various sensors, and the powertrain control module (PCM). The PCM controls the VTC oil control solenoid valve A by duty cycle and supplies hydraulic pressure to the advance chamber or the retard chamber in the actuator so the valve timing is optimized depending on the driving conditions (engine load, engine speed, and vehicle speed). If the difference between the VTC oil control solenoid valve A commanded current and the actual current is a specified current for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

The difference between the VTC oil control solenoid valve A commanded current and the actual current is more than 0.20 A for at least 5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VTC oil control solenoid valve A VTC (IN) line short to ground
- VTC oil control solenoid valve A VTC (IN) line open
- VTC oil control solenoid valve A failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 5 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

Select the VTC TEST in the INSPECTION MENU with the HDS, then select the IN-VTC.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

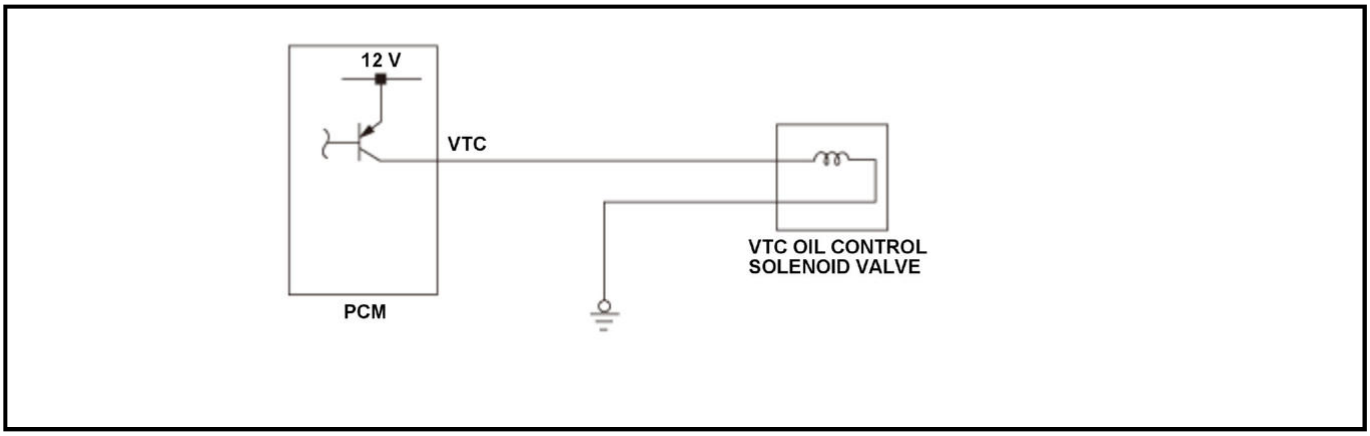
Conditions for clearing the DTC

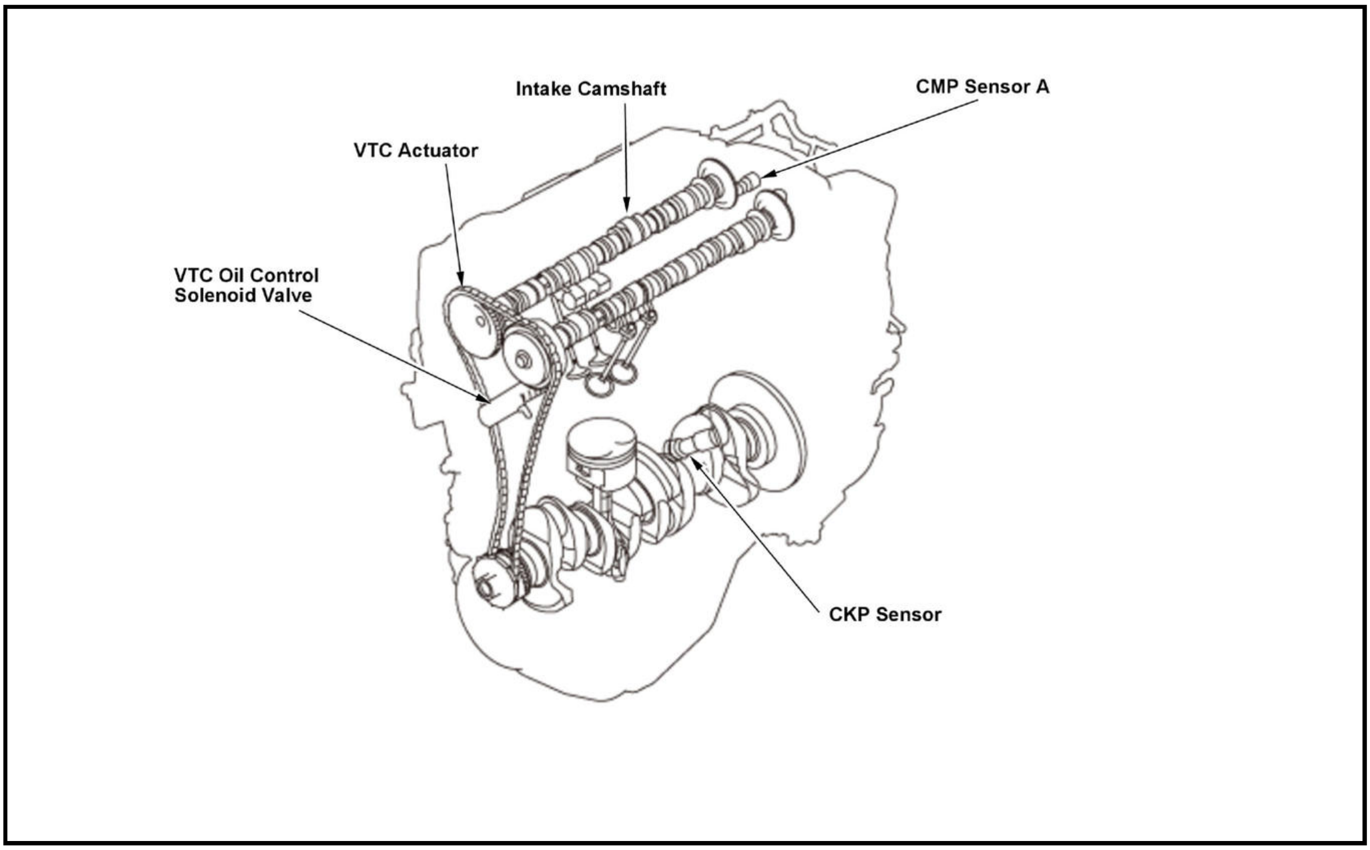
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0010 (2.4 L ENGINE) (2017 2018 2019)

DTC P0010: Variable Valve Timing Control (VTC) Oil Control Solenoid Valve Malfunction

General Description





The variable valve timing control (VTC) consists of the VTC actuator, the VTC oil control solenoid valve, various sensors, and the powertrain control module (PCM). The PCM controls the VTC oil control solenoid valve by duty cycle and supplies hydraulic pressure to the advance chamber or the retard chamber in the actuator so the valve timing is optimized depending on the driving conditions (engine load, engine speed, and vehicle speed). If the current compared to the output duty cycle is out of a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more

DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

One of these conditions is met:

- Output duty is 40 % or more and the VTC current is 200 mA or less for at least 5 seconds.
- Output duty is 5 % or less and the VTC current is 800 mA or more for at least 5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VTC oil control solenoid valve VTC line short to ground

- VTC oil control solenoid valve VTC line open
- VTC oil control solenoid valve abnormal
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 5 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

Do the VTC TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

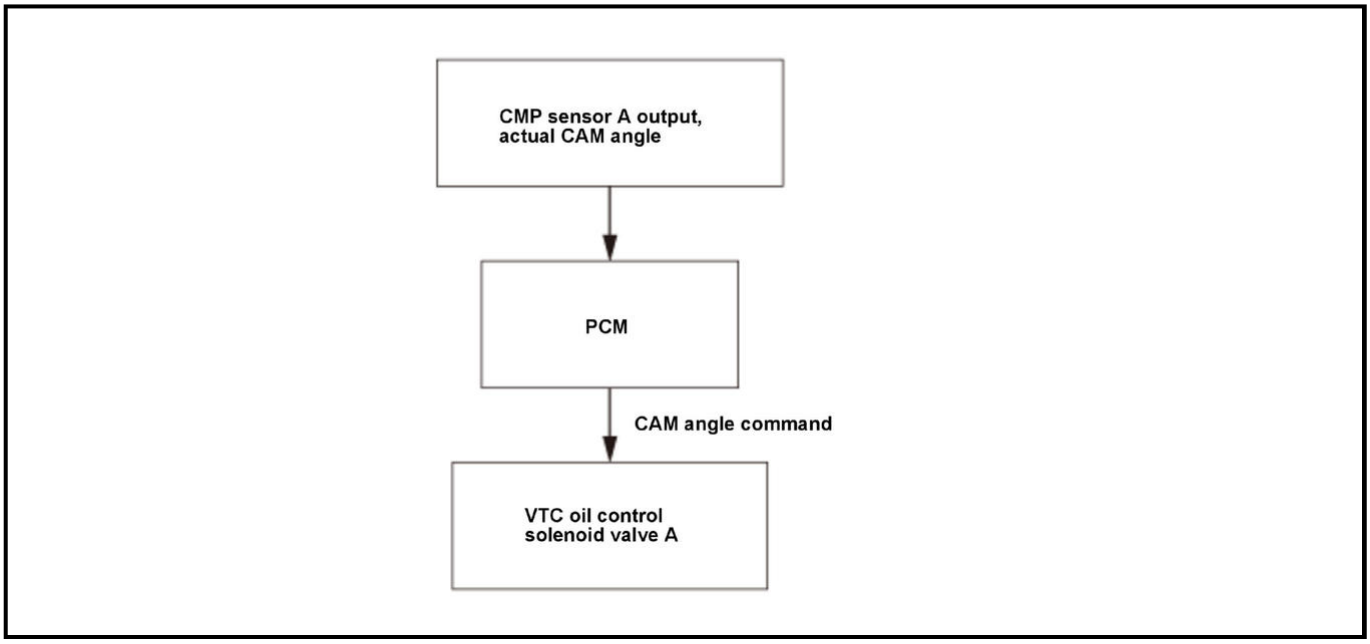
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0011 (1.5 L ENGINE)

DTC P0011: Variable Valve Timing Control (VTC) A System Malfunction

General Description



CMP sensor A output, actual CAM angle
PCM
CAM angle command
VTC oil control solenoid valve A

The variable valve timing control (VTC) system controls the phase of the intake camshaft and exhaust camshaft. It uses oil pressure to operate the VTC actuator A/B so the valve timing is optimized depending on driving conditions. The powertrain control module (PCM) monitors the phase control command and the actual phase of the intake camshaft by using camshaft position (CMP) sensor A. If the phase difference between them is excessive for a certain time period, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	15.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Either one of the conditions is met:

Case 1:

Condition		Minimum	Maximum
Elapsed time after starting the engine		10.0 seconds	-
Engine coolant temperature [ECT SENSOR 1]	23 deg. F (-5 deg. C)*	158 deg. F (70 deg. C)	-
	-13 deg. F (-25 deg. C)*	185 deg. F (85 deg. C)	
Engine speed [ENGINE SPEED]	203 deg. F (95 deg. C)**	800 rpm	-
	225 deg. F (107 deg. C)**	1, 600 rpm

	225 deg. F (107 deg. C)**	1, 600 rpm	
Elapsed CMP sensor A count after starting the engine	25 deg. F (-4 deg. C)*	0 time	-
	-13 deg. F (-25 deg. C)*	23, 500 times	
12 volt battery voltage [BATTERY]		10.5 V	-

*: Depending on initial engine coolant temperature [ECT SENSOR 1].**: Depending on engine coolant temperature [ECT SENSOR 1].[ ]: HDS Parameter

Malfunction Threshold

The phase difference between the phase control command and the actual phase of the intake camshaft is 20.0 deg. or more for at least 15 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VTC actuator A stuck
- VTC actuator A response delay
- VTC oil control solenoid valve A stuck
- VTC oil control solenoid valve A response delay
- VTC oil control solenoid valve A downstream short

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 15 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

Select the VTC TEST in the INSPECTION MENU with the HDS, then select the IN-VTC.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

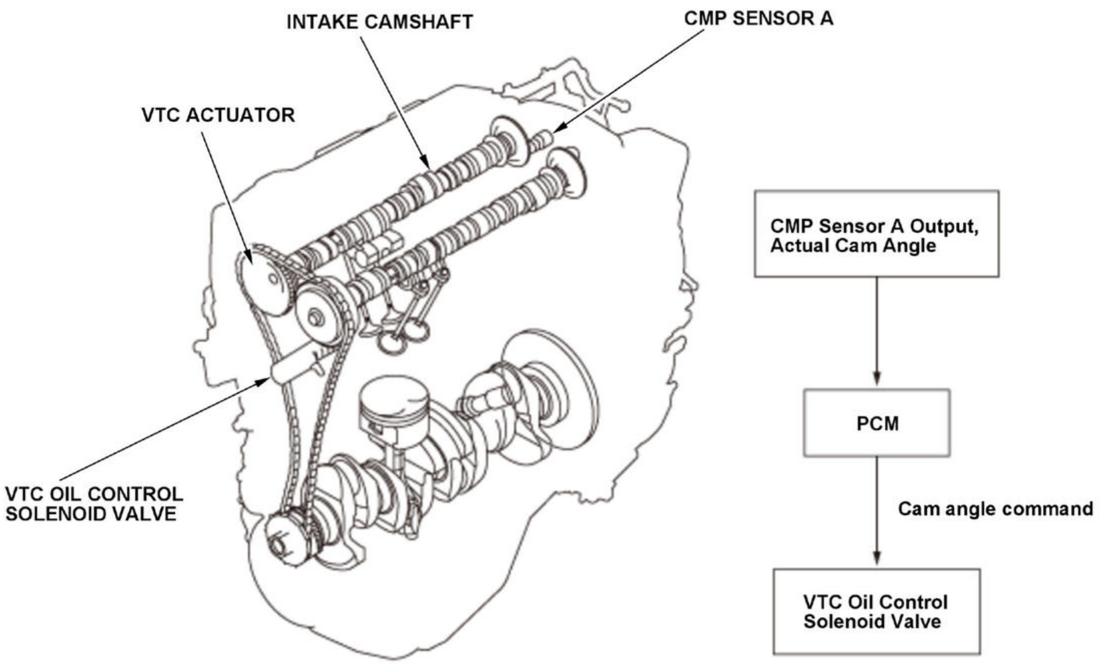
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0011 (2.4 L ENGINE) (2017 2018 2019)

DTC P0011: Variable Valve Timing Control (VTC) System Malfunction

General Description



INTAKE CAMSHAFT
CMP SENSOR A
VTC ACTUATOR
CMP Sensor A Output, Actual Cam Angle
PCM
Cam angle command
VTC OIL CONTROL SOLENOID VALVE
VTC Oil Control Solenoid Valve

The variable valve timing control (VTC) system controls the phase of the intake camshaft. It uses oil pressure to operate the VTC actuator so the valve timing is optimized depending on driving conditions. The powertrain control module (PCM) monitors the phase control command and the actual timing of the camshaft by using camshaft position (CMP) sensor A. If the phase difference between them is excessive for a certain time period, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

**: Depending on engine coolant temperature [ECT SENSOR 1].

[ ]: HDS Parameter

Malfunction Threshold

The timing difference between the timing control command and the actual timing of the camshaft is 20.0 deg. or more for at least 15 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VTC actuator stuck
- VTC actuator response delay
- VTC oil control solenoid valve stuck
- VTC oil control solenoid valve response delay
- VTC oil control solenoid valve down stream short

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 15 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Do the VTC TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

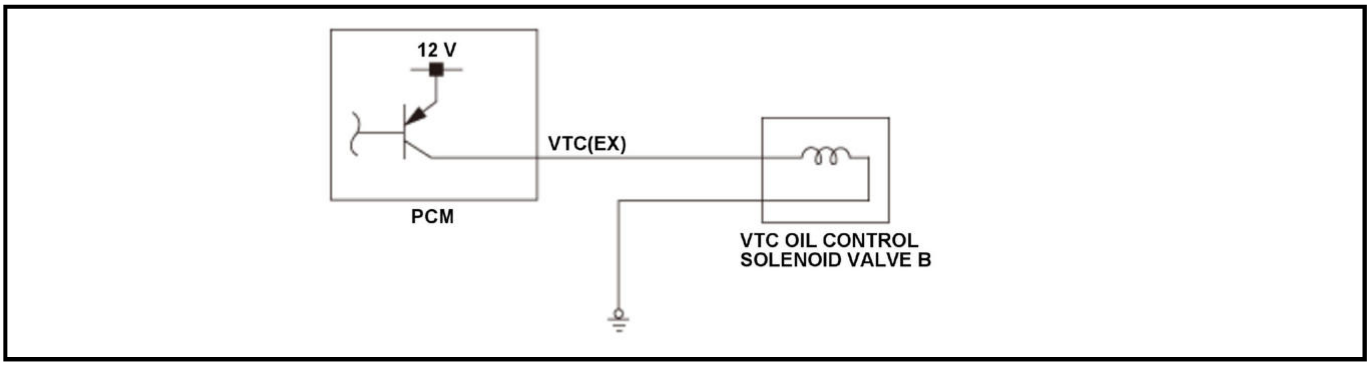
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0013 (1.5 L ENGINE)

DTC P0013: Variable Valve Timing Control (VTC) Oil Control Solenoid Valve B Malfunction

General Description



The variable valve timing control (VTC) system consists of the VTC actuator B, the VTC oil control solenoid valve B, various sensors, and the powertrain control module (PCM). The PCM controls the VTC oil control solenoid valve B by duty cycle and supplies hydraulic pressure to the advance chamber or the retard chamber in the actuator so the valve timing is optimized depending on the driving conditions (engine load, engine speed, and vehicle speed). If the difference between the VTC oil control solenoid valve B commanded current and the actual current is a specified current for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

The difference between the VTC oil control solenoid valve B commanded current and the actual current is more than 0.20 A for at least 5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VTC oil control solenoid valve B VTC (EX) line short to ground
- VTC oil control solenoid valve B VTC (EX) line open
- VTC oil control solenoid valve B failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 5 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

Select the VTC TEST in the INSPECTION MENU with the HDS, then select the EX-VTC.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

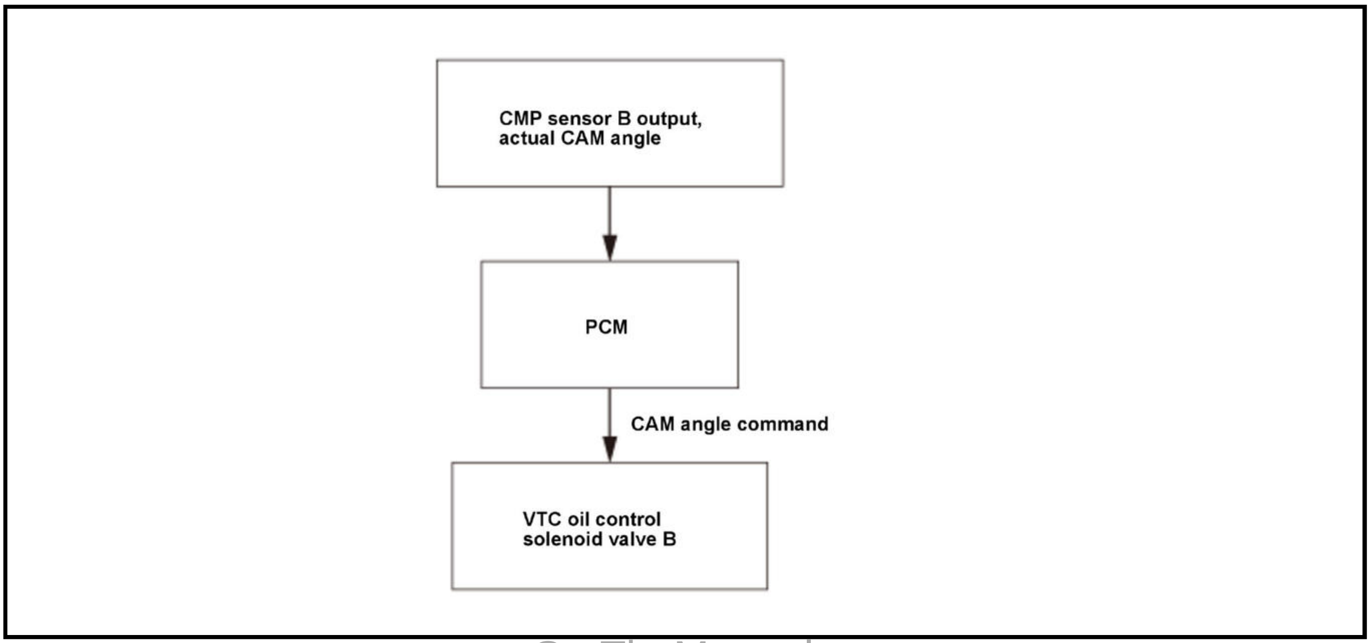
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0014 (1.5 L ENGINE)

DTC P0014: Variable Valve Timing Control (VTC) B System Malfunction

General Description



CMP sensor B output, actual CAM angle
PCM
CAM angle command
VTC oil control solenoid valve B

The variable valve timing control (VTC) system controls the phase of the intake camshaft and exhaust camshaft. It uses oil pressure to operate the VTC actuator A/B so the valve timing is optimized depending on driving conditions. The powertrain control module (PCM) monitors the phase control command and the actual phase of the exhaust camshaft by using camshaft position (CMP) sensor B. If the phase difference between them is excessive for a certain time period, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Either one of the conditions is met:

Case 1:

Condition		Minimum	Maximum
Elapsed time after starting the engine		10.0 seconds	-
Engine coolant temperature [ECT SENSOR 1]	23 deg. F (-5 deg. C)*	158 deg. F (70 deg. C)	-
	-13 deg. F (-25 deg. C)*	185 deg. F (85 deg. C)

*: Depending on initial engine coolant temperature [ECT SENSOR 1].**: Depending on engine coolant temperature [ECT SENSOR 1].[ ]: HDS Parameter

Malfunction Threshold

The phase difference between the phase control command and the actual phase of the exhaust camshaft is 15.0 deg. or more for at least 10.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VTC actuator B stuck
- VTC actuator B response delay
- VTC oil control solenoid valve B stuck
- VTC oil control solenoid valve B response delay
- VTC oil control solenoid valve B downstream short
- VTC actuator B failure (return spring cut)
- VTC system abnormal low oil pressure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 10.0 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

Select the VTC TEST in the INSPECTION MENU with the HDS, then select the EX-VTC.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

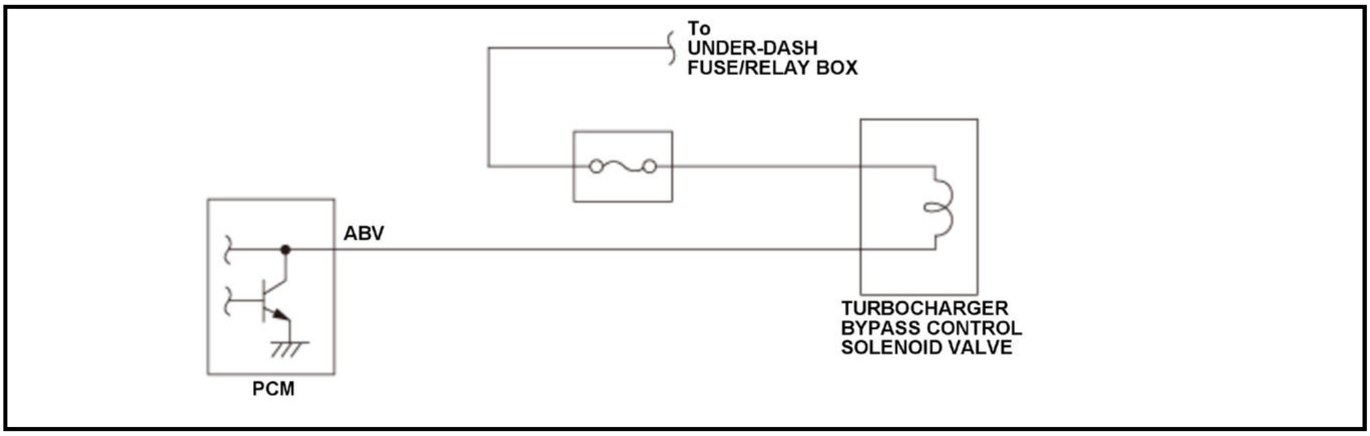
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0034 (1.5 L ENGINE)

DTC P0034: Turbocharger Bypass Control Solenoid Valve Circuit Low Voltage

General Description



The turbocharger bypass control solenoid valve is activated by the powertrain control module (PCM) to control the turbocharger bypass control solenoid valve timing to improve boost response during acceleration immediately after deceleration and boost pressure decrease during deceleration. The turbocharger bypass control solenoid valve is normally closed (negative pressure side). If the return signal is CLOSE for a specified duration when the PCM outputs an OPEN signal to the turbocharger bypass control solenoid valve, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.0 V	-
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

The return signal is CLOSE for at least 1 second when the PCM outputs an OPEN signal to the turbocharger bypass control solenoid valve.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Turbocharger bypass control solenoid valve ABV line short to ground
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine, and let it idle for at least 1 second.

With the HDS

Do the ABV TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

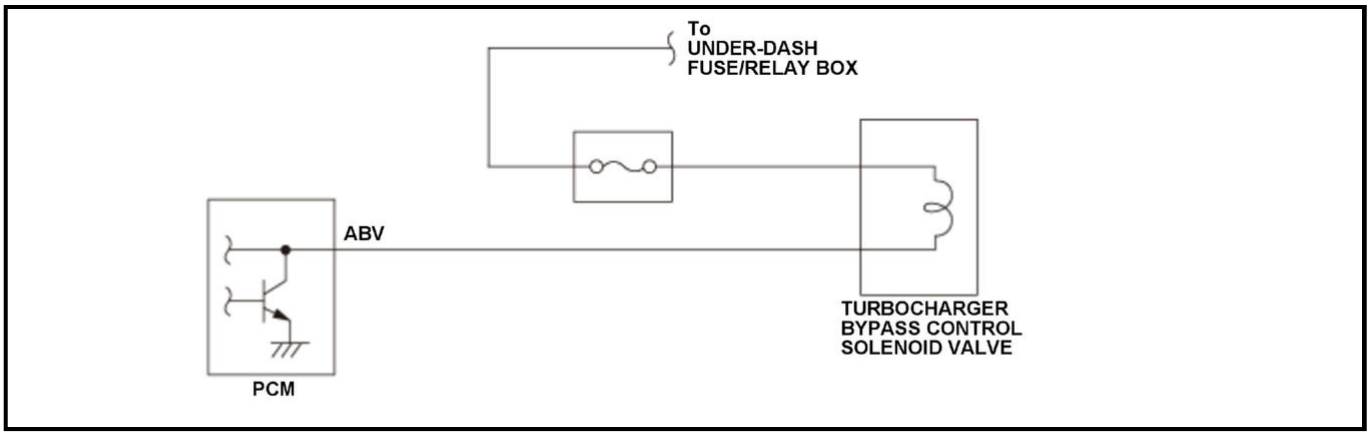
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0035 (1.5 L ENGINE)

DTC P0035: Turbocharger Bypass Control Solenoid Valve Circuit High Voltage

General Description



The turbocharger bypass control solenoid valve is activated by the powertrain control module (PCM) to control the turbocharger bypass control solenoid valve timing to improve boost response during acceleration immediately after deceleration and boost pressure decrease during deceleration. The turbocharger bypass control solenoid valve is normally closed (negative pressure side). If the return signal is OPEN for a specified duration when the PCM outputs a CLOSE signal to the turbocharger bypass control solenoid valve, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.0 V	-
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

The return signal is OPEN for at least 1 second when the PCM outputs a CLOSE signal to the turbocharger bypass control solenoid valve.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Turbocharger bypass control solenoid valve ABV line open
- Turbocharger bypass control solenoid valve failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine, and let it idle for at least 1 second.

With the HDS

Do the ABV TEST in the INSPECTION MENU with the HDS.

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

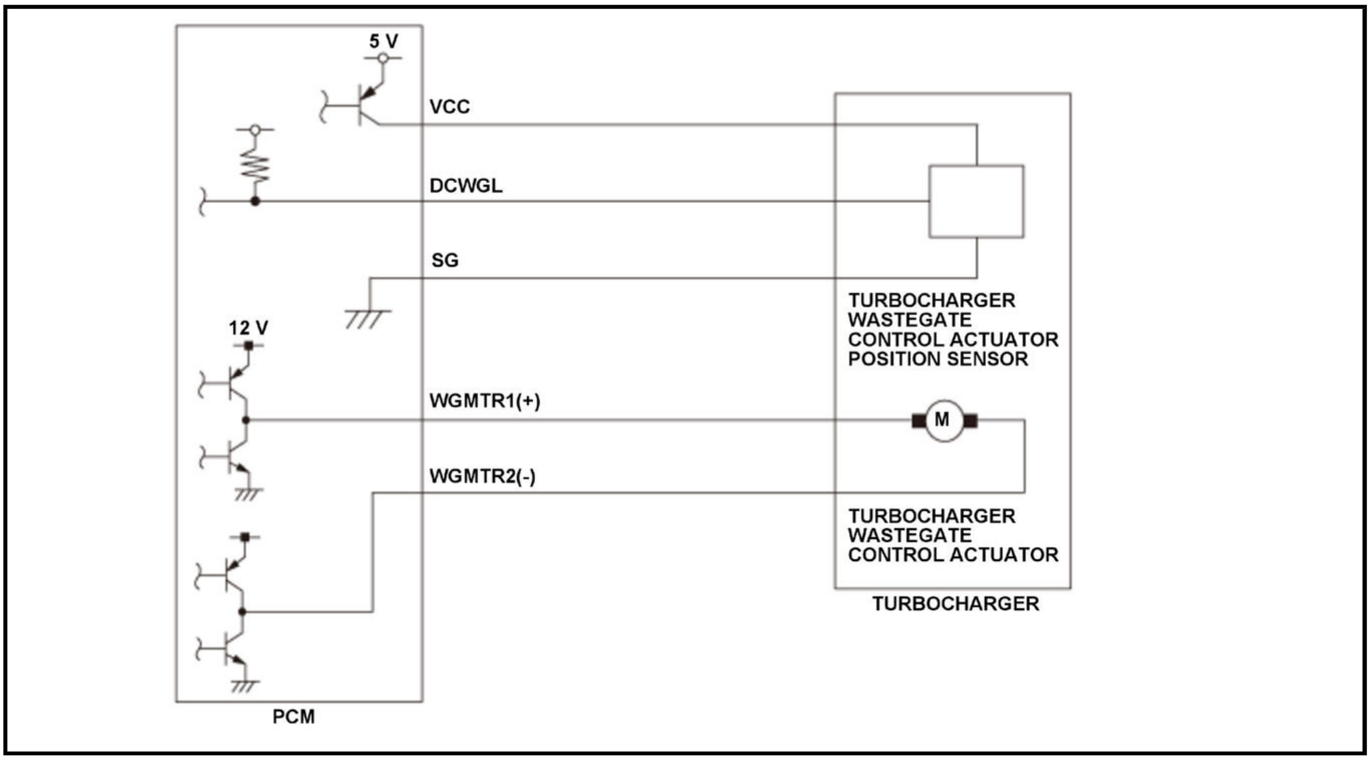
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P003A (1.5 L ENGINE)

DTC P003A: Turbocharger Wastegate Control Actuator Position Exceeded Learning Limit

General Description



5 V
VCC
DCWGL
SG
12 V
WGMTR1(+)
WGMTR2(-)
M
TURBOCHARGER WASTEGATE CONTROL ACTUATOR POSITION SENSOR
TURBOCHARGER WASTEGATE CONTROL ACTUATOR
TURBOCHARGER
PCM

The powertrain control module (PCM) adjusts the boost pressure by controlling the turbocharger wastegate control actuator of the turbocharger. Boost pressure becomes higher by fully closing the turbocharger wastegate control valve driven by the turbocharger wastegate control actuator. The turbocharger wastegate control valve position is detected by the turbocharger wastegate control actuator position sensor and the signal is input to the PCM for target position feedback control. The turbocharger wastegate control actuator position sensor value when the turbocharger wastegate control valve is fully closed is stored as fully closed learning value. Target and actual positions are represented by the relative value from the fully closed position. The PCM sets a target position, and outputs a drive signal to the driver IC and drives the turbocharger wastegate control actuator to be equal to the target position. If the turbocharger wastegate control actuator position sensor value is out of normal range for a specified time when the turbocharger wastegate control valve is in fully closed position, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature[ECT SENSOR 1]	156 deg. F (69 deg. C)	-
12 volt battery voltage [BATTERY]	10.0 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

Either of the conditions is met for at least 2 seconds:

- The turbocharger wastegate control actuator position sensor value is -3.45 mm (-0.14 in) or less, or 2.03 mm (0.08 in) or more when the turbocharger wastegate control valve is in fully closed condition.
- The difference between the target position and the actual position is 0.1 mm (0.004 in) or more when the turbocharger wastegate control valve is in fully closed condition.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Turbocharger wastegate control actuator failure
- Turbocharger wastegate control actuator position sensor failure

Confirmation Procedure

Operating Condition

Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

[ ]: HDS Parameter

With the HDS

Select the Electric Waste Gate in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

[ ]: HDS Parameter

Malfunction Threshold

The difference of the turbocharger wastegate control valve between the target position and the actual position is 0.8 mm (0.03 in) or more for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Turbocharger wastegate control actuator failure
- Turbocharger wastegate control actuator position sensor failure

Confirmation Procedure

Operating Condition

Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

[ ]: HDS Parameter

With the HDS

Select the Electric Waste Gate in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

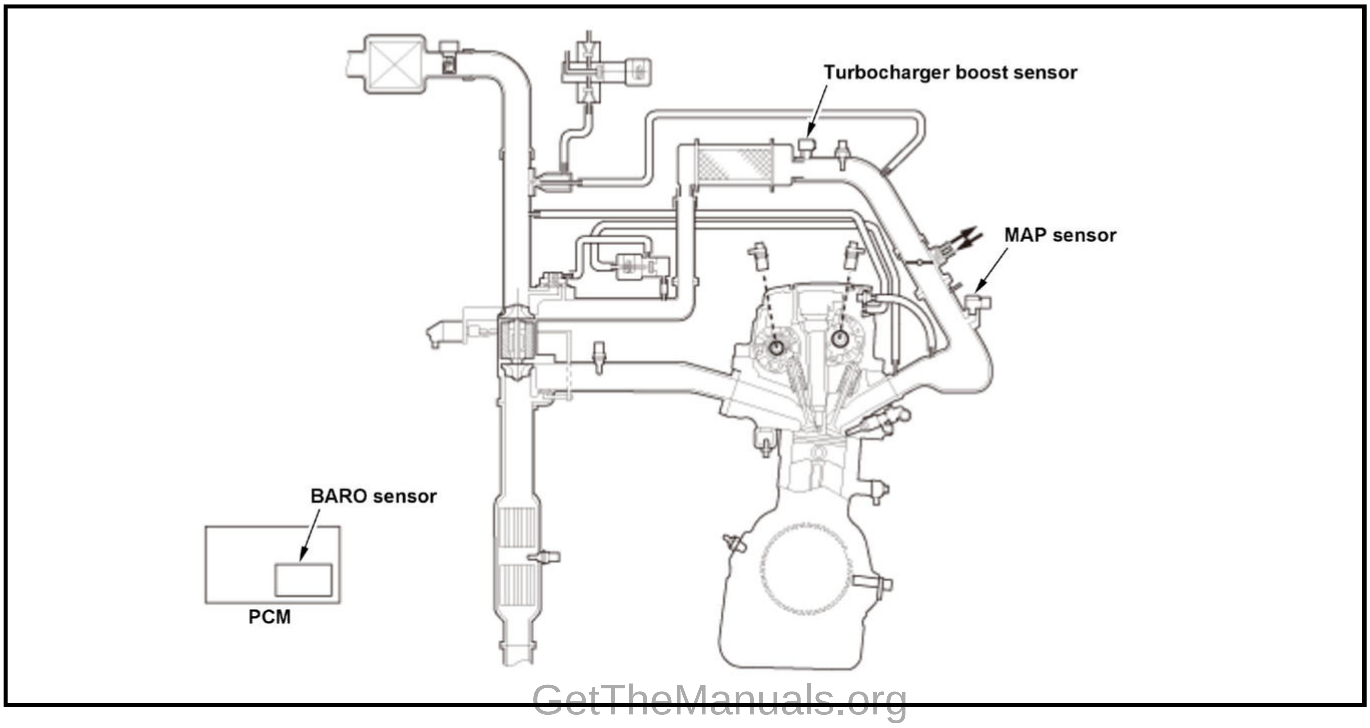
Conditions for clearing the DTC

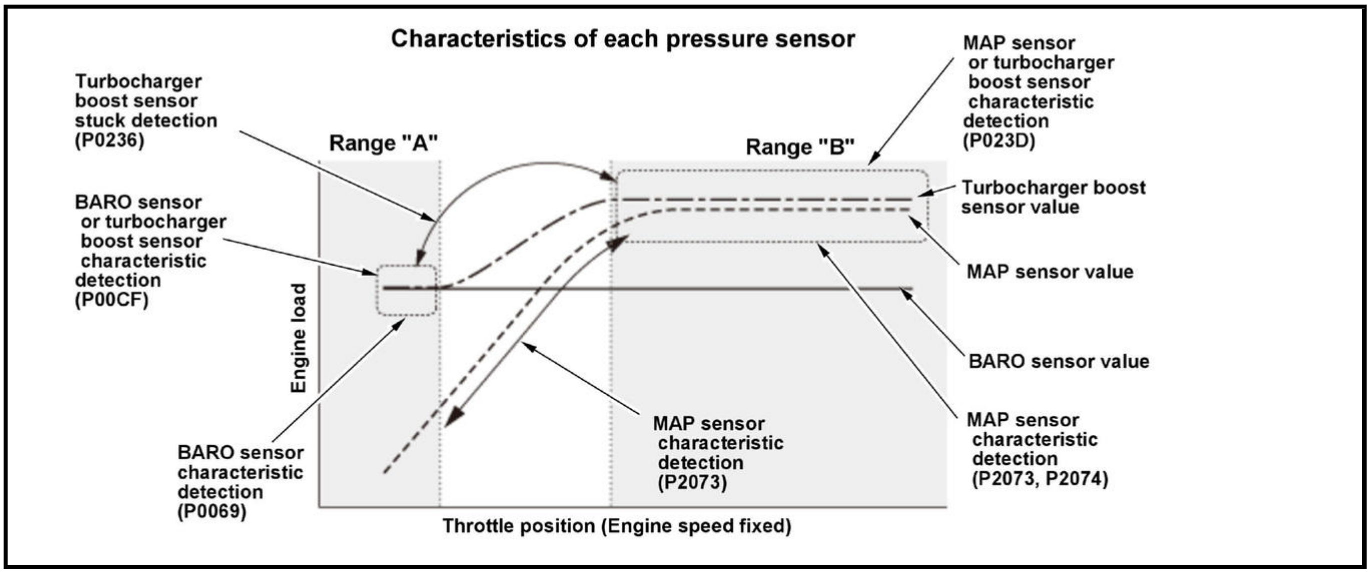
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0069 (1.5 L ENGINE)

DTC P0069: Barometric Pressure (BARO) Sensor Circuit Range/Performance Problem

General Description





Characteristics of each pressure sensor
Turbocharger boost sensor stuck detection (P0236)
Range "A"
Range "B"
MAP sensor or turbocharger boost sensor characteristic detection (P023D)
Turbocharger boost sensor value
BARO sensor or turbocharger boost sensor characteristic detection (P00CF)
MAP sensor value
BARO sensor value
Engine load
BARO sensor characteristic detection (P0069)
MAP sensor characteristic detection (P2073)
MAP sensor characteristic detection (P2073, P2074)
Throttle position (Engine speed fixed)

The barometric pressure (BARO) sensor, the manifold absolute pressure (MAP) sensor, and the turbocharger boost sensor are equipped to the vehicle to detect air pressure conditions to the engine. The BARO sensor value and the turbocharger boost sensor value shows similar value at range "A" such as in idle conditions, and the turbocharger boost sensor value and MAP sensor value shows similar value at range "B" such as in high throttle position.

Malfunction determinations are done by the powertrain control module (PCM) in two ranges by comparing the pressure sensor values.

- At range "A": BARO sensor or turbocharger boost sensor is abnormal if the difference of the two pressure sensor values are specified or more (P00CF)
- At range "B": Turbocharger boost sensor or MAP sensor is abnormal if the difference of the two pressure sensor values are specified or more (P023D)
- Range "A" determined as abnormal and range "B" determined as normal: BARO sensor abnormal (P0069)
- Both ranges "A" and "B" determined as abnormal: Turbocharger boost sensor abnormal (P0236)
- Turbocharger boost sensor or MAP sensor values do not change when throttle position is transited from ranges "A" to "B": Determined as turbocharger boost sensor output stuck (P0236) or MAP sensor output stuck (P2073 or P2074)

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition		Minimum	Maximum
Elapsed time after starting the engine		3.0 seconds	-
Engine speed [ENGINE SPEED]		1, 700 rpm	-
Throttle position	2, 000 rpm	36.3 deg.	-
	4, 000 rpm	42.2 deg.	-
Intake air amount		-	7.0 g/second (0.24 oz/second)

[ ]: HDS Parameter

Malfunction Threshold

Both range "A" (P00CF) and range "B" (P023D) determinations must be completed. The PCM stores DTC P0069 if range "A" determination (P00CF) is determined as abnormal and range "B" determination (P023D) is determined as normal. Determination at range A: Comparison of BARO sensor value and turbocharger boost sensor value. Determination at range B: Comparison of MAP sensor value and turbocharger boost sensor value.

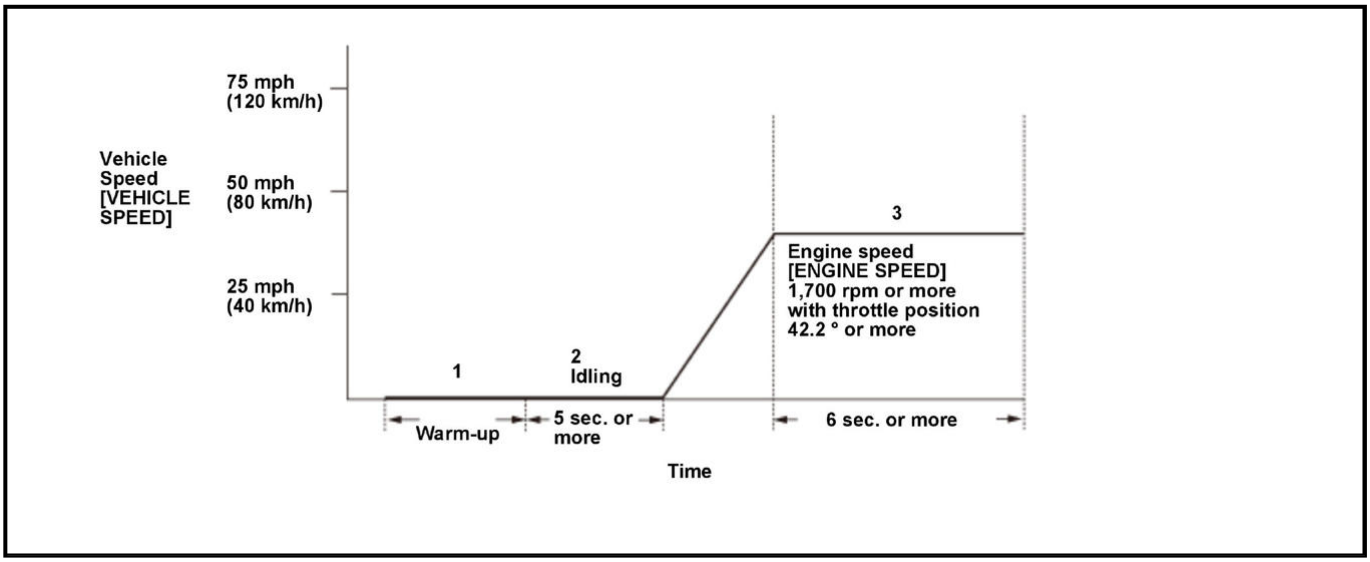
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor failure

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 5 seconds.
- Drive the vehicle at engine speed [ENGINE SPEED] 1, 700 rpm or more with throttle position 42.2 deg. or more for at least 6 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

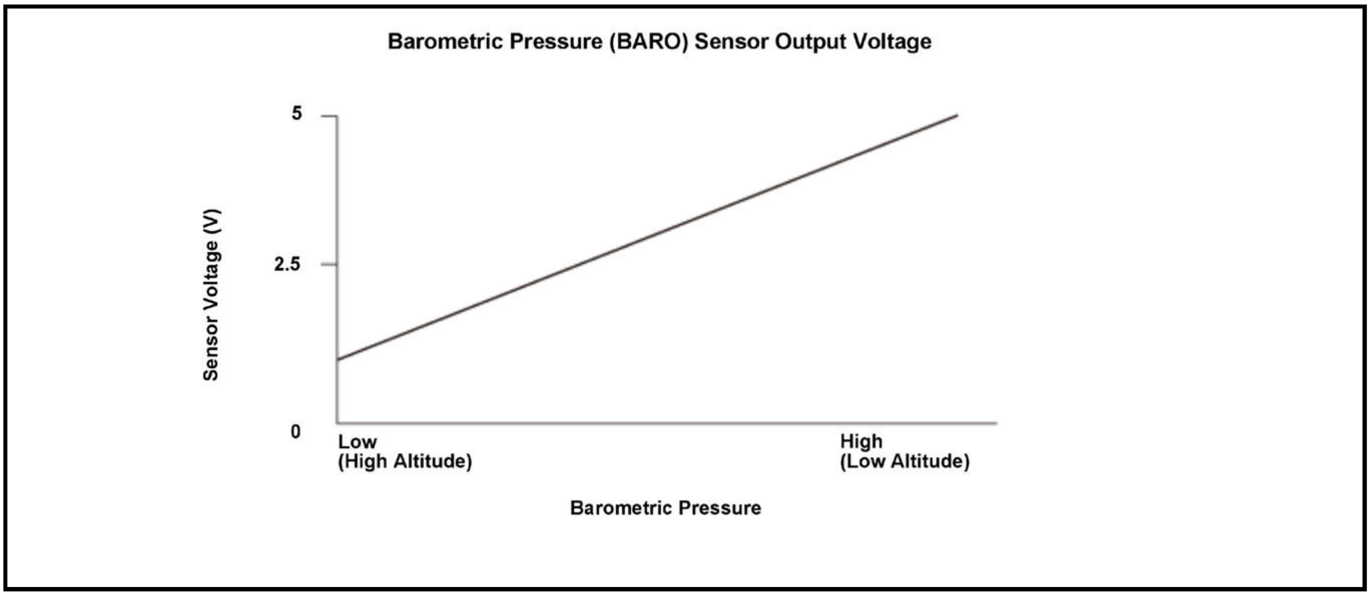
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear

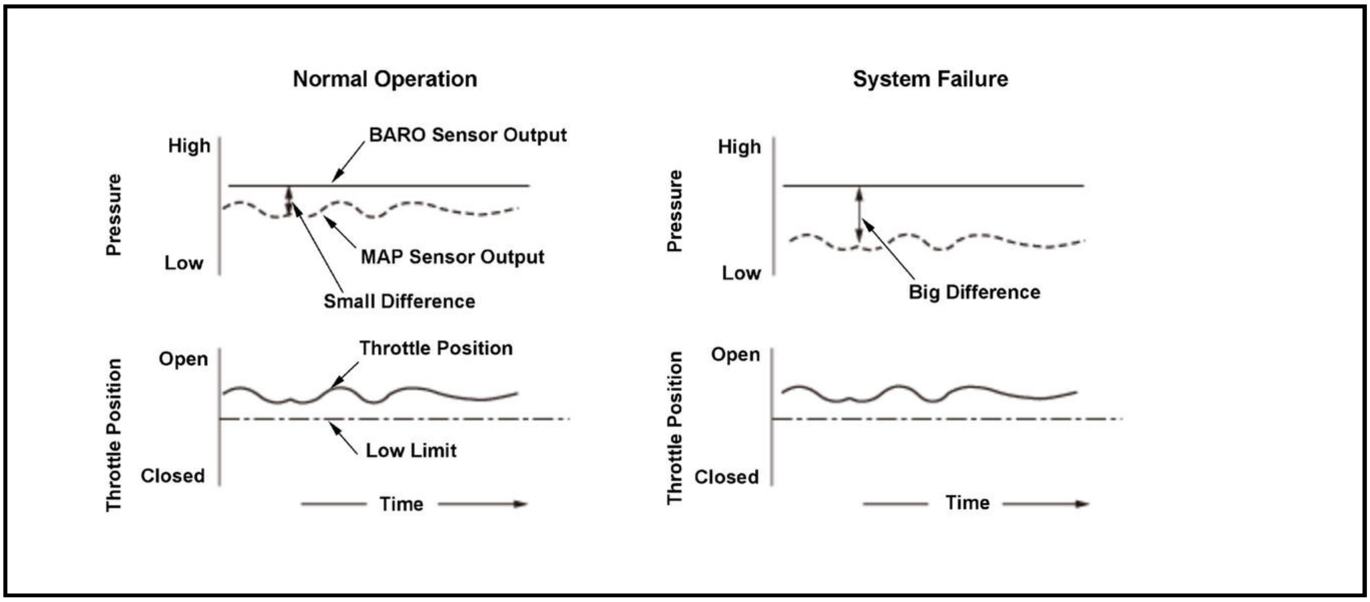
command or by disconnecting the 12 volt battery.

DTC P0069 (2.4 L ENGINE) (2017 2018 2019)

DTC P0069: Barometric Pressure (BARO) Sensor Circuit Range/Performance Problem

General Description





The barometric pressure (BARO) sensor is built into the powertrain control module (PCM) and monitors atmospheric pressure. When the throttle valve is wide open, the manifold absolute pressure (MAP) sensor output is nearly equal to the BARO sensor output. If the throttle position is beyond a value stored in the PCM that is used to detect "wide-open throttle", and if the difference between the MAP sensor output and the BARO sensor output is equal to or greater than a set value, the PCM detects a malfunction in the BARO sensor output and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition		Minimum	Maximum
Throttle position	1, 000 rpm	12.0 deg.	-
	4, 000 rpm	31.5 deg.	-

Malfunction Threshold

The difference between the BARO sensor output and the MAP sensor output is 28 kPa (204 mmHg, 8.1 inHg) or more for at least 2.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor failure
- Air cleaner element clogged

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle under Enable Conditions (see "Throttle position") for at least 2.5 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

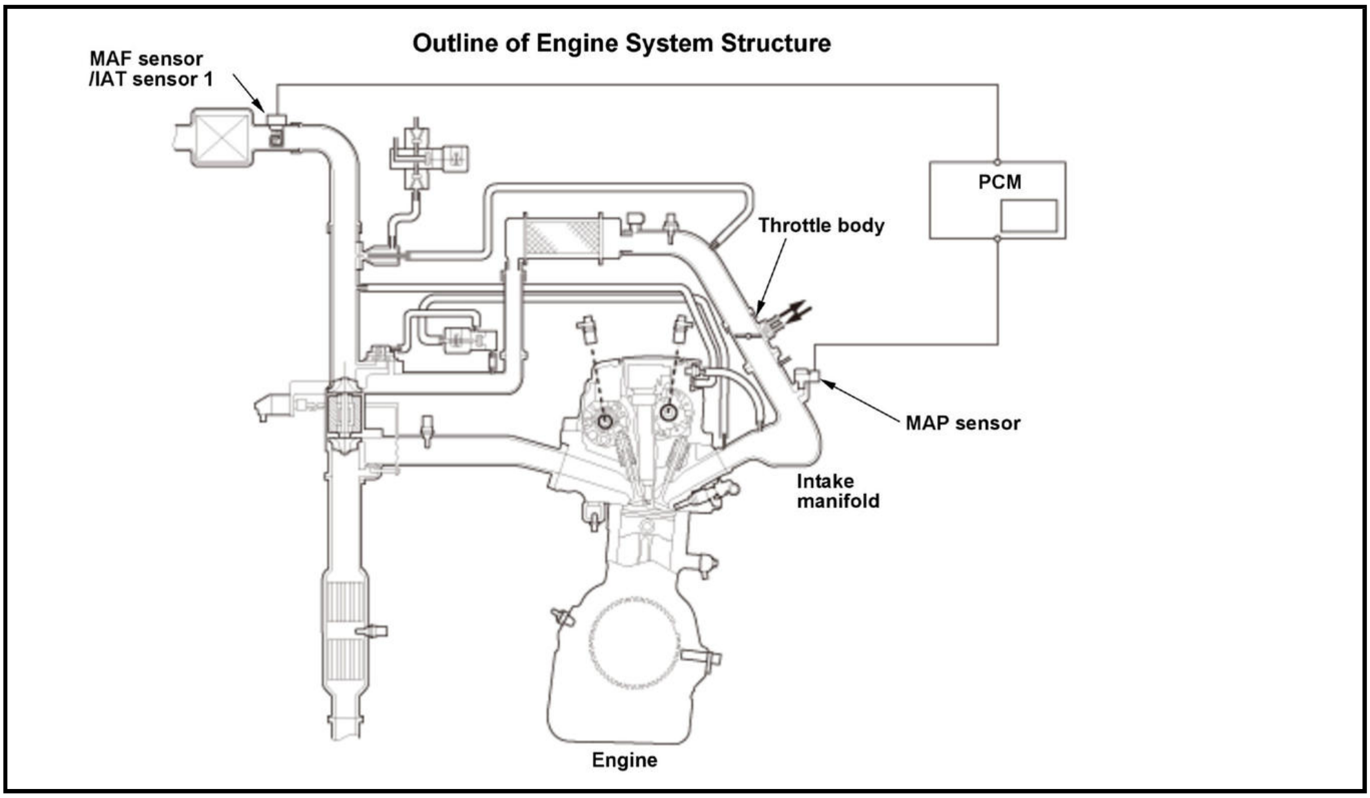
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

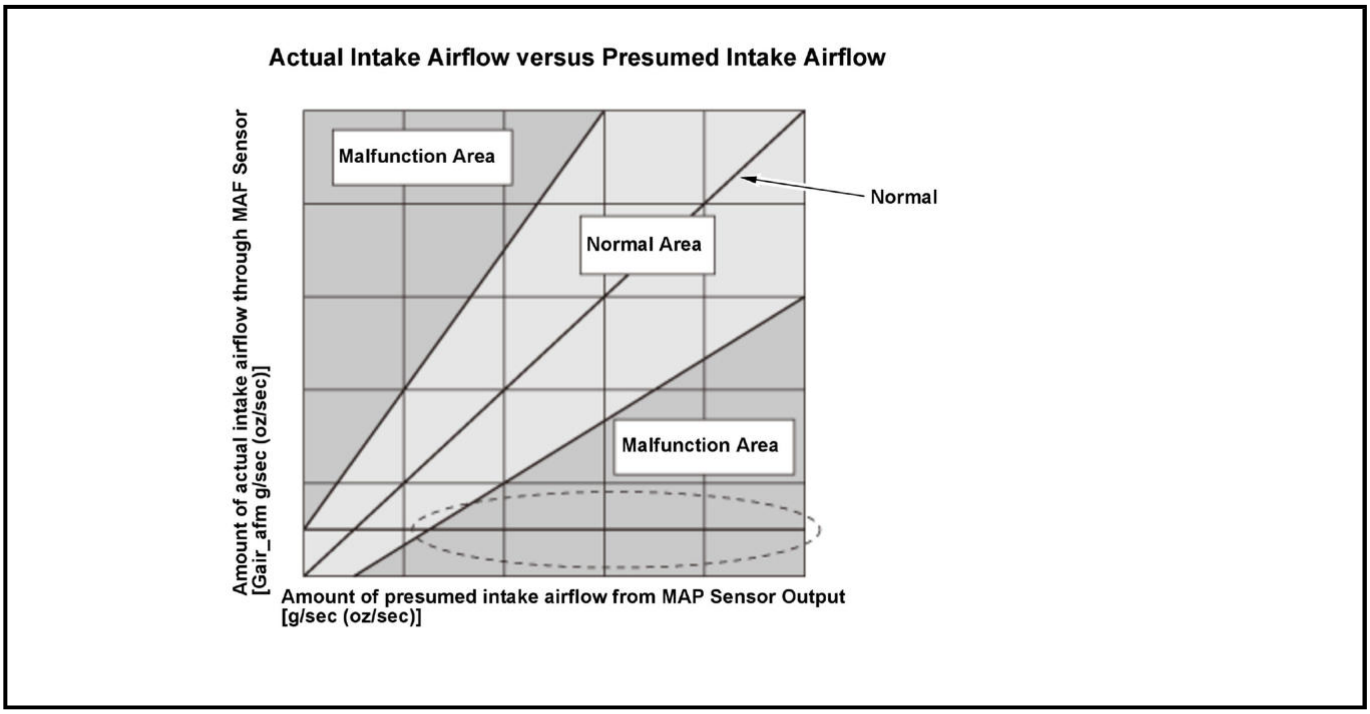
DTC P006A (1.5 L ENGINE)

DTC P006A: Mass Air flow (MAF) Sensor Circuit Range/Performance Problem

General Description



Outline of Engine System Structure
MAF sensor /IAT sensor 1
PCM
Throttle body
MAP sensor
Intake manifold
Engine



The mass airflow (MAF) sensor directly measures the amount of intake airflow into the engine, and the powertrain control module (PCM) controls the fuel injection based on the measured value. The manifold absolute pressure (MAP) sensor measures the intake manifold pressure, and the PCM calculates the amount of intake airflow from the MAP sensor output and the engine revolutions. The PCM compares the MAF sensor output (amount of intake airflow) and the amount of intake airflow calculated from MAP sensor output. If their difference is too large (in the malfunction area), the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	3.0 seconds	-
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Engine speed [ENGINE SPEED]	530 rpm	6, 500 rpm

[ ]: HDS Parameter

Malfunction Threshold

The difference between the amount of intake air measured by the MAF sensor and the amount of intake air calculated from the MAP sensor output is out of the normal area for at least 5.0 seconds.

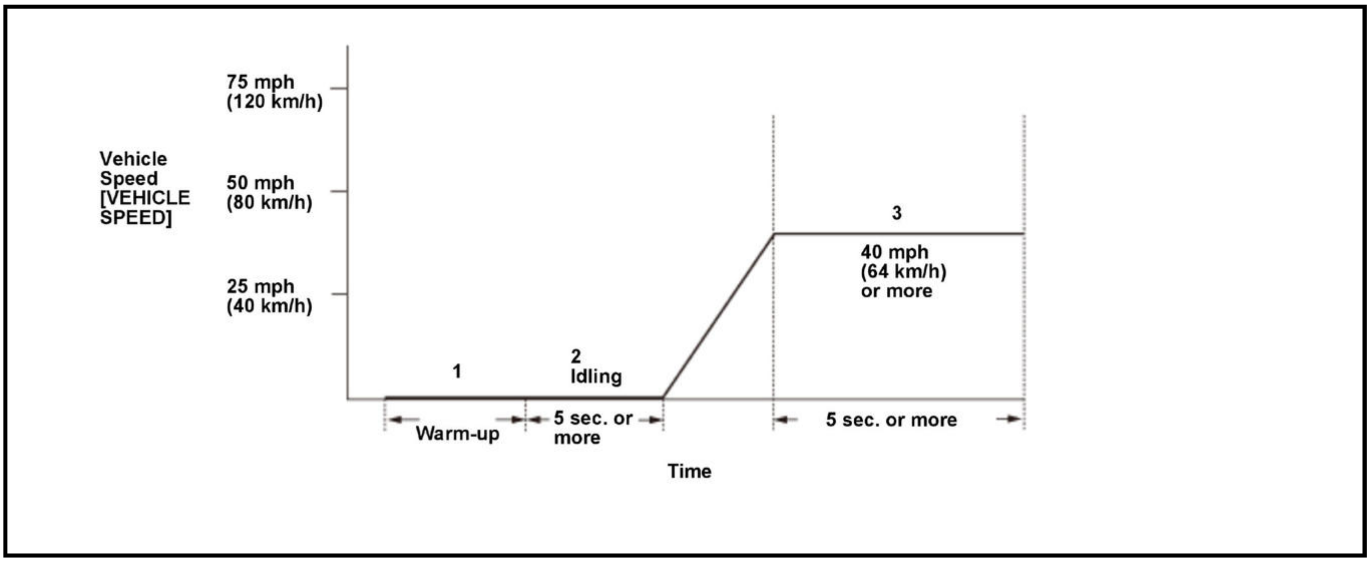
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Intake air duct misinstalled
- Intake air duct damage
- Evaporative emission (EVAP) canister hose misinstalled
- Intake manifold damage
- MAP sensor misinstalled
- Positive crankcase ventilation (PCV) hose misinstalled
- Air cleaner element damage
- Air cleaner element clogged
- MAF sensor element damage

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 5 seconds.

- Drive the vehicle at a steady speed of 40 mph (64 km/h) or more for at least 5 seconds.
- When freeze data or the on-board snapshot is stored, drive the vehicle under those conditions instead of Driving Pattern step 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

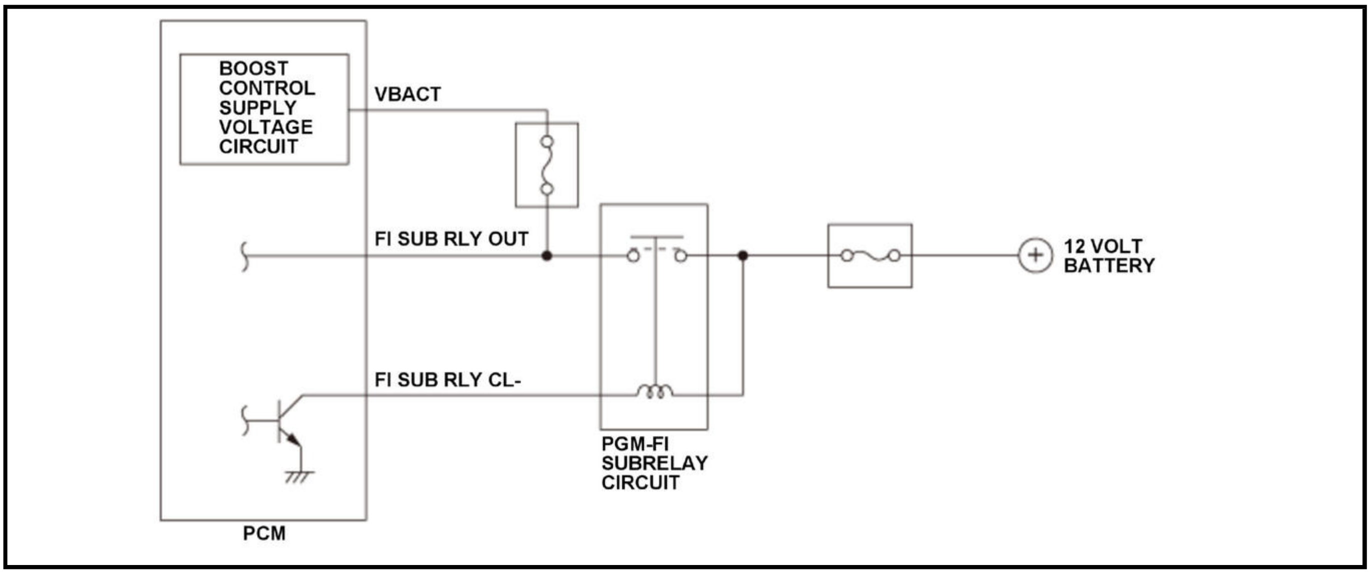
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P006E (1.5 L ENGINE)

DTC P006E: Turbocharger Power Supply Circuit Malfunction

General Description



The powertrain control module (PCM) adjusts the boost pressure by controlling the turbocharger wastegate control actuator of the turbocharger. Boost pressure becomes higher by fully closing the turbocharger wastegate control valve driven by the turbocharger wastegate control actuator. The turbocharger wastegate control valve position is detected by the turbocharger wastegate control actuator position sensor and the signal is input to the PCM for target position feedback control. The turbocharger wastegate control actuator position sensor value when the turbocharger wastegate control valve is fully closed is stored as fully closed learning value. Target and actual positions are represented by the relative value from the fully closed position. The PCM sets a target position, and outputs a drive signal to the driver IC and drives the turbocharger wastegate control actuator to be equal to the target position. The power necessary to drive the turbocharger wastegate control actuator is provided to the PCM via PGM-FI subrelay circuit from the 12 volt battery. The boost control supply voltage circuit in the PCM monitors whether the power is properly supplied to the turbocharger wastegate control actuator. If the boost control supply voltage circuit voltage is a specified value for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.0 V	-

Elapsed time after returning from fuel cut	3.0 seconds	-
State of the engine	Running	
Other	Other than initial engine start	

Malfunction Threshold

Either of these condition is met for at least 4 seconds:

- The actual fuel pressure is 800 kPa (8.15 kgf/cm 2, 116 psi) or less when target fuel pressure is 2, 500 kPa (25.49 kgf/cm 2, 362.6 psi).
- The actual fuel pressure is 11, 500 kPa (117.26 kgf/cm 2, 1, 667.9 psi) or less when target fuel pressure is 15, 000 kPa (152.96 kgf/cm 2, 2, 175.6 psi).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes

- Fuel pump low flow
- Fuel line clogged
- Fuel filter clogged
- Fuel injector stuck open
- High pressure fuel pump failure
- Fuel rail pressure sensor range/performance problem

Confirmation Procedure

Operating Condition

- Start the engine.
- Drive the vehicle repeated acceleration and deceleration.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Select the DI Fuel Pressure Test in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

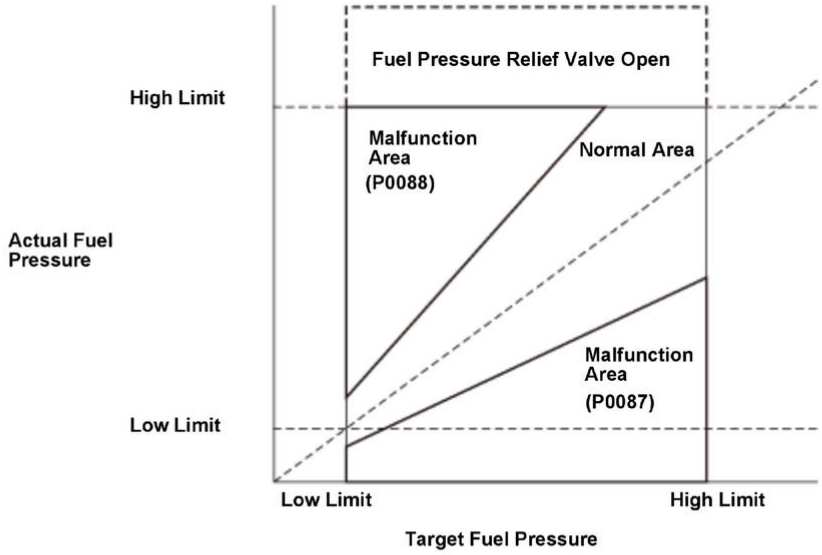
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0087 (2.4 L ENGINE) (2017 2018 2019)

DTC P0087: Fuel Rail Pressure Too Low

General Description



The powertrain control module (PCM) controls fuel pressure delivered by the high pressure fuel pump. If the actual fuel pressure deviates from the target fuel pressure for a set time, the PCM detects a malfunction. The DTC is also stored when the fuel pressure relief valve is opened to protect the fuel hose when the fuel reaches an abnormally high pressure.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	6.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after returning from fuel cut	3.0 seconds	-

Malfunction Threshold

Either of these condition is met for at least 6.0 seconds:

- The actual fuel pressure is 0.5 MPa (5.0 kgf/cm 2, 72.5 psi) or less when target fuel pressure is 3.5 MPa (35.7 kgf/cm 2, 508 psi).
- The actual fuel pressure is 11 MPa (112 kgf/cm 2, 1, 595 psi) or less when target fuel pressure is 15 MPa (153 kgf/cm 2, 2, 176 psi).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes

- Low pressure fuel pump low flow
- Low pressure fuel line clogged

- Fuel filter clogged
- Fuel injector stuck open
- Spill valve stuck
- Fuel pressure sensor range/performance problem

Confirmation Procedure

Operating Condition

- Start the engine.
- Drive the vehicle repeated acceleration and deceleration.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Do the DI FUEL PRESSURE TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

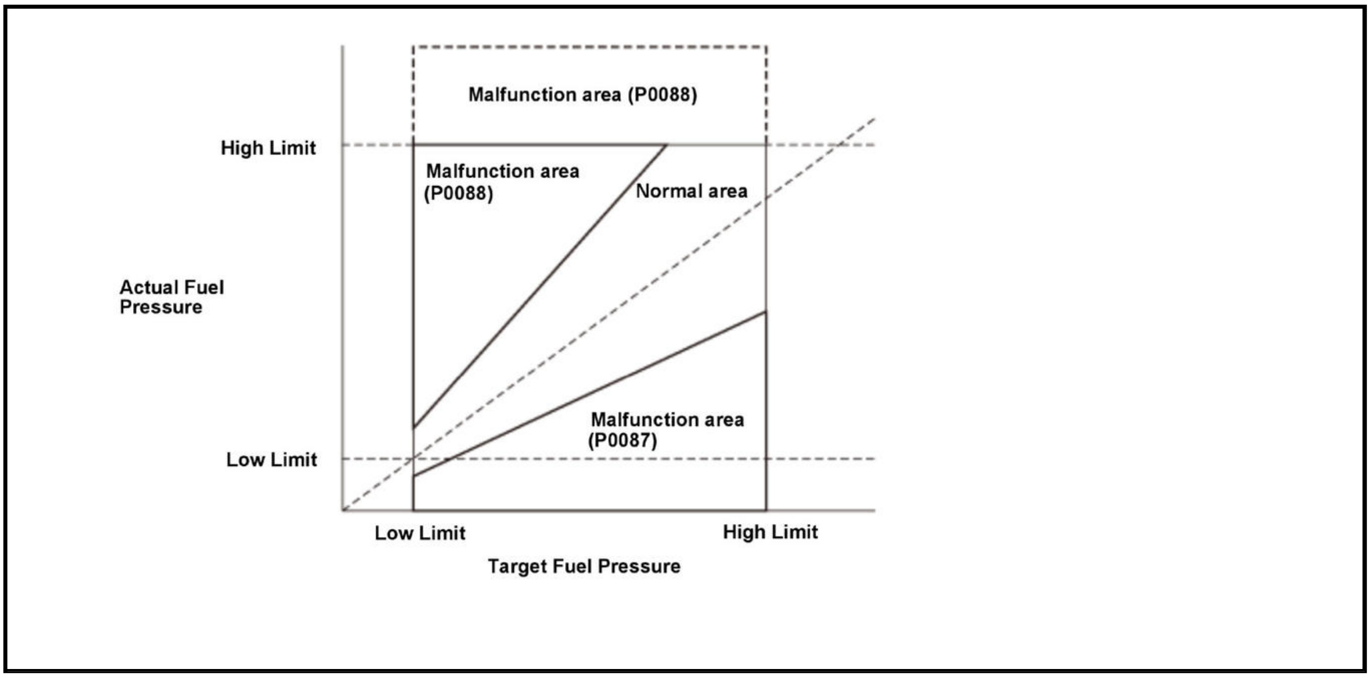
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0088 (1.5 L ENGINE)

DTC P0088: Fuel Rail Pressure Too High

General Description



The powertrain control module (PCM) controls fuel pressure delivered by the high pressure fuel pump. If the actual fuel pressure deviates from the target fuel pressure for a set time, the PCM detects a malfunction. The DTC is also stored when the pressure relief valve is opened to protect the fuel hose when the fuel reaches an abnormally high pressure.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	4.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after returning from fuel cut	3.0 seconds	-
State of the engine	Running	
Other	Other than initial engine start	

Malfunction Threshold

Either of these condition is met:

- The actual fuel pressure is 7, 750 kPa (79.03 kgf/cm 2, 1, 124.1 psi) or more for at least 4.0 seconds when target fuel pressure is 2, 500 kPa (25.49 kgf/cm 2, 362.6 psi).
- The actual fuel pressure is 20, 250 kPa (206.5 kgf/cm 2, 2, 937.1 psi) or more for at least 4.0 seconds when target fuel pressure is 15, 000 kPa (152.96 kgf/cm 2, 2, 175.6 psi).
- The actual fuel pressure is 23, 000 kPa (234.5 kgf/cm 2, 3, 335.9 psi) or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes

- High pressure fuel pump failure
- Fuel rail pressure sensor range/performance problem

Confirmation Procedure

Operating Condition

- Start the engine.
- Drive the vehicle repeated acceleration and deceleration.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Select the DI Fuel Pressure Test in the INSPECTION MENU with the HDS.

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

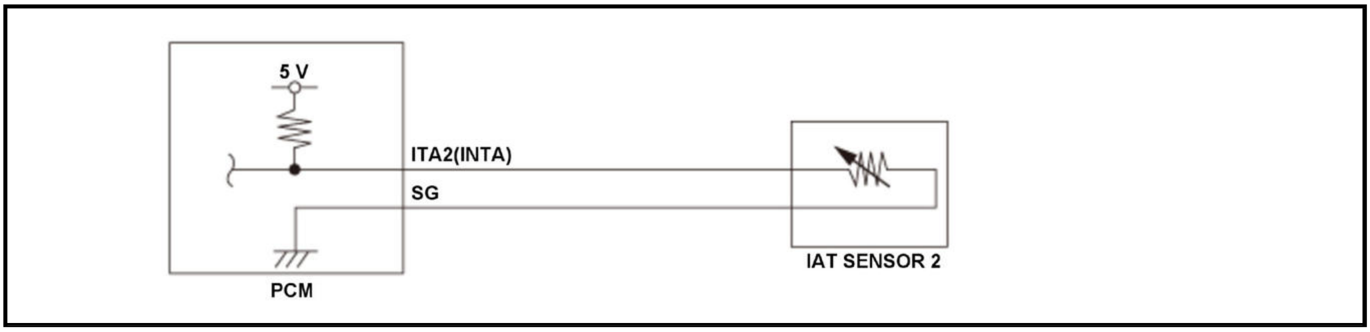
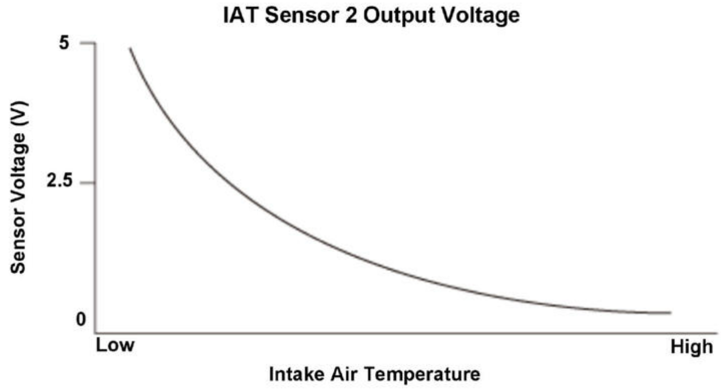
DTC P0096 (1.5 L ENGINE)

DTC P0096: Intake Air Temperature (IAT) Sensor 2 Circuit Range/Performance Problem

General Description





Intake air temperature (IAT) sensor 2 is a thermistor that detects intake air temperature, and it is used for air/fuel ratio feedback control to compensate for the atmospheric density fluctuations that accompany changes in intake air temperature. IAT sensor 2 resistance varies depending on temperature. The output voltage and the sensor resistance increase as the intake air temperature decreases. Conversely, the output voltage and the sensor resistance decrease as the intake air temperature increases. If the intake air temperature is a specified value for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The intake air temperature [IAT Sensor (2)] is 285 deg. F (141 deg. C) or more for at least 3.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- IAT sensor 2 failure (range/performance problem)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

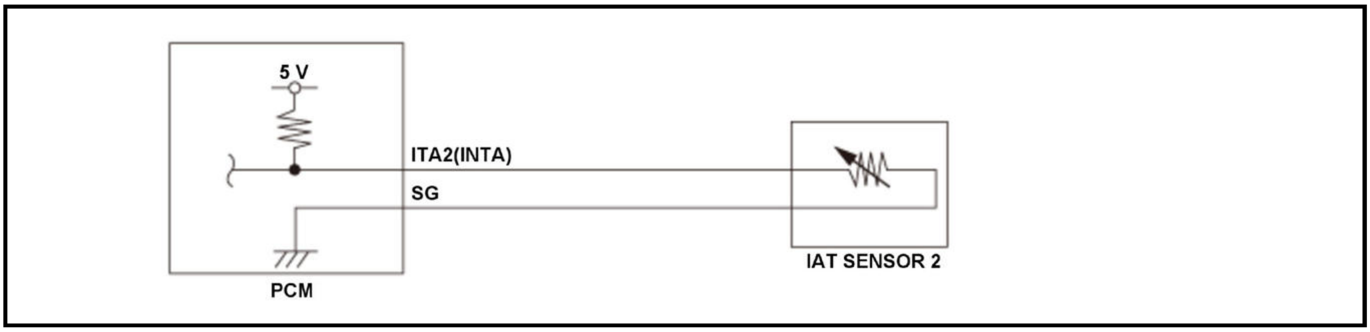
Conditions for clearing the DTC

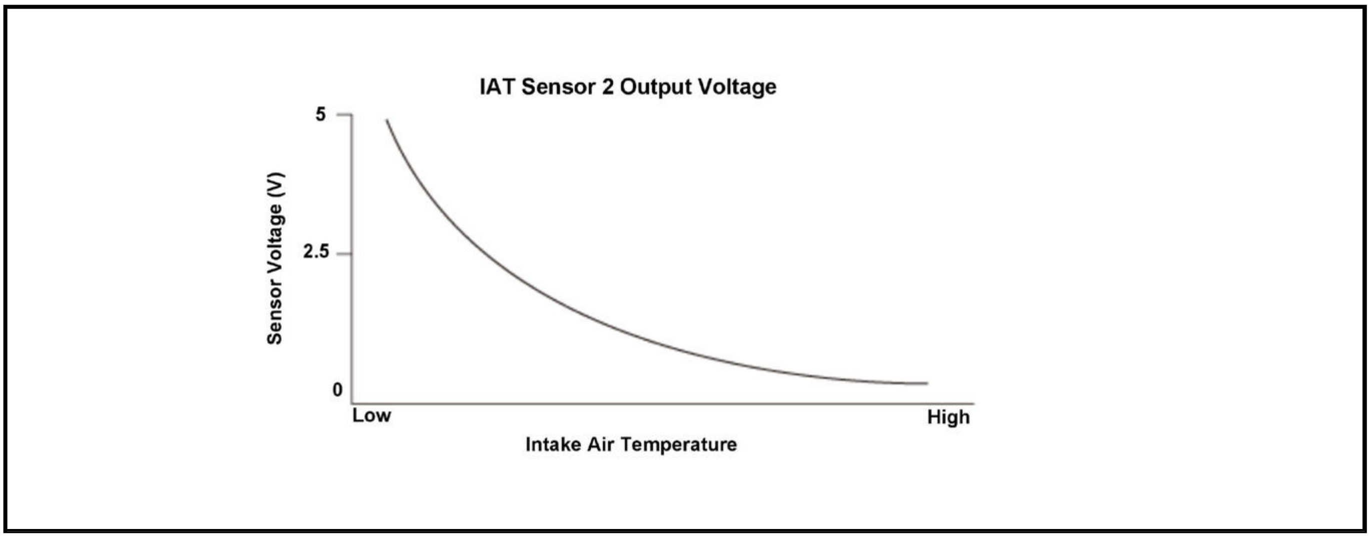
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0097, P0098 (1.5 L ENGINE)

DTC P0097: Intake Air Temperature (IAT) Sensor 2 Circuit Low Voltage **DTC P0098:** Intake Air Temperature (IAT) Sensor 2 Circuit High Voltage

General Description





Intake air temperature (IAT) sensor 2 is a thermistor that detects intake air temperature, and it is used for air/fuel ratio feedback control to compensate for the atmospheric density fluctuations that accompany changes in intake air temperature. IAT sensor 2 resistance varies depending on temperature. The output voltage and the sensor resistance increase as the intake air temperature decreases. Conversely, the output voltage and the sensor resistance decrease as the intake air temperature increases. If the IAT sensor 2 output voltage is specified value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P0097

The IAT sensor 2 output voltage [IAT Sensor (2)] is 0.08 V or less for at least 2.0 seconds.

DTC: P0098

The IAT sensor 2 output voltage [IAT Sensor (2)] is 4.92 V or more for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0097

- IAT sensor 2 ITA2 (INTA) line short to ground

DTC: P0098

- IAT sensor 2 ITA2 (INTA) line open
- IAT sensor 2 SG line open

Common

- IAT sensor 2 failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

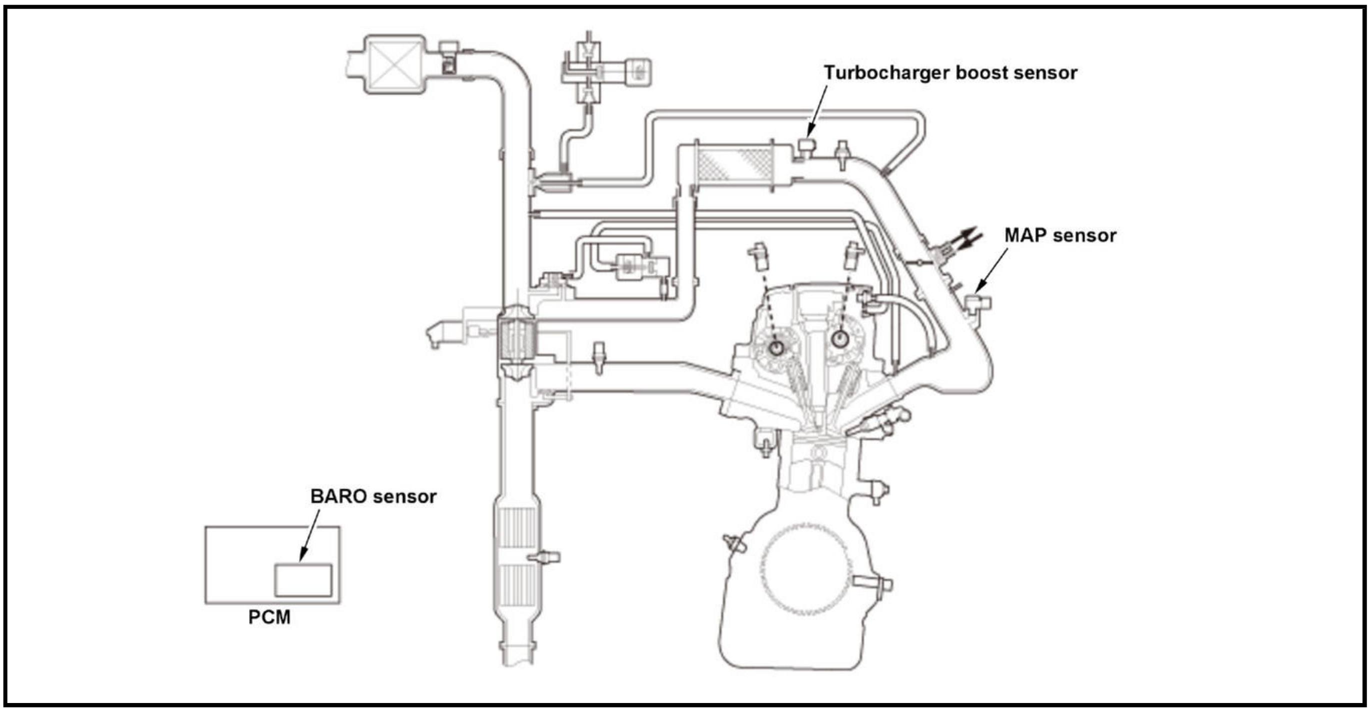
Conditions for clearing the DTC

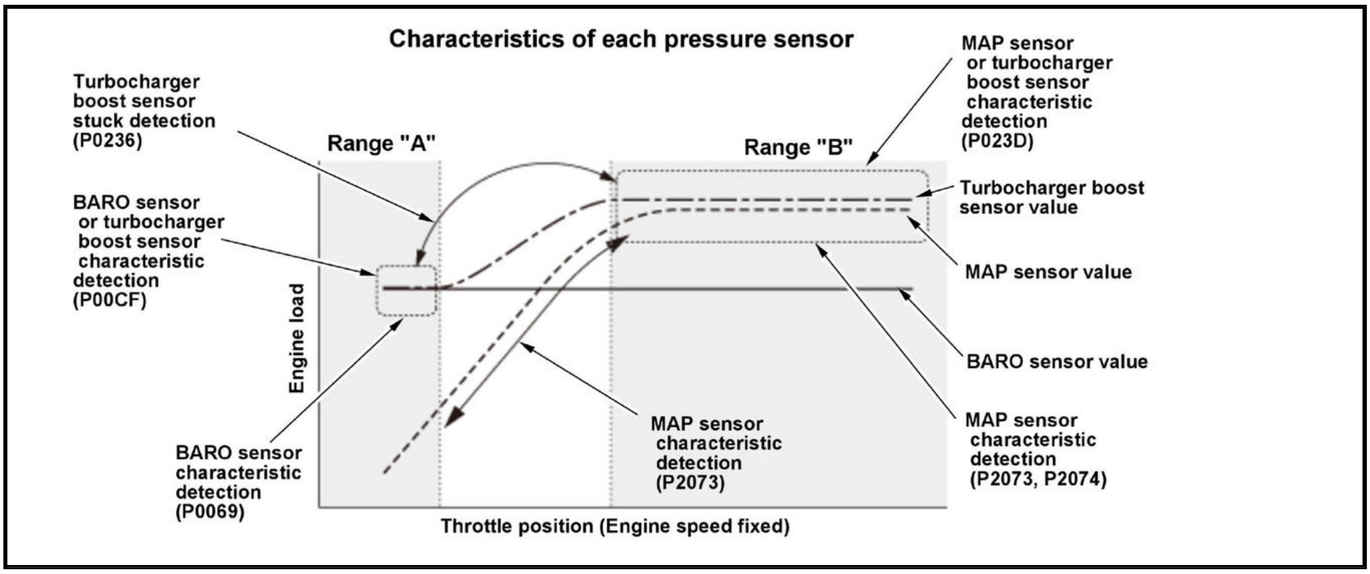
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P00CF (1.5 L ENGINE)

DTC P00CF: Turbocharger Boost Sensor/BARO Sensor Incorrect Correlation

General Description





The barometric pressure (BARO) sensor, the manifold absolute pressure (MAP) sensor, and the turbocharger boost sensor are equipped to the vehicle to detect air pressure conditions to the engine. The BARO sensor value and the turbocharger boost sensor value shows similar value at range "A" such as in idle conditions, and the turbocharger boost sensor value and MAP sensor value shows similar value at range "B" such as in high throttle position.

Malfunction determinations are done by the powertrain control module (PCM) in two ranges by comparing the pressure sensor values.

- At range "A": BARO sensor or turbocharger boost sensor is abnormal if the difference of the two pressure sensor values are specified or more (P00CF)
- At range "B": Turbocharger boost sensor or MAP sensor is abnormal if the difference of the two pressure sensor values are specified or more (P023D)
- Range "A" determined as abnormal and range "B" determined as normal: BARO sensor abnormal (P0069)
- Both ranges "A" and "B" determined as abnormal: Turbocharger boost sensor abnormal (P0236)
- Turbocharger boost sensor or MAP sensor values do not change when throttle position is transited from ranges "A" to "B": Determined as turbocharger boost sensor output stuck (P0236) or MAP sensor output stuck (P2073 or P2074)

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine time after starting the engine	3 seconds	-
Engine speed [ENGINE SPEED]	530 rpm	-
Intake air amount	-	7.0 g/second (0.24 oz/second)
Other	At idle	

[ ]: HDS Parameter

Malfunction Threshold

The difference between the BARO sensor value and the turbocharger boost sensor value is 27 kPa (200 mmHg, 7.9 inHg) or more for at least 5.0 seconds.

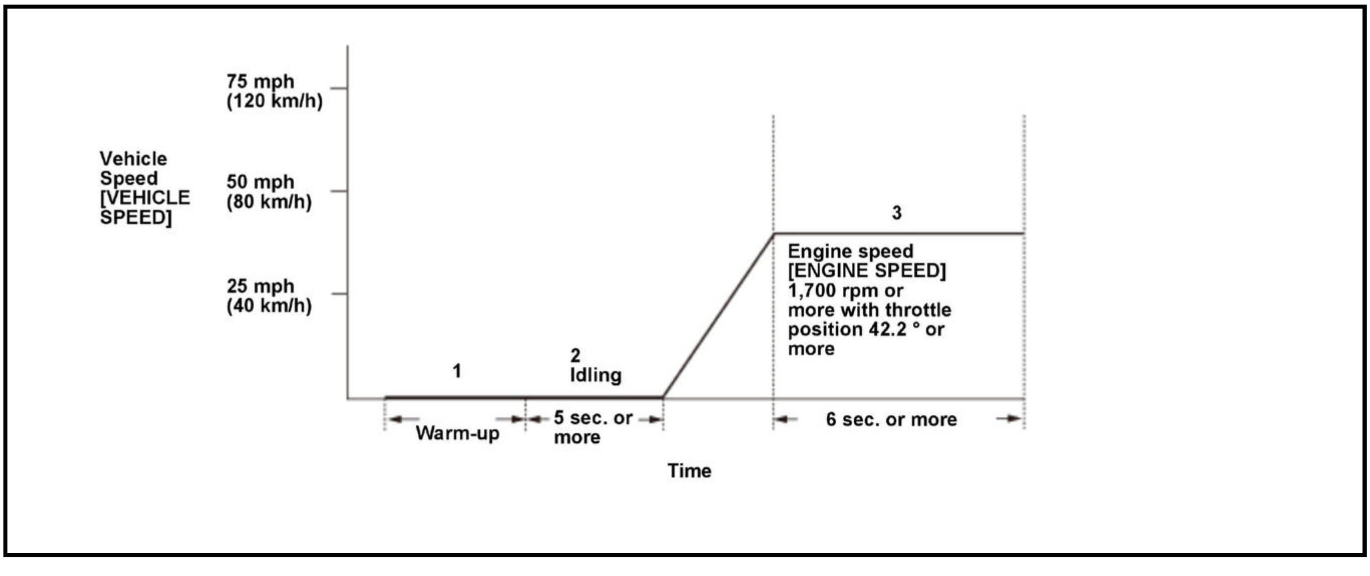
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor output range/performance problem
- Turbocharger boost sensor output range/performance problem

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 7 seconds.

- Drive the vehicle at engine speed [ENGINE SPEED] 1, 700 rpm or more with throttle position 42.2 deg. or more for at least 4 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

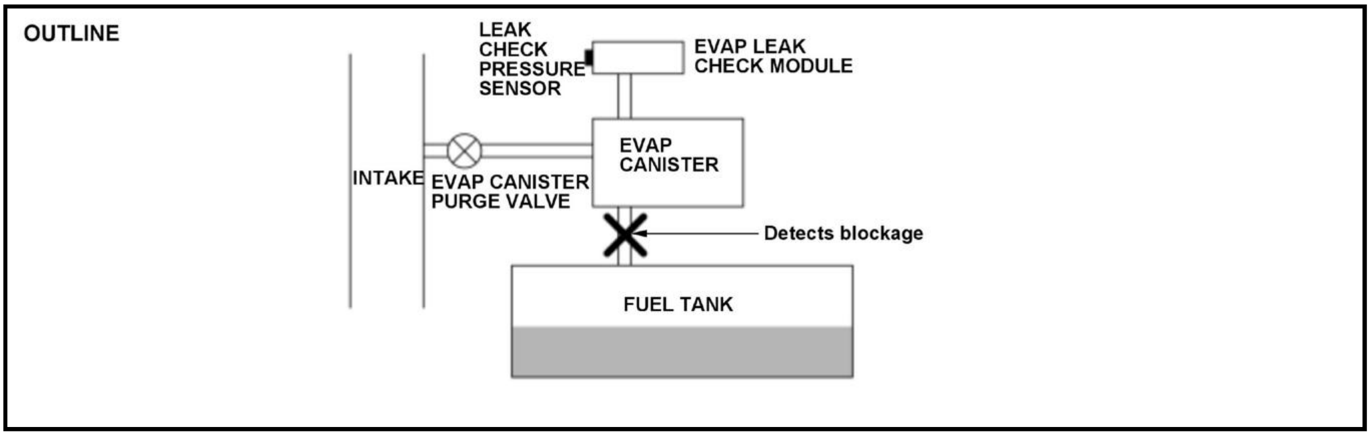
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

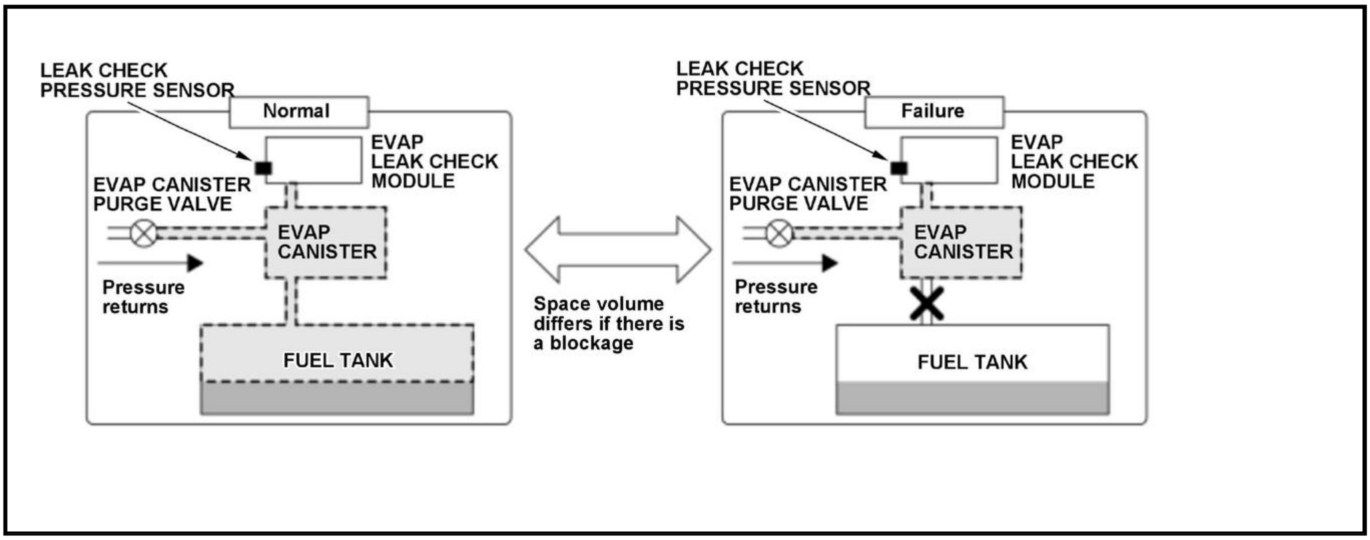
DTC P00FE (1.5 L ENGINE) (2020 2021)

DTC P00FE: Evaporative Emission (EVAP) Vent Line Blockage

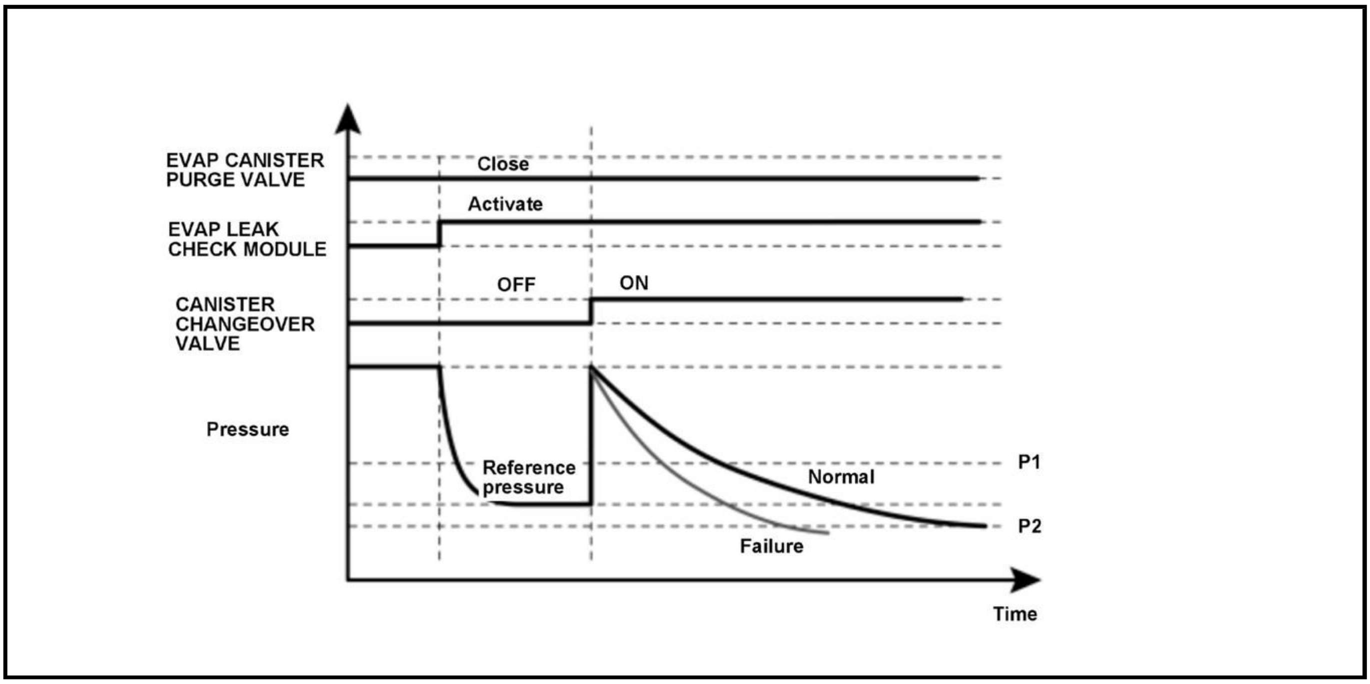
General Description



OUTLINE
LEAK CHECK PRESSURE SENSOR
EVAP LEAK CHECK MODULE
EVAP CANISTER
INTAKE
EVAP CANISTER PURGE VALVE
Detects blockage
FUEL TANK



LEAK CHECK PRESSURE SENSOR
Normal
EVAP LEAK CHECK MODULE
EVAP CANISTER PURGE VALVE
EVAP CANISTER
Pressure returns
FUEL TANK
Space volume differs if there is a blockage
LEAK CHECK PRESSURE SENSOR
Failure
EVAP LEAK CHECK MODULE
EVAP CANISTER PURGE VALVE
EVAP CANISTER
Pressure returns
FUEL TANK



Vent blockage is determined by the change in the internal pressure of the tank. The PCM detects a blockage of the vent line by estimating the volume of space in the evaporative emission (EVAP) system. The evaporative space volume is estimated from the pressure behavior when the EVAP canister purge valve is closed and when the pressure is reduced by the EVAP leak check module, the presence or absence of a blockage is determined. If the estimated volume is large, it is determined to be normal and when it estimated small, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	18 minutes 10 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Soak duration	5 hours	-
PCM wake up engine coolant temperature [ECT Sensor 2]	40.0 deg. F (4.4 deg. C)	95 deg. F (35 deg. C)
Barometric pressure[Baro Sensor]	76 kPa (22.5 inHg, 569 mmHg)	-
Driving time before soak	10 minutes	-
Vehicle speed before soak[VEHICLE SPEED]	25 mph (40 km/h) (For 5 minutes or more)	-
Drive distance after refueling	7 miles (10 km)	-
12 volt battery voltage [Battery]	10.5 V	-
Average fuel level [Fuel Level (Average)]	-	85 %

[ ]: HDS Parameter

Malfunction Threshold

When the calculated volume of space in the EVAP system is 10.7 L (2.83 US gal) or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP vent line blockage
- Vent shut float blockage

Confirmation Procedure

Operating Condition

- With an average fuel level of 85 % or less, drive the vehicle at least 10 minutes and run for 7 miles (10 km) or more. In the driving, make the vehicle at a steady speed 25 mph (40 km/h) or more for at least 5 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes 10 seconds.

- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

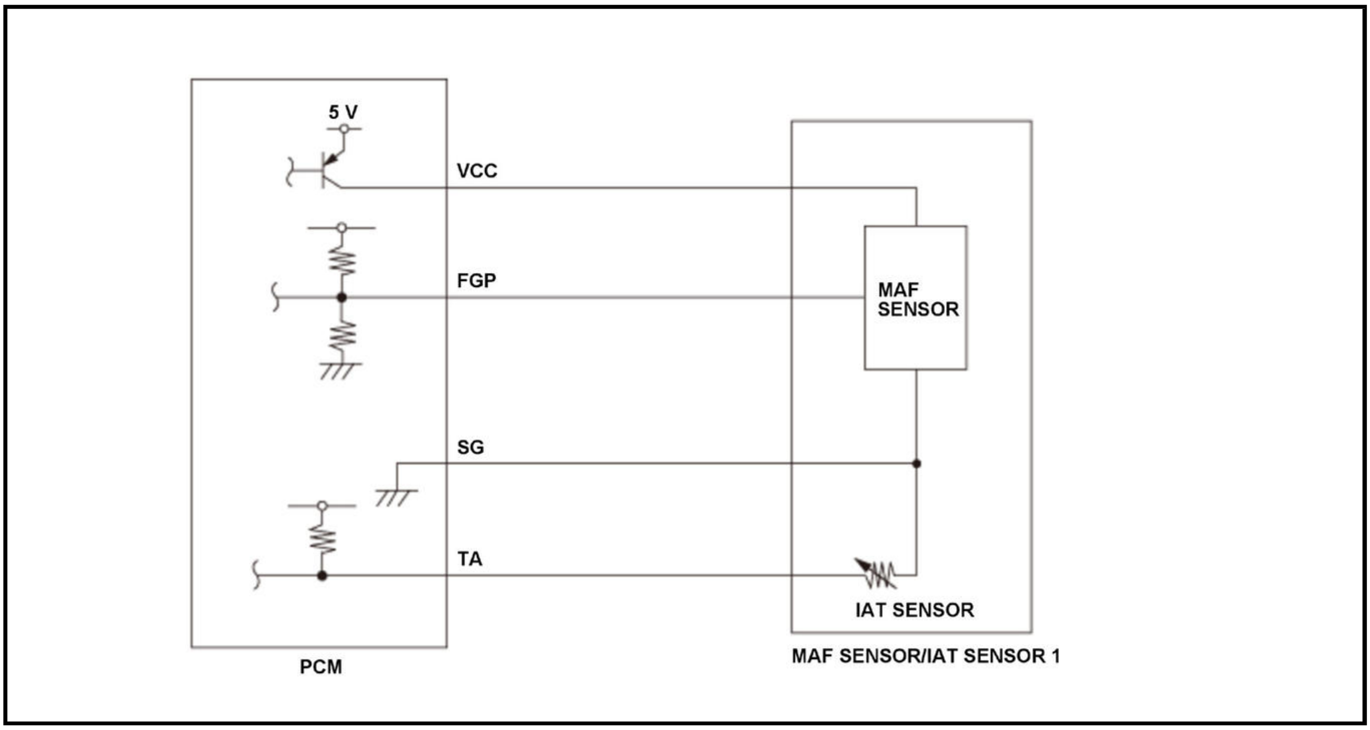
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P0100 (1.5 L ENGINE)

DTC P0100: Mass Air Flow (MAF) Sensor Circuit Malfunction

General Description



The mass airflow (MAF) sensor is attached to the intake air passage, and it measures the amount of intake airflow. The MAF sensor is a chip type airflow meter. The airflow cools the electrically heated chip that is mounted in the air passage. The powertrain control module (PCM) determines the amount of intake airflow by detecting the frequency. If the MAF sensor input frequency is a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The MAF sensor input frequency [MAF SENSOR] is less than 488 Hz for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAF sensor FGP line short to ground
- MAF sensor FGP line open
- MAF sensor FGP line short to power
- MAF sensor VCC line open
- MAF sensor VCC line short to ground
- MAF sensor SG line open

- MAF sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

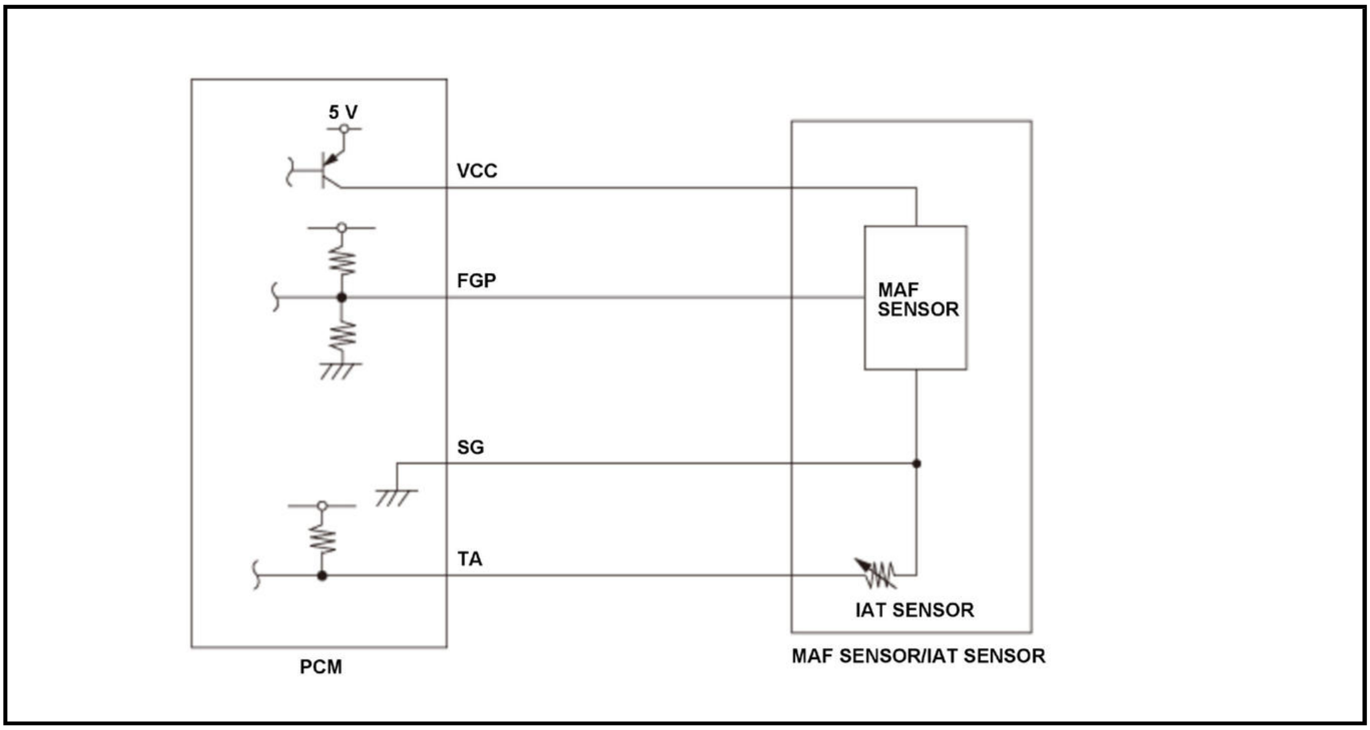
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0101 (1.5 L ENGINE) (2017)

DTC P0101: Mass Air Flow (MAF) Sensor Circuit Range/Performance Problem (Out of Range)

General Description



The mass airflow (MAF) sensor is attached to the intake air passage, and it measures the amount of intake airflow. The MAF sensor is a chip type airflow meter. The airflow cools the electrically heated chip that is mounted in the air passage. The powertrain control module (PCM) determines the amount of intake airflow by detecting the frequency. If the MAF sensor input frequency is out of range, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The MAF sensor input frequency [MAF SENSOR] is out of range from 520 to 10, 000 Hz for at least 3.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAF sensor failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

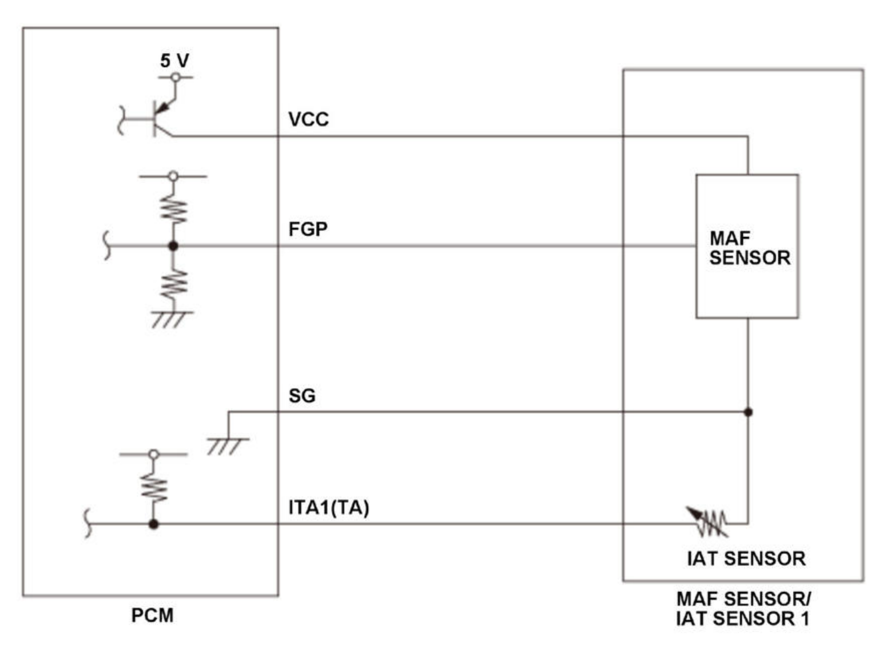
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0101 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P0101: Mass Air Flow (MAF) Sensor Circuit Range/Performance Problem (Out of Range)

General Description



The mass air flow (MAF) sensor is attached to the intake air passage, and it measures the amount of intake air flow. The MAF sensor is a chip type air flow meter. The air flow cools the electrically heated chip that is mounted in the air passage. The powertrain control module (PCM) determines the amount of intake air flow by detecting the frequency. If the MAF sensor input frequency is out of range, the PCM detects a malfunction and stores a DTC.

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The MAF sensor output voltage [MAF SENSOR] is 0.59 V or less, or 4.89 V or more for at least 6.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAF sensor failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

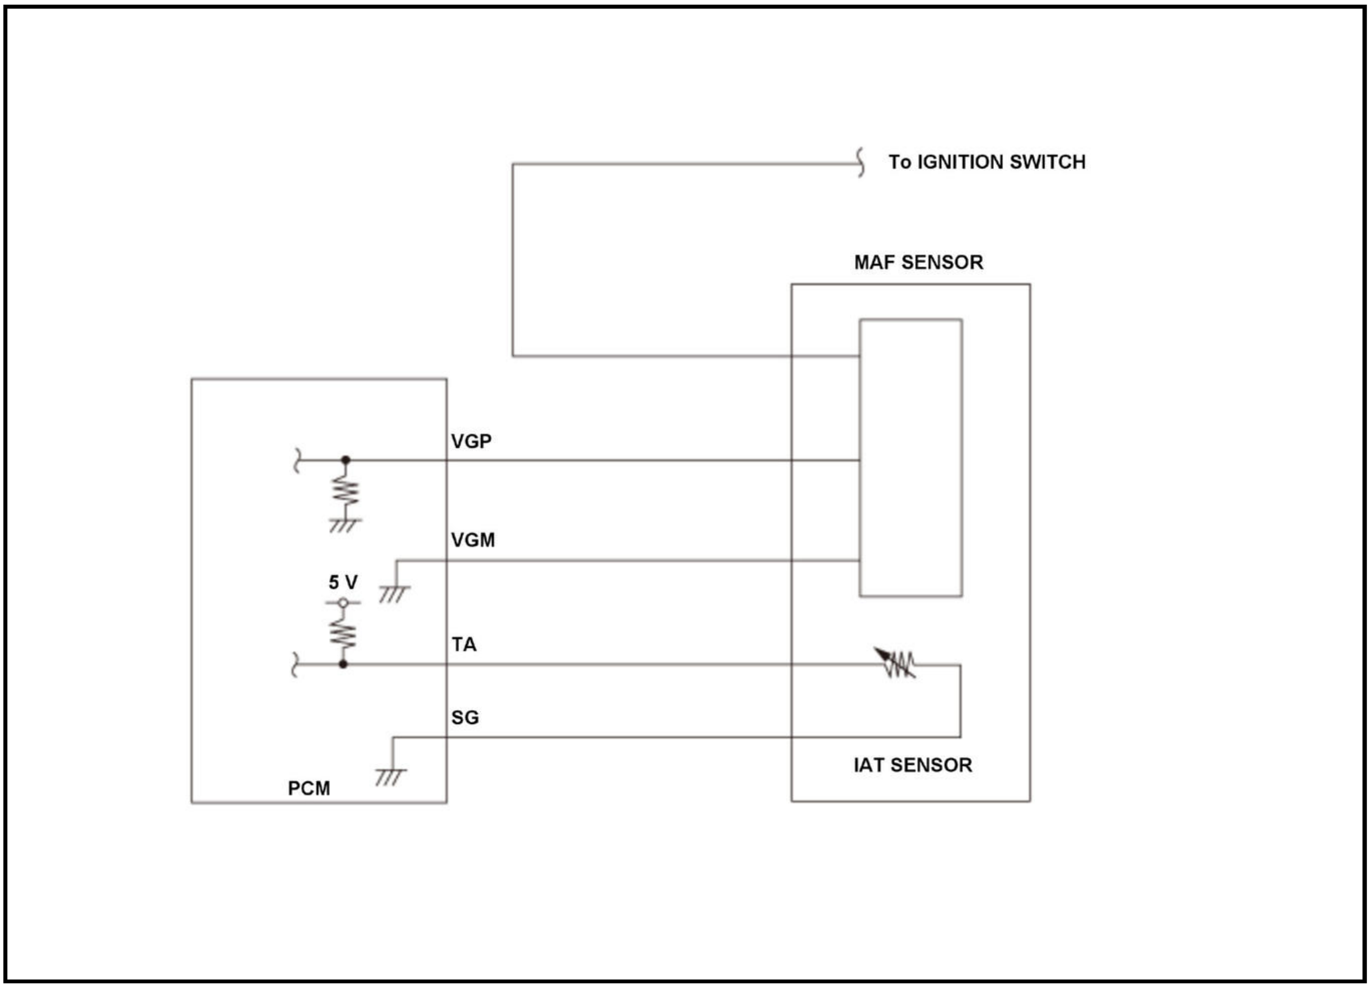
Conditions for clearing the DTC

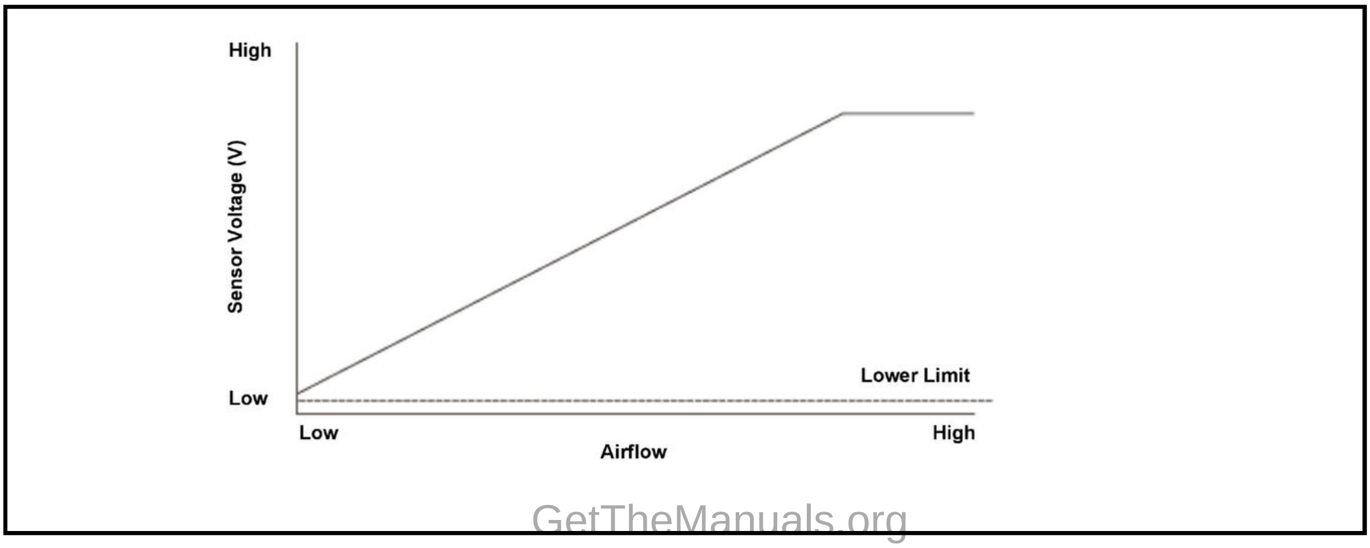
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0102, P0103 (2.4 L ENGINE) (2017 2018 2019)

DTC P0102: Mass Air flow (MAF) Sensor Circuit Low Voltage **DTC P0103:** Mass Air flow (MAF) Sensor Circuit High Voltage

General Description





The mass airflow (MAF) sensor is attached to the intake air passage, and it measures the amount of intake airflow. The MAF sensor is a hot wire airflow meter. The airflow cools the electrically heated wire that is mounted in the air passage. The powertrain control module (PCM) determines the amount of intake airflow by detecting the current that is required to keep the hot wire at a constant temperature. The lower limit of the MAF sensor output is specified. If the output is below that limit, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P0102

The MAF sensor output voltage [MAF SENSOR] is 0.10 V or less for at least 2.0 seconds.

DTC: P0103

The MAF sensor output voltage [MAF SENSOR] is 4.89 V or more for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0102

- MAF sensor VGP line short to ground
- MAF sensor VGP line open
- MAF sensor power supply line open

DTC: P0103

- MAF sensor VGM line open

Common

- MAF sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

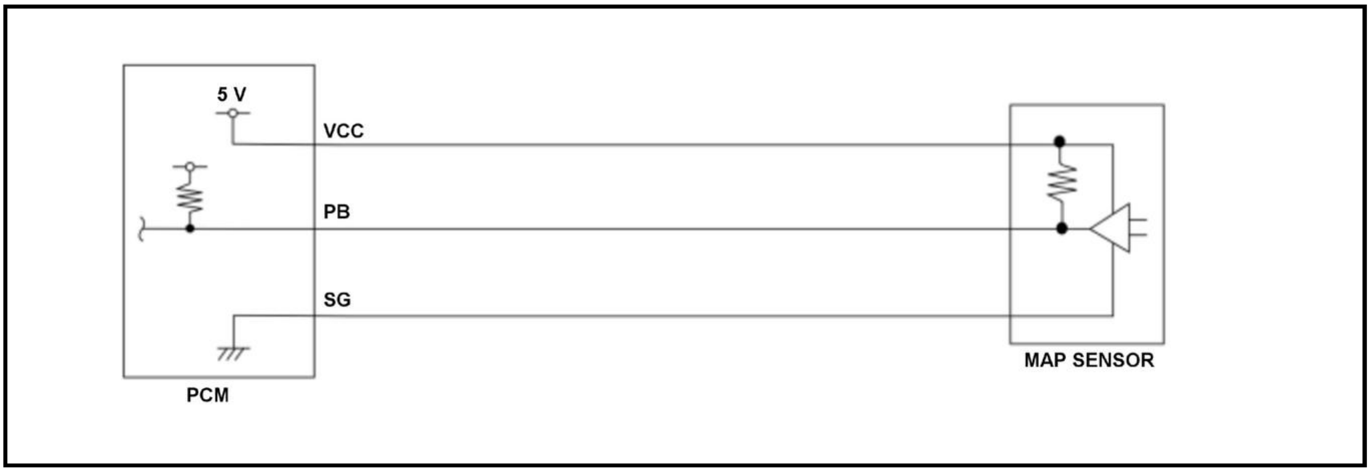
Conditions for clearing the DTC

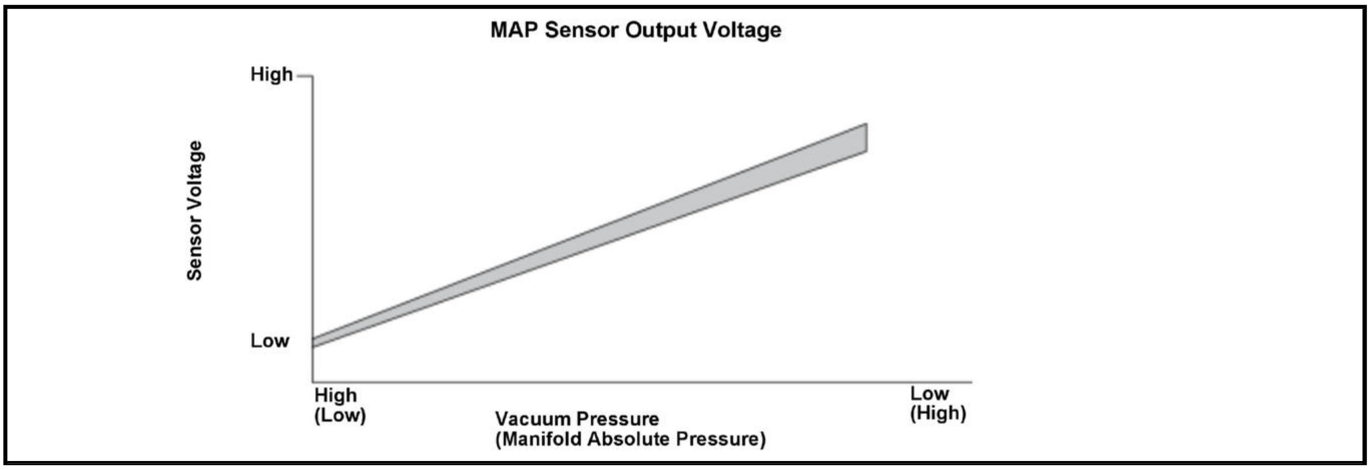
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0105 (2.4 L ENGINE) (2018 2019)

DTC P0105: Manifold Absolute Pressure (MAP) Sensor Out of Range

General Description





The manifold absolute pressure (MAP) sensor measures the pressure or vacuum in the manifold. This measurement is converted into an electrical signal which the powertrain control module (PCM) uses to monitor the engine. The MAP sensor outputs low signal voltage at high vacuum (throttle valve closed) and high signal voltage at low vacuum (throttle valve wide open). If the signal voltage from the MAP sensor falls below or exceeds a set value for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The MAP sensor output voltage [MAP SENSOR] is 0.23 V or less, or 3.39 V or more for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAP sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

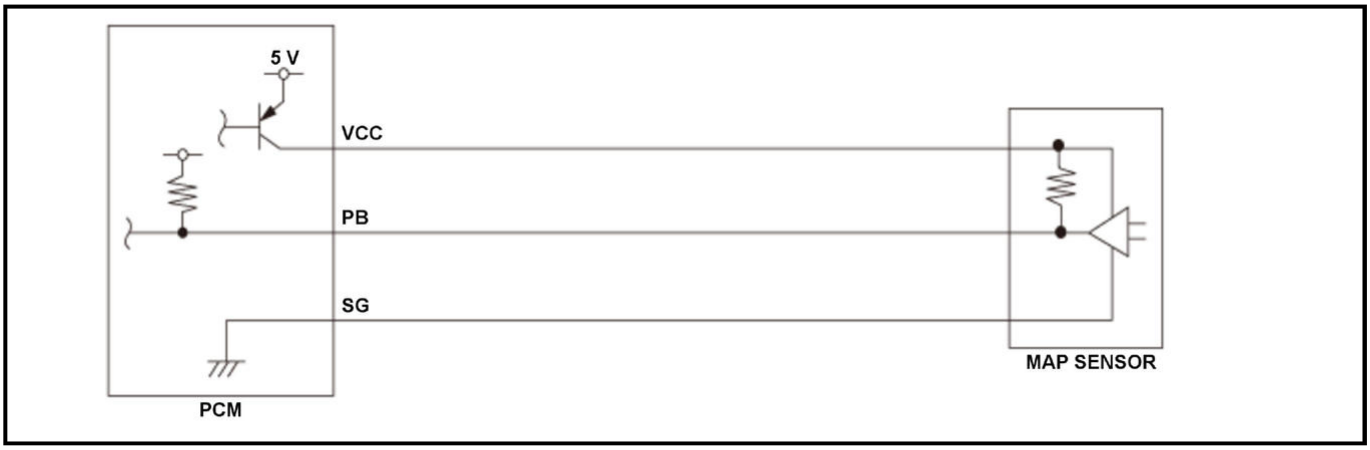
Conditions for clearing the DTC

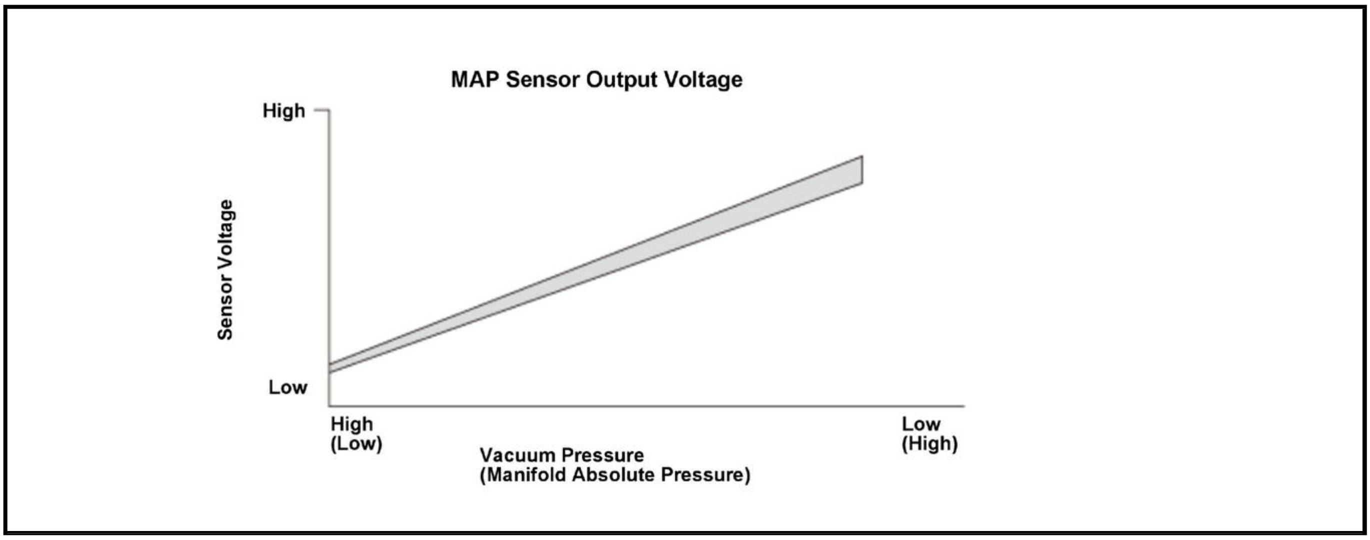
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0107, P0108 (1.5 L ENGINE)

DTC P0107: Manifold Absolute Pressure (MAP) Sensor Circuit Low Voltage **DTC P0108:** Manifold Absolute Pressure (MAP) Sensor Circuit High Voltage

General Description





The manifold absolute pressure (MAP) sensor measures the pressure or vacuum in the manifold. This measurement is converted into an electrical signal which the powertrain control module (PCM) uses to monitor the engine. The MAP sensor outputs low signal voltage at high vacuum (throttle valve closed) and high signal voltage at low vacuum (throttle valve wide open). If the signal voltage from the MAP sensor falls below or exceeds a set value for a specified time, the PCM detects a malfunction and stores a DTC.

The MAP sensor output voltage [MAP SENSOR] is 0.23 V or less for at least 2.0 seconds.

DTC: P0108

The MAP sensor output voltage [MAP SENSOR] is 4.49 V or more for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0107

- MAP sensor PB line short to ground
- MAP sensor VCC line open

DTC: P0108

- MAP sensor PB line open
- MAP sensor SG line open

Common

- MAP sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

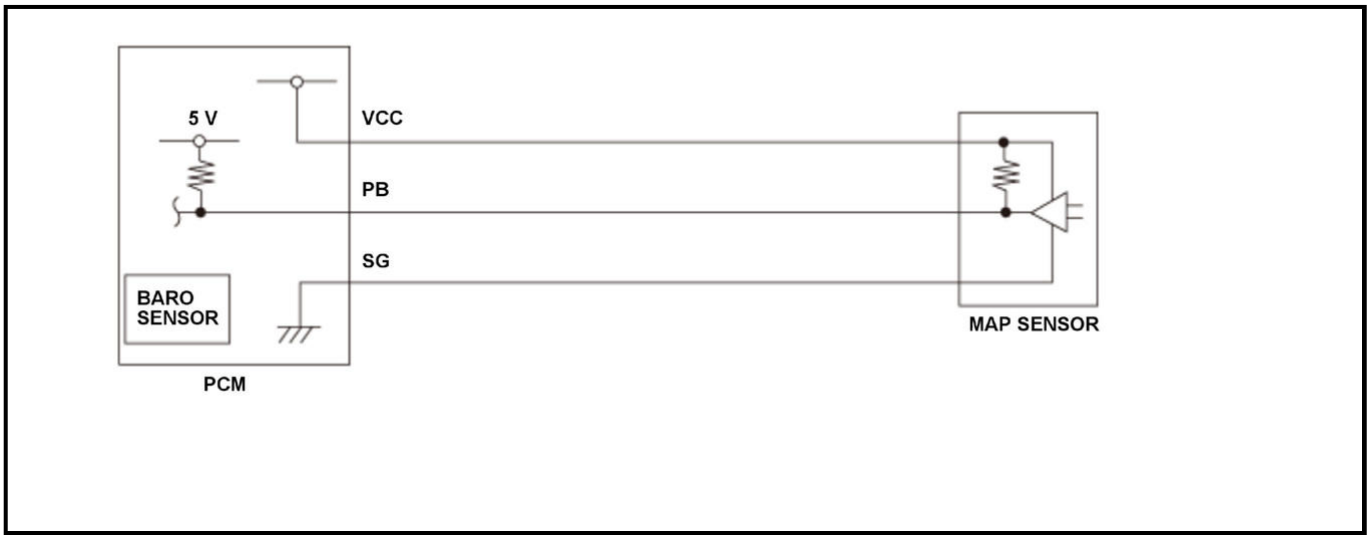
Conditions for clearing the DTC

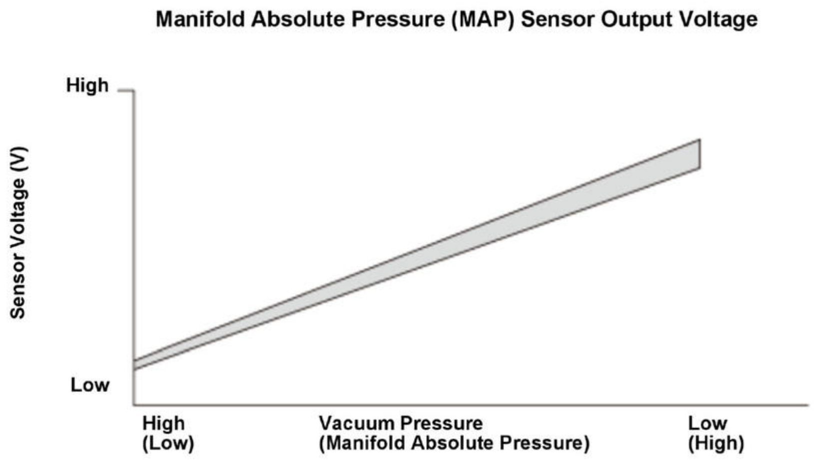
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0107, P0108 (2.4 L ENGINE) (2017 2018 2019)

DTC P0107: Manifold Absolute Pressure (MAP) Sensor Circuit Low Voltage **DTC P0108:** Manifold Absolute Pressure (MAP) Sensor Circuit High Voltage

General Description





The manifold absolute pressure (MAP) sensor measures the pressure or vacuum in the manifold. This measurement is converted into an electrical signal which the powertrain control module (PCM) uses to monitor the engine. The MAP sensor outputs low signal voltage at high vacuum (throttle valve closed) and high signal voltage at low vacuum (throttle valve wide open). If the signal voltage from the MAP sensor falls below a set value for a specified time, the PCM detects a malfunction and stores a DTC.

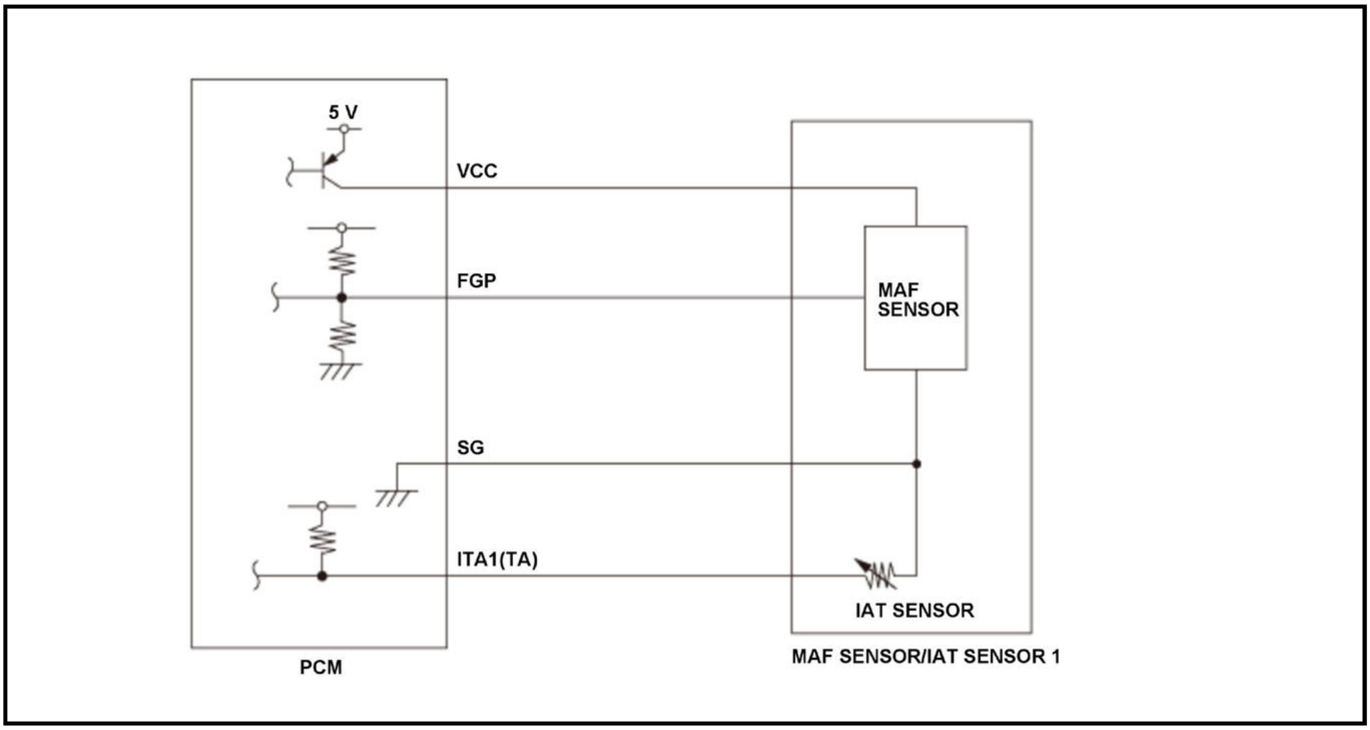
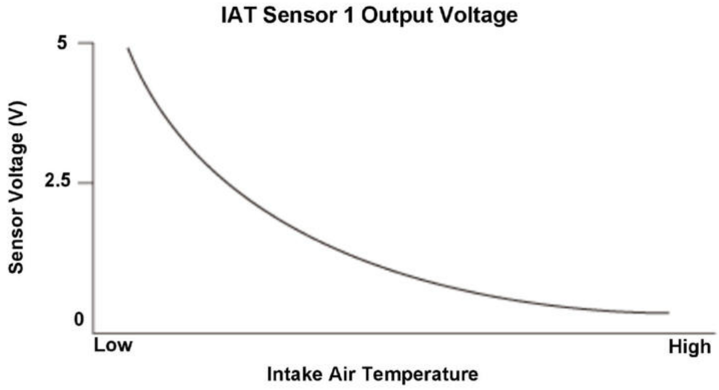
DTC P0111 (1.5 L ENGINE)

DTC P0111: Intake Air Temperature (IAT) Sensor 1 Circuit Range/Performance Problem

General Description





Intake air temperature (IAT) sensor 1 is a thermistor that detects intake air temperature, and it is used for air/fuel ratio feedback control to compensate for the atmospheric density fluctuations that accompany changes in intake air temperature. IAT sensor 1 resistance varies depending on temperature. The output voltage and the sensor resistance increase as the intake air temperature decreases. Conversely, the output voltage and the sensor resistance decrease as the intake air temperature increases. If the intake air temperature is a specified value for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

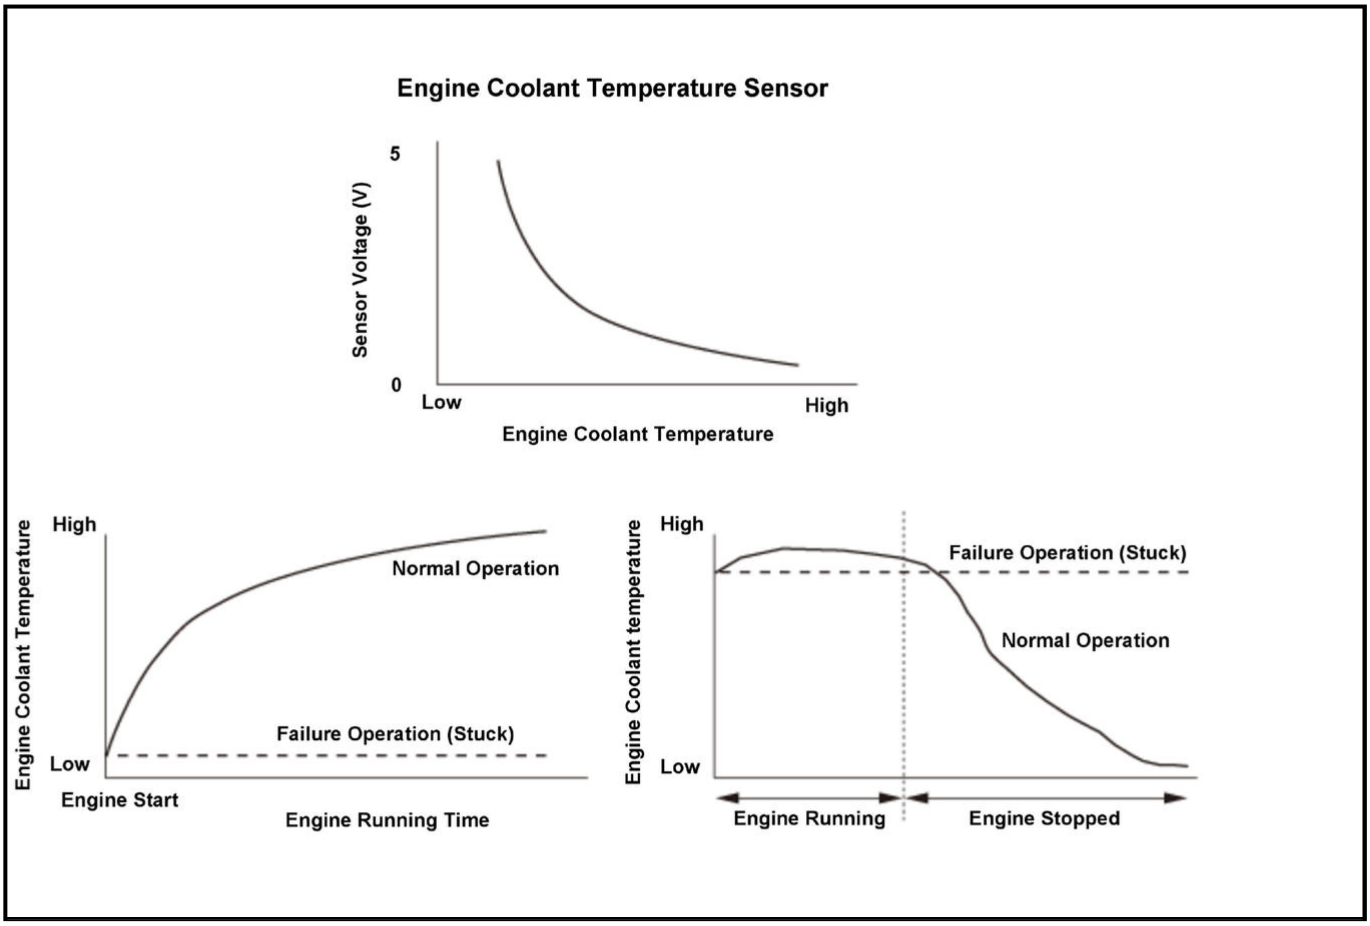
DTC P0116 (1.5 L ENGINE)

DTC P0116: Engine Coolant Temperature (ECT) Sensor 1 Circuit Range/Performance Problem

General Description



The powertrain control module (PCM) supplies voltage to the engine coolant temperature signal circuit (about 5 V) through a pull-up resistor. As the engine coolant cools, the engine coolant temperature (ECT) sensor 1 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 1 output voltage does not reach a set temperature after starting the engine and driving a set time, or when the difference between the ECT sensor 1 output voltage while driving and the output voltage of ECT sensor 1 after the engine has been stopped a certain length of time does not change a certain amount, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	42.0 minutes or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine time after starting the engine	10.0 seconds	-
Fuel feedback	Other than during fuel cut-off operation	

Condition	Minimum	Maximum
Other	With a completely cooled engine (one that has been off for at least 6 hours): Judgment is made after the engine has run for at least 42.0 minutes or been driven at least 5 miles (7 km), turn the vehicle to the OFF (LOCK) mode and wait for at least 10.0 seconds, then start and run again for at least 10.0 seconds.	
	With a partially cooled engine (one that has been off for less than 6 hours): Judgment is made after the engine has run for at least 42.0 minutes or been driven at least 5 miles (7 km), turn the vehicle to the OFF (LOCK) mode and wait for at least 6 hours then start and run again for at least 10.0 seconds.	

Malfunction Threshold

Malfunction determination 1:

With a completely cooled engine (one that has been off for at least 6 hours):

When the change in coolant temperature after 42.0 minutes or more of running time or 5 miles (7 km) or more of driving distance is 18 deg. F (10 deg. C) or less, a malfunction is detected.

Malfunction determination 2:

With a partially cooled engine (one that has been off for less than 6 hours):

When the difference between the coolant temperature after 42.0 minutes or more of running time or 5 miles (7 km) or more of driving distance the coolant temperature after the engine has been off for 6 hours and then run for 10.0 seconds is 18 deg. F (10 deg. C) or less, a malfunction is detected.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure

Confirmation Procedure

Operating Condition

With a completely cooled engine (one that has been off for at least 6 hours).

- Start the engine, and let it idle for at least 42.0 minutes or drive for at least 5 miles (7 km).
- Turn the vehicle to the OFF (LOCK) mode for 10.0 seconds, then restart the engine and let it idle for at least 10.0 seconds.

With a partially cooled engine (one that has been off for less than 6 hours).

- Start the engine, and let it idle for at least 42.0 minutes or drive for at least 5 miles (7 km).
- Turn the vehicle to the OFF (LOCK) mode for 6 hours then restart the engine and let it idle for at least 10.0 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

Time
Failure
ECT1
Δ> Malfunction threshold
ECT2
IAT
Δ< Malfunction threshold

Two engine coolant temperature (ECT) sensors and one intake air temperature (IAT) sensor are used by the powertrain control module (PCM). When the engine is stopped and enough time has passed, the temperature of the engine will equalize to ambient temperature. ECT sensor 1 and IAT sensor are compared to ECT sensor 2, and if an inappropriate temperature is read, the PCM detects a malfunction in the corresponding sensor and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine off time	6 hours	-

Malfunction Threshold

A malfunction is detected if the following conditions are present after the engine has stopped and the vehicle condition has been turned to the OFF (LOCK) mode for at least 6 hours before restarting the engine:

Temperature difference between each sensor values		Malfunction judgment		
ECT1* - ECT2**	IAT*** - ECT2**	ECT sensor 1	IAT sensor	ECT sensor 2
Higher than 57 deg. F (32 deg. C)	Higher than 57 deg. F (32 deg. C)	Normal	Normal	Failure

Temperature difference between each sensor values		Malfunction judgment		
ECT1* - ECT2*	**IAT*** - ECT2****	**ECT sensor 1**	**IAT sensor**	**ECT sensor 2**

*: [ECT SENSOR 1]

**: [ECT SENSOR 2]

***: [IAT SENSOR (1)]

****: Malfunction judgment is suspended because the cooled air introduced after engine start lowers the intake air temperature; the ambient temperature condition does not stay equal.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- ECT sensor 2 failure
- IAT sensor failure
- Engine block heater attachment (non-genuine part)

Confirmation Procedure

Operating Condition

- Turn the vehicle to the OFF (LOCK) mode, and wait at least 6 hours.
- Start the engine, and let it idle for at least 10 seconds.

- Do not use an engine block heater because the engine coolant temperature will not stay equal during engine stop.

- When freeze data is stored, test the vehicle under an ambient temperature close to the intake air temperature in the freeze data.
- When an ambient temperature extremely changes, malfunction judgment may not execute. Avoid extreme temperature changing condition after or before engine start. (When the vehicle is parked in the garage, open the garage door to introduce outside air; then start the engine.)

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

Malfunction threshold

Two engine coolant temperature (ECT) sensors and one intake air temperature (IAT) sensor are used by the powertrain control module (PCM). When the engine is stopped and enough time has passed, the temperature of the engine will equalize to ambient temperature. ECT sensor 1 and IAT sensor are compared to ECT sensor 2, and if an inappropriate temperature is read, the PCM detects a malfunction in the corresponding sensor and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine off time	6 hours	-

Malfunction Threshold

A malfunction is detected if the following conditions are present after the engine has stopped and the vehicle condition has been turned to the OFF (LOCK) mode for at least 6 hours before restarting the engine:

Temperature difference between each sensor values		Malfunction judgment		
ECT1* - ECT2**	IAT*** - ECT2**	ECT sensor 1	IAT sensor	ECT sensor 2
Higher than 57 deg. F (32 deg. C)	Higher than 57 deg. F (32 deg. C)	Normal	Normal	Failure

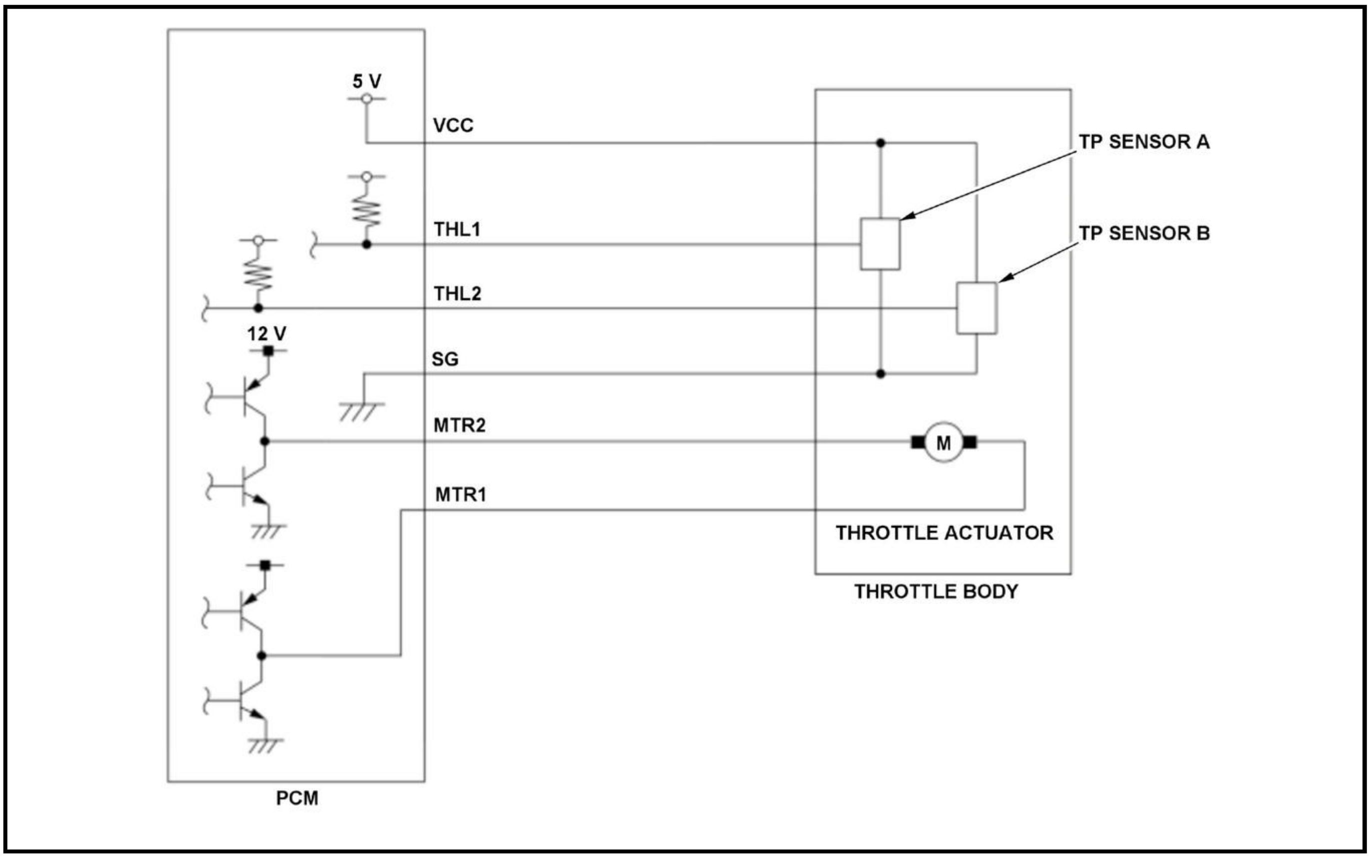
DTC P0121 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P0121: Throttle Position (TP) Sensor A Out of Range

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). TP sensor A is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position. The throttle valve position signal from TP sensor A is transmitted to the PCM for target position feedback control. If the signal from TP sensor A is a fixed value for a set time, the PCM detects a TP sensor A malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The TP sensor A output voltage [TP SENSOR A] is 0.38 V or less, or 4.5 V or more for at least 6.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle body internal failure (TP sensor A)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

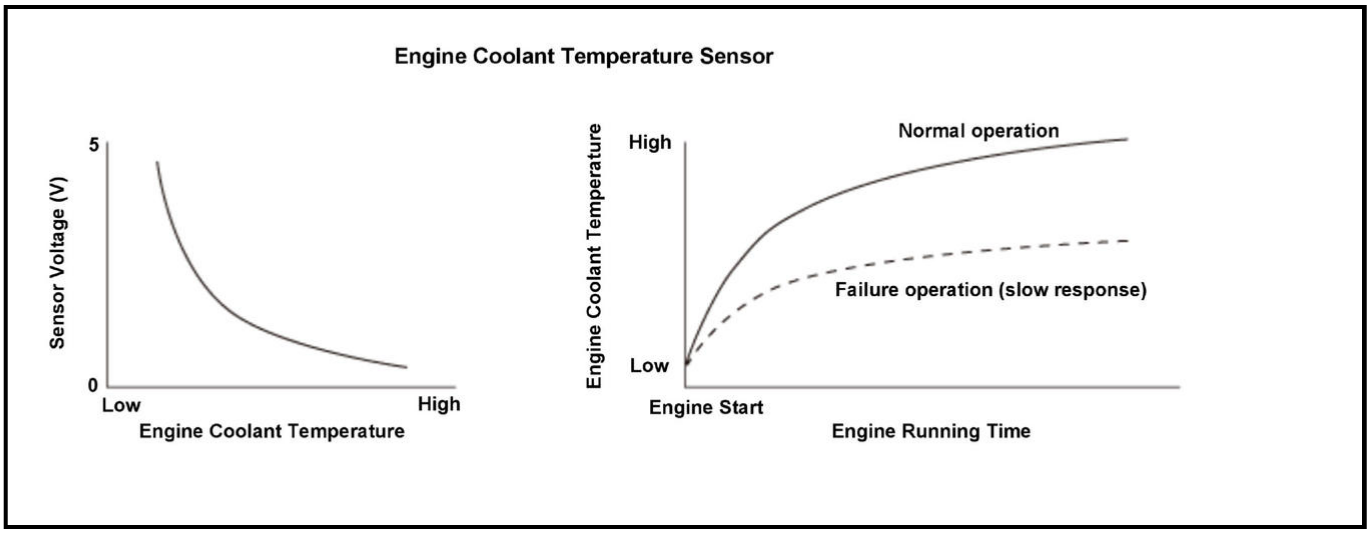
DTC P0125 (1.5 L ENGINE)

DTC P0125: Engine Coolant Temperature (ECT) Sensor 1 Malfunction/Slow Response

General Description



The powertrain control module (PCM) supplies voltage to the engine coolant temperature signal circuit (about 5 V) through a pull-up resistor. As the engine coolant cools, the engine coolant temperature (ECT) sensor 1 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 1 output voltage does not reach a specified temperature at which closed loop control for stoichiometric air/fuel ratio starts within a set time, depending on the initial engine coolant temperature after starting the engine, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	20 minutes or less
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Initial engine coolant temperature [ECT SENSOR 1]	-	0 deg. F (-18 deg. C)
Fuel feedback	Other than during fuel cut-off operation	

[ ]: HDS Parameter

Malfunction Threshold

The engine running time before the engine coolant temperature [ECT SENSOR 1] reaches 0 deg. F (-18 deg. C), based on the initial engine coolant temperatures [ECT SENSOR 1], is as follows:

Initial engine coolant temperature [ECT SENSOR 1]	Engine running time
-54 deg. F (-48 deg. C)	5 minutes or more
-35 deg. F (-37 deg. C)	5 minutes or more
0 deg. F (-18 deg. C)	1 minute or more

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- Thermostat stuck open

Confirmation Procedure

Operating Condition

- Start the engine under Enable Conditions (see "Initial engine coolant temperature [ECT SENSOR 1]").
- Let the engine idle for at least 20 minutes.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

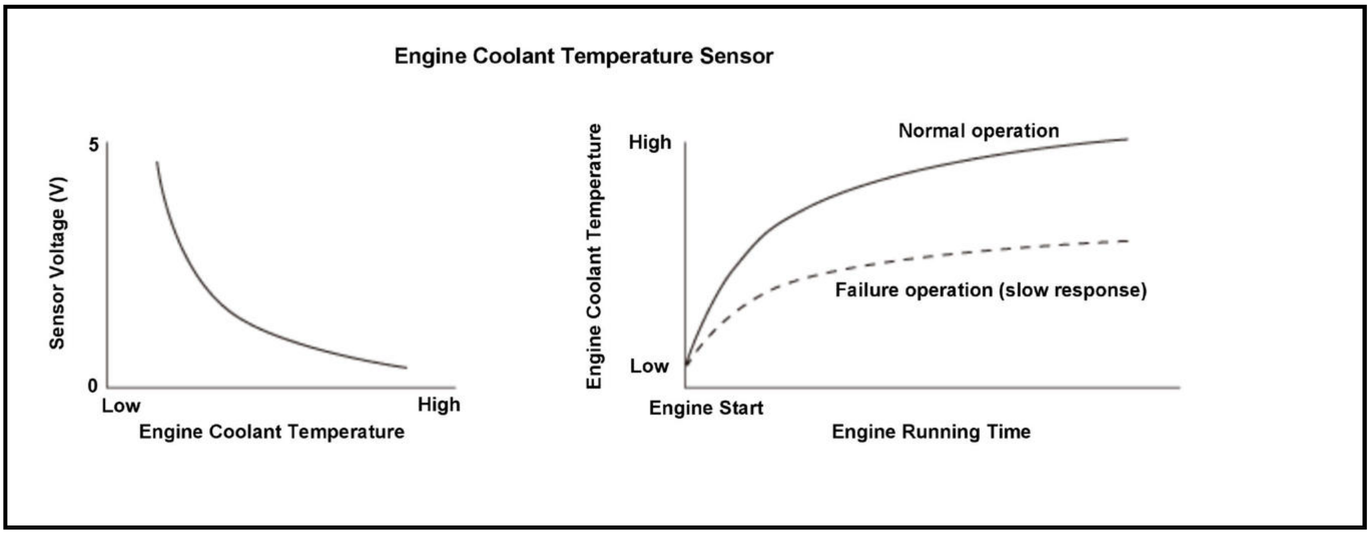
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0125 (2.4 L ENGINE) (2017 2018 2019)

DTC P0125: Engine Coolant Temperature (ECT) Sensor 1 Malfunction/Slow Response

General Description



The powertrain control module (PCM) supplies voltage to the engine coolant temperature signal circuit (about 5 V) through a pull-up resistor. As the engine coolant cools, the engine coolant temperature (ECT) sensor 1 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 1 output voltage does not reach a specified temperature at which closed loop control for stoichiometric air/fuel ratio starts within a set time, depending on the initial engine coolant temperature after starting the engine, the PCM detects a malfunction and stores a DTC.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- Thermostat stuck open

Confirmation Procedure

Operating Condition

- Start the engine under Enable Conditions (see "Initial engine coolant temperature [ECT SENSOR 1]").
- Let the engine idle for at least 20 minutes.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

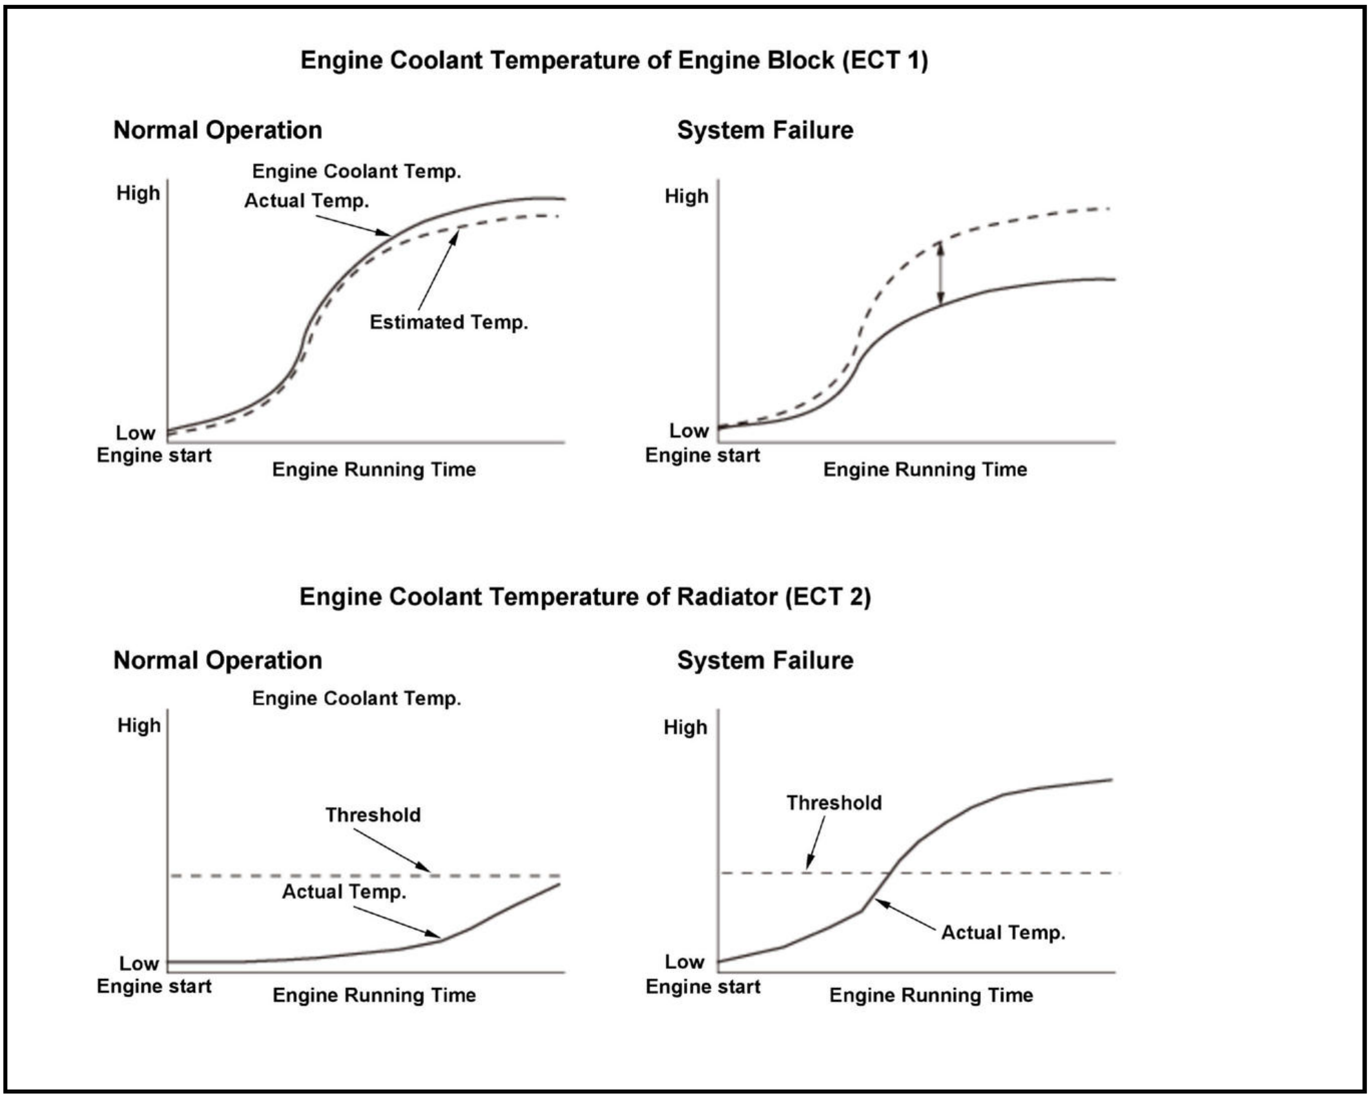
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0128 (1.5 L ENGINE)

DTC P0128: Cooling System Malfunction

General Description



The thermostat is closed when the engine coolant temperature is low, and it stops the circulation of engine coolant to speed engine warm up. When the engine coolant temperature increases, the thermostat opens and circulates engine coolant to control its temperature. When the engine coolant temperature decreases, the opening area of the thermostat is reduced to regulate the engine coolant temperature. If the thermostat sticks open, engine warm up is delayed, and exhaust emissions are adversely affected. The powertrain control module (PCM) measures the rise in the coolant temperature after the engine starts at the engine block and at the radiator, and it estimates the characteristics of the engine coolant temperature by calculations based on those two temperatures and the driving conditions. When ECT 2 immediately increases from the starting value, it is defined as the thermostat stuck open. When ECT 1 does not reach a specified value at a certain condition, it is defined as a thermostat malfunction.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine off time	6 hours	-
Estimated initial outside air temperature	20 deg. F (-7 deg. C)	-

Condition	Minimum	Maximum
Initial engine coolant temperature (ECT 1) [ECT SENSOR 1]	-	123 deg. F (50 deg. C)
The difference between initial intake air temperature [IAT Sensor (1)] and current intake air temperature [IAT Sensor (1)]	-	3 deg. F (2 deg. C)*
		7 deg. F (4 deg. C)**

*: Intake air temperature decrease judgment when there is no driving record of 25 mph (40 km/h) in this drive cycle.**: Intake air temperature decrease judgment when there is a driving record of 25 mph (40 km/h) in this drive cycle.[ ]: HDS Parameter

Malfunction Threshold

Malfunction determination 1:

The difference between the current engine coolant temperature at the radiator (ECT 2) [ECT SENSOR 2] and the initial engine coolant temperature at the radiator (ECT 2) [ECT SENSOR 2] is at least 11 deg. F (6 deg. C) when either of these condition is met:

- When the estimated engine coolant temperature [EST ECT1] reached to 162 deg. F (72 deg. C).
- When the estimated engine coolant temperature [EST ECT1] changed 40 deg. F (22 deg. C).

Malfunction determination 2:

The estimated engine coolant temperature [EST ECT1] reaches to 158 deg. F (70 deg. C) before the actual engine coolant temperature at the engine (ECT 1) [ECT SENSOR 1] reaches to 70 deg. C (158 deg. F).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Thermostat failure
- Engine coolant temperature (ECT) sensor 1 failure
- Intake air temperature (IAT) sensor failure
- Manifold absolute pressure (MAP) sensor failure
- Crankshaft position (CKP) sensor failure
- Barometric pressure (BARO) sensor failure
- Ignition system failure
- Fuel supply system failure
- Radiator fan failure
- Hood opened

Confirmation Procedure

Operating Condition

- Start the engine under Enable Conditions (see "Engine off time", "Estimated initial outside air temperature", "Initial engine coolant temperature (ECT 1) [ECT SENSOR 1]", and "The difference between initial intake air temperature [IAT Sensor (1)] and current intake air temperature [IAT Sensor (1)]").
- Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 30 minutes.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

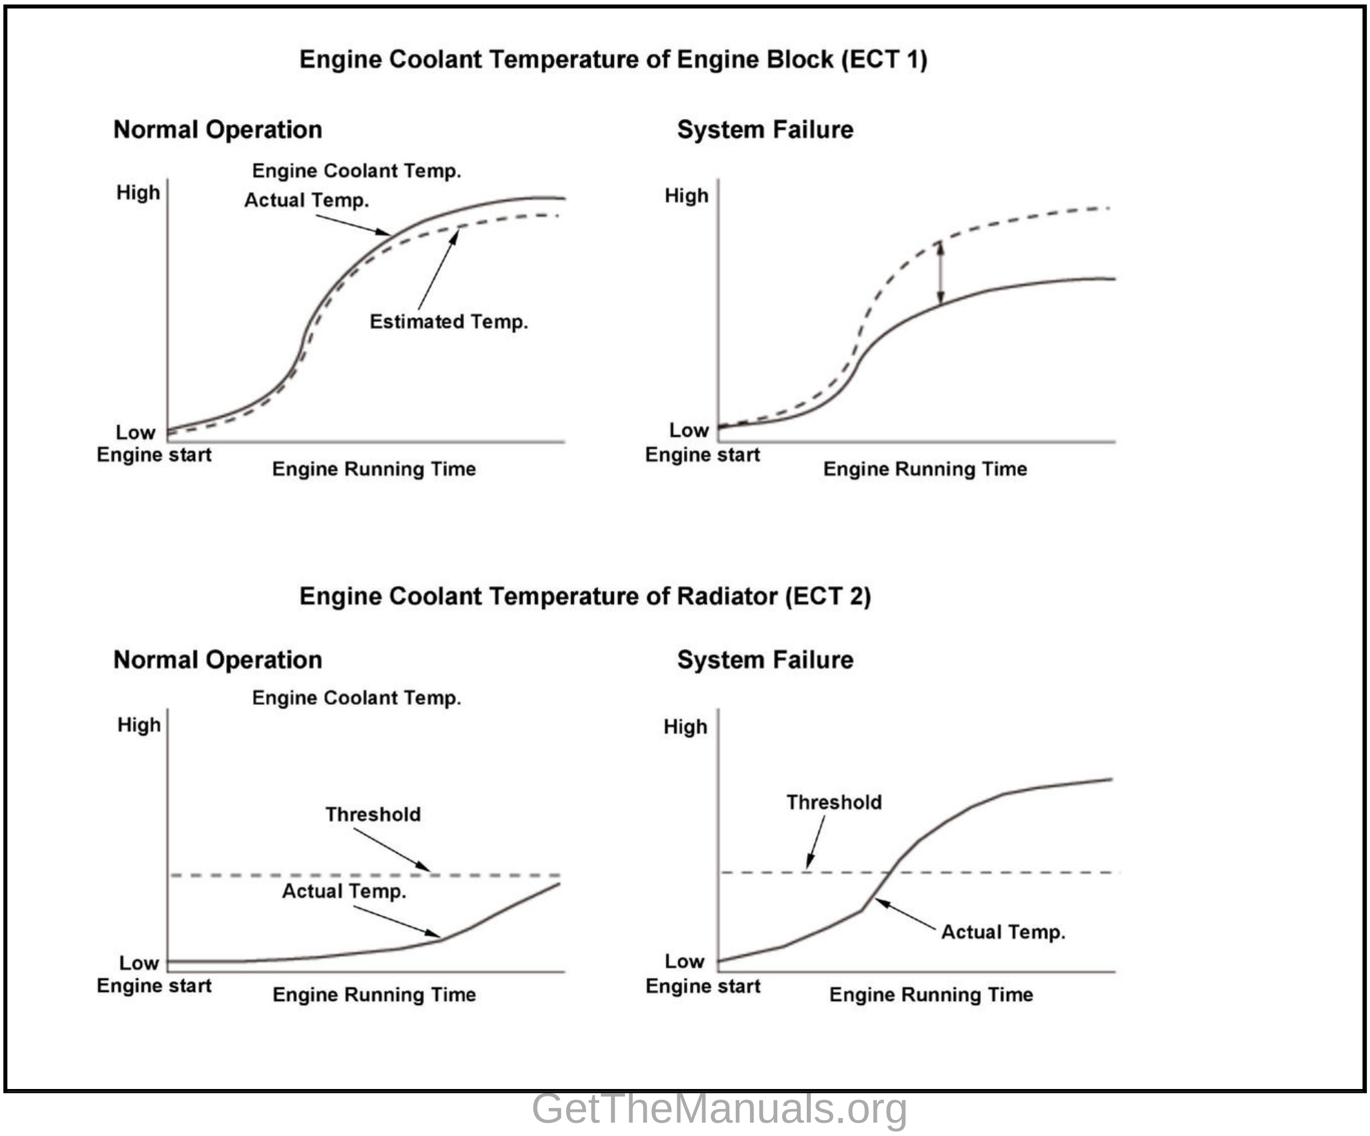
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0128 (2.4 L ENGINE) (2017 2018 2019)

DTC P0128: Cooling System Malfunction

General Description



The thermostat is closed when the engine coolant temperature is low, and it stops the circulation of engine coolant to speed engine warm up. When the engine coolant temperature increases, the thermostat opens and circulates engine coolant to control its temperature. When the engine coolant temperature decreases, the opening area of the thermostat is reduced to regulate the engine coolant temperature. If the thermostat sticks open, engine warm up is delayed, and exhaust emissions are adversely affected. The powertrain control module (PCM) measures the rise in the coolant temperature after the engine starts at the engine block and at the radiator, and it estimates the characteristics of the engine coolant temperature by calculations based on those two temperatures and the driving conditions. When ECT 2 immediately increases from the starting value, it is defined as the thermostat stuck open. When ECT 1 does not reach a specified value at a certain condition, it is defined as a thermostat malfunction.

[ ]: HDS Parameter

Malfunction Threshold

Malfunction determination 1:

The difference between the current engine coolant temperature at the radiator (ECT 2) [ECT SENSOR 2] and the initial engine coolant temperature at the radiator (ECT 2) [ECT SENSOR 2] is at least 43 deg. F (6 deg. C) when either of these condition is met:

- When the estimated engine coolant temperature [EST ECT1] reached to 164 deg. F (74 deg. C).
- When the estimated engine coolant temperature [EST ECT1] changed 68 deg. F (20 deg. C).

Malfunction determination 2:

The estimated engine coolant temperature [EST ECT1] reaches to 158 deg. F (70 deg. C) before the actual engine coolant temperature at the engine (ECT 1) [ECT SENSOR 1] reaches to 158 deg. F (70 deg. C).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Thermostat failure
- Engine coolant temperature (ECT) sensor 1 failure
- Intake air temperature (IAT) sensor failure
- Manifold absolute pressure (MAP) sensor failure
- Crankshaft position (CKP) sensor failure
- Barometric pressure (BARO) sensor failure
- Ignition system failure
- Fuel supply system failure
- Radiator fan failure
- Hood opened

Confirmation Procedure

Operating Condition

- Start the engine under Enable Conditions (see "Engine off time", "Initial intake air temperature [IAT SENSOR (1)]", "Initial engine coolant temperature (ECT 2) [ECT SENSOR 2]", and "The difference between initial intake air temperature [IAT SENSOR (1)] and current intake air temperature [IAT SENSOR (1)]").
- Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 30 minutes.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

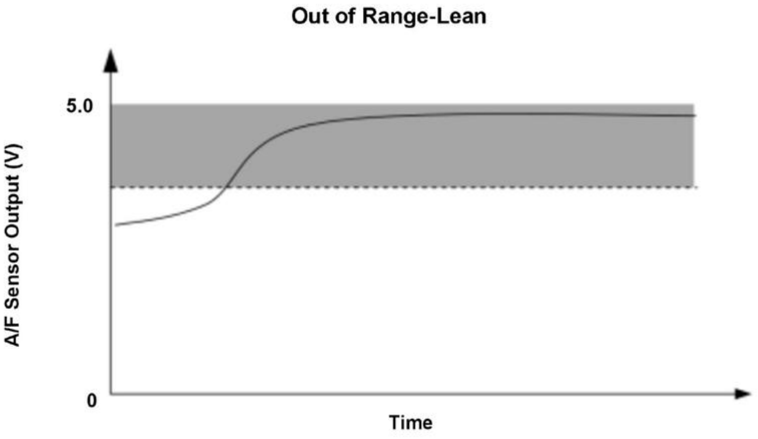
In Range A/F



If a malfunction causes the air/fuel ratio (A/F) sensor (sensor 1) signal to the powertrain control module (PCM) to deviate from the normal control area, the A/F sensor (sensor 1) may still become active after the engine starts, but the air/fuel feedback does not start normally and the emissions deteriorate. When the A/F sensor (sensor 1) output is out of the normal area, and this condition continues after the A/F sensor (sensor 1) is active, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	7.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

A malfunction is detected when the rear A/F sensor (bank 1, sensor 1) output voltage is 4.64 V or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Air/fuel ratio feedback is started while idling, hold for at least 7 seconds.

Deteriorated response

The air/fuel ratio (A/F) sensor (sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the A/F sensor (sensor 1) output voltage and uses fuel feedback control to improve exhaust emissions. The PCM compares the response characteristics against the A/F sensor (sensor 1) output. If the total A/F sensor (sensor 1) output is a specified value for a specified time, the PCM detects a deteriorated response and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	9.0 seconds or more

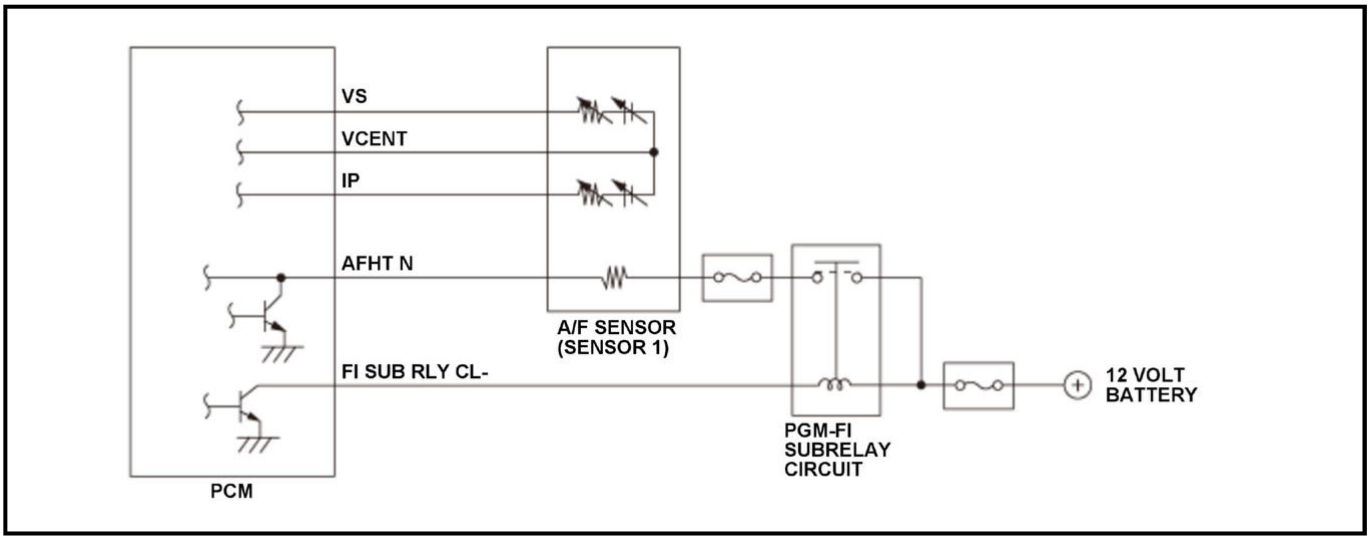
DTC P0135 (1.5 L ENGINE)

DTC P0135: Air/Fuel Ratio (A/F) Sensor (Sensor 1) Heater Circuit Malfunction

General Description



A heater for the sensor element is embedded in the air/fuel ratio (A/F) sensor (sensor 1), and it is controlled by the powertrain control module (PCM). It is activated and heats the sensor to stabilize and speed up the detection of oxygen content when the exhaust gas temperature is cold. The PCM monitors the A/F sensor (sensor 1) heater output (return check). If the return signals do not meet the command value (for heater activation) for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	9.0 V	-
State of the engine	Running	
Other	During A/F sensor (sensor 1) heater operation	

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions must be met for at least 5 seconds:

- No return signal HIGH is detected when the PCM output duty is less than 5 %.
- Return signal does not change when the PCM output duty 5 %* or more.

*: PCM output duty is limited to 95 % when it exceeds 95 %.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) AFHT N line open
- A/F sensor (sensor 1) AFHT N line short to ground
- A/F sensor (sensor 1) failure
- Electronic throttle control system (ETCS) control relay failure (includes fuse blown)

Confirmation Procedure

Operating Condition

Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

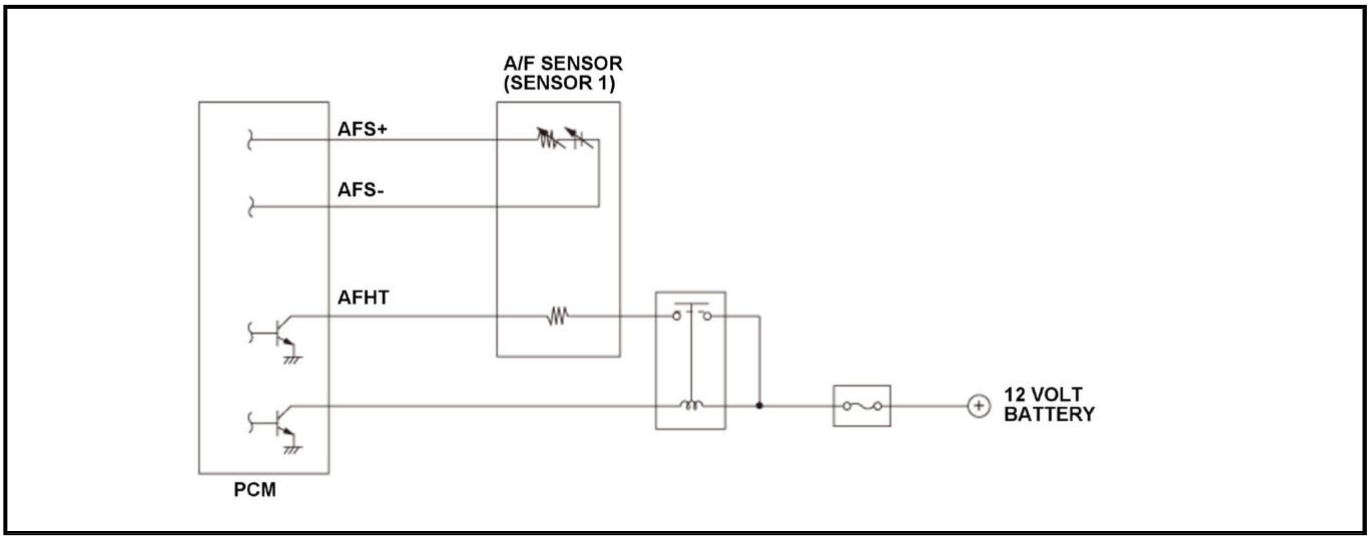
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0135 (2.4 L ENGINE) (2017 2018 2019)

DTC P0135: Air Fuel Ratio (A/F) Sensor (Sensor 1) Heater Circuit Malfunction

General Description



A heater for the sensor element is embedded in the air/fuel ratio (A/F) sensor (sensor 1), and it is controlled by the powertrain control module (PCM). It is activated and heats the sensor to stabilize and speed up the detection of oxygen content when the exhaust gas temperature is cold. The PCM monitors the A/F sensor (sensor 1) heater output (return check). If the return signals do not meet the command value (for heater activation) for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	4 seconds or more*540 milliseconds or more**
DTC Type	Two drive cycles, MIL on

*: Case 1

**: Case 2

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	68 deg. F (20 deg. C)	-
12 volt battery voltage [BATTERY]	10.5 V	-
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

- Case 1

  The heater current is 0.8 A or less for at least 4 seconds while the heater is activated, and the heater current is 0.8 A or more for at least 4 seconds while the heater is not activated.

- Case 2

  The heater current is 15.2 A or more for at least 540 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) AFHT line open
- A/F sensor (sensor 1) AFHT line short to ground
- A/F sensor (sensor 1) power supply line open
- PGM-FI subrelay power supply line open
- A/F sensor (sensor 1) failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

With the HDS

None.

Diagnosis Details

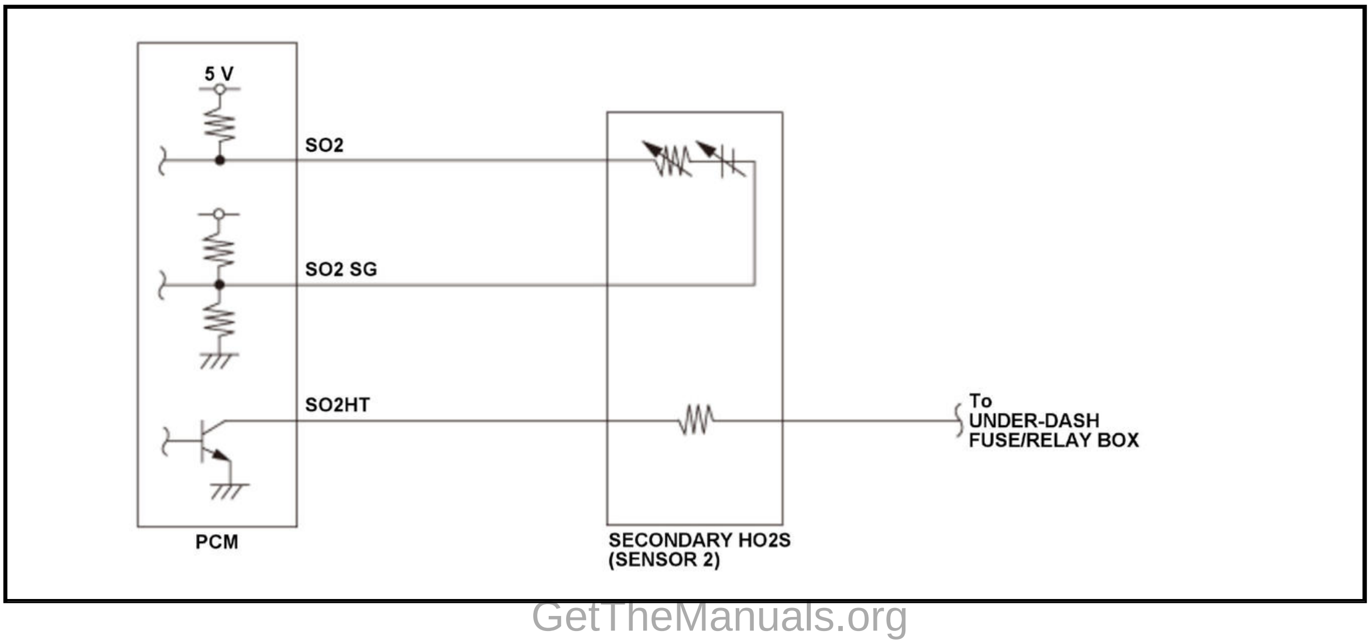
DTC P0137 (1.5 L ENGINE)

DTC P0137: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Circuit Low Voltage

General Description



The secondary heated oxygen sensor (secondary HO2S (sensor 2)) detects the oxygen density in the exhaust gas and converts it into electrical signals. If the secondary HO2S (sensor 2) output voltage is a specified value for a set time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running
Other	At least 55 seconds must be passed after the secondary HO2S (sensor 2) output voltage reaches 1.0 V or less

Malfunction Threshold

The secondary HO2S (sensor 2) output voltage [HO2S S2] is less than 0.17 V for at least 5 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) SO2 line short to ground
- Secondary HO2S (sensor 2) SO2 SG line short to ground
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

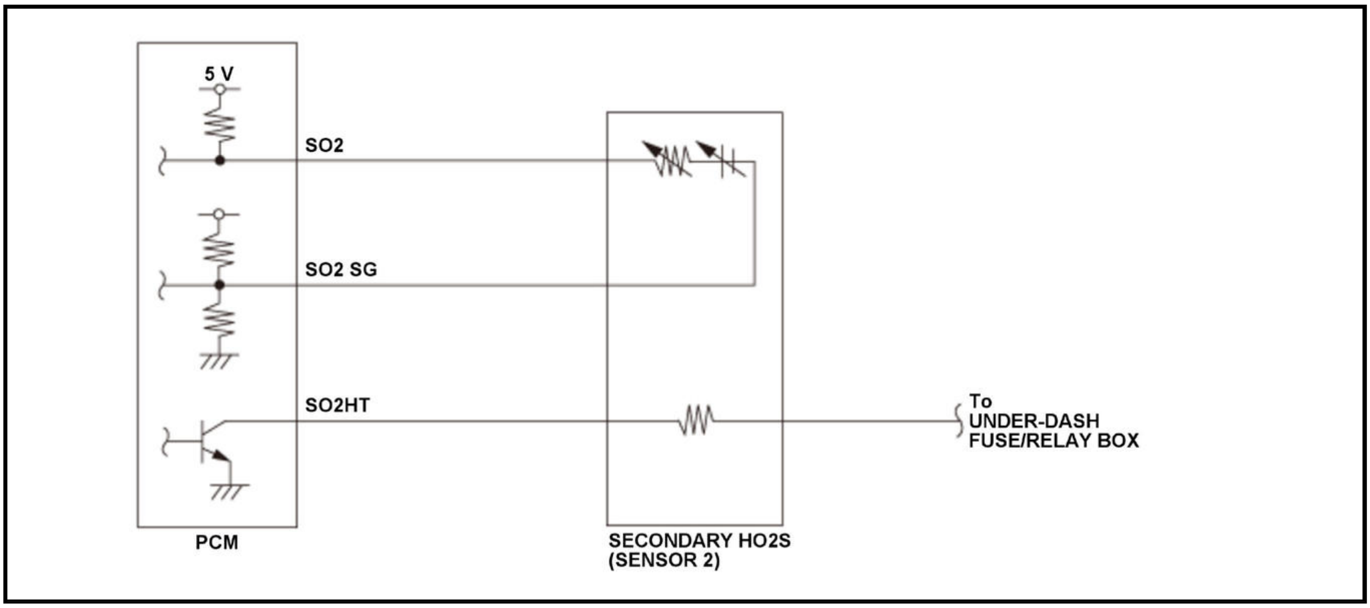
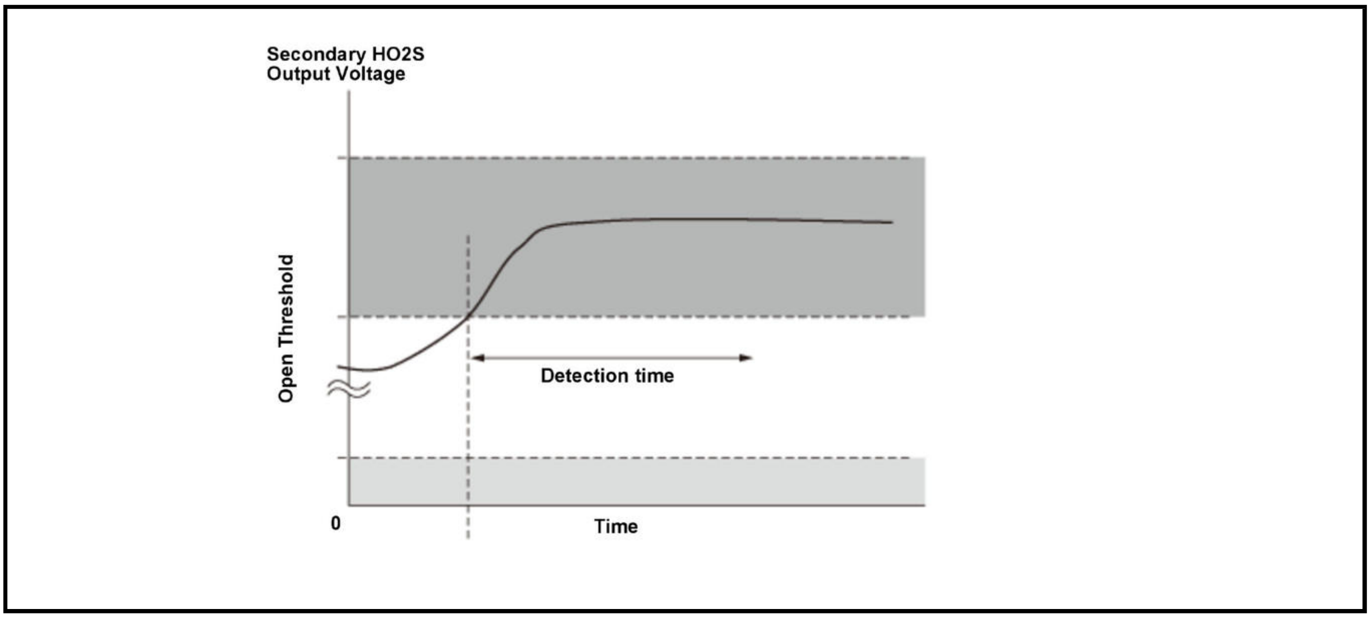
DTC P0138 (1.5 L ENGINE) (2017)

DTC P0138: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Circuit High Voltage

General Description





The secondary heated oxygen sensor (secondary HO2S (sensor 2)) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control. The powertrain control module (PCM) controls the air/fuel ratio from the air/fuel ratio (A/F) sensor (sensor 1) output voltage to optimize the TWC efficiency. When power is applied to the secondary HO2S (sensor 2) heater, if the secondary HO2S (sensor 2) output continues to exceed the upper limit used during feedback control, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time that secondary HO2S activity is not monitored after starting the engine	15 seconds	-
Fuel feedback	Closed loop	

Malfunction Threshold

The secondary HO2S (sensor 2) output voltage [HO2S S2] is 1.27 V or more for at least 5 seconds.

[ ]: HDS Parameter

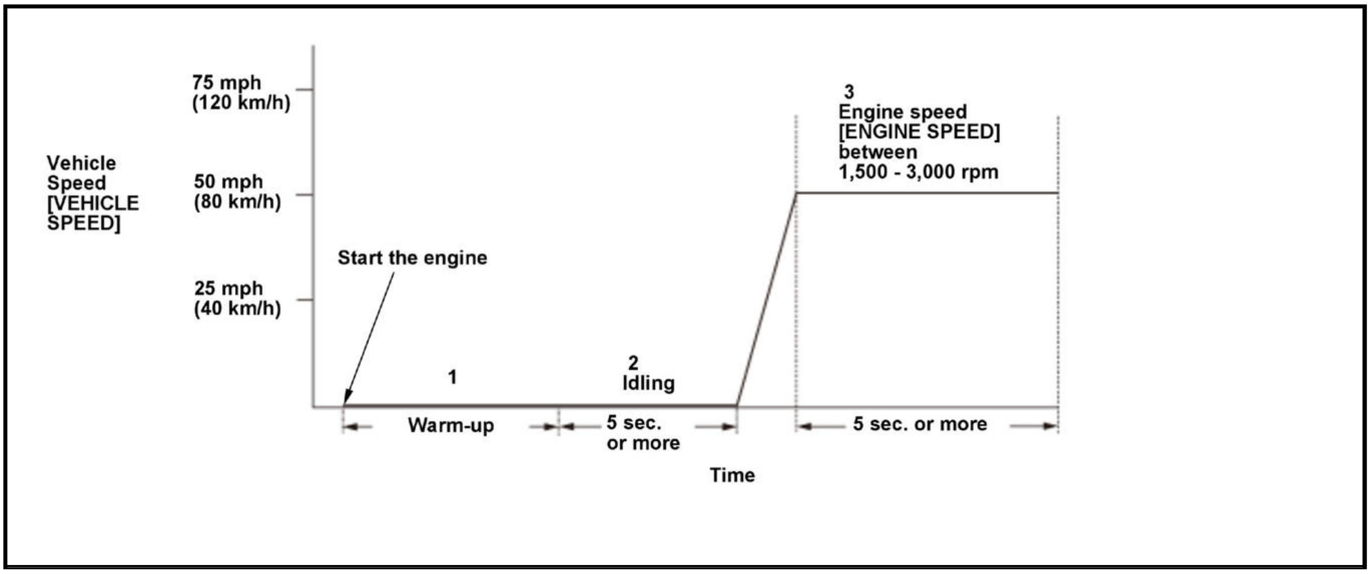
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) internal circuit failure
- Secondary HO2S (sensor 2) output rich side stuck

Confirmation Procedure

Operating Condition



- Start the engine, and let it idle until the radiator fan comes on.
- Let the engine idle for at least 5 seconds.
- When the diagnosis does not finish at idle, drive immediately at a steady engine speed [ENGINE SPEED] between 1, 500 - 3, 000 rpm for at least 5 seconds.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 3.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

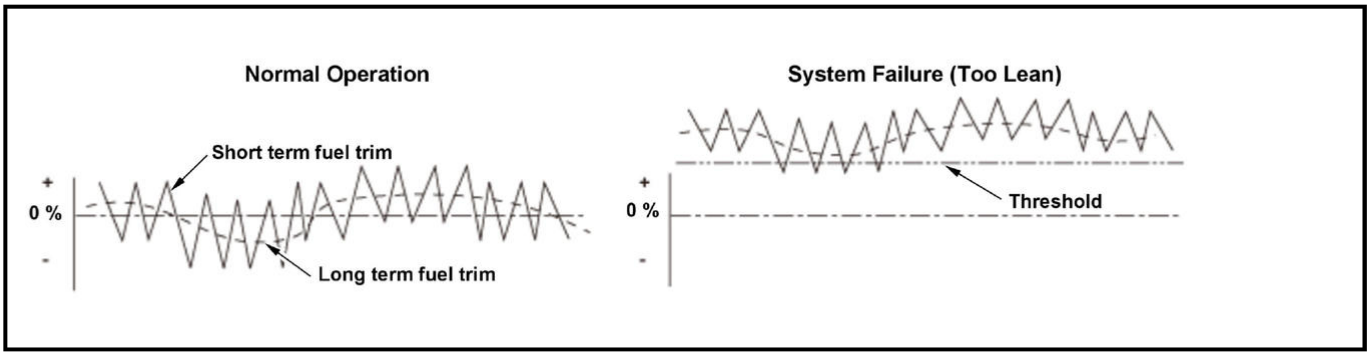
DTC P0171 (1.5 L ENGINE)

DTC P0171: Fuel System Too Lean

General Description



The powertrain control module (PCM) detects the oxygen content in the exhaust gas from the air/fuel ratio (A/F) sensor (sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions. Long term fuel trim is computed from short term fuel trim and is used to regulate long term deviation from the stoichiometric air/fuel ratio, which occurs when fuel metering components deteriorate with age or system failures occur. In addition, long term fuel trim is stored in the PCM memory and is used to determine when fuel metering components malfunction. When long term fuel trim is higher than normal, which is about 1 (0 %), the amount of injected fuel must be increased, and when lower than normal, it must be decreased. If long term fuel trim is normal (too lean) or more, the PCM detects a malfunction in the fuel metering components and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle*
Sequence	None
Duration	Every 3.0 seconds
DTC Type	Two drive cycles, MIL on

*: The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT Sensor (1)]	18 deg. F (-7.6 deg. C)	-
Engine speed [ENGINE SPEED]	530 rpm	4, 000 rpm
MAP value [MAP SENSOR]	16 kPa (120 mmHg, 4.8 inHg)	-
Fuel feedback	Closed loop	
Monitoring priority	P0133, P0420	

[ ]: HDS Parameter

Malfunction Threshold

Long term fuel trim is 1.33 (+33 %) or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel pump failure
- Fuel injector failure
- Fuel pressure regulator failure
- Fuel line failure
- Fuel supply system failure
- Mass air flow (MAF) sensor range/performance problem
- Manifold absolute pressure (MAP) sensor range/performance problem
- A/F sensor (sensor 1) failure
- Secondary HO2S (sensor 2) failure
- Vacuum hose mis installed
- Throttle body air leak
- Intake manifold air leak
- EVAP canister purge valve failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

- Drive at a steady speed between 15 - 75 mph (25 - 120 km/h) for at least 15 minutes, and watch the long term fuel trim. If the long term fuel trim stays at about 1, the vehicle is OK or it is a very minor problem. If a significant fault is still present, the long term fuel trim will move up or down while driving.
- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- After clearing the DTC by disconnecting the 12 volt battery or using the scan tool, drive at steady speed between 15 - 55 mph (25 - 88 km/h) for at least 40 minutes to allow time for long term fuel trim to recover.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

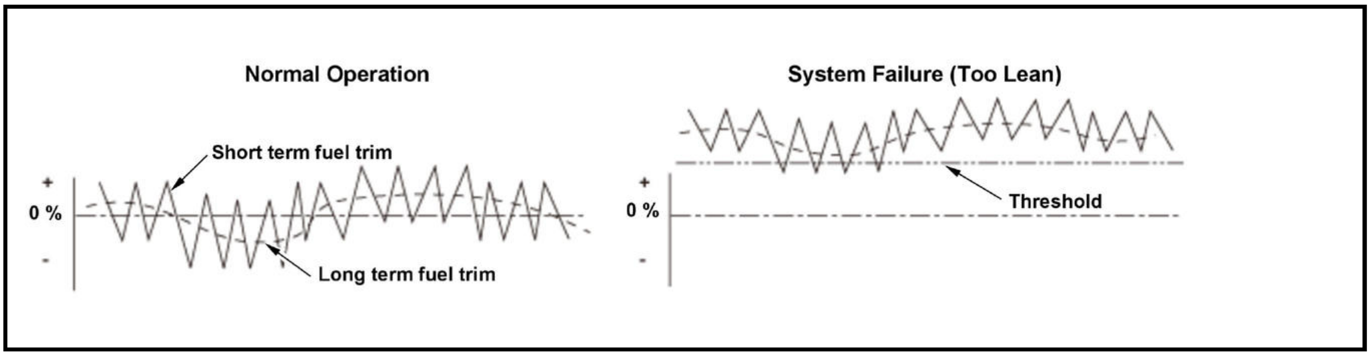
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0171 (2.4 L ENGINE) (2017 2018 2019)

DTC P0171: Fuel System Too Lean

General Description



The powertrain control module (PCM) detects the oxygen content in the exhaust gas from the air/fuel ratio (A/F) sensor (sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions. Long term fuel trim is computed from short term fuel trim and is used to regulate long term deviation from the stoichiometric air/fuel ratio, which occurs when fuel metering components deteriorate with age or system failures occur. In addition, long term fuel trim is stored in the PCM memory and is used to determine when fuel metering components malfunction. When long term fuel trim is higher than normal, which is about 1 (0 %), the amount of injected fuel must be increased, and when lower than normal, it must be decreased. If long term fuel trim is normal (too lean) or more, the PCM detects a malfunction in the fuel metering components and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle*
Sequence	None
Duration	Every 3.0 seconds
DTC Type	Two drive cycles, MIL on

*: The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT Sensor (1)]	19 deg. F (-7 deg. C)	-
Engine speed [ENGINE SPEED]	500 rpm	4, 000 rpm
MAP value [MAP SENSOR]	16 kPa (120 mmHg, 4.8 inHg)	-
Fuel feedback	Closed loop	
Monitoring priority	P0133, P0420	

[ ]: HDS Parameter

Malfunction Threshold

Long term fuel trim is 1.33 (+33 %) or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel pump failure
- Injector failure
- Fuel pressure regulator failure
- Fuel line failure
- Fuel supply system failure
- Mass airflow (MAF) sensor range/performance problem
- Manifold absolute pressure (MAP) sensor range/performance problem
- A/F sensor (sensor 1) failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive at a steady speed between 15 - 75 mph (25 - 120 km/h) for at least 15 minutes, and watch the long term fuel trim. If the long term fuel trim stays at about 1, the vehicle is OK or it is a very minor problem. If a significant fault is still present, the long term fuel trim will move up or down while driving.
- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- After clearing the DTC by disconnecting the 12 volt battery or using the scan tool, drive at steady speed between 15 - 55 mph (25 - 88 km/h) for at least 40 minutes to allow time for long term fuel trim to

recover.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

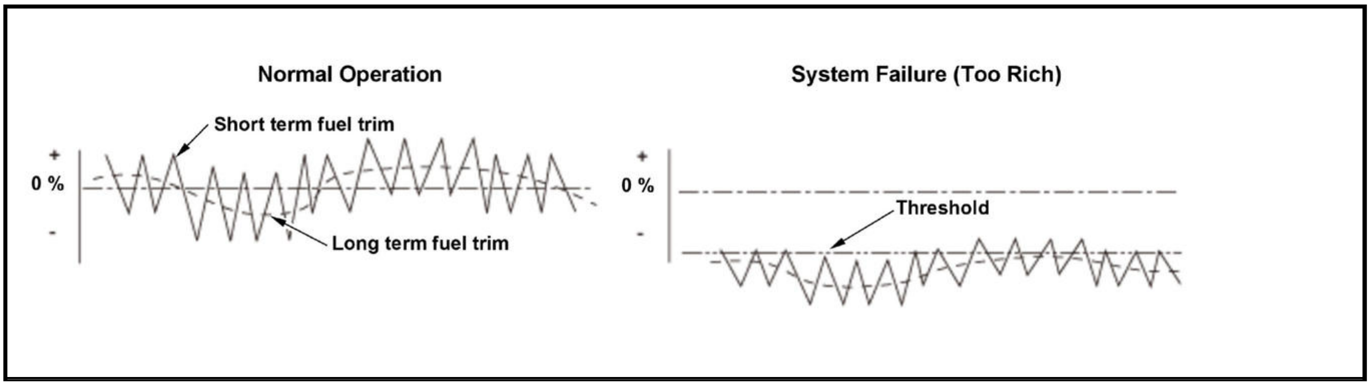
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0172 (1.5 L ENGINE)

DTC P0172: Fuel System Too Rich

General Description



The powertrain control module (PCM) detects the oxygen content in the exhaust gas from the air/fuel ratio (A/F) sensor (sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions. Long term fuel trim is computed from short term fuel trim and is used to regulate long term deviation from the stoichiometric air/fuel ratio, which occurs when fuel metering components deteriorate with age or system failures occur. In addition, long term fuel trim is stored in the PCM memory and is used to determine when fuel metering components malfunction. When long term fuel trim is higher than normal, which is about 1 (0 %), the amount of injected fuel must be increased, and when lower than normal, it must be decreased. If long term fuel trim is normal (too rich) or less, the PCM detects a malfunction in the fuel metering components and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle*
Sequence	None
Duration	20 seconds or more

DTC Type	Two drive cycles, MIL on

*: The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT Sensor (1)]	18 deg. F (-7.6 deg. C)	-
Engine speed [ENGINE SPEED]	530 rpm	4, 000 rpm
MAP value [MAP SENSOR]	16 kPa (120 mmHg, 4.8 inHg)	-
Fuel feedback	Closed loop	
Monitoring priority	P0133, P0420	

[ ]: HDS Parameter

Malfunction Threshold

Long term fuel trim is 0.79 (-21 %) or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel pump failure
- Fuel injector failure
- Fuel pressure regulator failure
- Fuel line failure
- Fuel supply system failure
- Mass air flow (MAF) sensor range/performance problem
- Manifold absolute pressure (MAP) sensor range/performance problem
- A/F sensor (sensor 1) failure
- Secondary HO2S (sensor 2) failure
- Vacuum hose mis installed
- Throttle body air leak
- Intake manifold air leak
- EVAP canister purge valve failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive at a steady speed between 15 - 75 mph (25 - 120 km/h) for at least 15 minutes, and watch the long term fuel trim. If the long term fuel trim stays at about 1.0, the vehicle is OK or it is a very minor problem. If a significant fault is still present, the long term fuel trim will move up or down while driving.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.

- After clearing the DTC by disconnecting the 12 volt battery or using the scan tool, drive at steady speed between 15 - 55 mph (25 - 88 km/h) for at least 40 minutes to allow time for long term fuel trim to recover.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

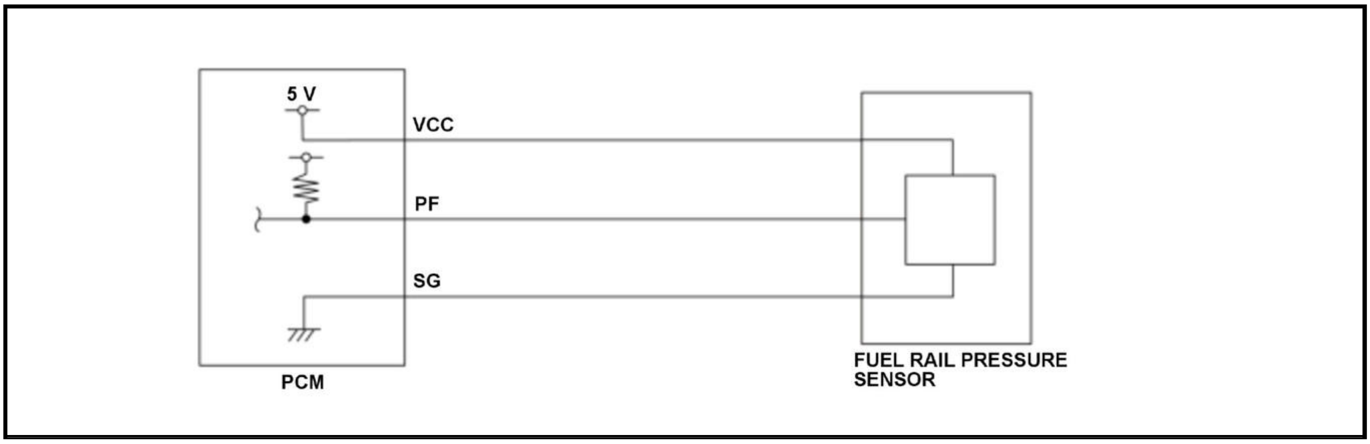
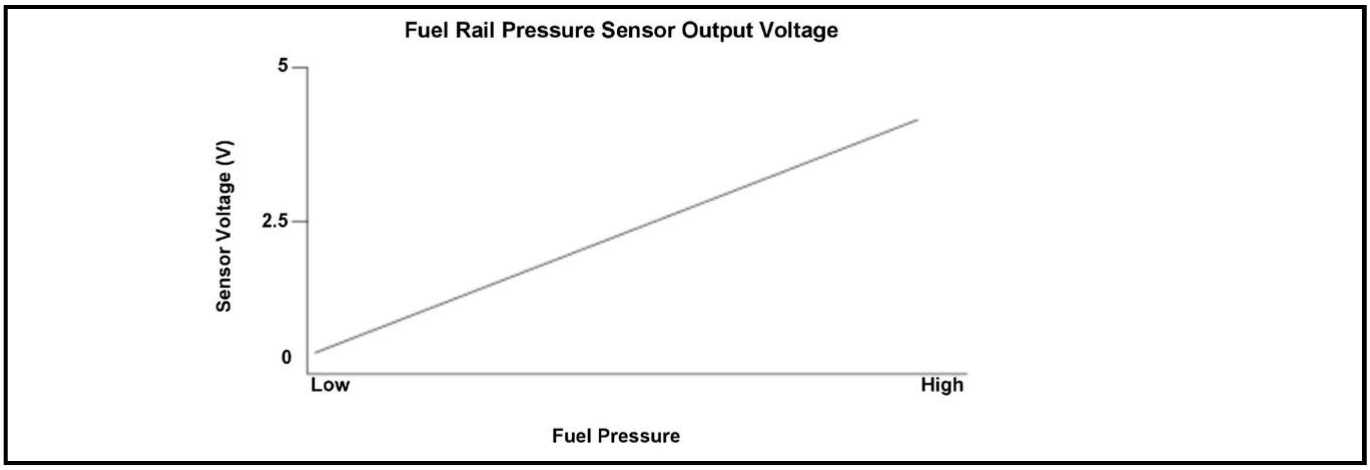
DTC P0191 (2.4 L ENGINE) (2018 2019)

DTC P0191: Fuel Rail Pressure Sensor Out of Range

General Description





The fuel rail pressure sensor senses fuel pressure and converts it into electrical signals. The powertrain control module (PCM) adjusts to a specified fuel pressure by controlling the high pressure fuel pump solenoid based on the fuel rail pressure sensor output signal. The fuel rail pressure sensor outputs low signal voltage at low fuel pressure and high signal voltage at high fuel pressure. If the fuel rail pressure sensor output voltage is out of a specified range for predetermined time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The fuel rail pressure sensor output voltage [FUEL PRESSURE CONVERTED FROM PF SENSOR] is 0.22 V or less, or 4.89 V or more for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel rail pressure sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

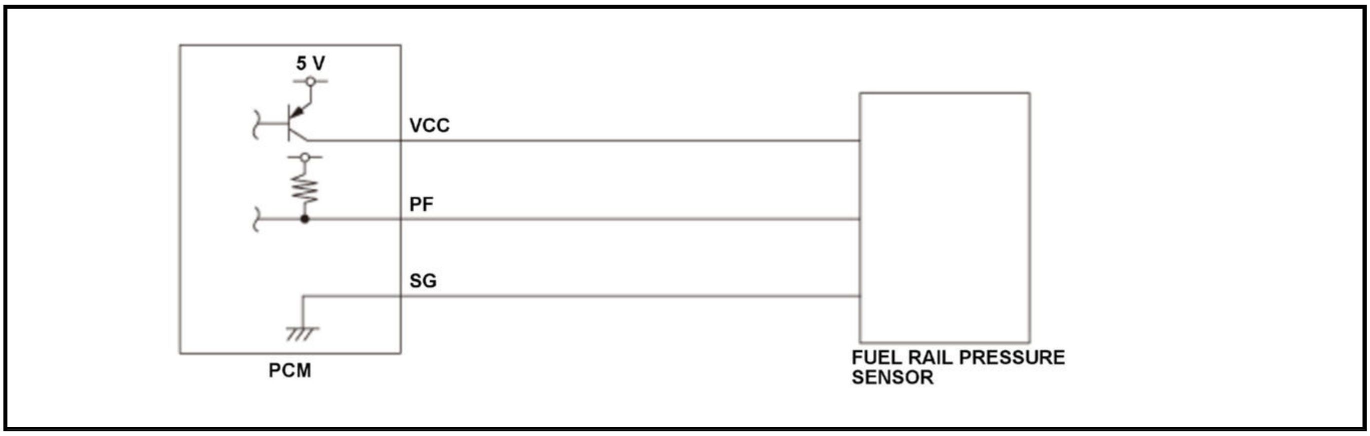
Conditions for clearing the DTC

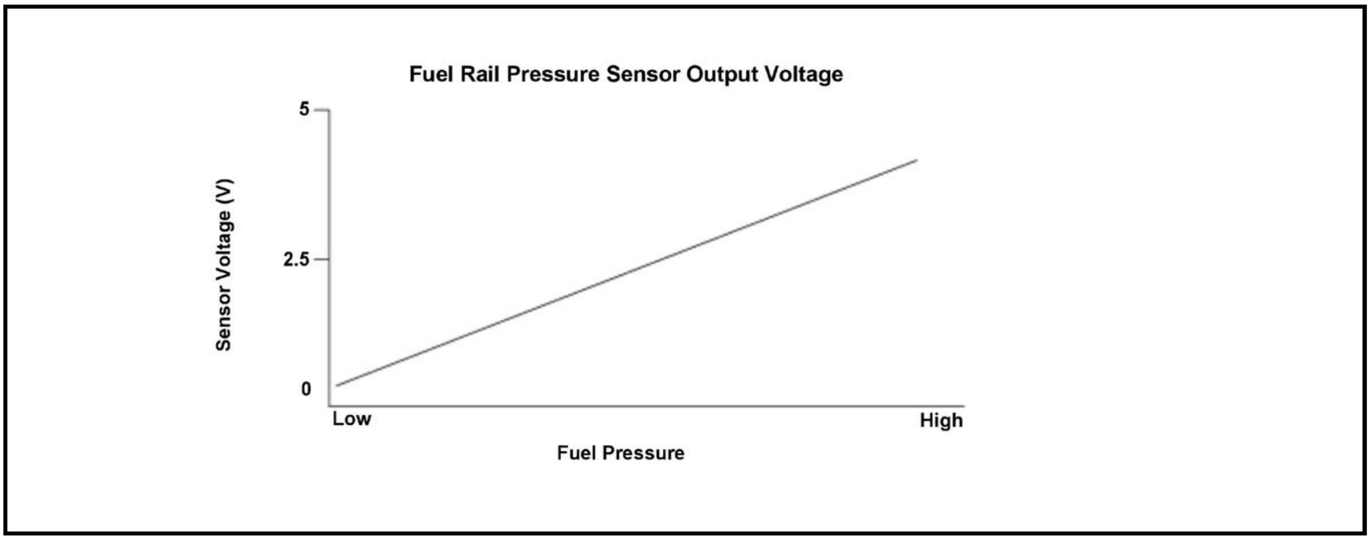
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command.

DTC P0192, P0193 (1.5 L ENGINE)

DTC P0192: Fuel Rail Pressure Sensor Circuit Low Voltage **DTC P0193:** Fuel Rail Pressure Sensor Circuit High Voltage

General Description





The fuel rail pressure sensor senses fuel pressure and converts it into electrical signals. The powertrain control module (PCM) adjusts to a specified fuel pressure by controlling the high pressure fuel pump solenoid based on the fuel rail pressure sensor output signal. The fuel rail pressure sensor outputs low signal voltage at low fuel pressure and high signal voltage at high fuel pressure. If the fuel rail pressure sensor output voltage is out of a specified range for predetermined time, the PCM detects a malfunction and stores a DTC.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

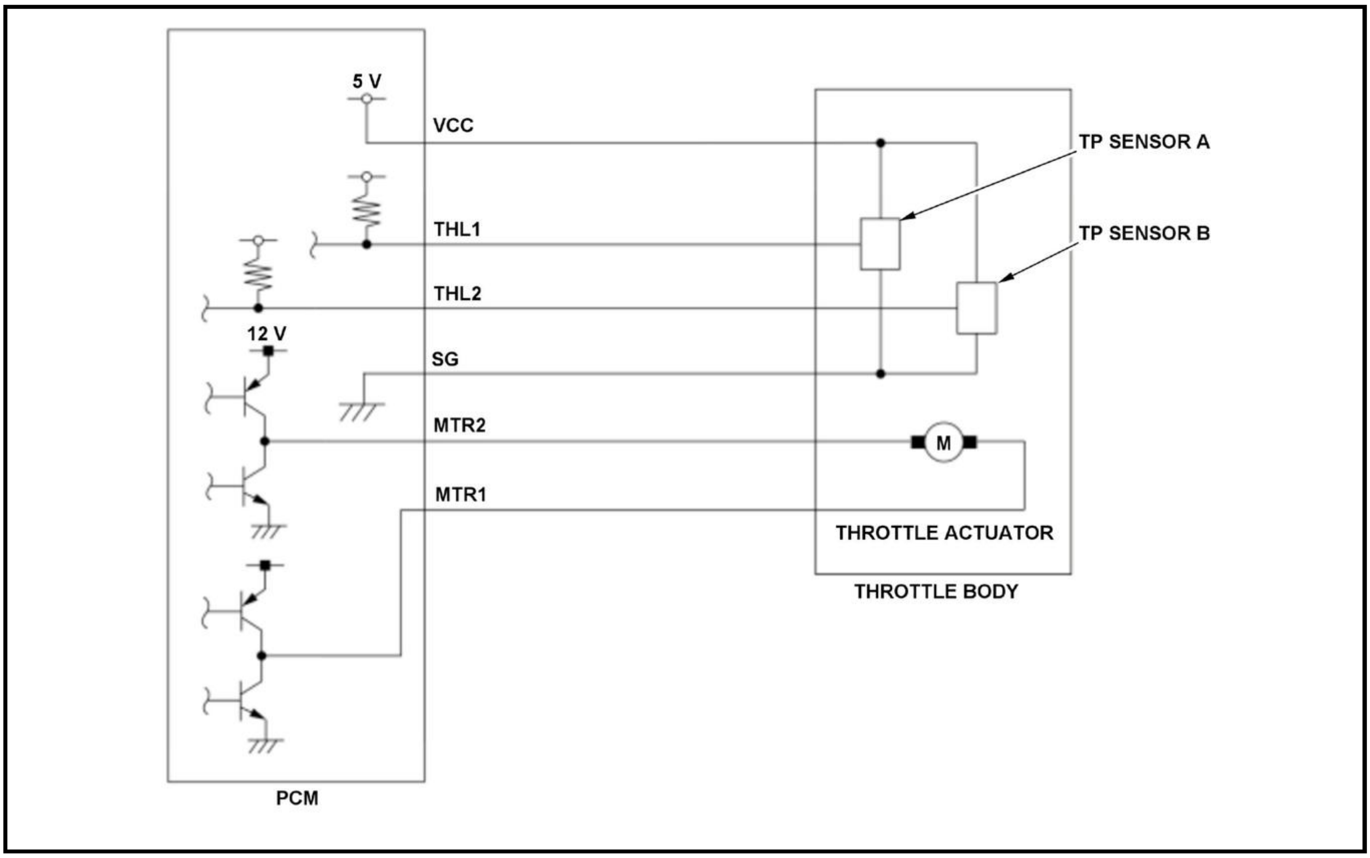
DTC P0221 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P0221: Throttle Position (TP) Sensor B Out of Range

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). TP sensor B is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position. The throttle valve position signal from TP sensor B is transmitted to the PCM for target position feedback control. If the signal from TP sensor B is a fixed value for a set time, the PCM detects a TP sensor B malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The TP sensor B output voltage [TP SENSOR B] is 0.48 V or less, or 4.61 V or more for at least 6.0 seconds.

Duration	6.0 seconds or more

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The TP sensor B output voltage [TP SENSOR B] is 1.24 V or less, or 4.73 V or more for at least 6.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle body internal failure (TP sensor B)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

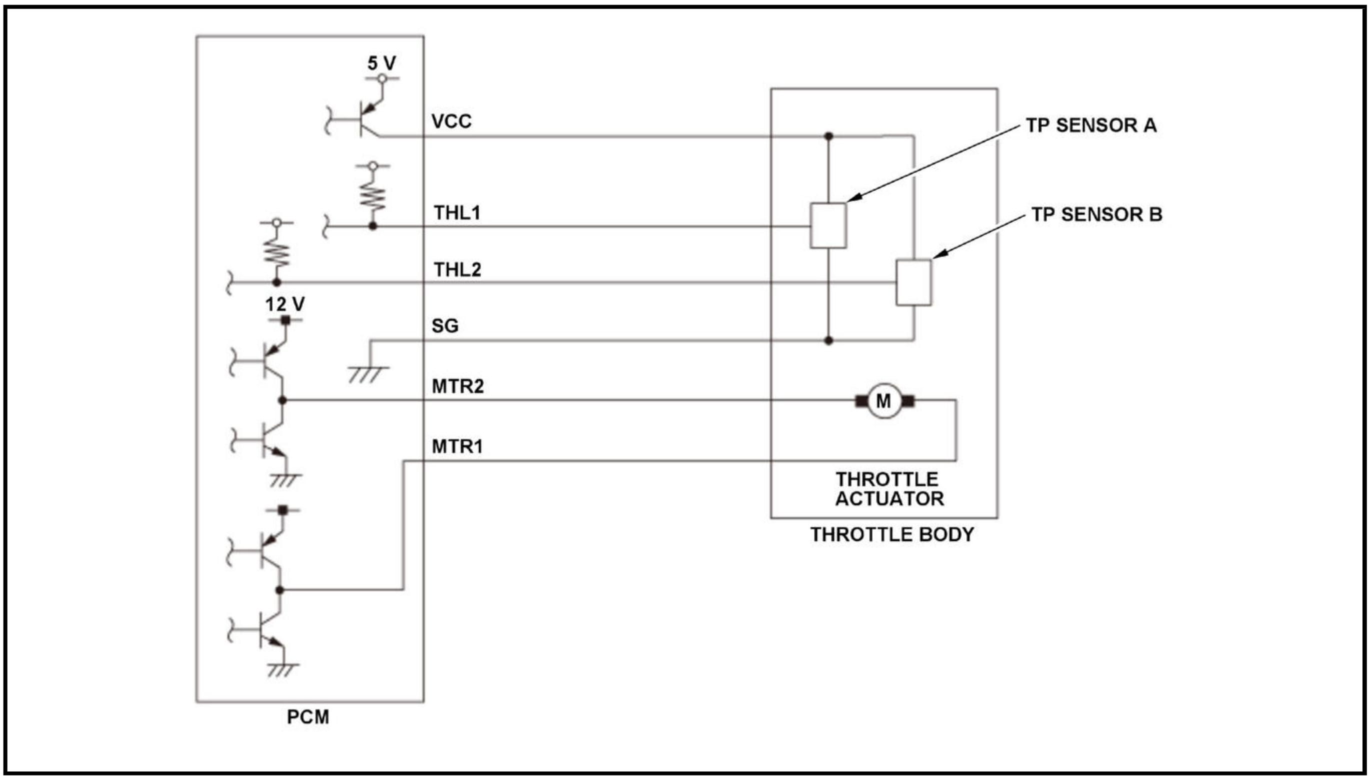
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0222, P0223 (1.5 L ENGINE)

DTC P0222: Throttle Position (TP) Sensor B Circuit Low Voltage **DTC P0223:** Throttle Position (TP) Sensor B Circuit High Voltage

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). TP sensor B is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position. The throttle valve position signal from TP sensor B is transmitted to the PCM for target position feedback control. If the signal from TP sensor B is a fixed value for a set time, the PCM detects a TP sensor B malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P0222

The TP sensor B output voltage [TP SENSOR B] is 0.3 V or less for at least 200 milliseconds.

DTC: P0223

The TP sensor B output voltage [TP SENSOR B] is 4.8 V or more for at least 200 milliseconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0222

- TP sensor B THL2 line short to ground
- TP sensor B VCC line open

DTC: P0223

- TP sensor B THL2 line open
- TP sensor B SG line open

Common

- TP sensor B failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

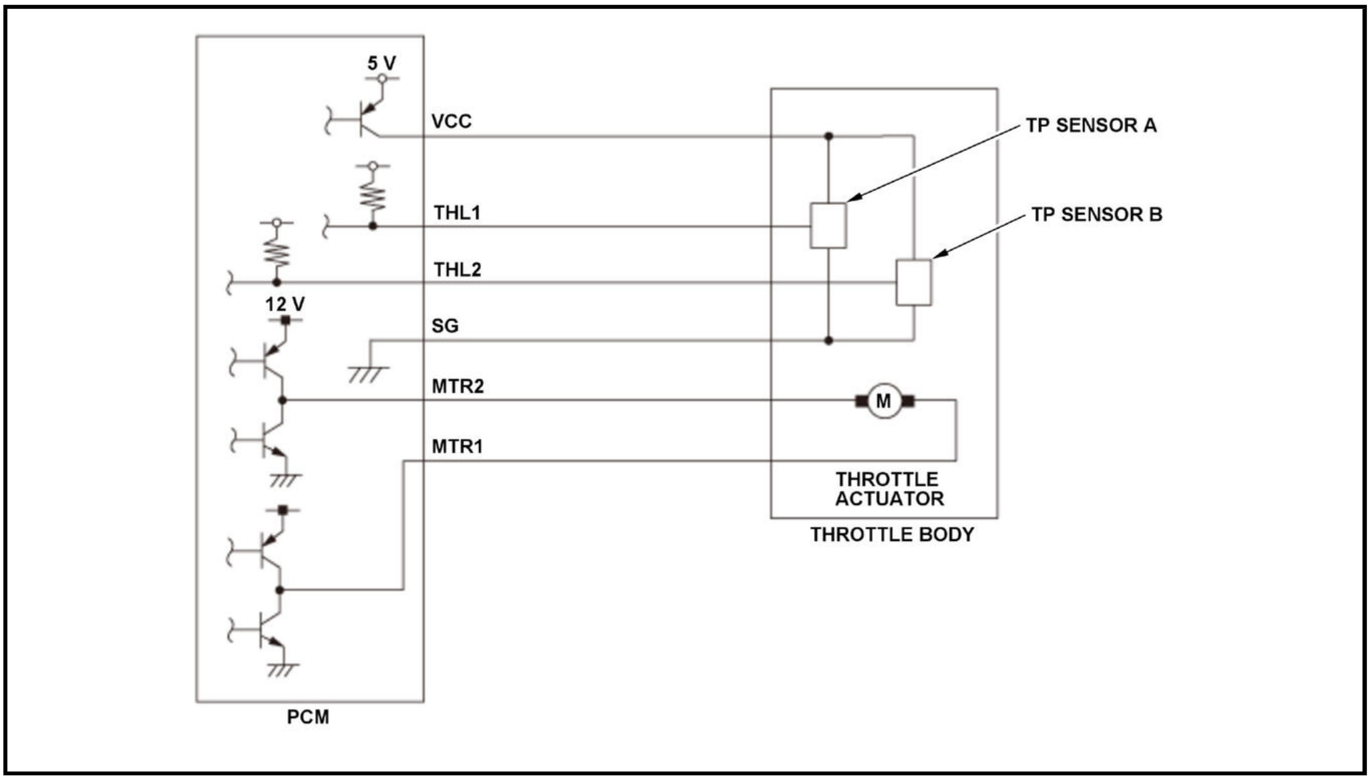
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0222, P0223 (2.4 L ENGINE) (2017 2018 2019)

DTC P0222: Throttle Position (TP) Sensor B Circuit Low Voltage **DTC P0223:** Throttle Position (TP) Sensor B Circuit High Voltage

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). TP sensor B is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position. The throttle valve position signal from TP sensor B is transmitted to the PCM for target position feedback control. If the signal from TP sensor B is a fixed value for a set time, the PCM detects a TP sensor B malfunction and stores a DTC.

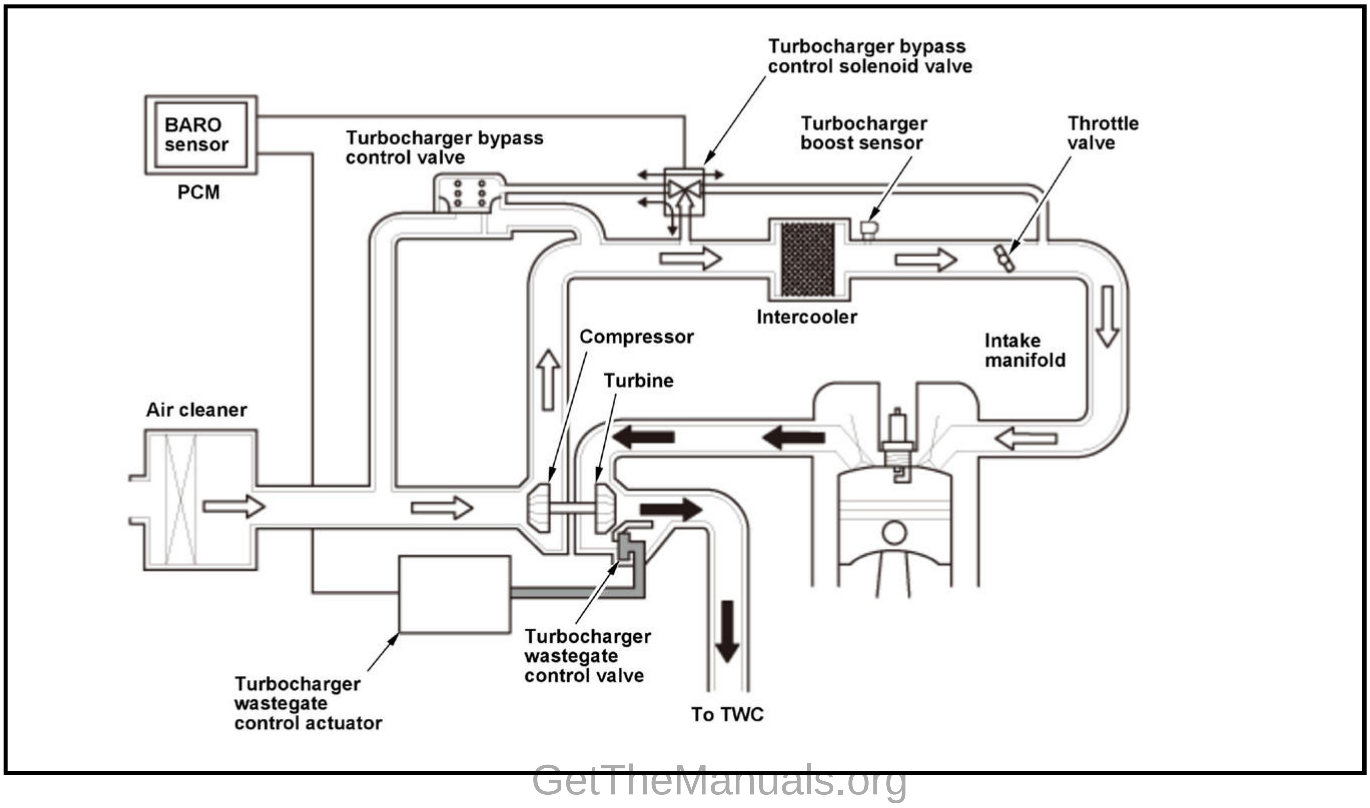
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

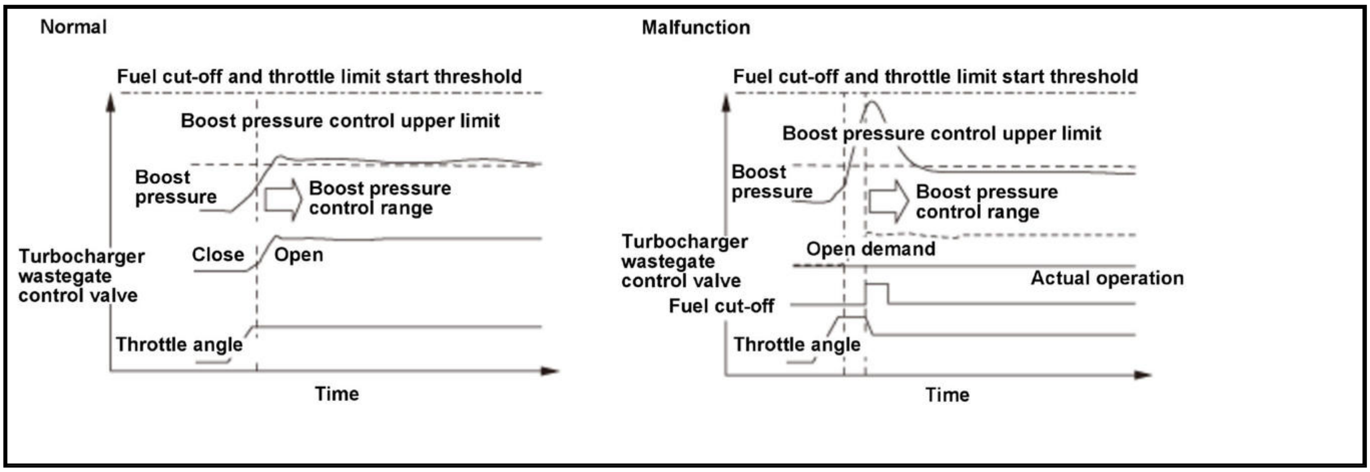
DTC P0234 (1.5 L ENGINE)

DTC P0234: Turbocharger Overboost Problem

General Description



Turbocharger bypass control solenoid valve
BARO sensor
PCM
Turbocharger bypass control valve
Turbocharger boost sensor
Throttle valve
Intercooler
Compressor
Turbine
Intake manifold
Air cleaner
Turbocharger wastegate control valve
Turbocharger wastegate control actuator
To TWC



The powertrain control module (PCM) controls the turbocharger boost pressure so that the boost pressure to the engine does not exceed the set upper pressure limit. When the boost pressure increases abnormally, a malfunction of the turbocharger control system is determined and fuel cut and throttle restriction control is done to protect the powertrain.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.0 second or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Engine speed [ENGINE SPEED]	1, 000 rpm	-
Other	No change of boost pressure upper limit	

[ ]: HDS Parameter

Malfunction Threshold

Either one of conditions is met for at least 1 second, and fuel cut-off is operated for engine protection.

- The boost pressure is 148 - 300 kPa (1, 109 - 2, 250 mmHg, 43.7 - 88.6 inHg) or more*
- The intake air pressure is 216 - 305 kPa (1, 614 - 2, 291 mmHg, 63.8 - 90.1 inHg) or more*

*: Varies with driving conditions.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes

- Turbocharger wastegate control valve stuck close failure
- Turbocharger wastegate control actuator stuck close failure
- Turbocharger wastegate control valve bypass clogged
- PCM internal circuit failure (BARO sensor)
- Turbocharger boost sensor internal failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive at engine speed [ENGINE SPEED] at 1, 200 rpm or more for at least 1 second.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

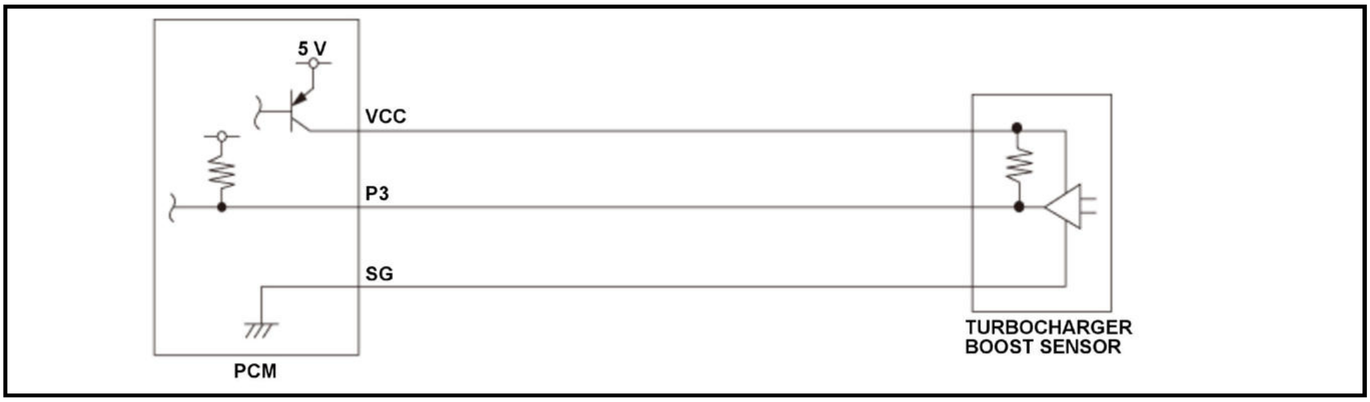
Conditions for clearing the DTC

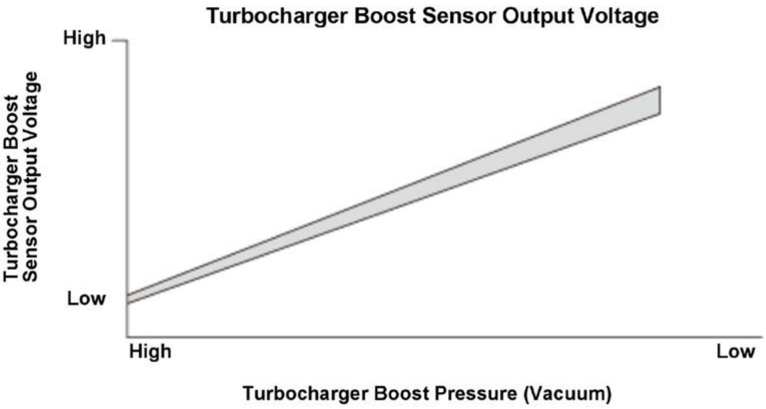
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0235 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P0235: Turbocharger Boost Sensor Out of Range

General Description





The turbocharger boost sensor senses turbocharger boost pressure (vacuum) and converts it into electrical signals. The turbocharger boost sensor outputs low signal voltage at high-vacuum (throttle valve closed) and high signal voltage at low-vacuum (throttle valve wide open). If the signal voltage from the turbocharger boost sensor is a set value, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The turbocharger boost sensor output voltage [TC BOOST PRESSURE SENSOR] is 0.37 V or less for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Turbocharger boost sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

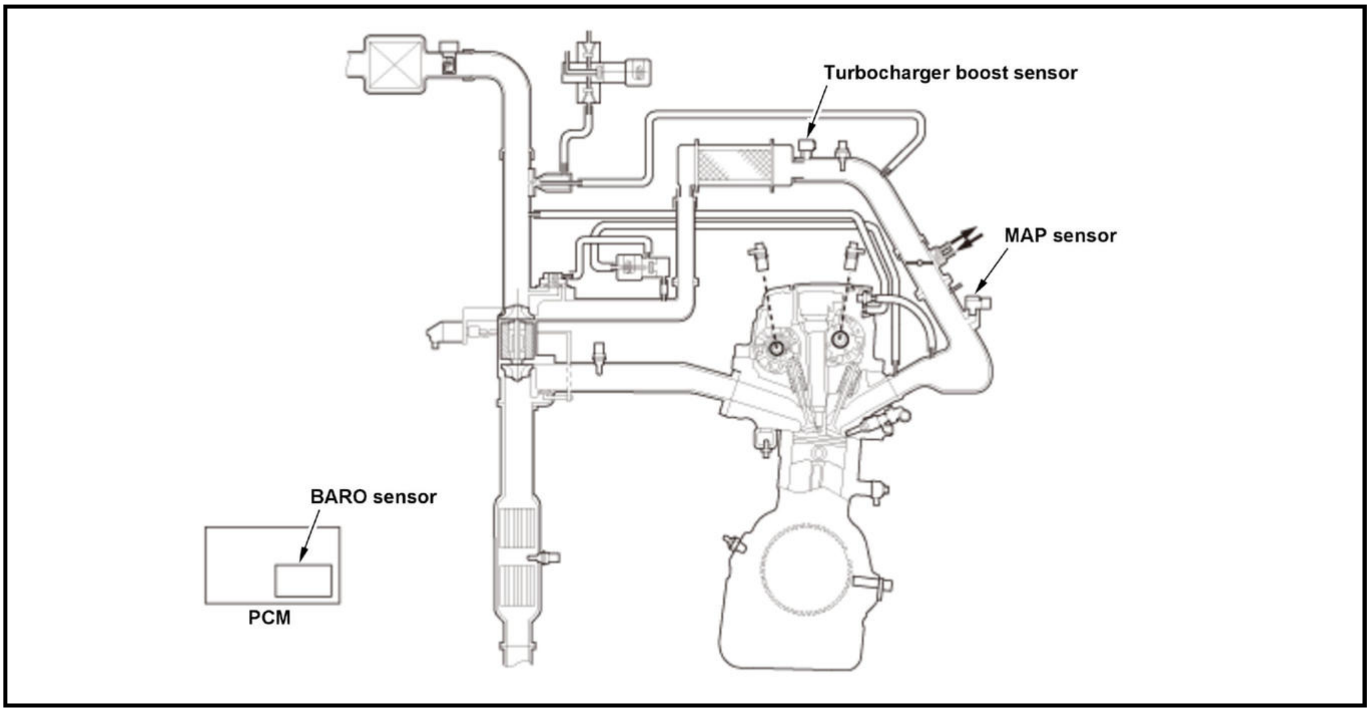
Conditions for clearing the DTC

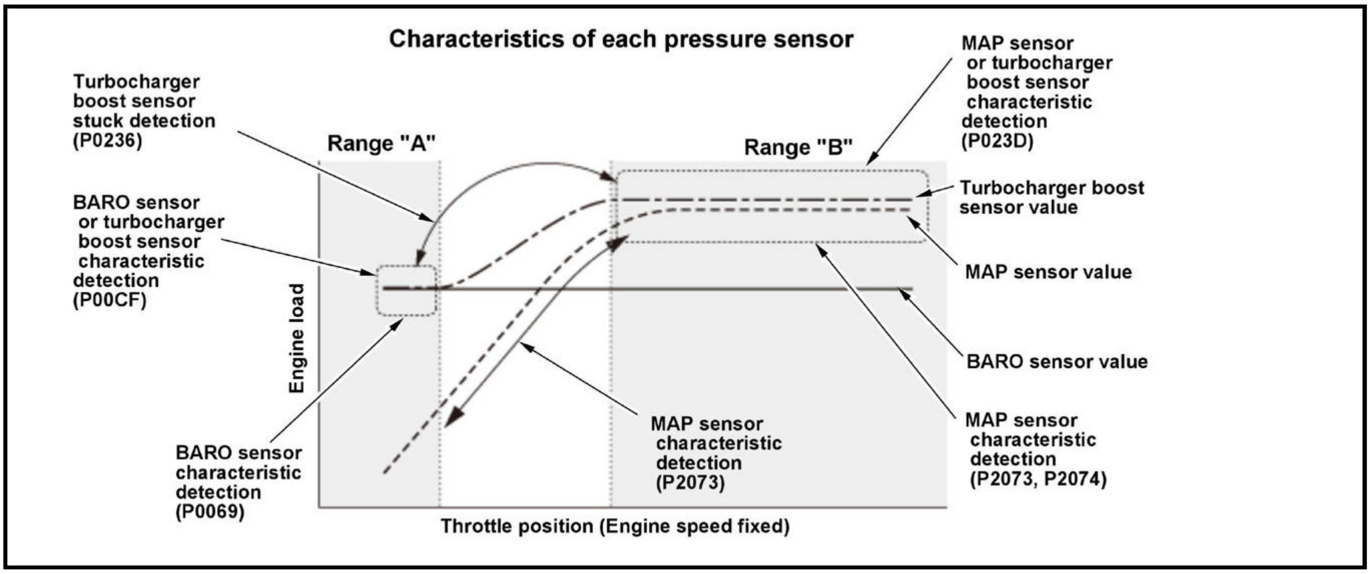
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0236 (1.5 L ENGINE)

DTC P0236: Turbocharger Boost Sensor Circuit Range/Performance Problem

General Description





The barometric pressure (BARO) sensor, the manifold absolute pressure (MAP) sensor, and the turbocharger boost sensor are equipped to the vehicle to detect air pressure conditions to the engine. The BARO sensor value and the turbocharger boost sensor value shows similar value at range "A" such as in idle conditions, and the turbocharger boost sensor value and MAP sensor value shows similar value at range "B" such as in high throttle position.

Malfunction determinations are done by the powertrain control module (PCM) in two ranges by comparing the pressure sensor values.

- At range "A": BARO sensor or turbocharger boost sensor is abnormal if the difference of the two pressure sensor values are specified or more (P00CF)

- At range "B": Turbocharger boost sensor or MAP sensor is abnormal if the difference of the two pressure sensor values are specified or more (P023D)
- Range "A" determined as abnormal and range "B" determined as normal: BARO sensor abnormal (P0069)
- Both ranges "A" and "B" determined as abnormal: Turbocharger boost sensor abnormal (P0236)
- Turbocharger boost sensor or MAP sensor values do not change when throttle position is transited from ranges "A" to "B": Determined as turbocharger boost sensor output stuck (P0236) or MAP sensor output stuck (P2073 or P2074)

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition		Minimum	Maximum
Elapsed time after starting the engine		3.0 seconds	-
Engine speed [ENGINE SPEED]		1, 700 rpm	-
Throttle position	2, 000 rpm	36.3 deg.	-
	4, 000 rpm	42.2 deg.	-
Intake air amount		-	7.0 g/second (0.24 oz/second)

[ ]: HDS Parameter

Malfunction Threshold

Both range "A" (P00CF) and range "B" (P023D) determinations must be completed. The PCM stores DTC P0236 if either conditions occur:

- Range "A" determination (P00CF) and range "B" determination (P023D) are determined as abnormal.
- The variation of the turbocharger boost sensor value measured during range "A" determination and range "B" determination is 0.7 kPa (5 mmHg, 0.2 inHg) or less when range "A" determination and range "B" determination are determined as normal and the difference of the BARO sensor value measured during range "A" determination and range "B" determination is 5.4 kPa (40 mmHg, 1.6 inHg) or less.

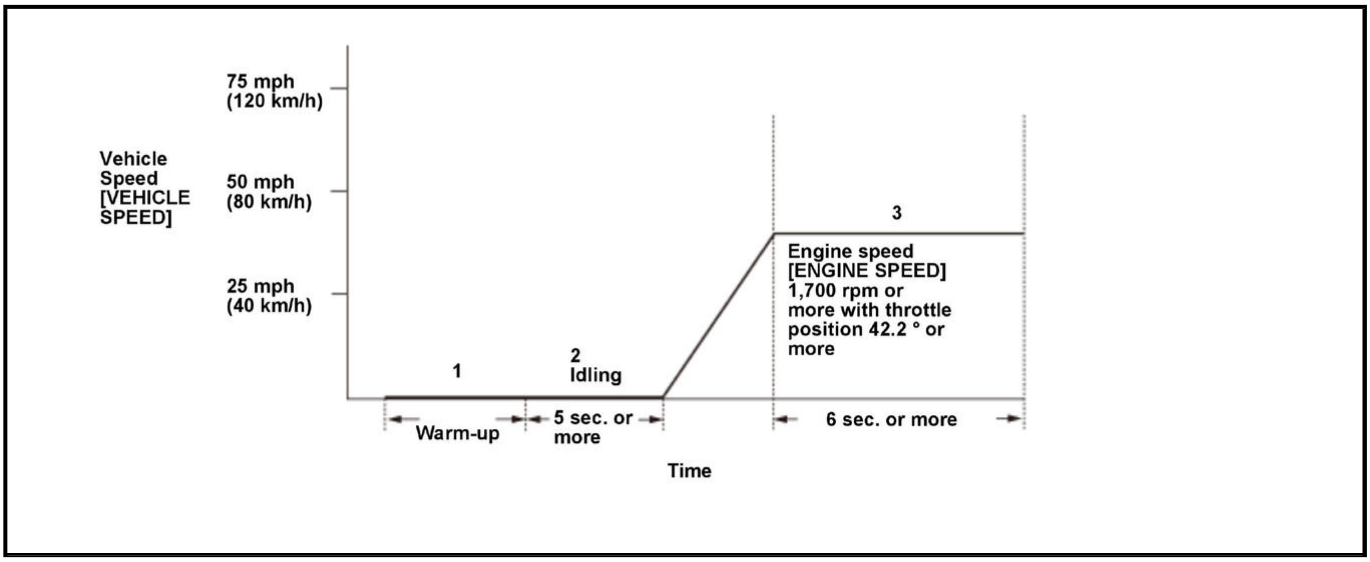
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Turbocharger boost sensor output range/performance problem
- Turbocharger boost sensor output stuck

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 5 seconds.
- Drive the vehicle at engine speed [ENGINE SPEED] 1, 700 rpm or more with throttle position 42.2 deg. or more for at least 6 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

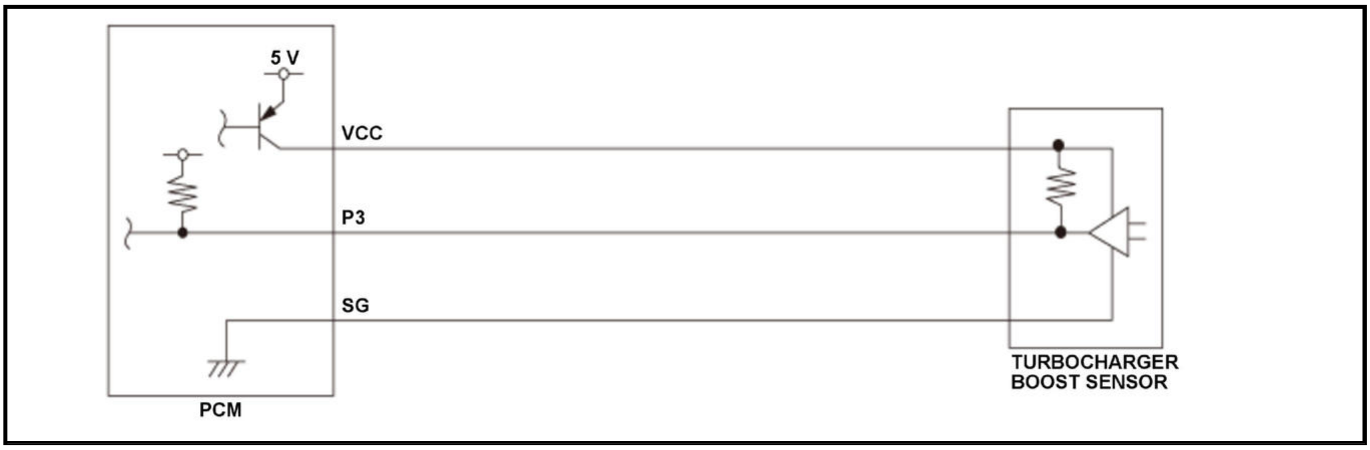
Conditions for clearing the DTC

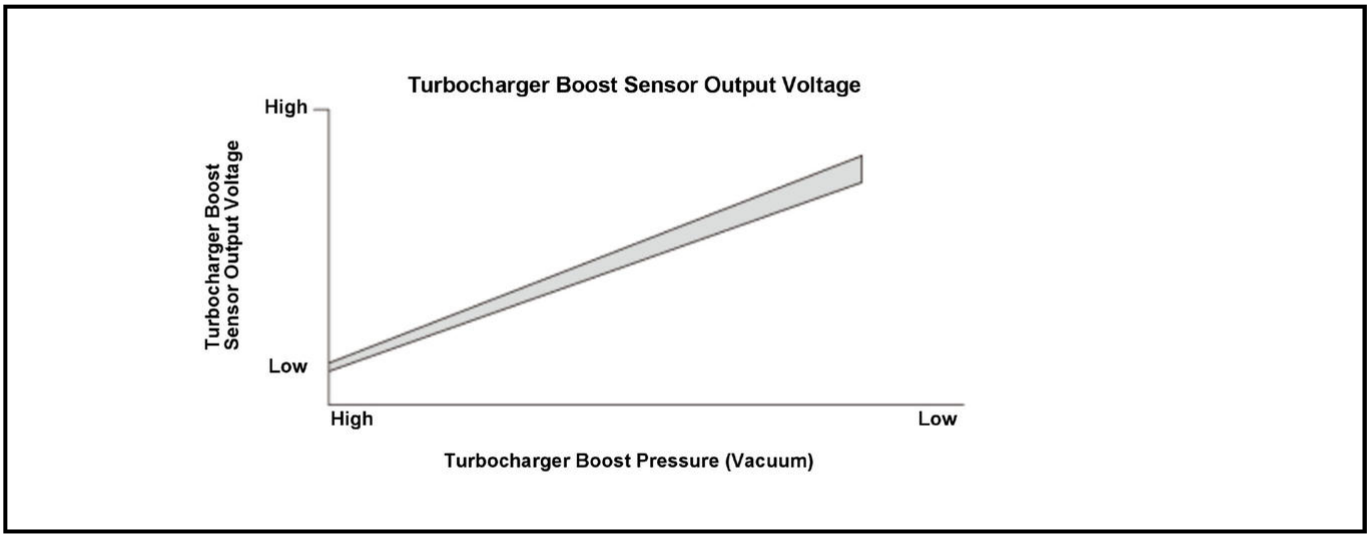
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0237, P0238 (1.5 L ENGINE)

DTC P0237: Turbocharger Boost Sensor Circuit Low Voltage **DTC P0238:** Turbocharger Boost Sensor Circuit High Voltage

General Description





The turbocharger boost sensor senses turbocharger boost pressure (vacuum) and converts it into electrical signals. The turbocharger boost sensor outputs low signal voltage at high-vacuum (throttle valve closed) and high signal voltage at low-vacuum (throttle valve wide open). If the signal voltage from the turbocharger boost sensor is a set value, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P0237

The turbocharger boost sensor output voltage [TC BOOST PRESSURE SENSOR] is 0.23 V or less for at least 2 seconds.

DTC: P0238

The turbocharger boost sensor output voltage [TC BOOST PRESSURE SENSOR] is 4.49 V or more for at least 2 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0237

- Turbocharger boost sensor P3 line short to ground
- Turbocharger boost sensor VCC line open

DTC: P0238

- Turbocharger boost sensor P3 line open
- Turbocharger boost sensor SG line open

Common

- Turbocharger boost sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

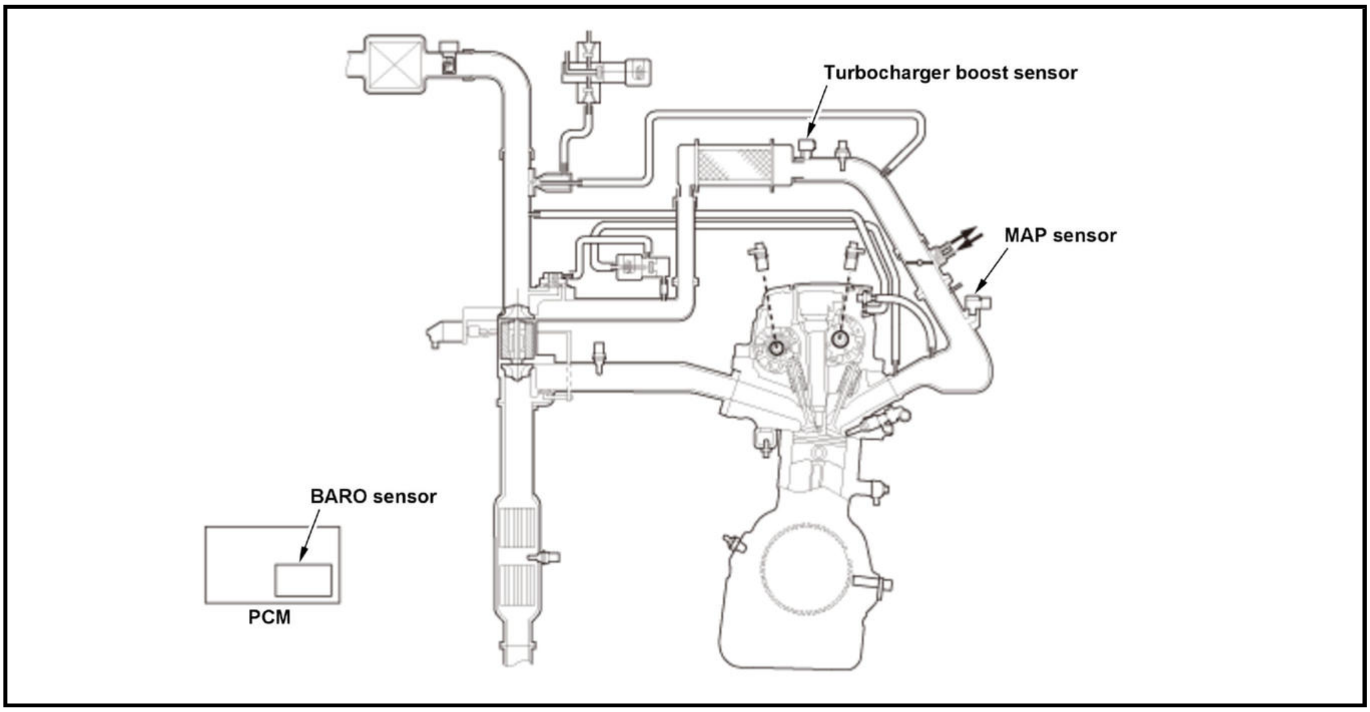
Conditions for clearing the DTC

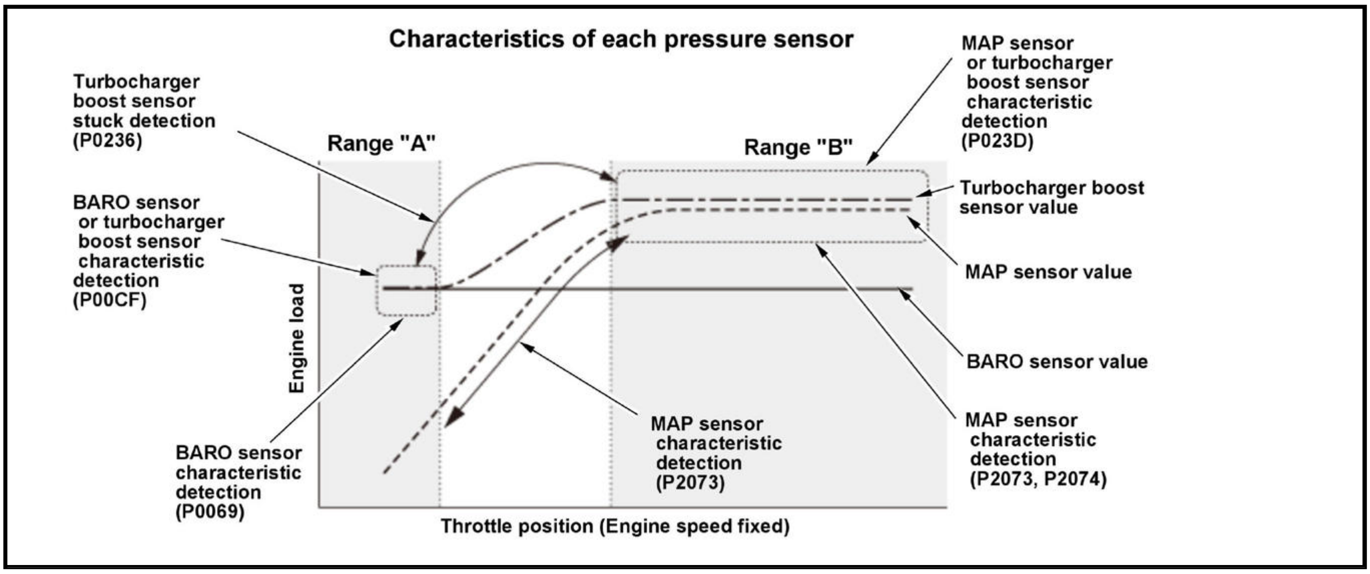
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P023D (1.5 L ENGINE)

DTC P023D: Turbocharger Boost Sensor/Manifold Absolute Pressure (MAP) Sensor Incorrect Correlation

General Description





The barometric pressure (BARO) sensor, the manifold absolute pressure (MAP) sensor, and the turbocharger boost sensor are equipped to the vehicle to detect air pressure conditions to the engine. The BARO sensor value and the turbocharger boost sensor value shows similar value at range "A" such as in idle conditions, and the turbocharger boost sensor value and MAP sensor value shows similar value at range "B" such as in high throttle position.

Malfunction determinations are done by the powertrain control module (PCM) in two ranges by comparing the pressure sensor values.

- At range "A": BARO sensor or turbocharger boost sensor is abnormal if the difference of the two pressure sensor values are specified or more (P00CF)
- At range "B": Turbocharger boost sensor or MAP sensor is abnormal if the difference of the two pressure sensor values are specified or more (P023D)
- Range "A" determined as abnormal and range "B" determined as normal: BARO sensor abnormal (P0069)
- Both ranges "A" and "B" determined as abnormal: Turbocharger boost sensor abnormal (P0236)
- Turbocharger boost sensor or MAP sensor values do not change when throttle position is transited from ranges "A" to "B": Determined as turbocharger boost sensor output stuck (P0236) or MAP sensor output stuck (P2073 or P2074)

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition		Minimum	Maximum
Engine speed [ENGINE SPEED]		1, 700 rpm	-
Throttle position	2, 000 rpm	36.3 deg.	-
	4, 000 rpm	42.2 deg.	-

[ ]: HDS Parameter

Malfunction Threshold

The difference between the MAP sensor value and the turbocharger boost pressure value is 27 kPa (200 mmHg, 7.9 inHg) or more.

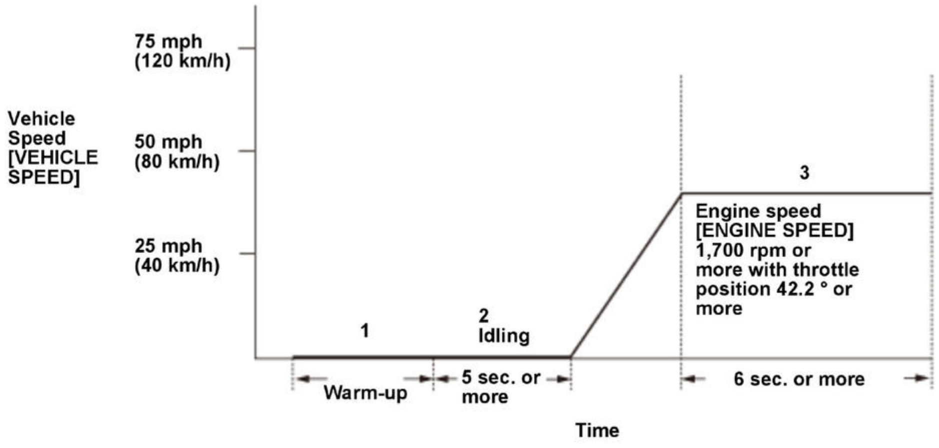
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAP sensor output range/performance problem
- Turbocharger boost sensor output range/performance problem

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 5 seconds.
- Drive the vehicle at engine speed [ENGINE SPEED] 1, 700 rpm or more with throttle position 42.2 deg. or more for at least 6 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

The cold start emission reduction strategy controls air fuel ratio to lean when the engine is started at cold condition to lower the emission while the catalyst is not warmed up enough. If the commanded air fuel ratio is too lean or too rich compared to the target air fuel ratio, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Duration of quick warm-up system operation after engine start-up	-	40 seconds
Engine coolant temperature [ECT SENSOR 1]	50 deg. F (10 deg. C)	122 deg. F (50 deg. C)
Throttle valve	Fully closed	
Accelerator pedal position	Released	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

The ratio of commanded air fuel ratio by target air fuel ratio is 0.87 or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Leave the vehicle until the engine coolant temperature [ECT SENSOR 1] lowers to 122 deg. F (50 deg. C) or less.
- Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Leave the vehicle until the engine coolant temperature [ECT SENSOR 1] lowers to 122 deg. F (50 deg. C) or less.
- Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

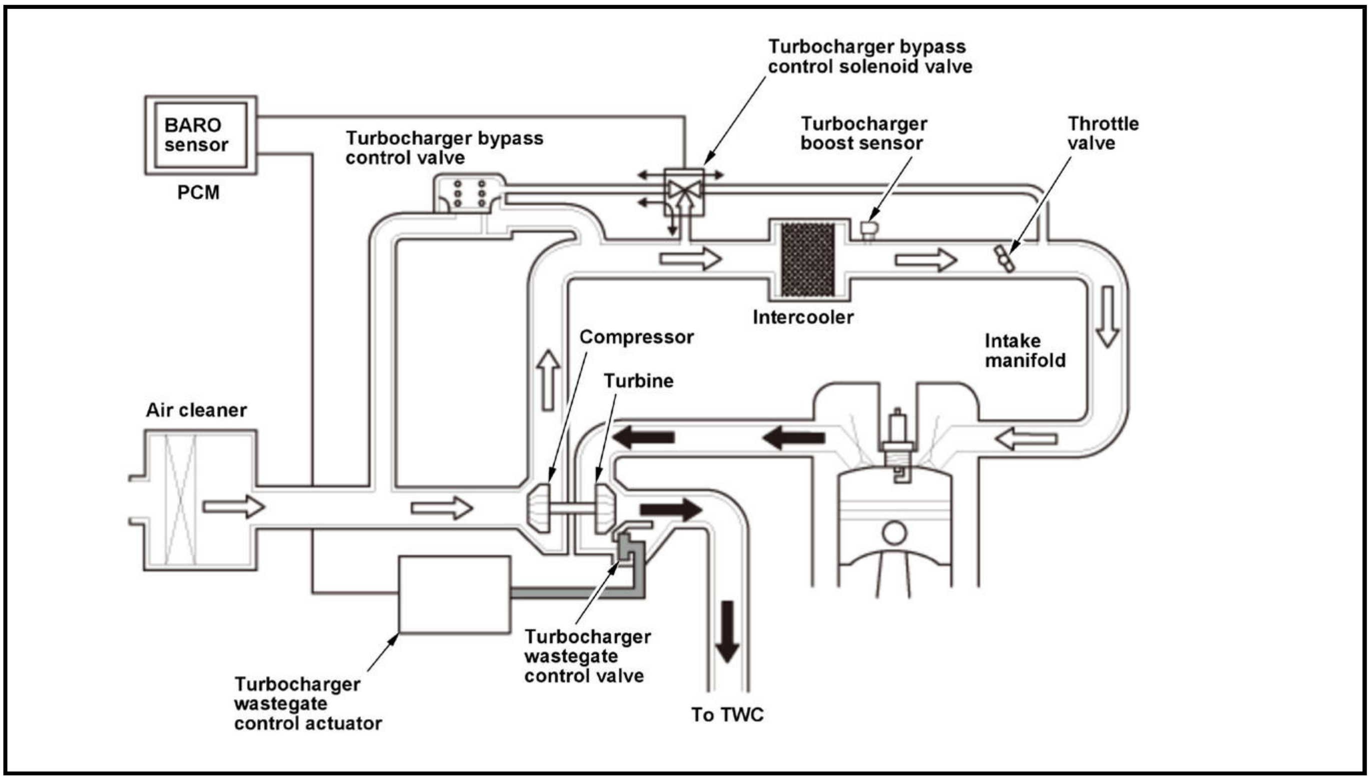
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

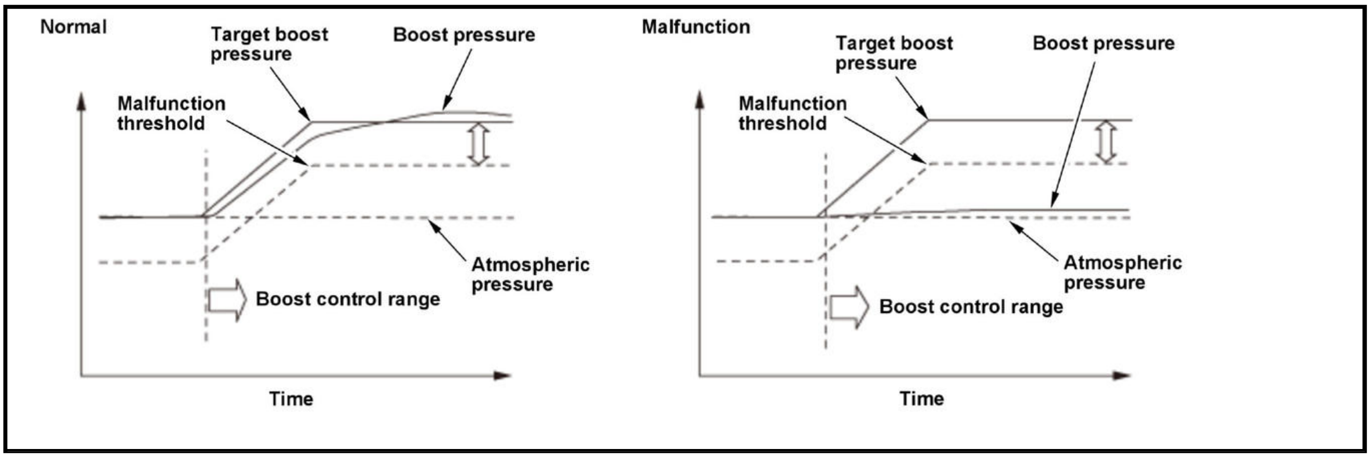
DTC P0299 (1.5 L ENGINE)

DTC P0299: Turbocharger Underboost Problem

General Description



Turbocharger bypass control solenoid valve
BARO sensor
PCM
Turbocharger bypass control valve
Turbocharger boost sensor
Throttle valve
Intercooler
Compressor
Turbine
Intake manifold
Air cleaner
Turbocharger wastegate control valve
Turbocharger wastegate control actuator
To TWC



The powertrain control module (PCM) controls the turbocharger control system to control boost pressure. When the difference between the target boost pressure and actual boost pressure is at a specified value for a predetermined time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Engine speed [ENGINE SPEED]	3, 000 rpm	-
Other	No change of boost pressure upper limit	

[ ]: HDS Parameter

Malfunction Threshold

The difference between the target boost pressure and actual boost pressure is 3.6 kPa (27 mmHg, 1.06 inHg) or more for at least 6 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes

- Turbocharger wastegate control valve stuck open failure
- Turbocharger bypass control valve open/close failure
- Turbine damage or seizure
- Exhaust pipe clogged
- Air cleaner element clogged
- Air tube between compressor and intercooler damage/leakage
- Turbocharger boost sensor range/performance problem
- BARO sensor range/performance problem

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at an engine speed [ENGINE SPEED] at 3, 000 rpm or more for at least 6.0 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

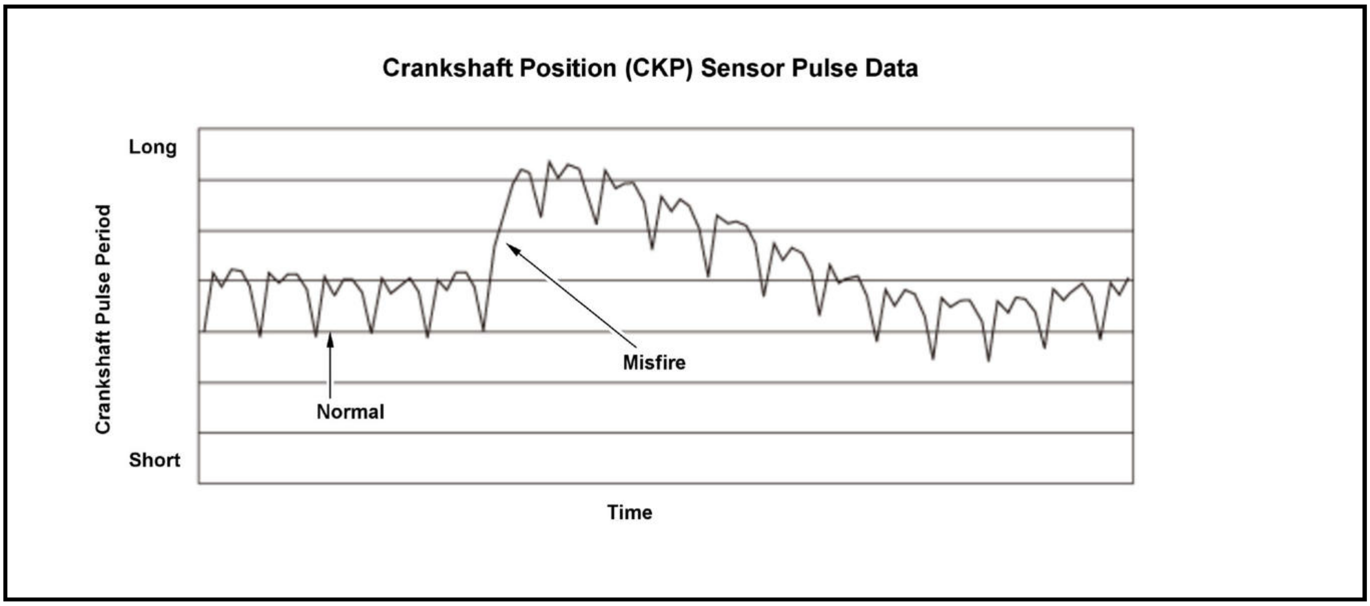
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0300, P0301, P0302, P0303, P0304 (1.5 L ENGINE) (2017 2018)

DTC P0300: Random Misfire Detected **DTC P0301:** No. 1 Cylinder Misfire Detected **DTC P0302:** No. 2 Cylinder Misfire Detected **DTC P0303:** No. 3 Cylinder Misfire Detected **DTC P0304:** No. 4 Cylinder Misfire Detected

General Description



The crankshaft vibrates slightly when each cylinder fires. If a misfire occurs, the crankshaft rotation speed changes rapidly. The powertrain control module (PCM) monitors the crankshaft rotation speed based on the output pulses from the crankshaft position (CKP) sensor. By monitoring changes in the crankshaft rotation speed, the PCM counts the number of misfires and determines which cylinder is misfiring.

- P0300: If more than one DTC from P0301 through P0304 has been stored while misfires in multiple cylinders are detected, a malfunction is detected and a DTC is stored.
- P0301, P0302, P0303, P0304: If a misfire is detected, a DTC is stored.

There are two types of misfire detection:

- Type 1: When the number of misfires per 200 engine revolutions reaches the level that can damage the three way catalyst (TWC), a DTC is stored and the MIL blinks.
- Type 2: When the number of misfires per 1, 000 engine revolutions reaches the level that affects exhaust emissions but not severe enough to immediately damage the catalyst, a DTC is stored and the MIL comes on.

Monitor Execution, Sequence, Duration, DTC Type

Execution		Continuous
Sequence		None
Duration	Type 1	Per 200 revolutions
	Type 2	Per 1, 000 revolutions
DTC Type		Two drive cycles, MIL on

Enable Conditions

Condition		Minimum	Maximum
Elapsed time after monitor finishing condition except immediate starting the engine		1.0 second	-
Engine coolant temperature [ECT SENSOR 1]		None, unless the initial engine coolant temperature [ECT SENSOR 1] is 14 deg. F (-10 deg. C) or less, in which case the monitor will not run until the engine coolant temperature [ECT SENSOR 1] reaches 68 deg. F (20 deg. C)	
Engine speed [ENGINE SPEED]		480 rpm	6, 500 rpm
MAP value [MAP SENSOR]*	500 rpm	28 kPa (205 mmHg, 8.1 inHg)	-
	2, 500 rpm	24 kPa (170 mmHg, 6.9 inHg)	-
Fuel feedback		Other than during fuel cut-off operation	
Other		Test-drive on a flat road to avoid misdetection	

*: Varies with driving conditions.[ ]: HDS Parameter

Malfunction Threshold

The number of misfires versus engine revolutions is equal to or greater than the values in the table.

Misfire Type	The number of engine revolutions	The number of misfires
Misfire Type 1 (Severe)	Per 200 revolutions	17 - 89 times**
Misfire Type 2 (Light)	Per 1, 000 revolutions	77 times

**: Depending on engine speed and load.

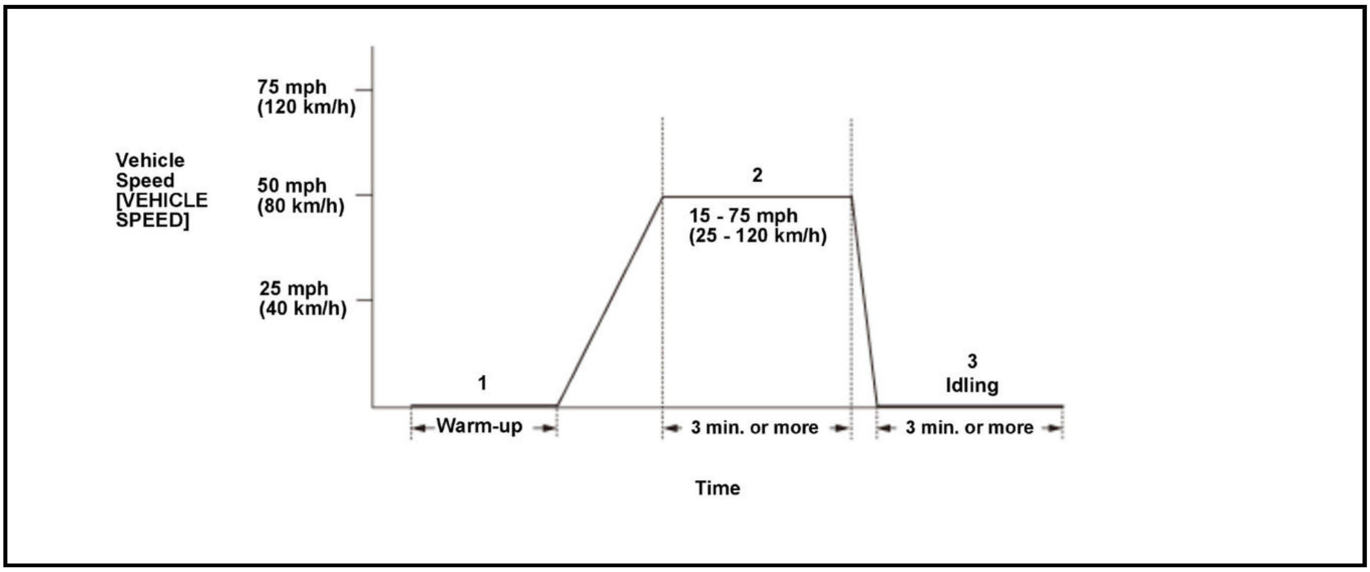
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Ignition system failure
- Fuel supply system failure
- Intake air system failure

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a speed between 15 - 75 mph (25 - 120 km/h) for at least 3 minutes.
- Stop the vehicle, and let the engine idle for at least 3 minutes.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2 or 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

Misfire Type 1:

- If a type 1 misfire (catalyst damaging) occurs once, the MIL blinks once per second, a Pending DTC is stored, and the high rpm fuel injection stop system activates. The fuel injection stops, at high rpm only, on the cylinder that has the highest misfire counts. The MIL then continues to blink and the fuel injection stays off at high rpm, until the drive is completed.
- If a type 1 misfire occurs during a second drive cycle, the MIL and fuel injection behave the same and a Confirmed DTC is stored.
- After a type 1 misfire has been detected during two drive cycles, the MIL comes on and stays on beginning with the third drive cycle, unless the Pending DTC has been cleared by the PCM***. Even if the MIL is on, it will start blinking if a type 1 misfire occurs.
- If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Misfire Type 2:

- If a type 2 misfire (emission-related but not severe enough to immediately damage the catalyst) occurs, a Pending DTC is stored, but the MIL does not come on or blink. If a type 2 misfire occurs during a second drive cycle, the MIL comes on and stays on unless the Pending DTC has been cleared by the PCM***.

*** The Pending DTC is erased if either of these conditions is met:

- The vehicle is operated at least once under the same driving conditions as the first misfire detection, and no misfire is detected.
- 80 drive cycles, regardless of driving conditions, are completed with no misfire detected.

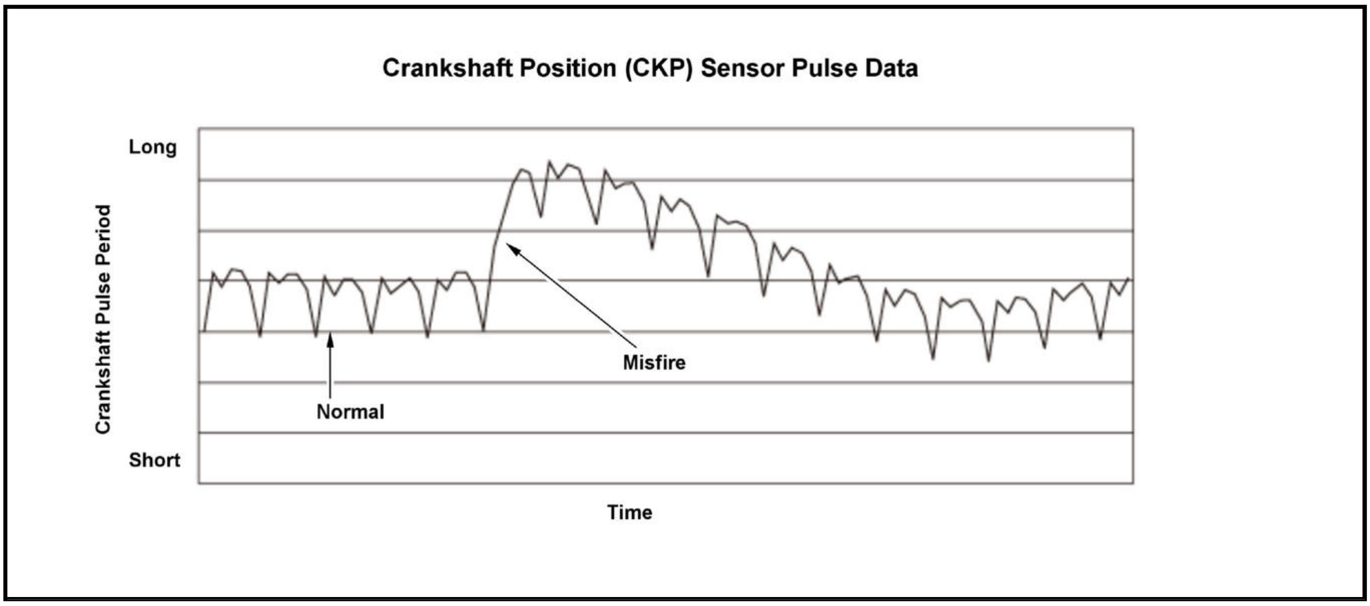
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0300, P0301, P0302, P0303, P0304 (1.5 L ENGINE) (2019 2020 2021)

DTC P0300: Random Misfire Detected **DTC P0301:** No. 1 Cylinder Misfire Detected **DTC P0302:** No. 2 Cylinder Misfire Detected **DTC P0303:** No. 3 Cylinder Misfire Detected **DTC P0304:** No. 4 Cylinder Misfire Detected

General Description



The crankshaft vibrates slightly when each cylinder fires. If a misfire occurs, the crankshaft rotation speed changes rapidly. The powertrain control module (PCM) monitors the crankshaft rotation speed based on the output pulses from the crankshaft position (CKP) sensor. By monitoring changes in the crankshaft rotation speed, the PCM counts the number of misfires and determines which cylinder is misfiring.

- P0300: If more than one DTC from P0301 through P0304 has been stored while misfires in multiple cylinders are detected, a malfunction is detected and a DTC is stored.
- P0301, P0302, P0303, P0304: If a misfire is detected, a DTC is stored.

There are two types of misfire detection:

- Type 1: When the number of misfires per 200 engine revolutions reaches the level that can damage the three way catalyst (TWC), a DTC is stored and the MIL blinks.
- Type 2: When the number of misfires per 1, 000 engine revolutions reaches the level that affects exhaust emissions but not severe enough to immediately damage the catalyst, a DTC is stored and the MIL comes on.

Monitor Execution, Sequence, Duration, DTC Type

Execution		Continuous
Sequence		None
Duration	Type 1	Per 200 revolutions
	Type 2	Per 1, 000 revolutions
DTC Type		Two drive cycles, MIL on

Enable Conditions

Condition		Minimum	Maximum
Elapsed time after monitor finishing condition except immediate starting the engine		1.0 second	-
Engine coolant temperature [ECT SENSOR 1]		None, unless the initial engine coolant temperature [ECT SENSOR 1] is 14 deg. F (-10 deg. C) or less, in which case the monitor will not run until the engine coolant temperature [ECT SENSOR 1] reaches 68 deg. F (20 deg. C)	
Engine speed [ENGINE SPEED]		480 rpm	6, 500 rpm
MAP value [MAP SENSOR]*	500 rpm	26 kPa (190 mmHg, 7.5 inHg)	-
	2, 500 rpm	24 kPa (180 mmHg, 7.1 inHg)	-
Fuel feedback		Other than during fuel cut-off operation	
Other		Test-drive on a flat road to avoid misdetection	

*: Varies with driving conditions.[ ]: HDS Parameter

Malfunction Threshold

The number of misfires versus engine revolutions is equal to or greater than the values in the table.

Misfire Type	The number of engine revolutions	The number of misfires
Misfire Type 1 (Severe)	Per 200 revolutions	20 - 89 times**
Misfire Type 2 (Light)	Per 1, 000 revolutions	77 times

**: Depending on engine speed and load.

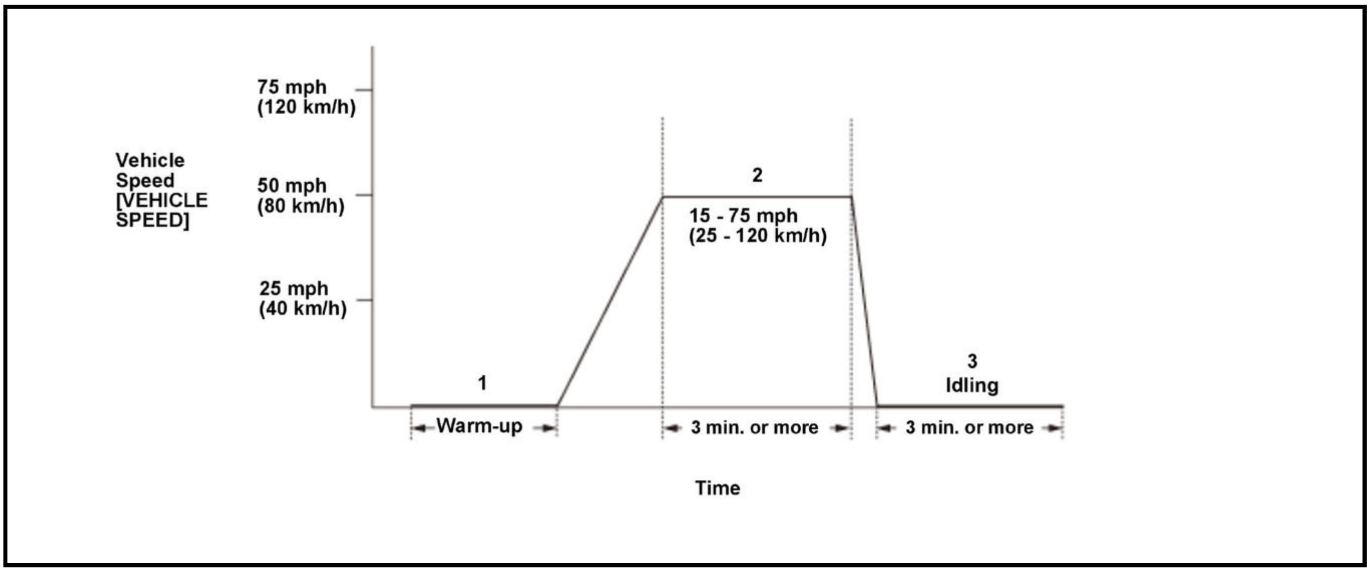
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Ignition system failure
- Fuel supply system failure
- Intake air system failure

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a speed between 15 - 75 mph (25 - 120 km/h) for at least 3 minutes.
- Stop the vehicle, and let the engine idle for at least 3 minutes.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2 or 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

Misfire Type 1:

- If a type 1 misfire (catalyst damaging) occurs once, the MIL blinks once per second, a Pending DTC is stored, and the high rpm fuel injection stop system activates. The fuel injection stops, at high rpm only, on the cylinder that has the highest misfire counts. The MIL then continues to blink and the fuel injection stays off at high rpm, until the drive is completed.
- If a type 1 misfire occurs during a second drive cycle, the MIL and fuel injection behave the same and a Confirmed DTC is stored.
- After a type 1 misfire has been detected during two drive cycles, the MIL comes on and stays on beginning with the third drive cycle, unless the Pending DTC has been cleared by the PCM***. Even if the MIL is on, it will start blinking if a type 1 misfire occurs.
- If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Misfire Type 2:

- If a type 2 misfire (emission-related but not severe enough to immediately damage the catalyst) occurs, a Pending DTC is stored, but the MIL does not come on or blink. If a type 2 misfire occurs during a second drive cycle, the MIL comes on and stays on unless the Pending DTC has been cleared by the PCM***.

*** The Pending DTC is erased if either of these conditions is met:

- The vehicle is operated at least once under the same driving conditions as the first misfire detection, and no misfire is detected.
- 80 drive cycles, regardless of driving conditions, are completed with no misfire detected.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

Conditions for setting the DTC

Misfire Type 1:

- If a type 1 misfire (catalyst damaging) occurs once, the MIL blinks once per second, a Pending DTC is stored, and the high rpm fuel injection stop system activates. The fuel injection stops, at high rpm only, on the cylinder that has the highest misfire counts. The MIL then continues to blink and the fuel injection stays off at high rpm, until the drive is completed.
- If a type 1 misfire occurs during a second drive cycle, the MIL and fuel injection behave the same and a Confirmed DTC is stored.
- After a type 1 misfire has been detected during two drive cycles, the MIL comes on and stays on beginning with the third drive cycle, unless the Pending DTC has been cleared by the PCM***. Even if the MIL is on, it will start blinking if a type 1 misfire occurs.
- If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Misfire Type 2:

- If a type 2 misfire (emission-related but not severe enough to immediately damage the catalyst) occurs, a Pending DTC is stored, but the MIL does not come on or blink. If a type 2 misfire occurs during a second drive cycle, the MIL comes on and stays on unless the Pending DTC has been cleared by the PCM***.

***** The Pending DTC is erased if either of these conditions is met:

- The vehicle is operated at least once under the same driving conditions as the first misfire detection, and no misfire is detected.
- 80 drive cycles, regardless of driving conditions, are completed with no misfire detected.

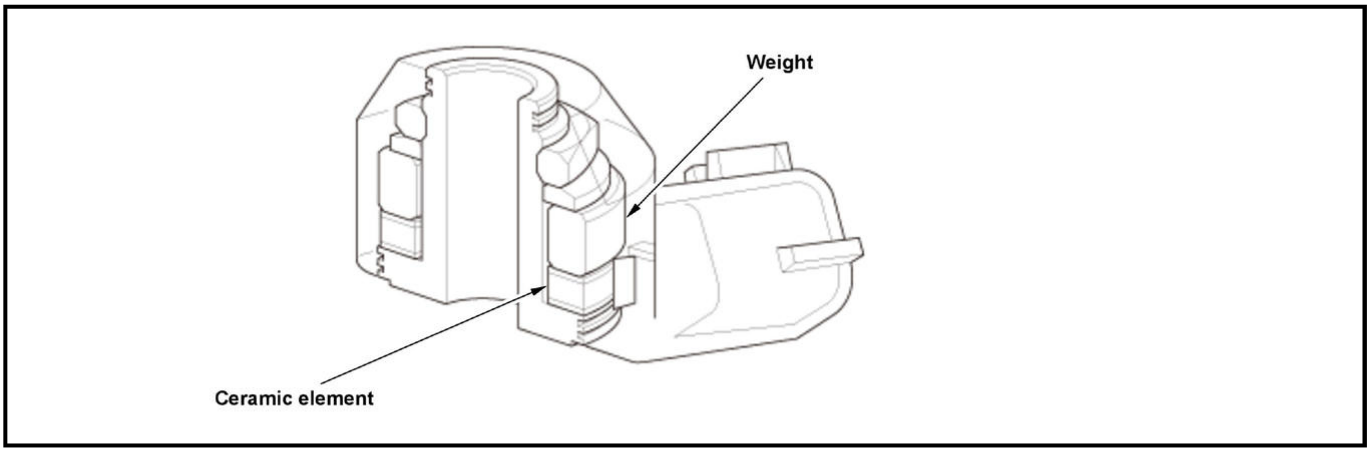
Conditions for clearing the DTC

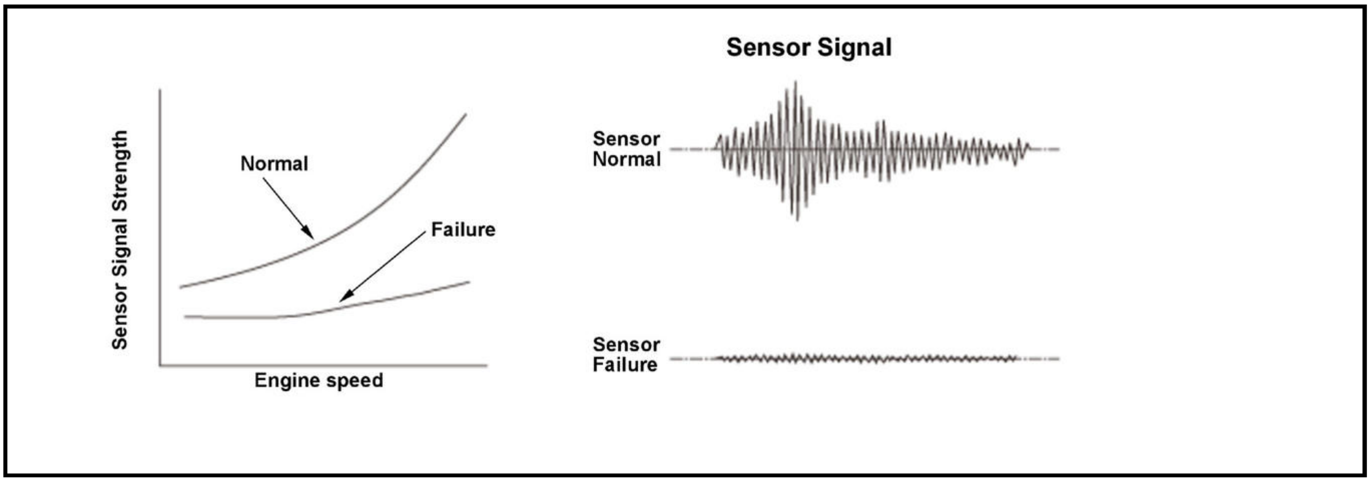
The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0326 (1.5 L ENGINE)

DTC P0326: Knock Sensor Malfunction

General Description





A nonresonant type of knock sensor is used, and it is mounted on the cylinder block to detect engine knocking. Vibration from engine combustion causes the torus-shaped weight to compress the ceramic element in the nonresonant knock sensor, and converts it into electrical signals. The powertrain control module (PCM) controls the ignition timing according to the electrical signal level. If the signal level from the knock sensor drops for a set time because of a poor connection at the knock sensor, or a bad sensor, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	5.0 seconds	-
Engine speed [ENGINE SPEED]	2, 000 rpm	-

[ ]: HDS Parameter

Malfunction Threshold

Either one of the conditions is met for at least 5.0 seconds.

- The knock sensor output signal strength is 60 or less at the engine speed [ENGINE SPEED] of 1, 250 rpm*.
- The knock sensor output signal strength is 111 or less at the engine speed [ENGINE SPEED] of 2, 500 rpm*.

*: Depending on engine speed and load.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Knock sensor mis installed
- Knock sensor failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at an engine speed [ENGINE SPEED] 2, 000 rpm or more for at least 5 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

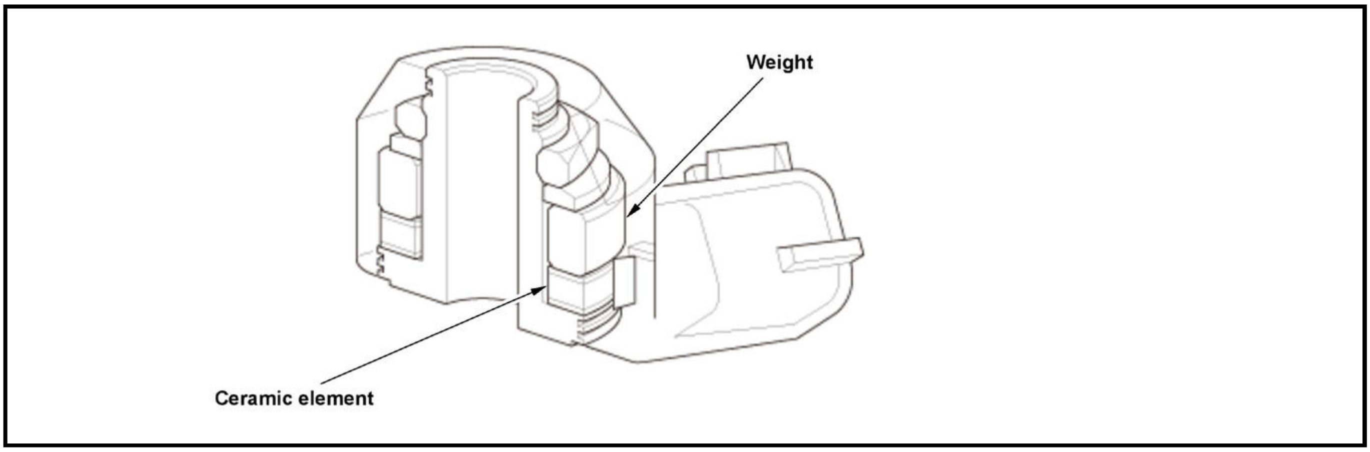
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear

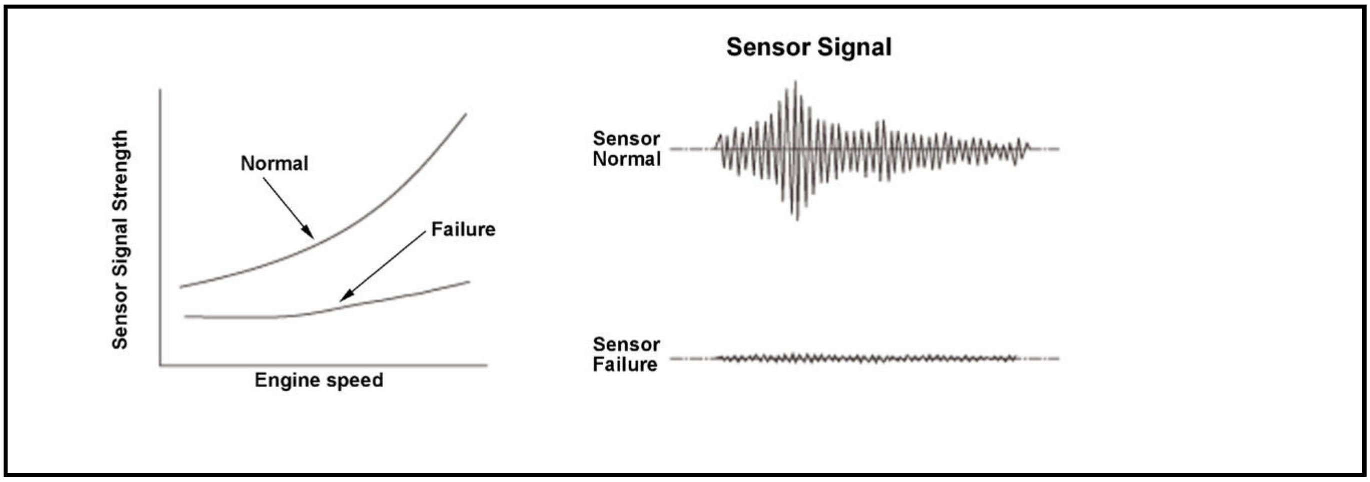
command or by disconnecting the 12 volt battery.

DTC P0326 (2.4 L ENGINE) (2017 2018 2019)

DTC P0326: Knock Sensor Malfunction

General Description





A nonresonant type of knock sensor is used, and it is mounted on the cylinder block to detect engine knocking. Vibration from engine combustion causes the torus-shaped weight to compress the ceramic element in the nonresonant knock sensor, and converts it into electrical signals. The powertrain control module (PCM) controls the ignition timing according to the electrical signal level. If the signal level from the knock sensor drops for a set time because of a poor connection at the knock sensor, or a bad sensor, the PCM detects a malfunction and stores a DTC.

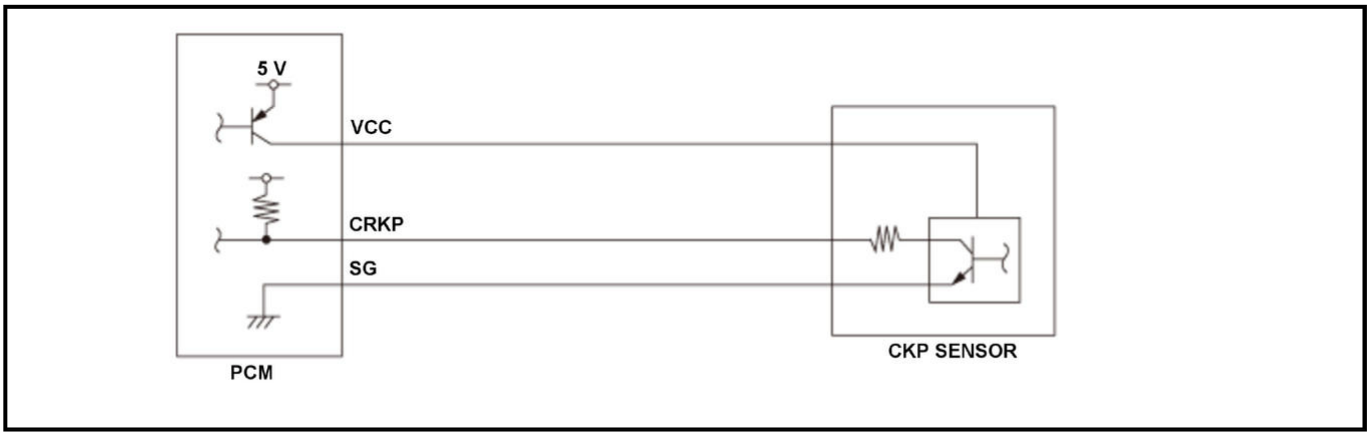
DTC P0335 (1.5 L ENGINE)

DTC P0335: Crankshaft Position (CKP) Sensor No Signal

General Description



The crankshaft position (CKP) sensor detects injection/ignition timing for each cylinder and engine speed. The CKP sensor consists of a rotor and a semiconductor that detects rotor position. When the engine starts, the rotor turns and the magnetic flux in the semiconductor device changes. The changes of magnetic flux are converted into pulsing signals to the powertrain control module (PCM). If no pulsing signals from the CKP sensor are detected, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

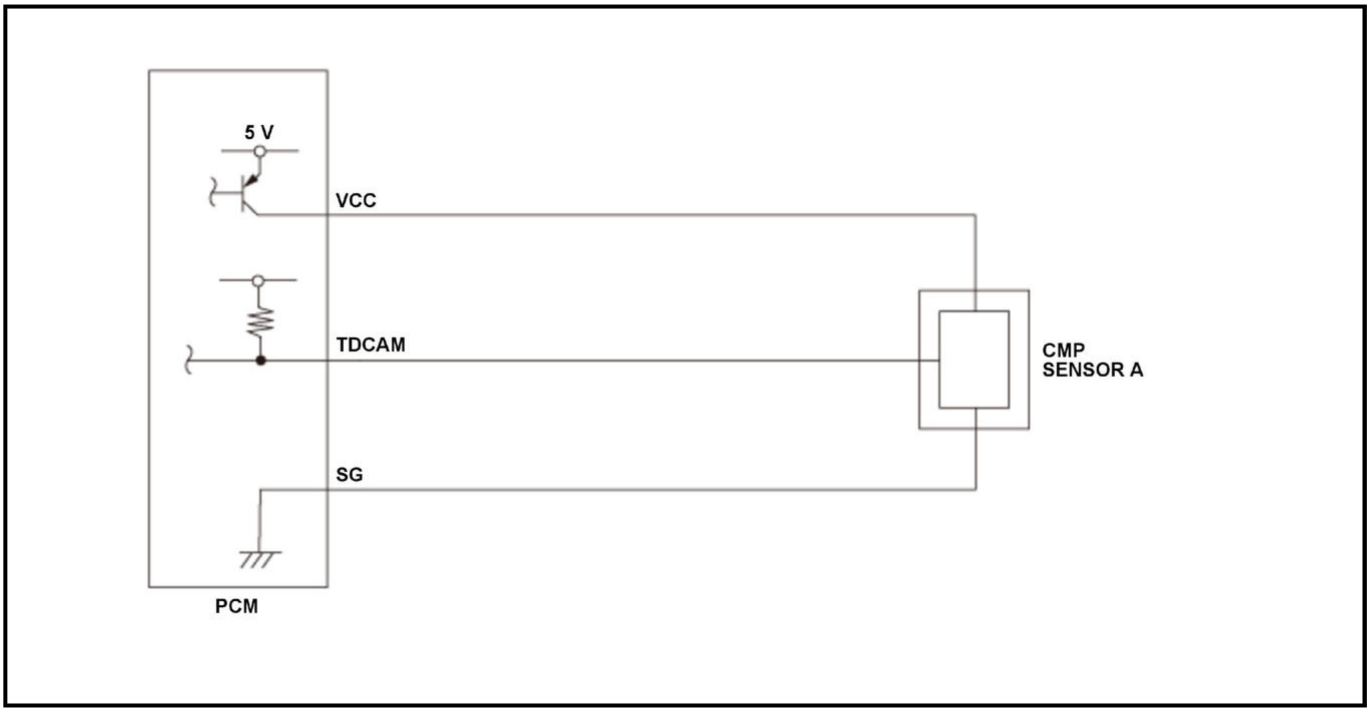
DTC P0340 (1.5 L ENGINE)

DTC P0340: Camshaft Position (CMP) Sensor A No Signal

General Description



Camshaft position (CMP) sensor A consists of a rotor and a semiconductor that detects rotor position and intake camshaft timing. When the rotor turns after starting the engine, the changes of magnetic flux in the semiconductor are converted into pulsing signals to the powertrain control module (PCM). CMP sensor A also detects the top dead center of each cylinder for fuel injection. The PCM determines the camshaft position according to the signals from the crankshaft position (CKP) sensor and CMP sensor A. If no pulsing signals from CMP sensor A are detected, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CMP sensor A TDCAM line open
- CMP sensor A TDCAM line short to ground
- CMP sensor A VCC line open
- CMP sensor A SG line open
- CMP sensor A failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

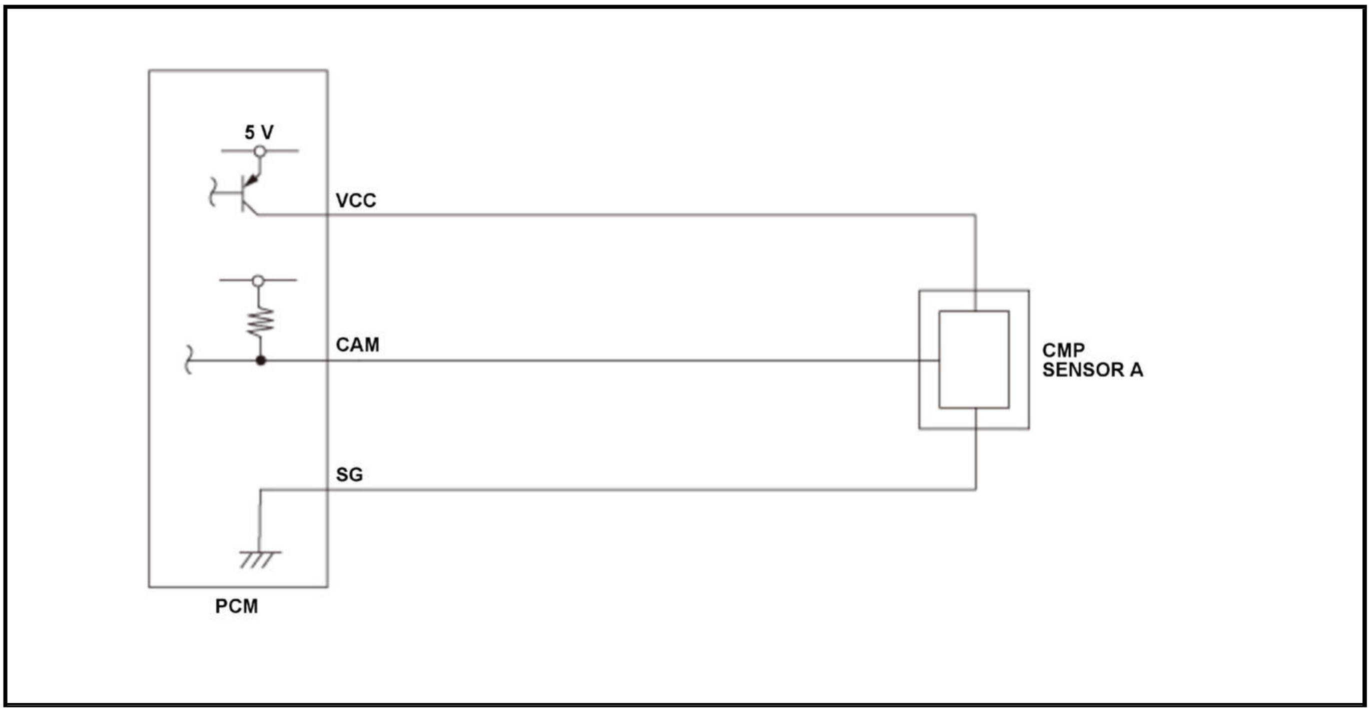
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0340 (2.4 L ENGINE) (2017 2018 2019)

DTC P0340: Camshaft Position (CMP) Sensor A No Signal

General Description



Camshaft position (CMP) sensor A consists of a rotor and a semiconductor that detects rotor position and intake camshaft timing. When the rotor turns after starting the engine, the changes of magnetic flux in the semiconductor are converted into pulsing signals to the powertrain control module (PCM). CMP sensor A also detects the top dead center of each cylinder for fuel injection. The PCM determines the camshaft position according to the signals from the crankshaft position (CKP) sensor and CMP sensor A. If no pulsing signals from CMP sensor A are detected, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more (when the engine speed is 750 min -1 (rpm))
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

No input signals from CMP sensor A are detected while signals from the CKP sensor are detected at least 300 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CMP sensor A CAM line open
- CMP sensor A CAM line short to ground
- CMP sensor A VCC line open
- CMP sensor A SG line open
- CMP sensor A failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

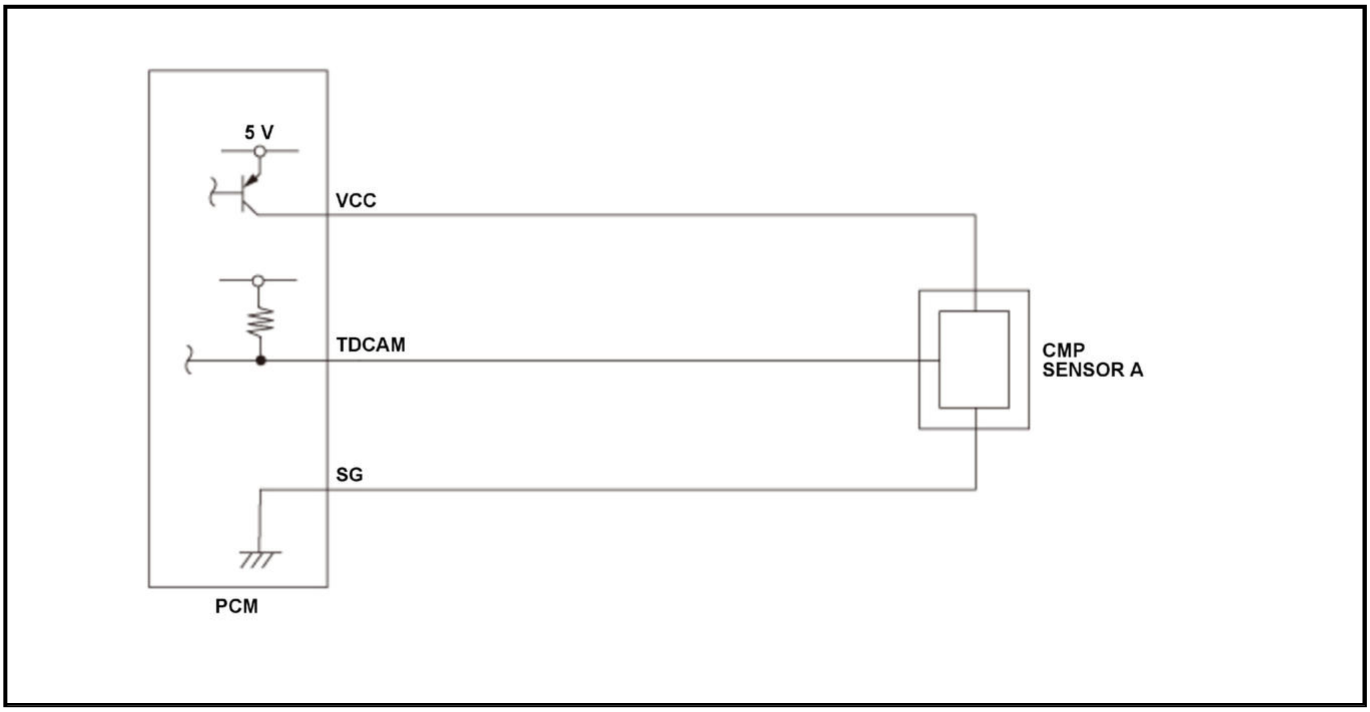
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0341 (1.5 L ENGINE)

DTC P0341: Camshaft Position (CMP) Sensor A and Crankshaft Position (CKP) Sensor Incorrect Phase Detected

General Description



Camshaft position (CMP) sensor A detects the intake camshaft timing and sends pulsing signals to the powertrain control module (PCM). The PCM determines the advance or the retard of the intake camshaft timing according to the signals from the crankshaft position (CKP) sensor and CMP sensor A. If the intake camshaft reference phase value deviates from a set range over a specified time period while the variable valve timing control (VTC) is not activated, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	4.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapse time after starting the engine	1 second	-
Engine speed [ENGINE SPEED]	500 rpm	-
Other	VTC system not operating	

[ ]: HDS Parameter

Malfunction Threshold

The difference between intake camshaft phase measured from CMP sensor A and intake camshaft standard phase value according to the CKP sensor position is 10.0 deg. or more for at least 4 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CMP sensor A poor installation
- CMP sensor A stuck
- CMP sensor A range/performance problem
- Cam chain poor installation
- VTC actuator A stuck
- VTC actuator A response delay

Confirmation Procedure

Operating Condition

Start the engine, and let it idle. When the diagnosis does not finish, allow the engine cool to an engine coolant temperature [ECT SENSOR 1] of ambient temperature, then restart the engine, and let it idle.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

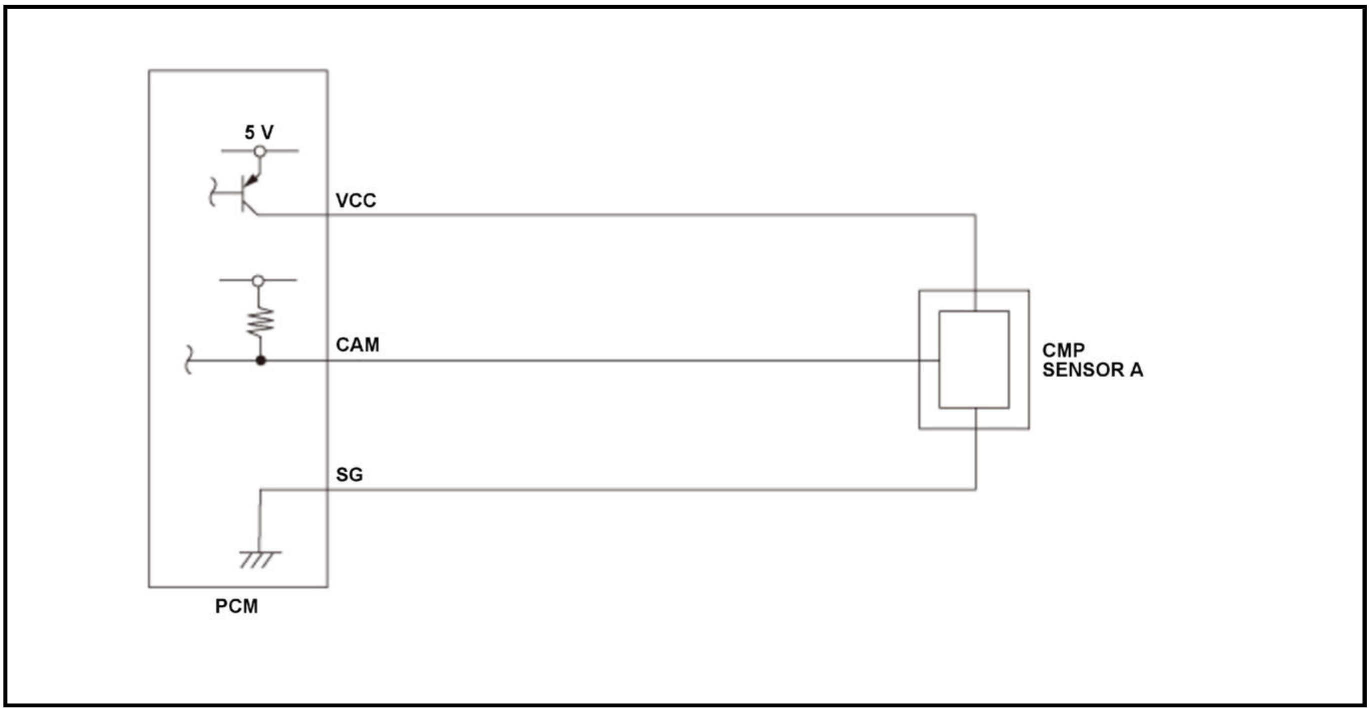
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0341 (2.4 L ENGINE) (2017 2018 2019)

DTC P0341: Camshaft Position (CMP) Sensor A and Crankshaft Position (CKP) Sensor Incorrect Phase Detected

General Description



Camshaft position (CMP) sensor A detects the intake camshaft timing and sends pulsing signals to the powertrain control module (PCM). The PCM determines the advance or the retard of the intake camshaft timing according to the signals from the crankshaft position (CKP) sensor and CMP sensor A. If the intake camshaft reference phase value deviates from a set range over a specified time period while the variable valve timing control (VTC) is not activated, the PCM detects a malfunction and stores a DTC.

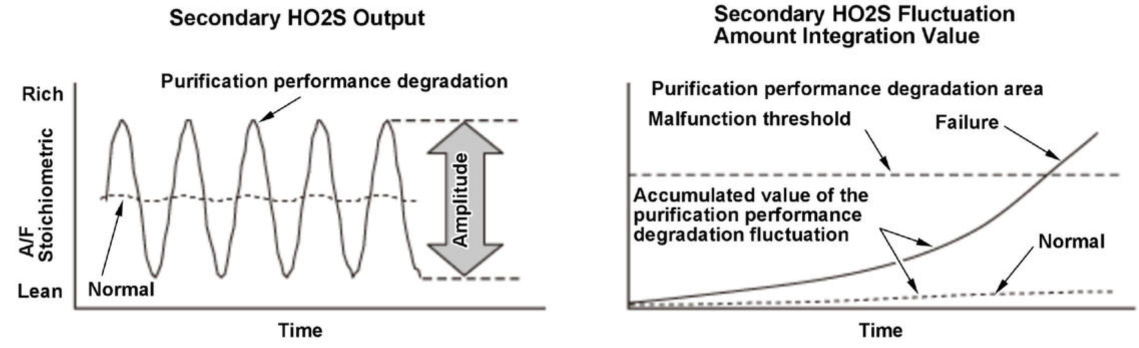
DTC P0420 (1.5 L ENGINE)

DTC P0420: Catalyst System Efficiency Below Threshold

General Description



Degradation failure of catalyst is detected by monitoring amplitude of secondary HO2S output

The three way catalytic converter (TWC) converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to water vapor, carbon dioxide (CO 2), and dinitrogen (N 2). The powertrain control module (PCM) fluctuates the air/fuel ratio temporarily to detect the performance of the TWC and measures the degree of fluctuation in the secondary heated oxygen sensor (secondary HO2S (sensor 2)) output. If the accumulated value for a set time is too great, deterioration of the performance of the catalyst is detected, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	7.5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time that secondary HO2S activity is not monitored after starting the engine	15 seconds	-
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg. F (-25 deg. C)	-
Estimated TWC temperature	986 deg. F (530 deg. C)	-
Vehicle speed [VEHICLE SPEED]	26 mph (41 km/h)	-
Fuel trim	0.75	1.47
Fuel feedback	Closed loop at stoichiometric	
Monitoring priority	P0133	
Other	Has record of deceleration at least once	
	Cruise load or more	

[ ]: HDS Parameter

Malfunction Threshold

The secondary HO2S (sensor 2) fluctuation integration value is 3.0 V or more for at least 7.5 seconds.

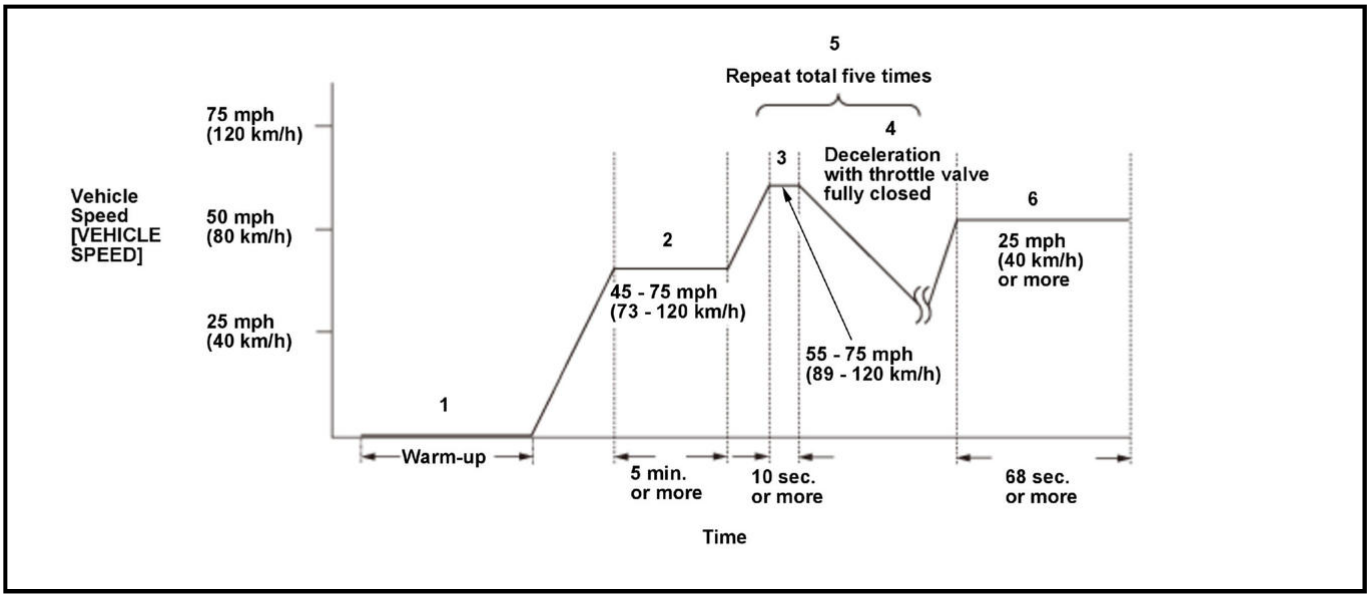
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TWC purification performance deterioration
- Secondary HO2S (sensor 2) line electrical noise overlapped
- Secondary HO2S (sensor 2) connector loose connection
- Exhaust system change (non-genuine part)

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a speed between 45 - 75 mph (73 - 120 km/h) for at least 5 minutes, to warm up the TWC.
- Drive at a steady speed between 55 - 75 mph (89 - 120 km/h) for at least 10 seconds.
- Decelerate with the throttle valve fully closed.
- Repeat driving pattern steps 3 through 4, five times.
- Drive at steady speed 25 mph (40 km/h) or more for at least 68 seconds.

- After disconnecting the 12 volt battery, extend Driving Pattern step 6 to 4 minutes or longer.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

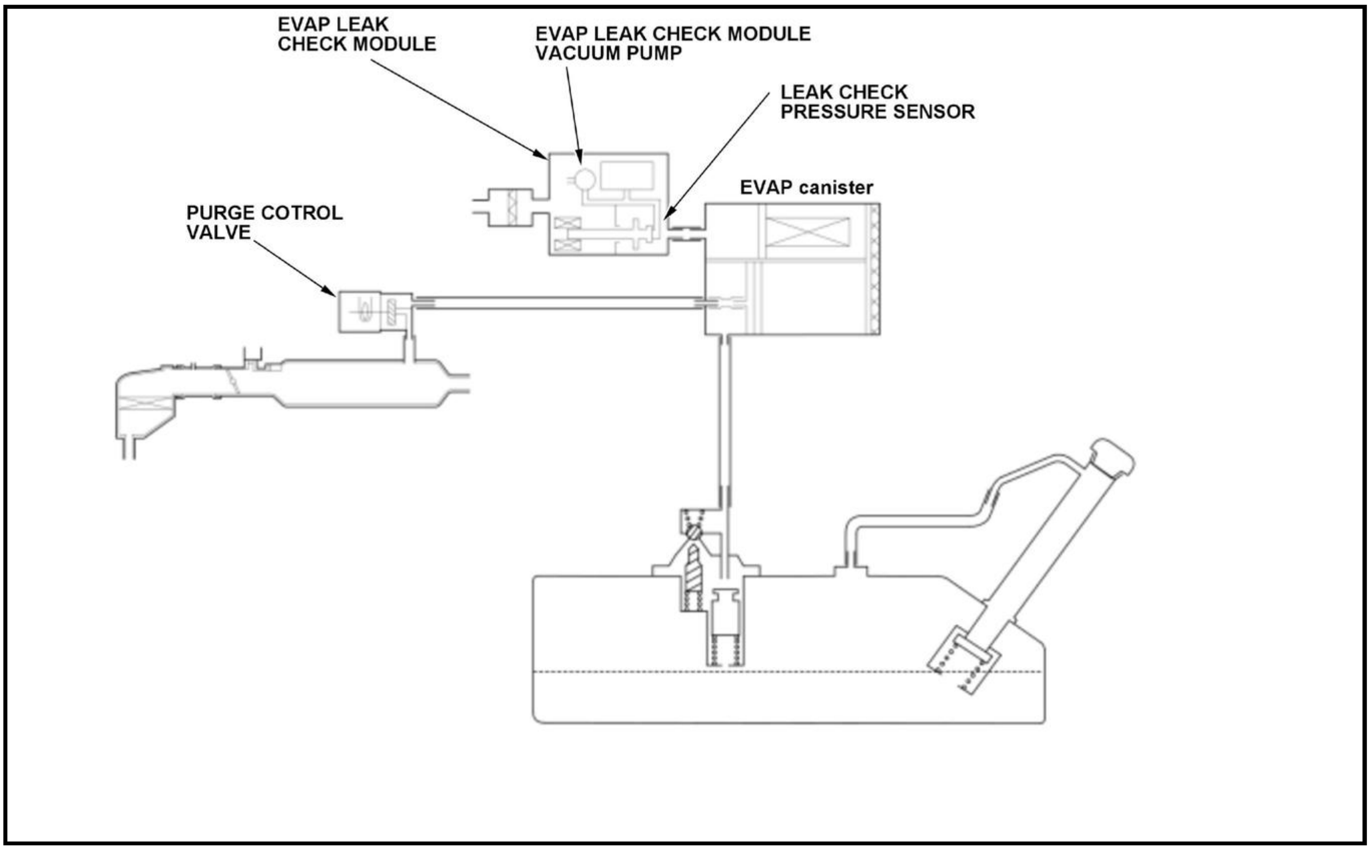
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

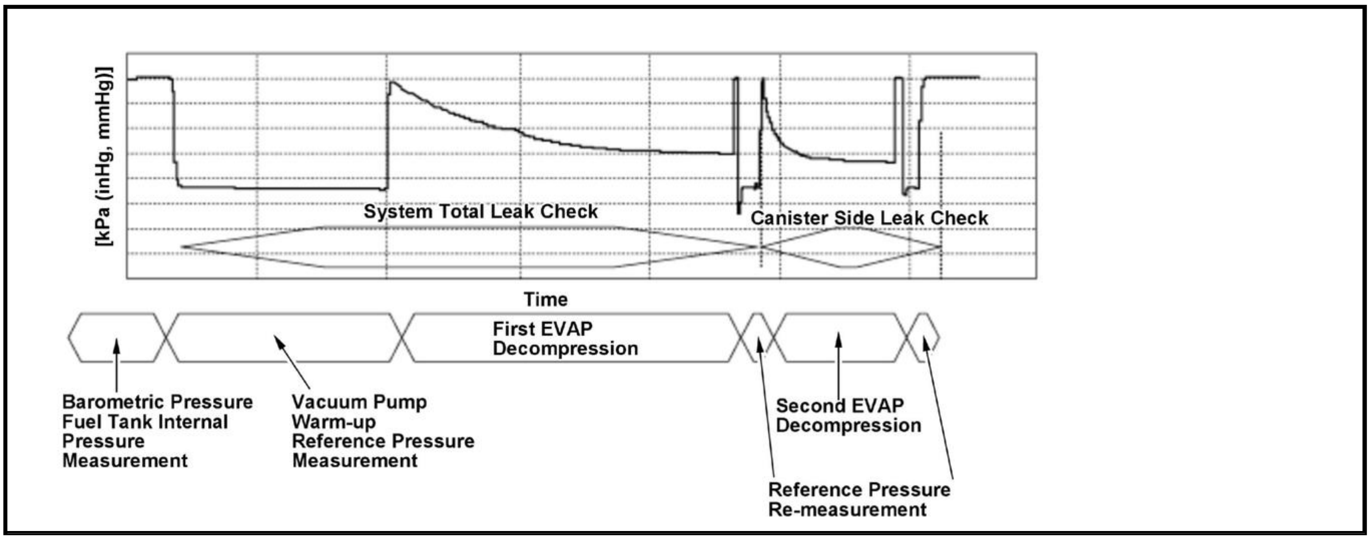
DTC P043E (1.5 L ENGINE)

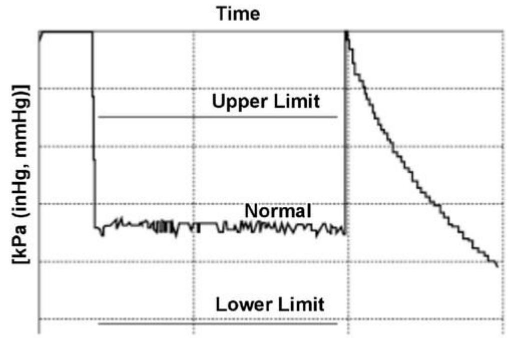
DTC P043E: Evaporative Emission (EVAP) Leak Check Module Standard Pressure Low

General Description



EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE VACUUM PUMP
LEAK CHECK PRESSURE SENSOR
EVAP canister
PURGE COTROL VALVE





The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT SENSOR 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere. If pressure is reduced with the fuel vapor containment valve open, the entire EVAP system will be diagnosed, and if the fuel vapor containment valve is closed, only the EVAP canister side will be diagnosed.

A malfunction is detected and a DTC is stored when changes in the pressure are equal to or less than the prescribed value after the prescribed time of starting the system pressure reduction.

EVAP leak check module operation flow

- Reference pressure measurement : Malfunction check in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction : Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement : Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the vacuum pump during detection.

Reference pressure is the pressure reduction by the reference orifice (#40 equivalent) in the EVAP leak check module used to check for leak by comparison with the system pressure reduction.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	6.5 seconds or more

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after turn the vehicle to the ON mode	10 minutes	-
Elapsed time after turn the vehicle to the OFF (LOCK) mode	5 hours	-
PCM wake up engine coolant temperature [ECT SENSOR 1]	40 deg. F (5 deg. C)	95 deg. F (35 deg. C)
Barometric pressure[BARO SENSOR]	76 kPa (22.5 inHg, 569 mmHg)	-
Battery voltage [BATTERY]	10.5 V	-
Other	No refueling is required	

[ ]: HDS Parameter

Malfunction Threshold

The reference pressure is -5 kPa (-1.5 inHg, -38.1 mmHg) or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Vacuum pump failure
- Vacuum pump (Motor) failure
- Control valve failure
- Reference orifice flow quantity is excessive
- Reference orifice flow quantity is too low

Confirmation Procedure

Operating Condition

- With the engine coolant temperature [ECT SENSOR 1] within the specified range, turn the vehicle to the ON mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 22 minutes, 17 seconds.

With the HDS

Do the EVAP TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored. engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory.

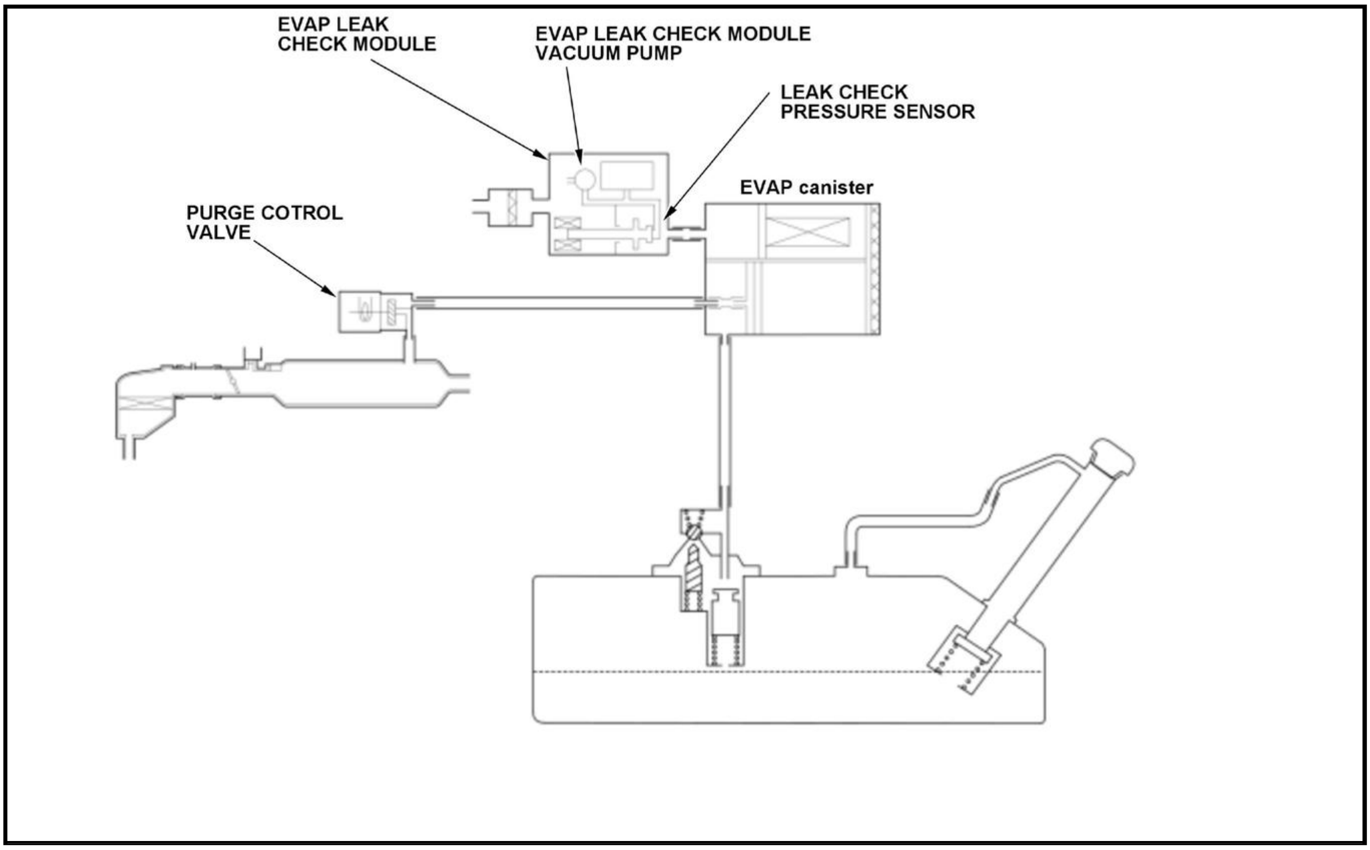
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

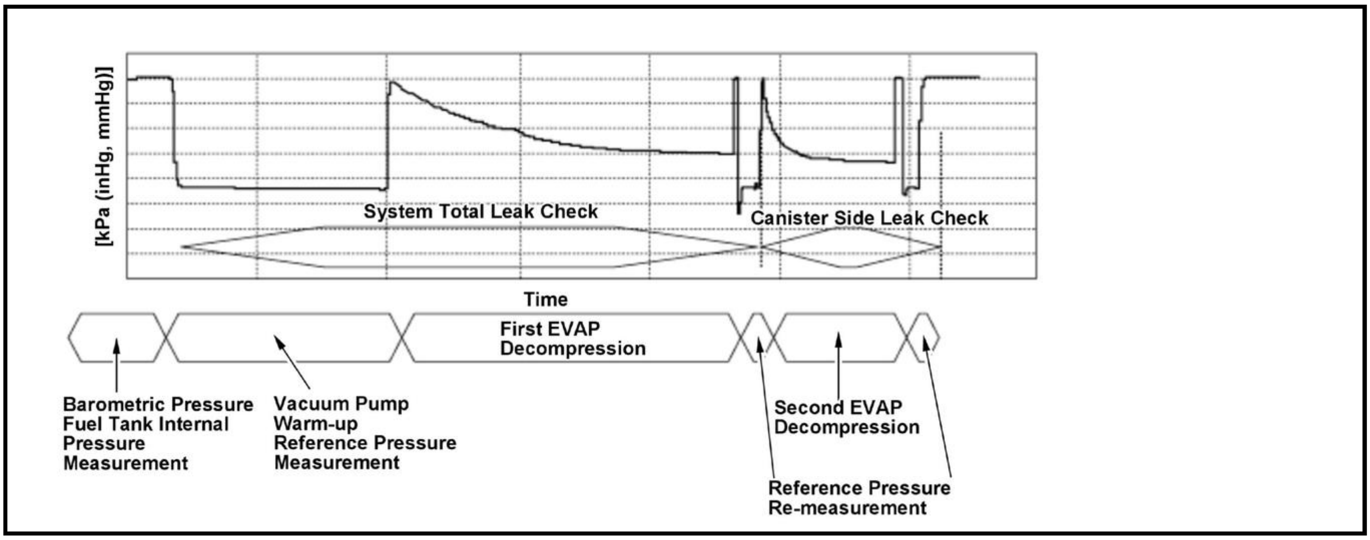
DTC P043F (1.5 L ENGINE)

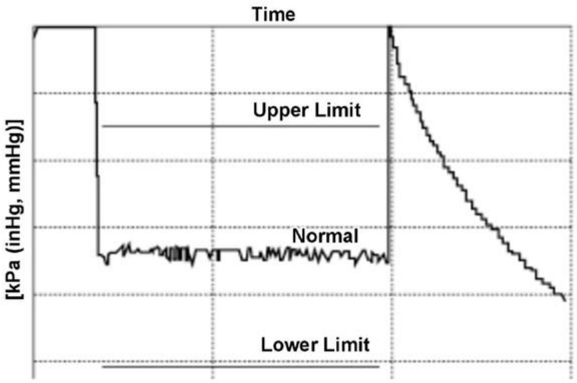
DTC P043F: Evaporative Emission (EVAP) Leak Check Module Standard Pressure High

General Description



EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE VACUUM PUMP
LEAK CHECK PRESSURE SENSOR
EVAP canister
PURGE COTROL VALVE





The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT SENSOR 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere. If pressure is reduced with the fuel vapor containment valve open, the entire EVAP system will be diagnosed, and if the fuel vapor containment valve is closed, only the EVAP canister side will be diagnosed.

A malfunction is detected and a DTC is stored when changes in the pressure are equal to or more than the prescribed value after the prescribed time of starting the system pressure reduction.

EVAP leak check module operation flow

- Reference pressure measurement : Malfunction detection in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction : Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement : Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the vacuum pump during detection.

Reference pressure is the pressure reduction caused by the reference orifice (#40 equivalent) in the EVAP leak check module used to check for leak by comparison with the system pressure reduction.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	At least 6 minutes, 30 seconds but not more than 18 minutes, 45 seconds
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after turn the vehicle to the ON mode	10 minutes	-
Elapsed time after turn the vehicle to the OFF (LOCK) mode	5 hours	-
PCM wake up engine coolant temperature [ECT SENSOR 1]	40 deg. F (5 deg. C)	95 deg. F (35 deg. C)

Condition	Minimum	Maximum
Barometric pressure[BARO SENSOR]	76 kPa (569 mmHg, 22.5 inHg)	-

Other	No refueling is required	

[ ]: HDS Parameter

Malfunction Threshold

The reference pressure is -0.1 kPa (-7.5 mmHg, -0.3 inHg) or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Vacuum pump failure
- Vacuum pump (Motor) failure
- Control valve failure
- Reference orifice flow quantity is excessive
- Reference orifice flow quantity is too low

Confirmation Procedure

Operating Condition

- With the engine coolant temperature [ECT SENSOR 1] within the specified range, turn the vehicle to the ON mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes 45 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored. Engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory.

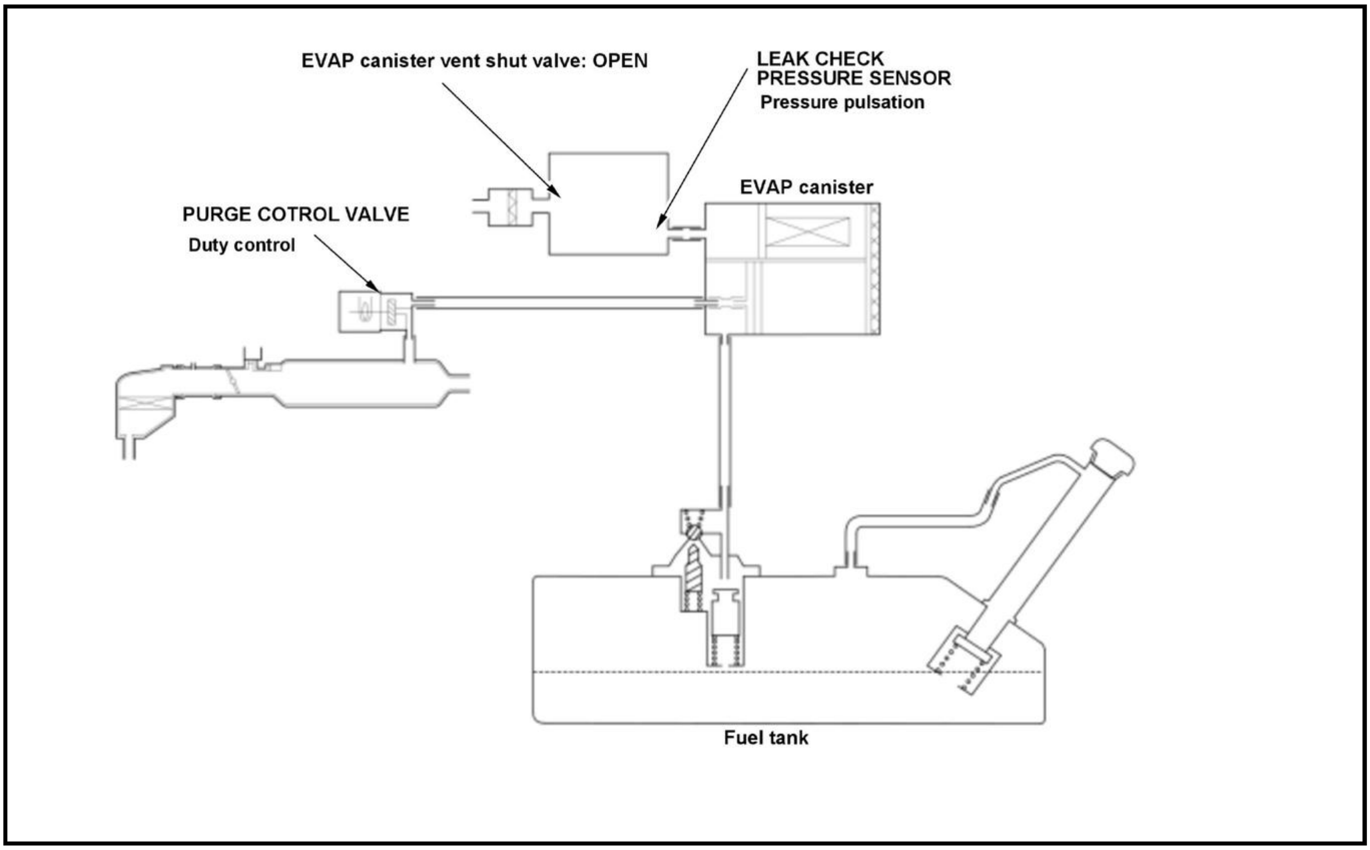
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

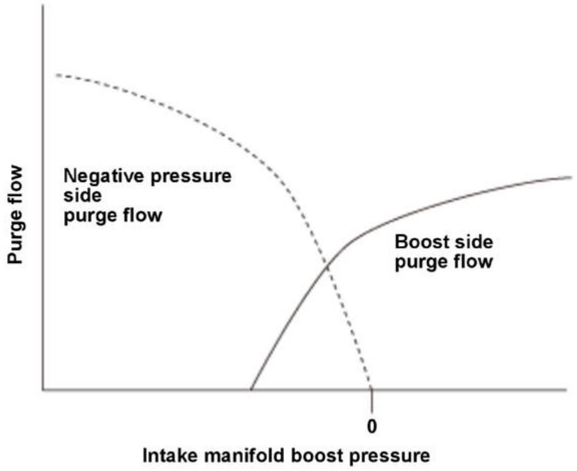
DTC P0441 (1.5 L ENGINE)

DTC P0441: Evaporative Emission (EVAP) System Purge Flow Malfunction

General Description



EVAP canister vent shut valve: OPEN
LEAK CHECK PRESSURE SENSOR
Pressure pulsation
PURGE COTROL VALVE
Duty control
EVAP canister
Fuel tank



Negative side purge flow	Boost side purge flow	Purge back-flow (P2450)	Condition
Flowing	Flowing	OK	Purge line normal, EVAP canister purge valve normal
Flowing	Flowing	NG (P2450)	Non-return valve A abnormal

Negative side purge flow	Boost side purge flow	Purge back-flow (P2450)	Condition
Not flowing	Flowing	-	Negative side purge line abnormal
Flowing	Not flowing	-	Boost side purge line abnormal
Not flowing	Not flowing	-	Purge line abnormal, EVAP canister purge valve open

The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine.

The PCM checks the purge flow conditions on both negative and boost pressure sides. If either side of the purge flow is detected as abnormal, it is determined that there is a clog or disconnection on the abnormal side of the purge line. If both sides of the purge flow are detected as abnormal, it is determined that the purge lines are abnormal or the EVAP canister purge valve is stuck opened.

Purge flow check of negative pressure side:

<STEP 1>

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the fuel tank pressure (FTP) sensor during purge flow (pulse method).

OK determination: Pulse exists (P0441 OK)

- P04F1 Purge flow OK
- P04DF EVAP canister purge valve stuck Open OK

NG determination: No pulse (P0441 NG)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve OPEN failure
- In this case, classify the failed part according to <STEP 2>

<STEP 2>

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN:

When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the vehicle condition is turned to the OFF (LOCK) mode: P04DF EVAP canister purge valve stuck OPEN

When there is no fluctuation of the FTP sensor: P04F1 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	9.5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Low load duration time	10 seconds	-
Engine coolant temperature [ECT SENSOR 1] before EVAP purge control starts	55 deg. C (131 deg. F)	-
MAP value [MAP SENSOR]	-	81 kPa (610 mmHg, 24.0 inHg)

[ ]: HDS Parameter

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.5 V	-
Fuel trim	0.75	1.47
EVAP canister purge valve duty [EVAP PC DUTY]	40 %	60 %
Fuel feedback	Closed loop at stoichiometric	

[ ]: HDS Parameter

Malfunction Threshold

The pulses detected by the FTP sensor are 30 % or less for at least 11 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve closed stuck
- EVAP canister purge valve open stuck
- FTP sensor output stuck
- EVAP system line clogged
- EVAP system line misinstalled

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 64 seconds.
- Drive the vehicle at high load for total of at least 11 seconds.
- Turn the vehicle to the OFF (LOCK) mode and leave the vehicle for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

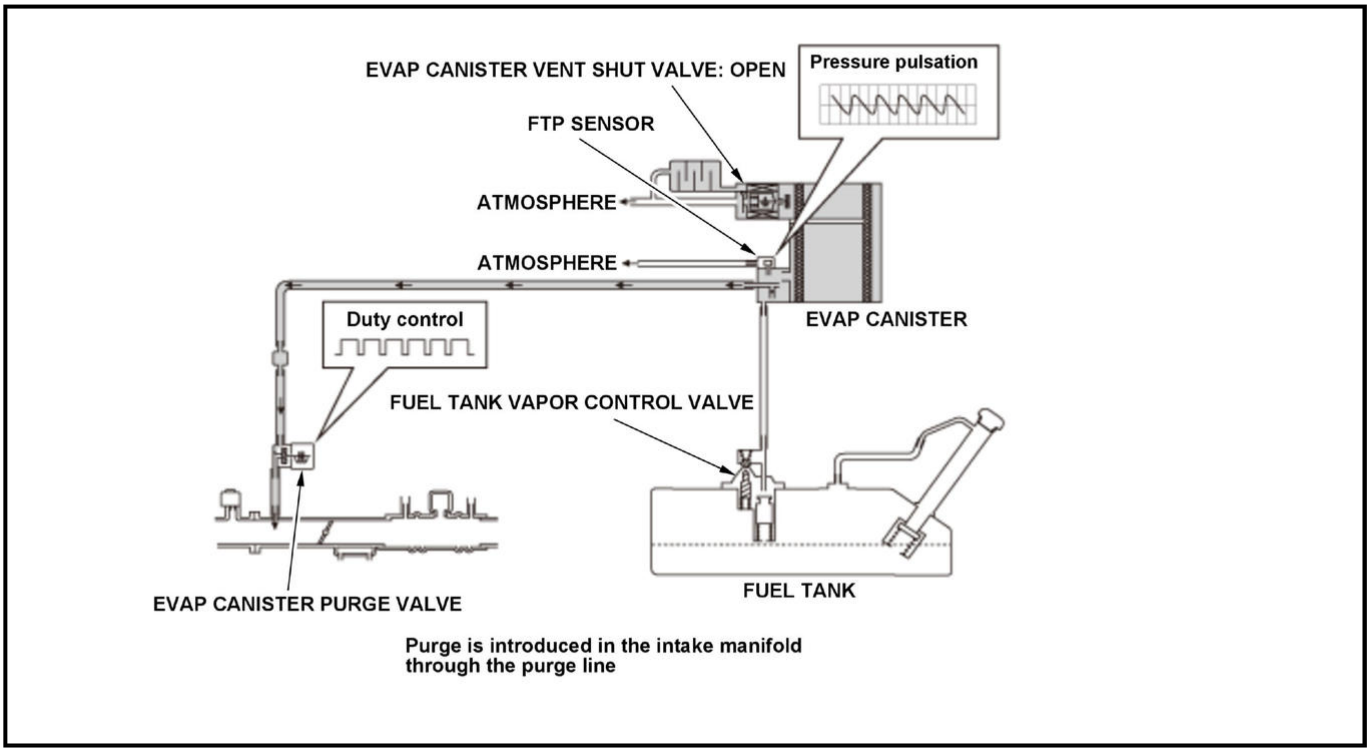
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0441 (2.4 L ENGINE) (2017 2018 2019)

DTC P0441: Evaporative Emission (EVAP) System Purge Flow Malfunction

General Description



EVAP CANISTER VENT SHUT VALVE: OPEN
Pressure pulsation
FTP SENSOR
ATMOSPHERE
ATMOSPHERE
EVAP CANISTER
Duty control
FUEL TANK VAPOR CONTROL VALVE
EVAP CANISTER PURGE VALVE
FUEL TANK
Purge is introduced in the intake manifold through the purge line

The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine.

<STEP 1>

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the fuel tank pressure (FTP) sensor during purge flow (pulse method).

OK determination: Pulse exists (P0441 OK)

- P04F1 Purge flow OK
- P04DF EVAP canister purge valve stuck Open OK

NG determination: No pulse (P0441 NG)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve OPEN failure.
- In this case, classify the failed part according to <STEP 2>.

<STEP 2>

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN:

When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the engine start/stop button is pressed to select the OFF mode: P04DF EVAP canister purge valve stuck OPEN

When there is no fluctuation of the FTP sensor: P04F1 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	18 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Low load duration time	10 seconds	-
Engine coolant temperature [ECT SENSOR 1] before EVAP purge control starts	131 deg. F (55 deg. C)	-
MAP value [MAP SENSOR]	-	-47 kPa (-350 mmHg, -13.7 inHg)
12 volt battery voltage [BATTERY]	10.5 V	-
Fuel trim	0.69	1.47
EVAP canister purge valve duty [EVAP PC DUTY]	30 %	80 %
Fuel feedback	Closed loop at stoichiometric	

[ ]: HDS Parameter

Malfunction Threshold

The pulses detected by the FTP sensor are 40 % or less for at least 18 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve closed stuck
- EVAP canister purge valve open stuck
- FTP sensor output stuck
- EVAP system line clogged
- EVAP system line misinstalled

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 63 seconds.
- Turn the vehicle to the OFF (LOCK) mode and leave the vehicle for at least 10 seconds.

With the HDS

None.

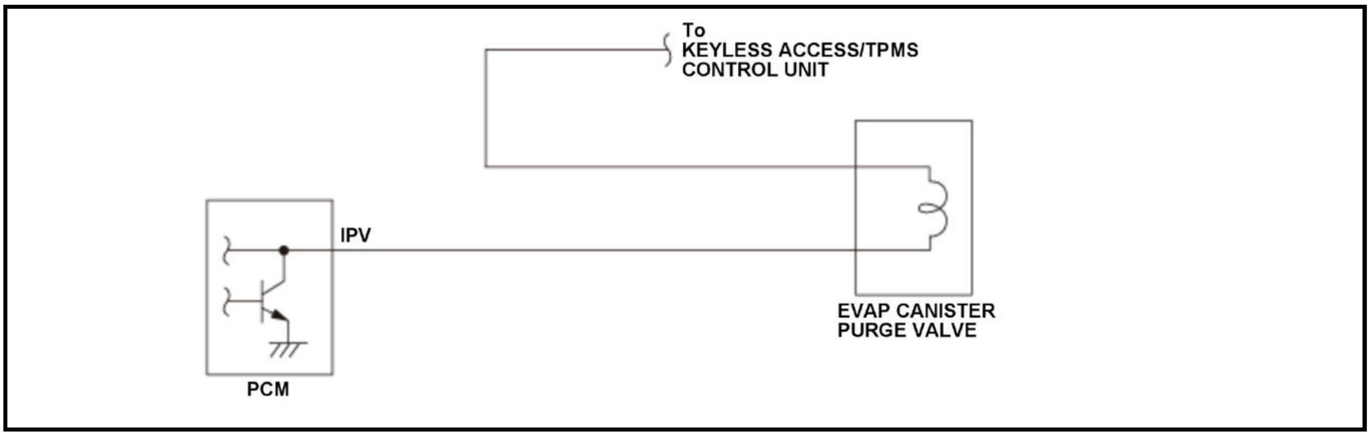
DTC P0443 (1.5 L ENGINE)

DTC P0443: Evaporative Emission (EVAP) Canister Purge Valve Circuit Malfunction

General Description



The evaporative emission (EVAP) canister purge valve is attached to the vacuum port between the intake manifold and the EVAP canister. The powertrain control module (PCM) does not turn on the EVAP canister purge valve when the engine coolant temperature is less than a specified value. The PCM adjusts the amount of fuel vapor sent to the engine by controlling the EVAP canister purge valve duty cycle. When the return signal does not change according to the EVAP canister purge valve output for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Nomal
LEAK DETCTION PRESSURE SENSOR output
(After Duty control component removal)
LEAK DETCTION PRESSURE SENSOR output
(After noise removal)
LEAK DETECTION PRESSURE SENSOR
Malfunction
Duty control
One Cycle
LEAK DETECTION PRESSURE SENSOR

The powertrain control module (PCM) monitors the leak detection pressure sensor output voltage. The leak detection pressure sensor output voltage rises as the fuel tank pressure increases. Conversely, the leak detection pressure sensor output voltage drops as the fuel tank pressure decreases. Rapid changes in the leak detection pressure sensor output voltage due to electrical noise or an intermittent open during the EVAP leak detection may cause incorrect leak detection, so abnormal output is monitored. If the leak detection pressure sensor output voltage change occurs for specified ratio within a set time, the PCM detects a malfunction and stores a DTC.

Malfunction Threshold

The leak detection pressure sensor output voltage change occurs for specified ratio within a set time.

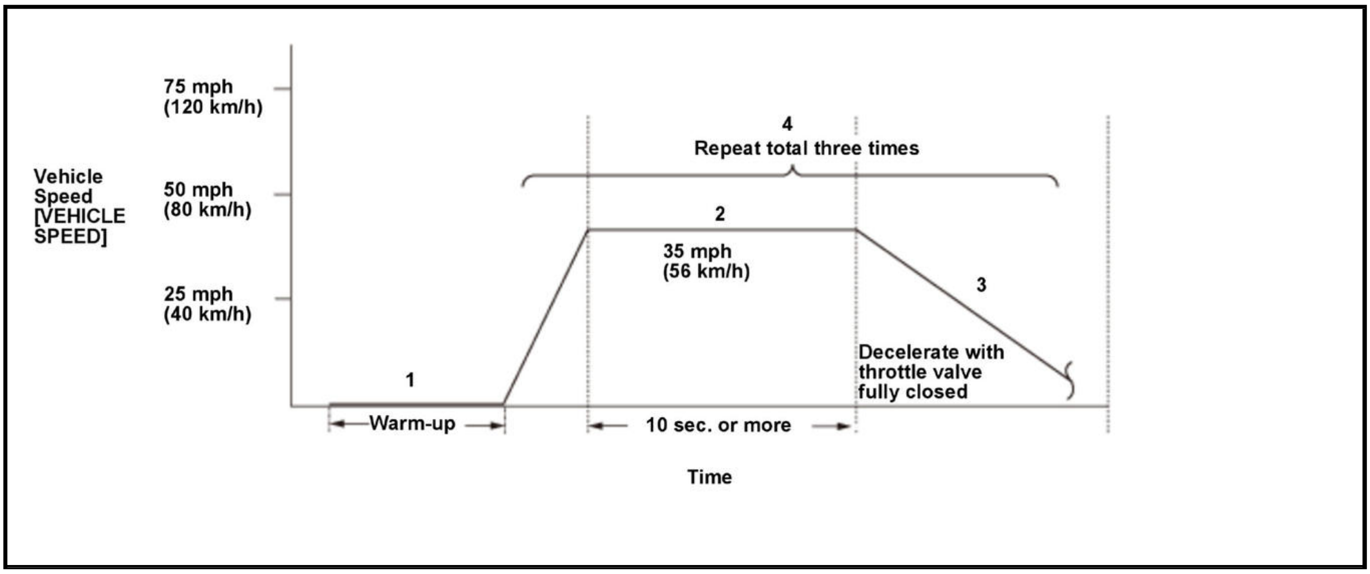
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Leak detection pressure sensor failure

Confirmation Procedure

Operating Condition



- Start the engine and let it idle until the radiator fan comes on.
- Drive the vehicle at a steady speed 35 mph (56 km/h) for at least 10 seconds.
- Decelerate with the throttle valve fully closed.
- Repeat Driving Pattern steps 2 through 3, three times.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

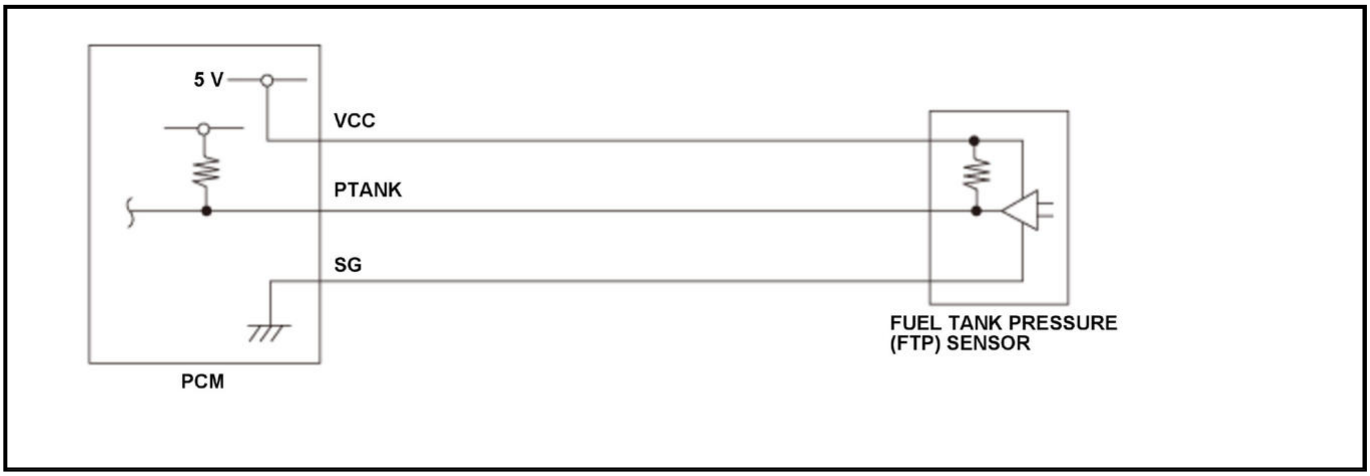
Conditions for clearing the DTC

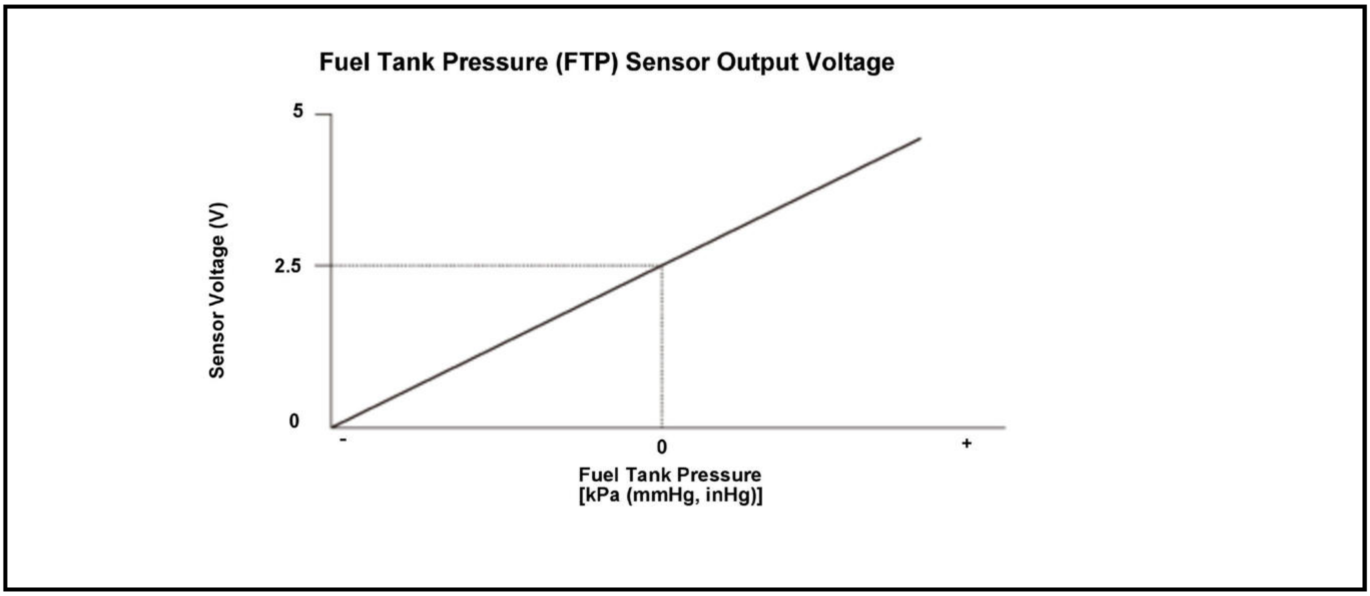
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

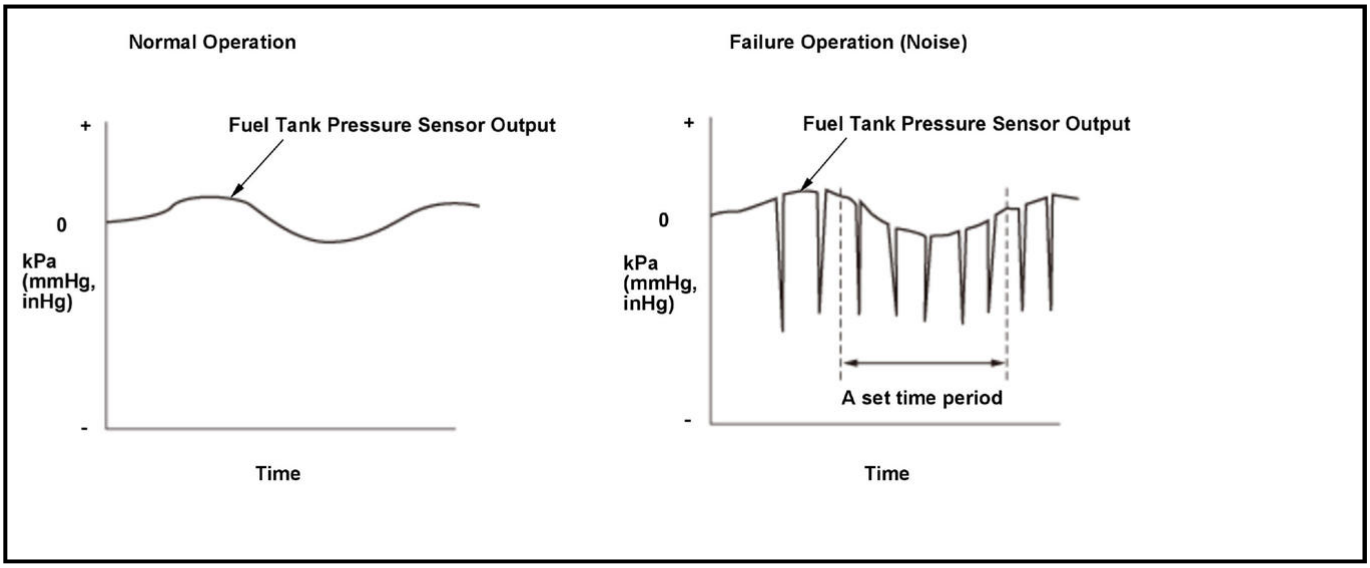
DTC P0451 (2.4 L ENGINE) (2017 2018 2019)

DTC P0451: Fuel Tank Pressure (FTP) Sensor Circuit Range/Performance Problem

General Description







The fuel tank pressure (FTP) sensor is installed on the evaporative emission (EVAP) canister. The FTP sensor is used to detect leaks in the EVAP system. The powertrain control module (PCM) monitors the FTP sensor output voltage. The FTP sensor output voltage rises as the fuel tank pressure increases. Conversely, the FTP sensor output voltage drops as the fuel tank pressure decreases. Rapid changes in the FTP sensor output voltage due to electrical noise or an intermittent open during the EVAP leak detection may cause incorrect leak detection, so abnormal output is monitored. If the FTP sensor output voltage change occurs for specified ratio within a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	31 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	10 seconds	-
Engine coolant temperature [ECT SENSOR 1]	131 deg. F (55 deg. C)	-

The starter control system prevents the starter from accidentally activating when the shift position is not in the P or N position, or when the engine is running. If the vehicle is turned mistakenly while shift position is not in P or N or while the engine is running, the powertrain control module (PCM) will stop power to the starter cut relays. In this system, two starter cut relays are connected in series (starter cut relay 1, starter cut relay 2) to prevent the starter from running continuously to a starter cut relay malfunction. To activate the starter, the starter control latch circuit and the drive cut circuit which are in the PCM are switched ON to apply power to the starter cut relays. When the starter control latch circuit ON malfunction is detected, the drive cut circuit shuts down output to the starter control latch circuit to prevent the starter from continuing to run. If the ST CUT RLY1 CL- return signal is LOW while the starter control latch circuit is OFF, the PCM detects a malfunction of the ST CUT RLY1 CL- line and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Duration	5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The ST CUT RLY1 CL- return signal is LOW for at least 5 seconds when the starter is OFF.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Starter cut relay 1 ST CUT RLY1 CL- line short to ground
- Starter cut relay 1 ST CUT RLY1 CL- line open
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

START DIAG
PCM

The starter control system prevents the starter from accidentally activating when the shift position is not in P or N position/mode, or when the engine is running. If the vehicle is turned mistakenly while shift position is not in P or N position/mode or while the engine is running, the powertrain control module (PCM) will stop power to the starter cut relays. However, cranking to return from auto idle stop does not correspond to this (if equipped). In this system, two starter cut relays are connected in series (starter cut relay 1, starter cut relay 2) to prevent the starter from running continuously due to a starter cut relays malfunction. Also a diagnosis line (START DIAG) is connected to monitor the voltage between the starter cut relay 1 and starter cut relay 2. Based on the diagnosis line signals, the PCM detects an OPEN malfunction of diagnosis line, an ON malfunction of starter cut relay 1, and an ON malfunction of starter cut relay 2. The PCM also equips with return signal circuits of starter cut relay 1 and starter cut relay 2 to detect an OFF malfunction. If the STRLY2 return signal is LOW for a specified time when the starter is OFF (STS OFF), the PCM detects an open or a short to ground of the STRLY2 and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The STRLY2 return signal is LOW for at least 5 seconds when the starter is OFF (STS OFF).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Starter cut relay 2 STRLY2 line short to ground
- Starter cut relay 2 STRLY2 line open
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

START DIAG
PCM

The starter control system prevents the starter from accidentally activating when the shift position is not in the P or N position, or when the engine is running. If the vehicle is turned mistakenly while shift position is not in P or N or while the engine is running, the powertrain control module (PCM) will stop power to the starter cut relays. In this system, two starter cut relays are connected in series (starter cut relay 1, starter cut relay 2) to prevent the starter from running continuously to a starter cut relay malfunction. To activate the starter, the starter control latch circuit and the drive cut circuit which are in the PCM are switched ON to apply power to the starter cut relays. When the starter control latch circuit ON malfunction is detected, the drive cut circuit shuts down output to the starter control latch circuit to prevent the starter from continuing to run. If the ST CUT RLY2 CL- return signal is LOW while the starter control latch circuit is OFF, the PCM detects a malfunction of the ST CUT RLY2 CL- line and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Duration	5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The ST CUT RLY2 CL- return signal is LOW for at least 5 seconds when the starter is OFF.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Starter cut relay 2 ST CUT RLY2 CL- line short to ground
- Starter cut relay 2 ST CUT RLY2 CL- line open
- PCM internal circuit failure

START DIAG
PCM

The starter control system prevents the starter from accidentally activating when the shift position is not in P or N position/mode, or when the engine is running. If the vehicle is turned mistakenly while shift position is not in P or N position/mode or while the engine is running, the powertrain control module (PCM) will stop power to the starter cut relays. However, cranking to return from auto idle stop does not correspond to this (if equipped). In this system, two starter cut relays are connected in series (starter cut relay 1, starter cut relay 2) to prevent the starter from running continuously due to a starter cut relays malfunction. Also a diagnosis line (START DIAG) is connected to monitor the voltage between the starter cut relay 1 and starter cut relay 2. Based on the diagnosis line signals, the PCM detects an OPEN malfunction of diagnosis line, an ON malfunction of starter cut relay 1, and an ON malfunction of starter cut relay 2. The PCM also equips with return signal circuits of starter cut relay 1 and starter cut relay 2 to detect an OFF malfunction. If the STRLY1 return signal is HIGH for a specified time when the starter is ON (STS ON), the PCM detects a short to power of the STRLY1 line and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	0.3 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
Starter	ON

Malfunction Threshold

The STRLY1 return signal is HIGH for at least 0.3 seconds when the starter is ON (STS ON).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Starter cut relay 1 STRLY1 line short to power
- PCM internal circuit failure

TRANSMISSION RANGE SWITCH

Transmission range switch contact point input matrix:

Shift lever position/mode	**Input per switch**							
	ATP-P	**ATP-R**	**ATP-N**	**ATP-D**	**ATP-S**	**ATP-L**	**ATP-FWD**	**ATP-RVS**
P	O	X	X	X	X	X	X	X
R	X	O	X	X	X	X	X	O
N	X	X	O	X	X	X	X	X
D	X	X	X	O	X	X	O	X
S	X	X	X	X	O	X	O	X
L	X	X	X	X	X	O	O	X

O: Closed X: Open

The transmission range switch is attached to a control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The shift position indicator shows which position is selected according to the Low/High signal combinations, which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is high (5 V or 12 V) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is low (0 V) when each switch is closed. If the RVS switch is open with the shift lever in R while shifting between P, R, and N, the PCM detects an RVS switch open failure and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	320 milliseconds or more
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY VOLTAGE]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

No RVS signal [Reverse Switch (ATPRVS)] is detected with the shift lever in R position/mode while shifting between P, R, and N position/mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission range switch ATP-RVS line open (includes connector loose connection or disconnection)
- Transmission range switch failure
- Shift cable adjustment failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine.
- With the brake pedal pressed, shift to P, R position/mode, through N position/mode, then shift to R position/mode again, and wait for at least 320 milliseconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

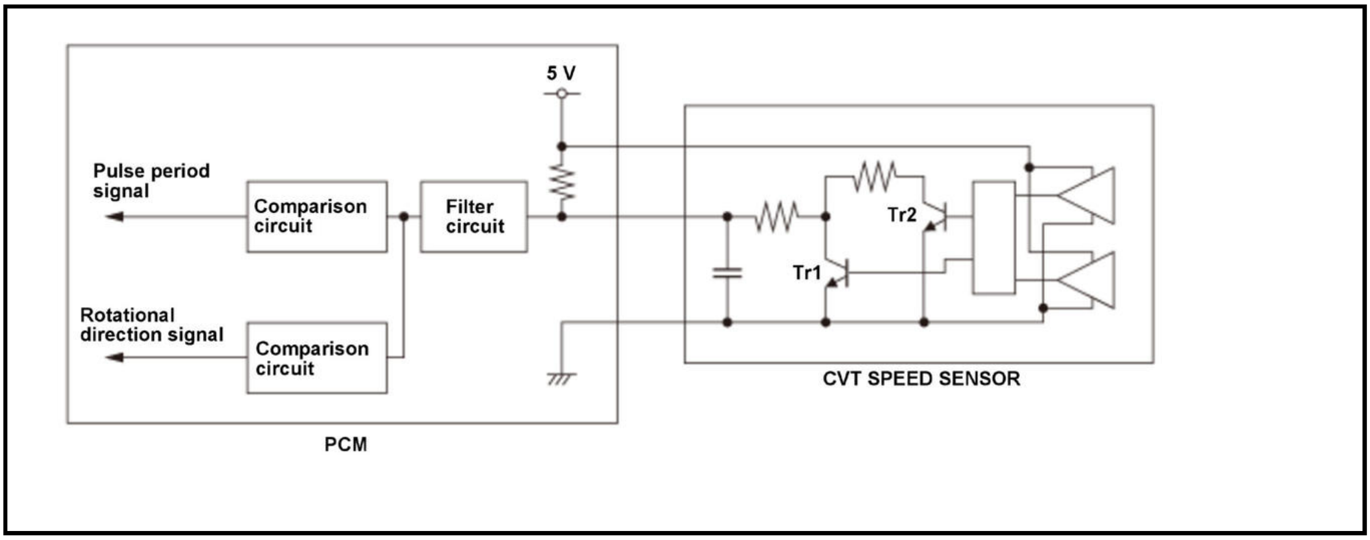
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P1840 (CVT (ECM/PCM))

DTC P1840: CVT Speed Sensor Circuit Forward Rotation Range/Performance

General Description



5 V
Pulse period signal
Comparison circuit
Filter circuit
Rotational direction signal
Comparison circuit
Tr2

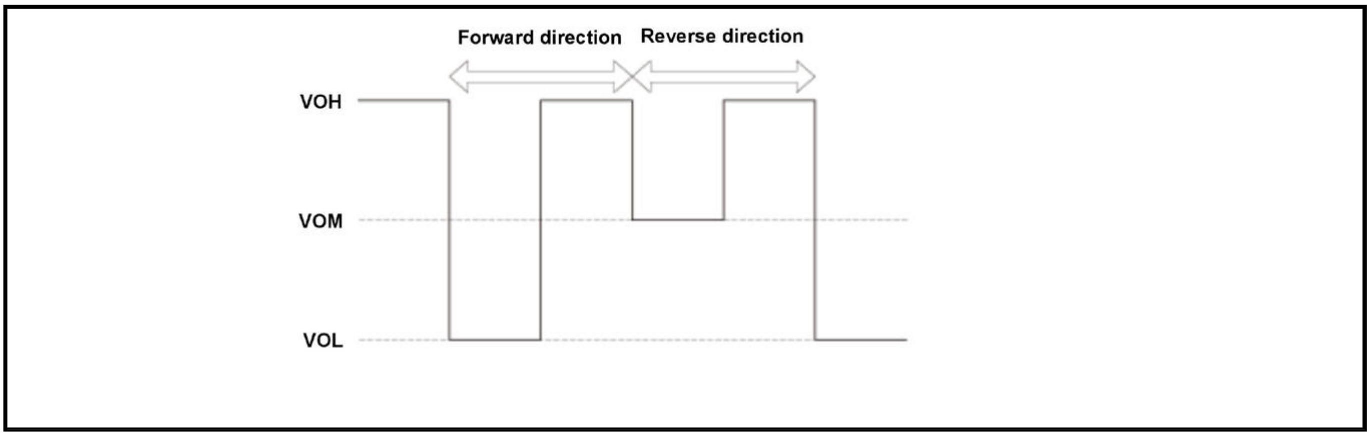
CVT SPEED SENSOR
PCM



Tr1	Tr2	Pulse signal voltage level
OFF	OFF	VOH

Tr1	Tr2	Pulse signal voltage level
OFF	ON	VOM
ON	OFF	VOL

The CVT speed sensor is attached to the outside of the torque converter housing. The CVT speed sensor consists of a semiconductor to detect the position of the secondary driven gear. When the secondary driven gear rotates, the magnetic flux in the CVT speed sensor changes. The changes of magnetic flux are converted into pulsing signals to the powertrain control module (PCM). The rotational direction of the secondary driven gear is detected by the voltage level of the pulsing signals. If the driving condition and the detected voltage level of the pulsing signals do not match, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

Vehicle speed [VEHICLE SPEED]	19 mph (30 km/h)	-
Shift lever position/mode	D, S, L	
Drive pulley rotational direction	Forward direction	
Other	Not when the shift lever is being shifted	

[ ]: HDS Parameter

Malfunction Threshold

The CVT speed sensor outputs [Direction of Secondary-shaft Rotation] a reverse direction signal for at least 2 seconds when driving in forward position.

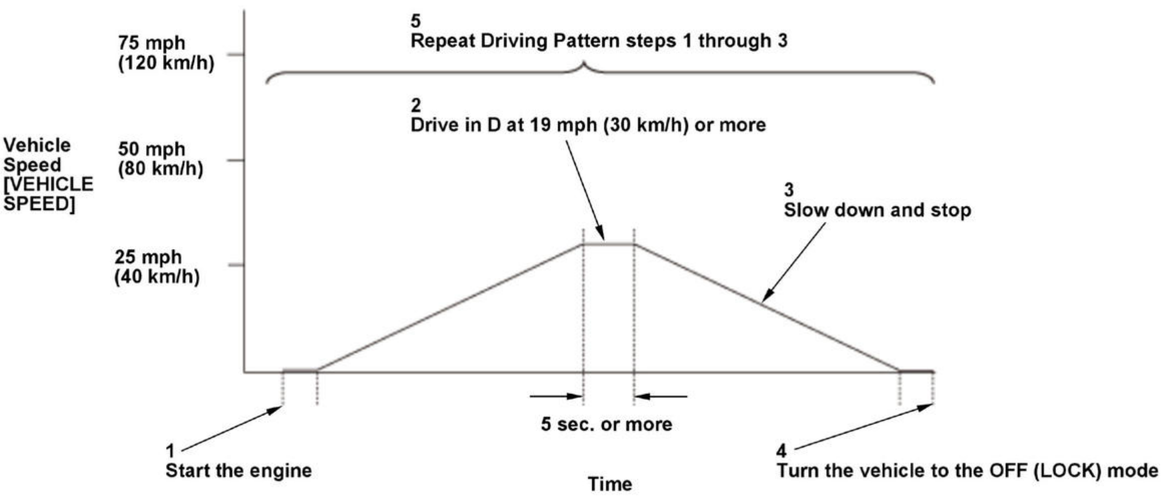
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT speed sensor failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition



- Start the engine.
- Drive the vehicle in D position/mode at a speed of 19 mph (30 km/h) or more for at least 5 seconds.
- Slow down and stop the vehicle.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 3.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P1841 (CVT (ECM/PCM))

DTC P1841: CVT Speed Sensor Circuit Reverse Rotation Range/Performance

Tr1
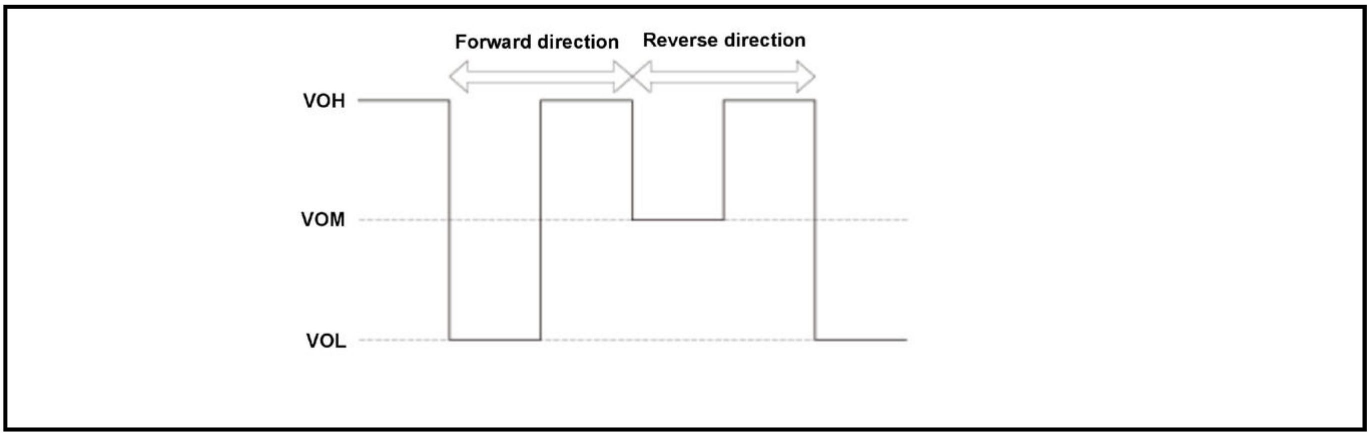
CVT DRIVE PULLEY SPEED SENSOR



Tr1	Tr2	Pulse signal voltage level
OFF	OFF	VOH
OFF	ON	VOM
ON	OFF	VOL

The CVT drive pulley speed sensor is attached to the outside of the end cover. The CVT drive pulley speed sensor consists of a semiconductor to detect the position of the drive pulley. When the drive pulley rotates, the magnetic flux in the CVT drive pulley speed sensor changes. The changes of magnetic flux are converted into pulsing signals to the powertrain control module (PCM). The rotational direction of the drive pulley is detected by the voltage level of the pulsing signals. If the driving condition and the detected voltage level of the pulsing signals do not match, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after forward clutch engage completion	3 seconds	-
Engine speed [ENGINE SPEED]	500 rpm	-
Forward clutch commanded	295 kPa (3.0 kgf/cm 2, 42.7 psi)	-

Condition	Minimum	Maximum
pressure		
Vehicle speed [VEHICLE SPEED]	19 mph (30 km/h)	-
Shift lever position/mode	D, S, L	
Other	Not when the shift lever is being shifted	
	Rotation speed [Secondary Shaft Speed 1 (rpm)] measured by CVT speed sensor is more than 500 rpm	
	Rotational direction [Direction of Secondary-shaft Rotation] measured by CVT speed sensor is forward direction	

[ ]: HDS Parameter

Malfunction Threshold

The CVT drive pulley speed sensor outputs [Direction of Drive Pulley Rotation] a reverse direction signal for at least 2 seconds when driving in forward position.

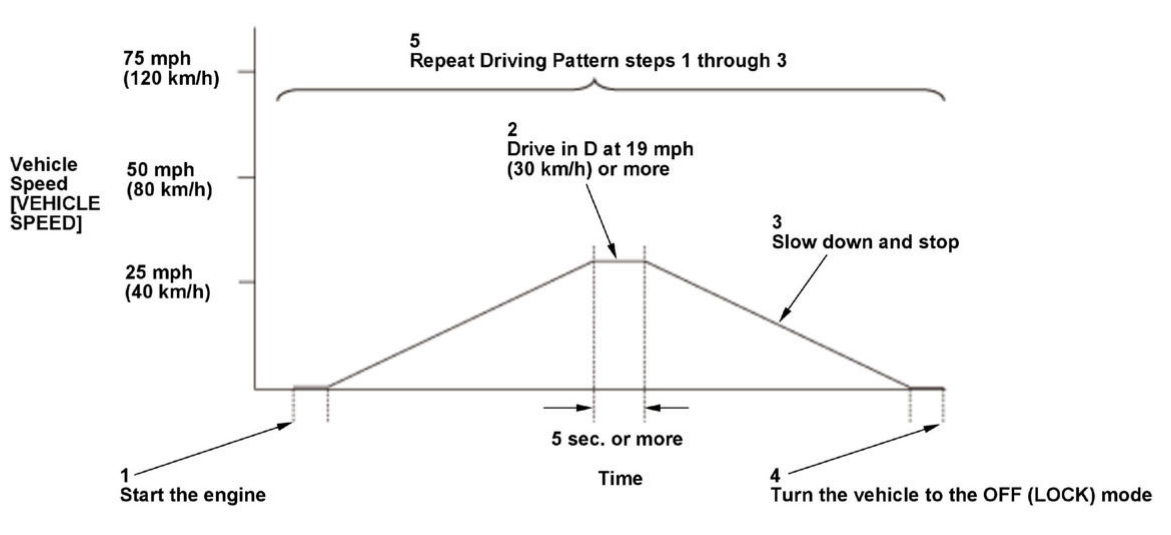
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT drive pulley speed sensor failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition



- Start the engine.
- Drive the vehicle in R position/mode at a speed of 19 mph (30 km/h) or more for at least 5 seconds.
- Slow down and stop the vehicle.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 3.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

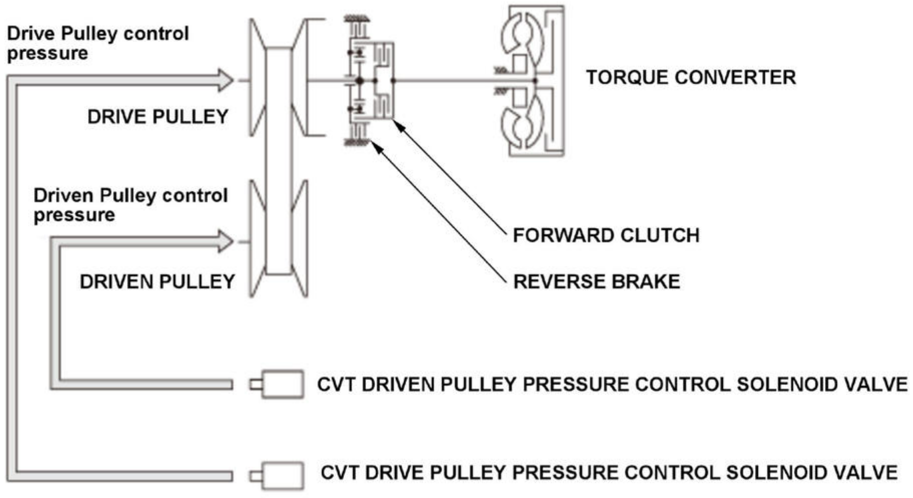
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P1890 (CVT (ECM/PCM))

DTC P1890: CVT Speed Control System

General Description



Drive Pulley control pressure
DRIVE PULLEY
Driven Pulley control pressure
DRIVEN PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
REVERSE BRAKE
CVT DRIVEN PULLEY PRESSURE CONTROL SOLENOID VALVE
CVT DRIVE PULLEY PRESSURE CONTROL SOLENOID VALVE

The shift control system controls each gear position using a map stored in the powertrain control module (PCM) memory. The shift control system controls the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve based on vehicle speed and the throttle position to keep the drive pulley speed close to the target rpm. It does this by varying the hydraulic pressure applied to the drive and driven pulley and providing feedback on the difference between the target drive pulley speed and the actual drive pulley speed when driving. It supplies high hydraulic pressure to the driven pulley and enlarges the driven pulley belt diameter when shifting to a lower ratio. It supplies high hydraulic pressure to the drive pulley and enlarges the drive pulley belt diameter when shifting to a higher ratio. If the difference between the target drive pulley speed and the actual drive pulley speed falls within a certain range when in D, S, L, or R, the PCM detects a malfunction in the CVT shift function and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	18 seconds or more
DTC Type	One drive cycle, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Drive pulley speed [Input Shaft (Drive Pulley) Speed rpm]	576 rpm	-
Vehicle speed [VEHICLE SPEED]	9 mph (14 km/h)	-
Accelerator pedal position	4.7 deg.	-
Shift lever position/mode	D, S, L, R	

[ ]: HDS Parameter

Malfunction Threshold

The difference between the target drive pulley speed and the actual drive pulley speed [Input Shaft (Drive Pulley) Speed rpm] is 500 rpm or more for at least 18 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT shift function failure

Confirmation Procedure

Operating Condition

- Start the engine.
- Accelerate gradually to 38 mph (60 km/h) and drive at least 1 minute at 38 mph (60 km/h).
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

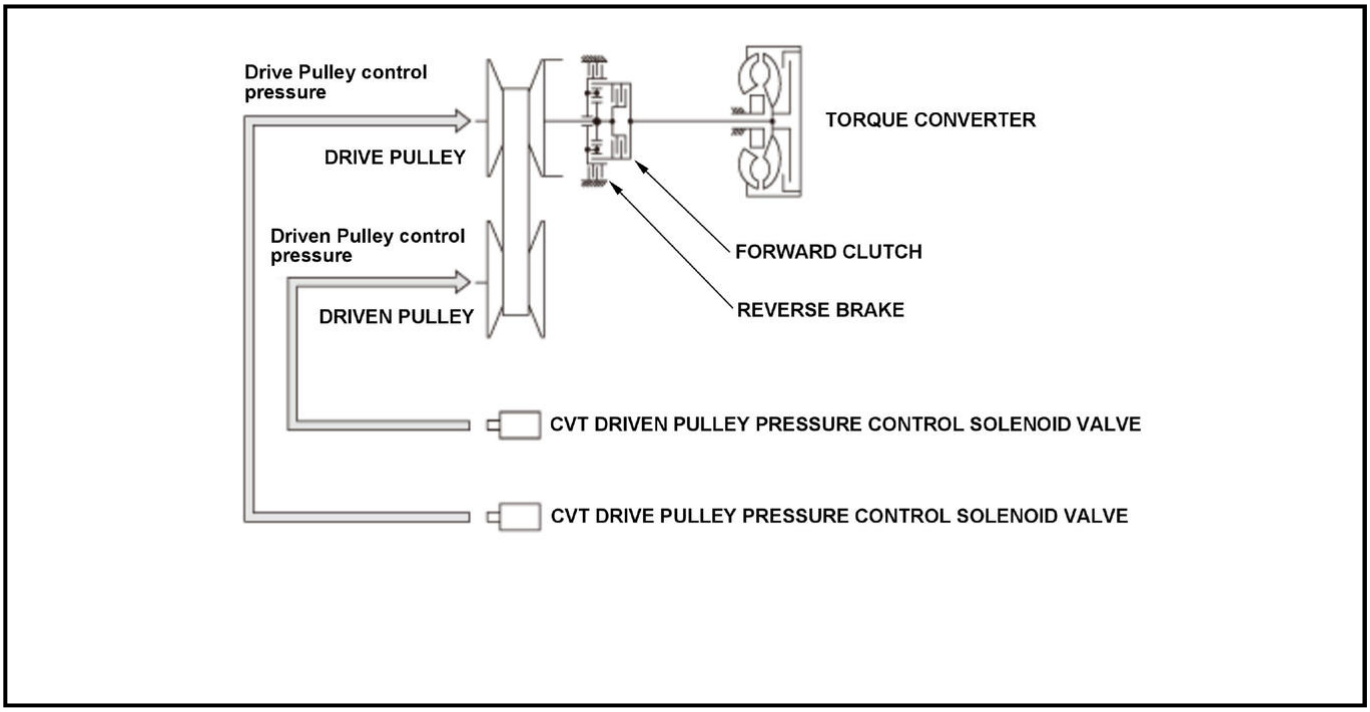
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P1898 (CVT (ECM/PCM))

DTC P1898: CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley Pressure Control Valve Stuck OFF

General Description



Drive Pulley control pressure
DRIVE PULLEY
Driven Pulley control pressure
DRIVEN PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
REVERSE BRAKE
CVT DRIVEN PULLEY PRESSURE CONTROL SOLENOID VALVE
CVT DRIVE PULLEY PRESSURE CONTROL SOLENOID VALVE

The CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve control hydraulic pressure. The CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve is controlled by duty cycle output. The spool in the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. The powertrain control module (PCM) measures the current that passes through the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve and uses feedback control to compensate for the difference between the measured current and the commanded one. To shift the transmission properly, the PCM outputs a drive/driven pulley oil pressure control signal. If the pulley ratio is out of specified range from the vehicle stopped with the forward clutch engaged to the vehicle running, the PCM detects a CVT drive pulley pressure control solenoid valve stuck ON failure or a CVT driven pulley pressure control solenoid valve stuck OFF and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [ENGINE SPEED]	500 rpm	-
Vehicle speed [VEHICLE SPEED]	-	3 mph (5 km/h)*
	9 mph (13 km/h)**	-
Accelerator pedal position	2.7 deg.	-
Shift lever position/mode	D	

*: Symptom 1

**: Symptom 2

[ ]: HDS Parameter

Malfunction Threshold

One of these symptoms occurs:

Symptom	Vehicle conditions	PCM detection
1	Stopped with forward clutch engaged	Pulley ratio is more than 2, or less than 3 for at least 400 milliseconds
2	Running	Pulley ratio is more than 1.8, or less than 3

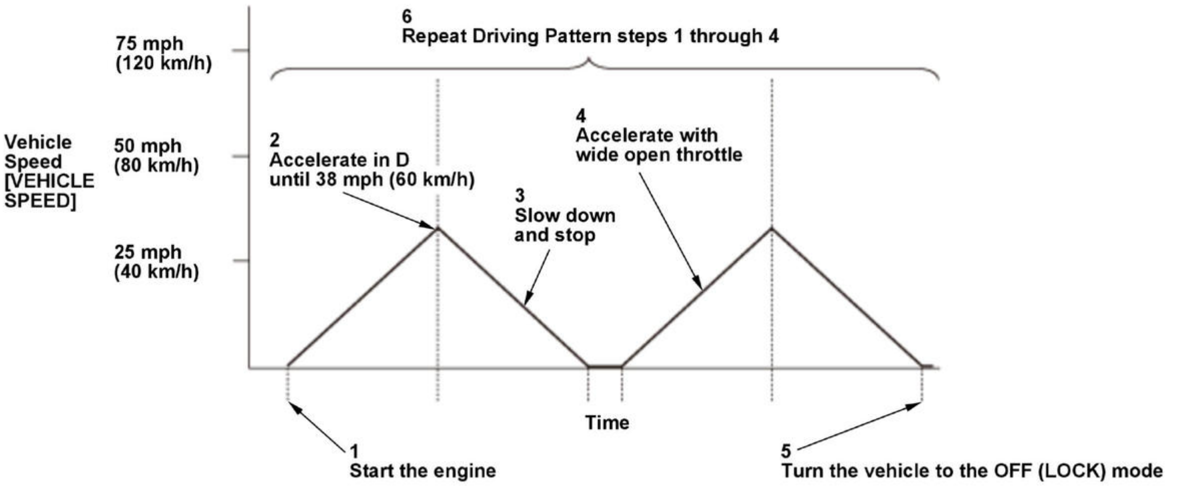
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT drive pulley pressure control solenoid valve stuck on
- CVT driven pulley pressure control solenoid valve stuck off

Confirmation Procedure

Operating Condition



- Start the engine.
- Accelerate the vehicle in D position/mode until the speed reaches 38 mph (60 km/h).
- Slow down and stop the vehicle.
- Accelerate the vehicle with wide open throttle.
- Slow down and stop the vehicle, and turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 4.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

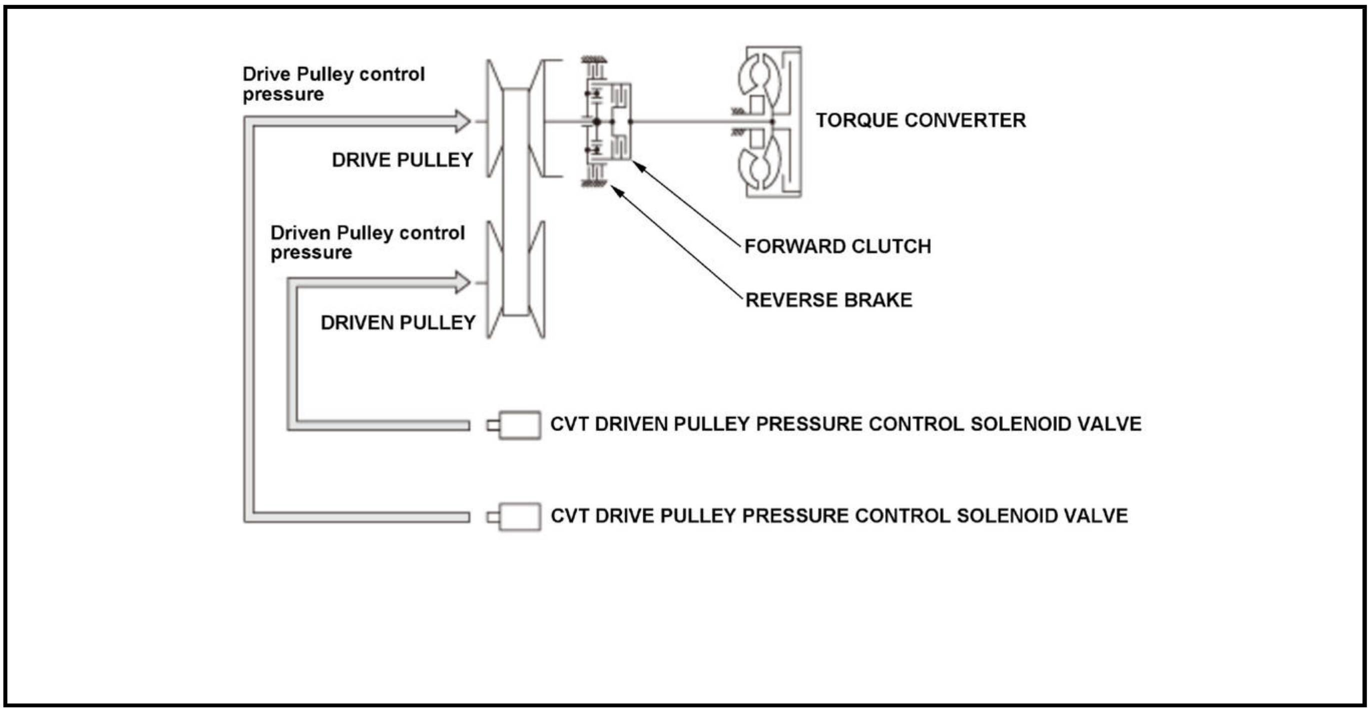
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

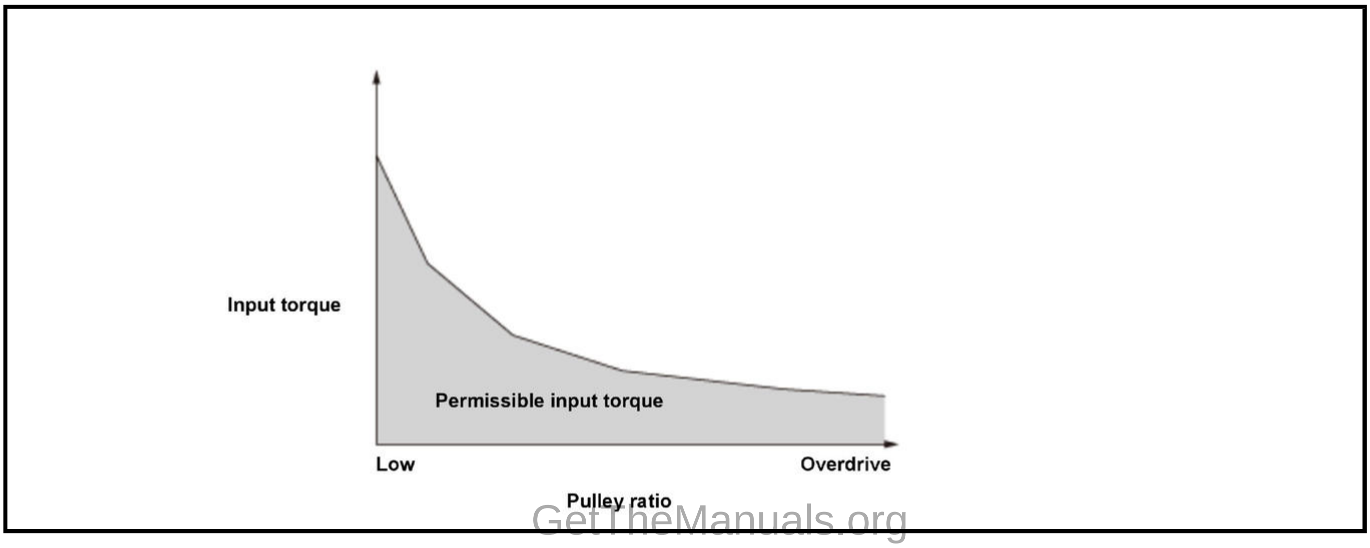
DTC P1899 (CVT (ECM/PCM))

DTC P1899: CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON

General Description



Drive Pulley control pressure
DRIVE PULLEY
Driven Pulley control pressure
DRIVEN PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
REVERSE BRAKE
CVT DRIVEN PULLEY PRESSURE CONTROL SOLENOID VALVE
CVT DRIVE PULLEY PRESSURE CONTROL SOLENOID VALVE



The CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve control hydraulic pressure. The CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve is controlled by duty cycle output. The spool in the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. The powertrain control module (PCM) measures the current that passes through the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve and uses feedback control to compensate for the difference between the measured current and the commanded one. To shift the transmission properly, the PCM outputs a drive/driven pulley oil pressure control signal. If the pulley ratio is overdrive while the vehicle is stopped with the forward clutch engaged, and the estimated input torque when starting is a specified value or less and belt slippage does not occur when driving, the PCM detects a CVT drive pulley pressure control solenoid valve stuck OFF failure or a CVT driven pulley pressure control solenoid valve stuck ON and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions occurs:

- Both Symptom 1 and Symptom 2-A occurs.
- Both Symptom 1 and Symptom 2-B occurs.

Symptom		Vehicle conditions	PCM detection
1		Stopped with forward clutch engaged	Pulley ratio is more than 0.3, or less than 0.6 for at least 2.5 seconds
2	2-A	Starting	Low input torque
	2-B	Running	Pulley ratio is more than 3.0

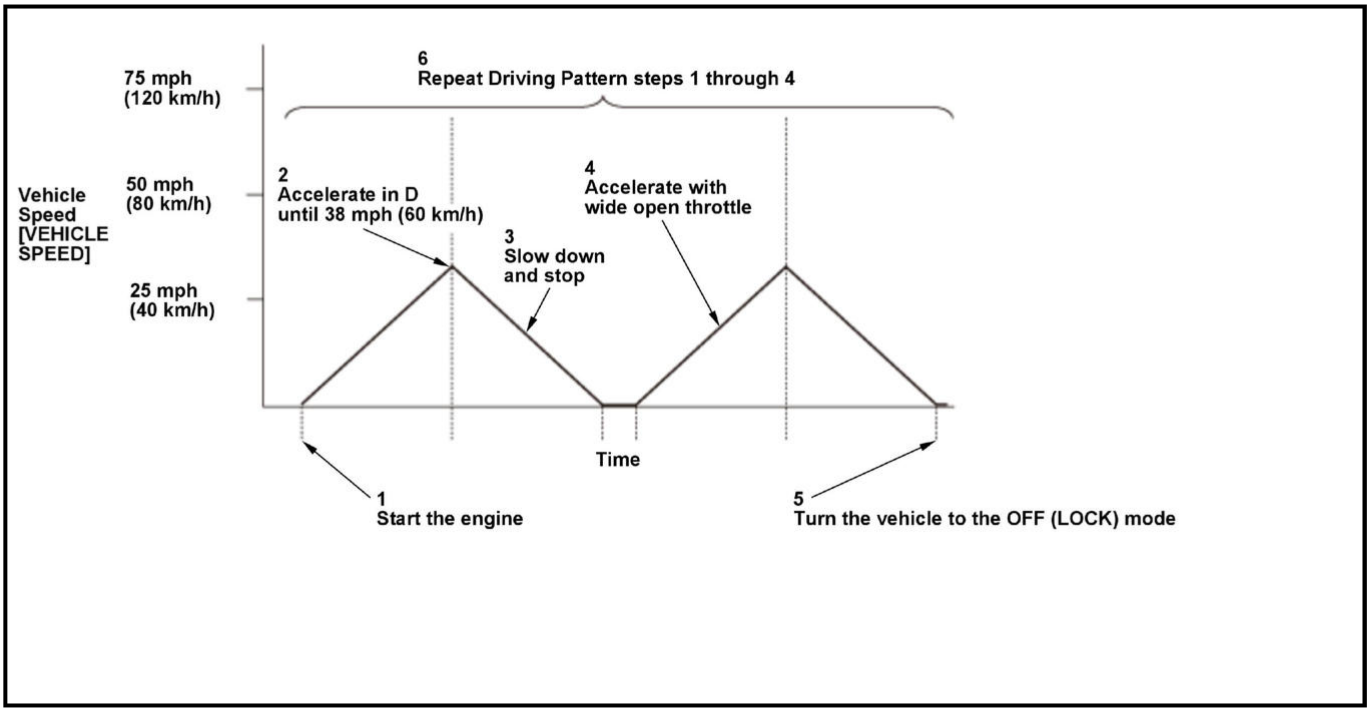
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT drive pulley pressure control solenoid valve stuck off
- CVT driven pulley pressure control solenoid valve stuck on

Confirmation Procedure

Operating Condition



- Start the engine.
- Accelerate the vehicle in D position/mode until the speed reaches 38 mph (60 km/h).
- Slow down and stop the vehicle.
- Accelerate the vehicle with wide open throttle.
- Slow down and stop the vehicle, and turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 4.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

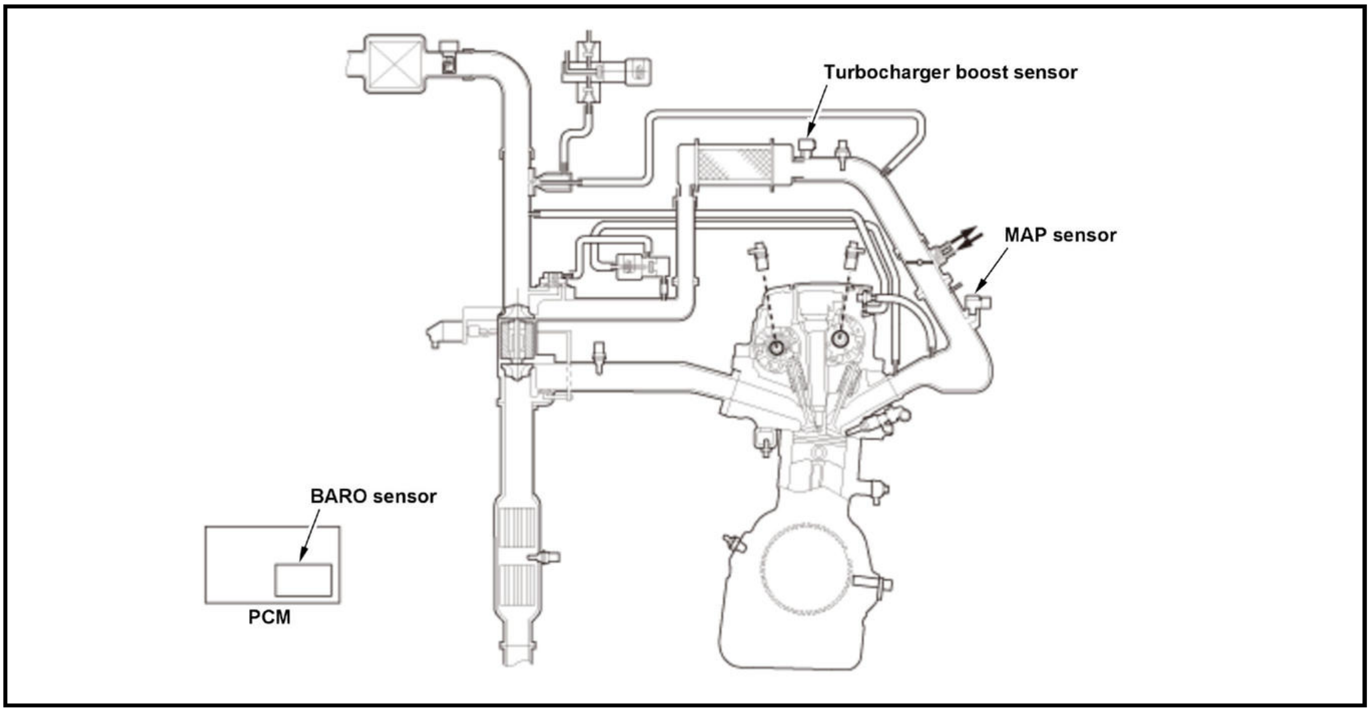
Conditions for clearing the DTC

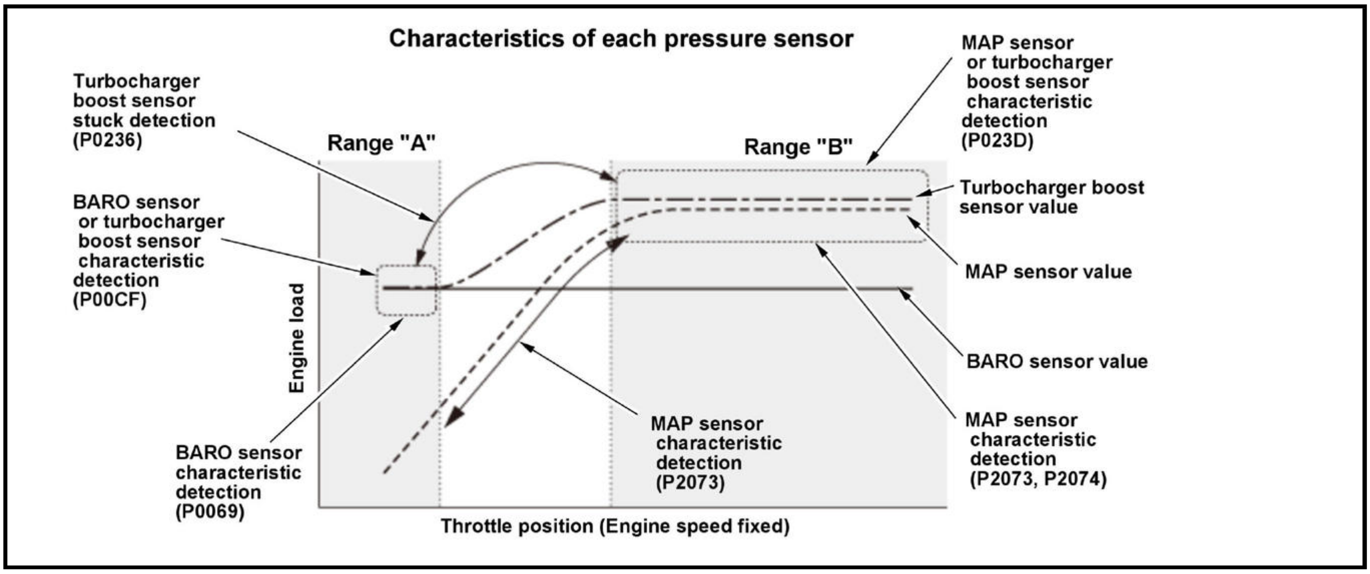
The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2073 (1.5 L ENGINE)

DTC P2073: Manifold Absolute Pressure (MAP) Sensor Signal Higher Than Expected

General Description





The barometric pressure (BARO) sensor, the manifold absolute pressure (MAP) sensor, and the turbocharger boost sensor are equipped to the vehicle to detect air pressure conditions to the engine. The BARO sensor value and the turbocharger boost sensor value shows similar value at range "A" such as in idle conditions, and the turbocharger boost sensor value and MAP sensor value shows similar value at range "B" such as in high throttle position.

Malfunction determinations are done by the powertrain control module (PCM) in two ranges by comparing the pressure sensor values.

- At range "A": BARO sensor or turbocharger boost sensor is abnormal if the difference of the two pressure sensor values are specified or more (P00CF)
- At range "B": Turbocharger boost sensor or MAP sensor is abnormal if the difference of the two pressure sensor values are specified or more (P023D)
- Range "A" determined as abnormal and range "B" determined as normal: BARO sensor abnormal (P0069)
- Both ranges "A" and "B" determined as abnormal: Turbocharger boost sensor abnormal (P0236)

- Turbocharger boost sensor or MAP sensor values do not change when throttle position is transited from ranges "A" to "B": Determined as turbocharger boost sensor output stuck (P0236) or MAP sensor output stuck (P2073 or P2074)

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition		Minimum	Maximum
Elapsed time after starting the engine		3.0 seconds	-
Engine speed [ENGINE SPEED]		1, 700 rpm	-
Throttle position	2, 000 rpm	36.3 deg.	-
	4, 000 rpm	42.2 deg.	-

[ ]: HDS Parameter

Malfunction Threshold

- The variation of the MAP sensor value measured during range "A" determination and range "B" determination is 0.7 kPa (5 mmHg, 0.2 inHg) or less when range "A" determination and range "B" determination are determined as normal and the difference of the BARO sensor value measured during range "A" determination and range "B" determination is 5.4 kPa (40 mmHg, 1.6 inHg) or less.

- The MAP sensor value is higher than the turbocharger boost sensor value for 27 kPa (200 mmHg, 7.9 inHg) or more* when range "A" determination is determined as normal and range "B" determination is determined as abnormal.*: Threshold value changes depending on throttle position.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAP sensor output signal high
- MAP sensor failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at engine speed [ENGINE SPEED] 1, 700 rpm or more for at least 6 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

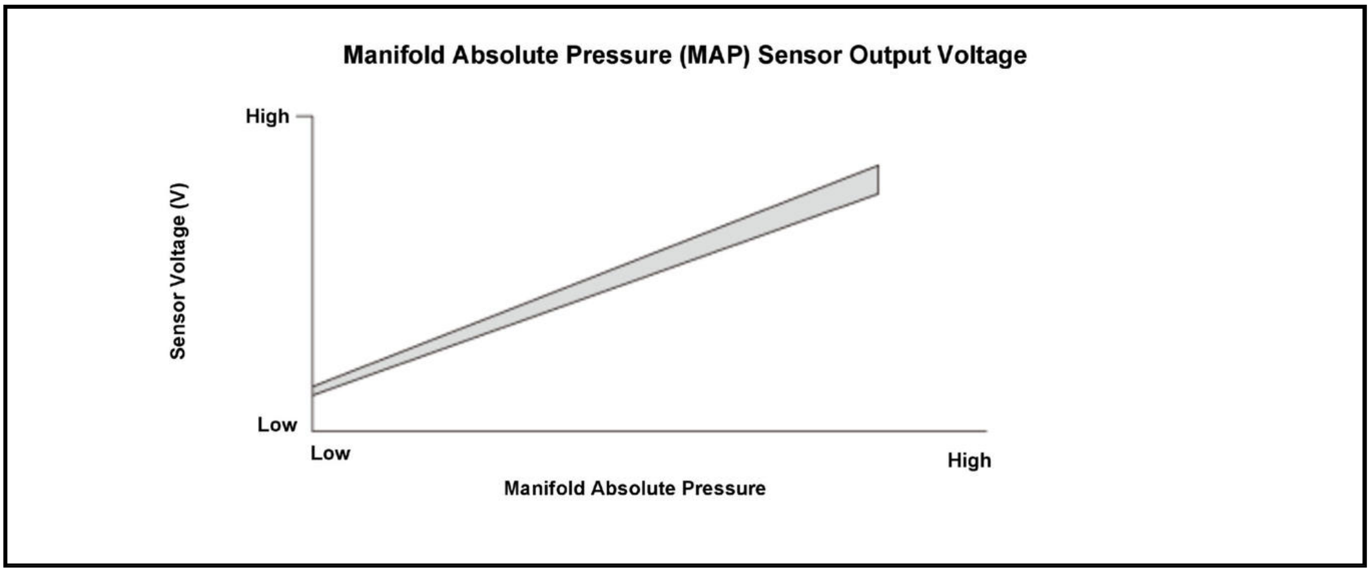
Conditions for clearing the DTC

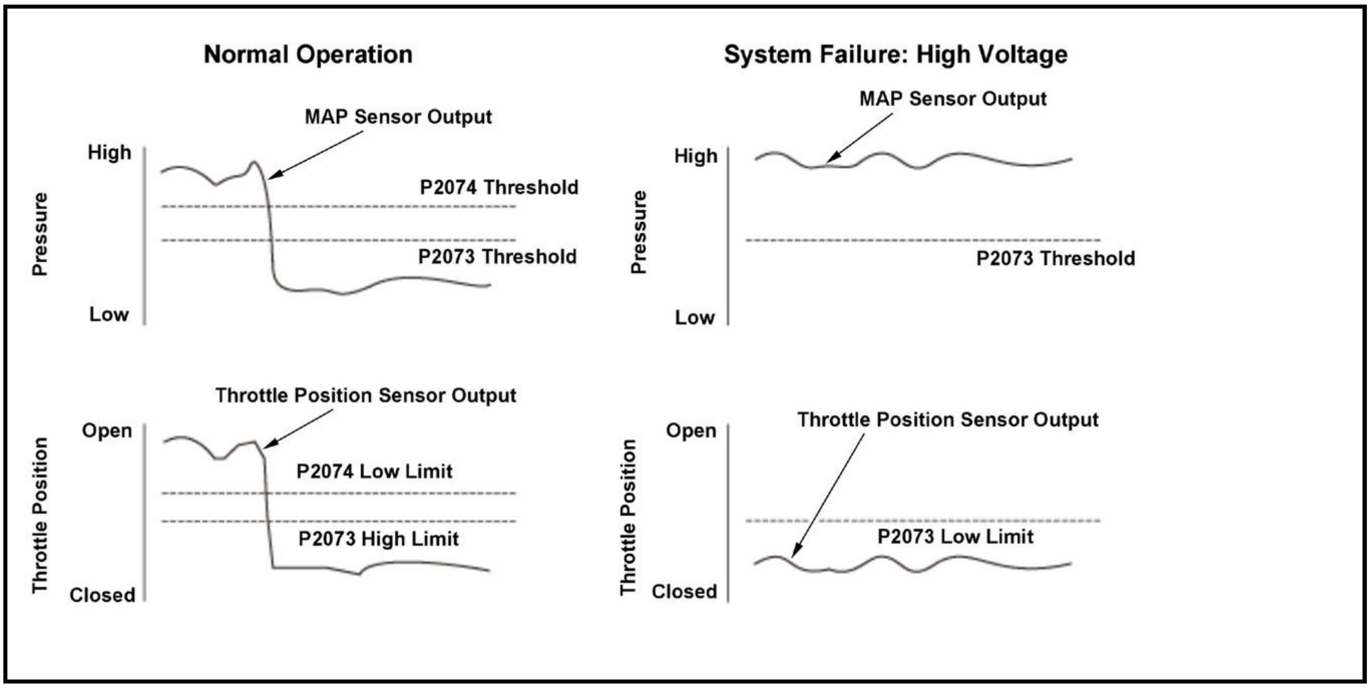
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2073 (2.4 L ENGINE) (2017 2018 2019)

DTC P2073: Manifold Absolute Pressure (MAP) Sensor Signal Higher Than Expected

General Description





The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high vacuum (throttle valve closed) and high signal voltage at low vacuum (throttle valve wide open). The powertrain control module (PCM) compares a predetermined MAP value at a given throttle position and manifold absolute pressure to the output voltage value of the MAP sensor. If the MAP sensor outputs high voltage during fuel cut-off operation for deceleration with the throttle valve fully closed, which should make the manifold absolute pressure lower, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	2.0 seconds or more

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Engine speed [ENGINE SPEED]	1, 400 rpm	6, 700 rpm
Vehicle speed [VEHICLE SPEED]	15 mph (24 km/h)	-
Throttle position	Fully closed	
Fuel feedback	During deceleration	

[ ]: HDS Parameter

Malfunction Threshold

The MAP sensor output [MAP SENSOR] is 37 kPa (277 mmHg, 11.0 inHg) or more for at least 2.0 seconds.

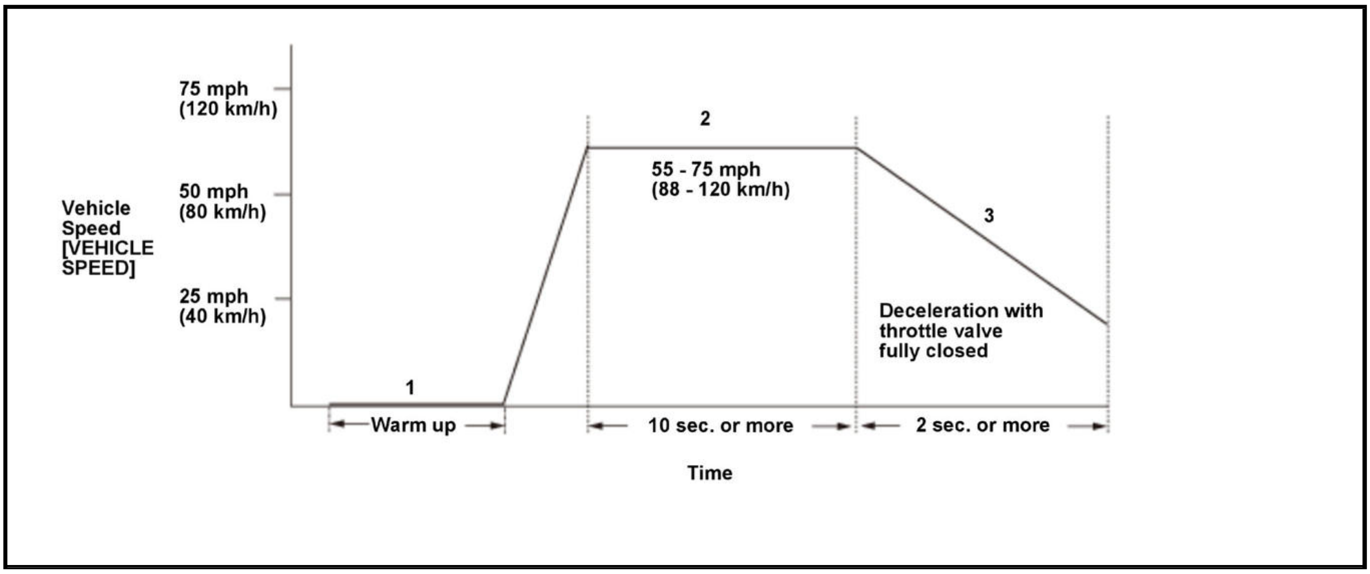
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAP sensor output signal high
- Evaporative emission (EVAP) canister purge valve failure
- Valve timing incorrect
- Intake air system air leak

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
- Decelerate with the throttle valve fully closed for at least 2 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Secondary HO2S feedback correction factor (Short term fuel trim)
Normal range
Target secondary HO2S voltage
Judgment permission by intake air amount accumulation value
Intake air amount accumulated value

The powertrain control module (PCM) detects oxygen content in the exhaust gas by the air/fuel ratio (A/F) sensor (sensor 1), and it uses feedback control before the warm up three way catalytic converter (WU-TWC) to bring the air/fuel ratio close to the target air/fuel ratio. The target air/fuel ratio is adjusted by the secondary heated oxygen sensor (secondary HO2S (sensor 2)) output so that the air/fuel ratio in the WU-TWC is optimized. When the A/F sensor (sensor 1) cannot measure air/fuel ratio in the exhaust gas normally, a gap occurs to the actual air/fuel ratio. As a result, the gap causes a deviation in target air/fuel ratio control (after WU-TWC) which is determined by the secondary HO2S (sensor 2). If the deviation exceeds a limit, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle*
Sequence	None
Duration	Depending on the driving conditions

DTC Type	Two drive cycles, MIL on

*: The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT SENSOR (1)]	19 deg. F (-7 deg. C)	-
Engine speed [ENGINE SPEED]	500 rpm	4, 000 rpm
Intake air amount	0.29 oz/second (8.0 g/second)	-
Fuel feedback	Closed loop	

[ ]: HDS Parameter

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT Sensor (1)]	19 deg. F (-7 deg. C)	-
Engine speed [ENGINE SPEED]	530 rpm	4, 000 rpm
Intake air amount	9.0 g/second (0.32 oz/second)	-
Fuel feedback	Closed loop	

[ ]: HDS Parameter

Malfunction Threshold

Either of the conditions is met:

DTC: P2096

- Short term fuel trim is lower than -0.0254.
- Long term fuel trim is lower than 0.001.

DTC: P2097

- Short term fuel trim is higher than -0.007.
- Long term fuel trim is higher than 0.043.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) malfunction/slow response
- A/F sensor (sensor 1) circuit range/performance
- Fuel system too lean
- Fuel system too rich
- Secondary HO2S (sensor 2) circuit signal stuck lean
- Secondary HO2S (sensor 2) circuit open
- Secondary HO2S (sensor 2) slow response
- Air/fuel ratio variation between cylinders

- Misfire
- Exhaust system failure (exhaust gas leak)

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive at a steady speed between 15 - 75 mph (25 - 120 km/h) and engine speed [ENGINE SPEED] 4, 000 rpm or less for at least 50 seconds.

- When freeze data or the on-board snapshot is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

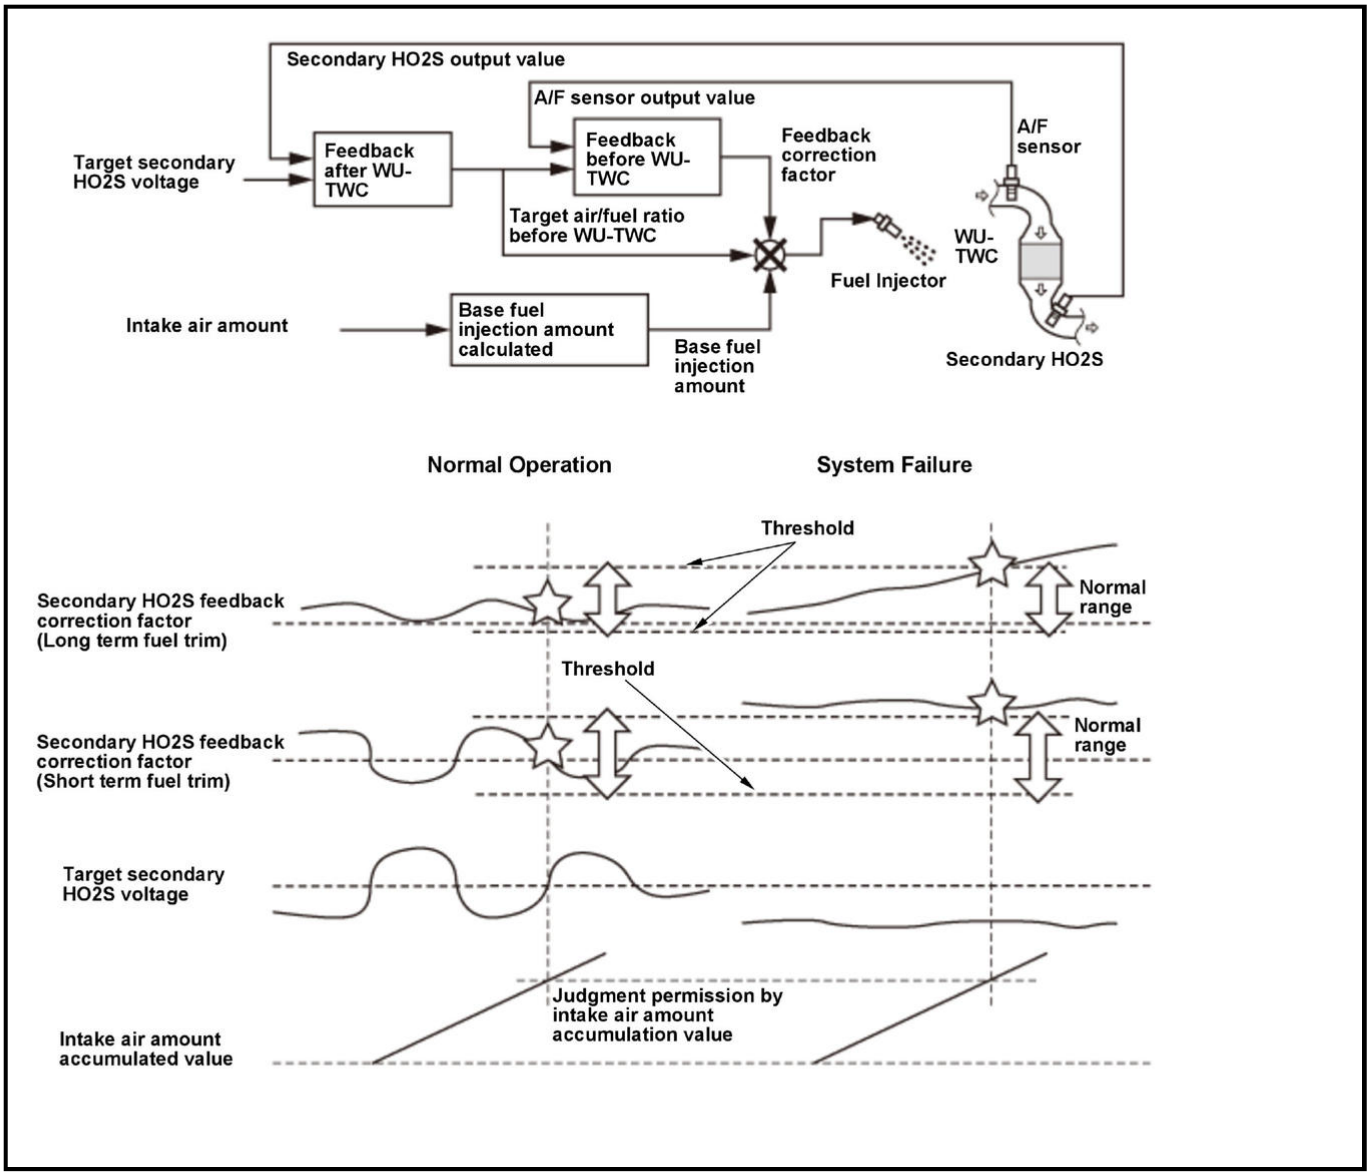
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2097 (2.4 L ENGINE) (2017 2018 2019)

DTC P2097: Post Catalyst Fuel Trim System Too Rich

General Description



Secondary HO2S output value
A/F sensor output value
Target secondary HO2S voltage
Feedback after WU-TWC
Feedback before WU-TWC
Feedback correction factor
A/F sensor
Target air/fuel ratio before WU-TWC
WU-TWC
Fuel Injector
Intake air amount
Base fuel injection amount calculated
Base fuel injection amount
Secondary HO2S
Normal Operation
System Failure
Threshold
Secondary HO2S feedback correction factor (Long term fuel trim)
Normal range
Threshold
Secondary HO2S feedback correction factor (Short term fuel trim)
Normal range
Target secondary HO2S voltage
Judgment permission by intake air amount accumulation value
Intake air amount accumulated value

The powertrain control module (PCM) detects oxygen content in the exhaust gas by the air/fuel ratio (A/F) sensor (sensor 1), and it uses feedback control before the warm up three way catalytic converter (WU-TWC) to bring the air/fuel ratio close to the target air/fuel ratio. The target air/fuel ratio is adjusted by the secondary heated oxygen sensor (secondary HO2S (sensor 2)) output so that the air/fuel ratio in the WU-TWC is optimized. When the A/F sensor (sensor 1) cannot measure air/fuel ratio in the exhaust gas normally, a gap occurs to the actual air/fuel ratio. As a result, the gap causes a deviation in target air/fuel ratio control (after WU-TWC) which is determined by the secondary HO2S (sensor 2). If the deviation exceeds a limit, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle*
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on

*: The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-

Condition	Minimum	Maximum
Intake air temperature [IAT SENSOR (1)]	19 deg. F (-7 deg. C)	-
Engine speed [ENGINE SPEED]	500 rpm	4, 000 rpm
Intake air amount	0.29 oz/second (8.0 g/second)	-
Fuel feedback	Closed loop

Malfunction Threshold

Either of the conditions is met:

- Short term fuel trim is higher than -0.0155.
- Long term fuel trim is higher than 0.045.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) malfunction/slow response
- A/F sensor (sensor 1) circuit range/performance
- Fuel system too lean
- Fuel system too rich
- Secondary HO2S (sensor 2) circuit signal stuck lean
- Secondary HO2S (sensor 2) circuit high voltage
- Secondary HO2S (sensor 2) slow response
- Misfire
- Exhaust system failure (exhaust gas leak)

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive at a steady speed between 15 - 75 mph (25 - 120 km/h) and engine speed [ENGINE SPEED] 4, 000 rpm or less for at least 94 seconds.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

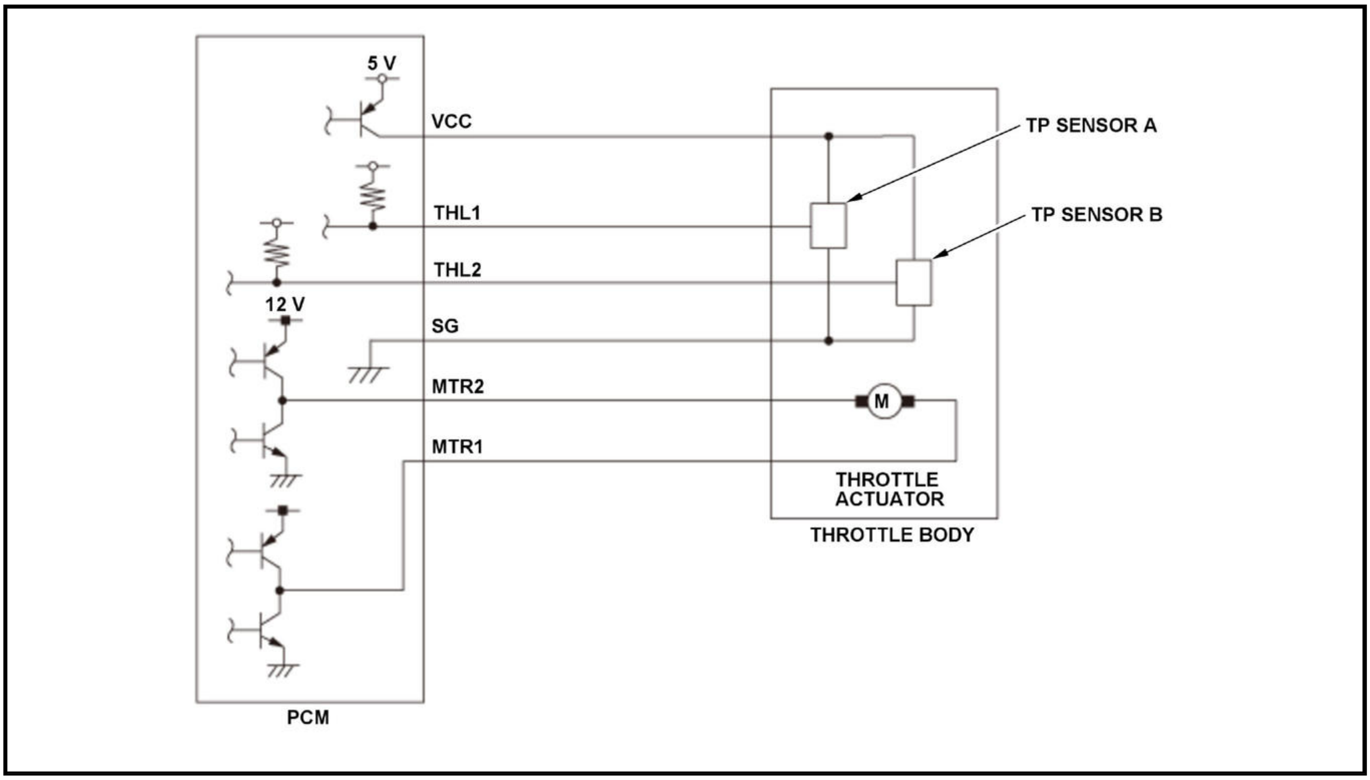
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2101 (1.5 L ENGINE)

DTC P2101: Electronic Throttle Control System (ETCS) Malfunction

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor A/B, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor A/B detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor A/B and transmitted to the PCM to compute the target position. The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). The PCM compares the throttle valve target opening angle and the actual throttle valve opening angle from TP sensor A, and when the difference exceeds the specification, the PCM detects the malfunction of the electronic throttle control system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	250 milliseconds or more*, 500 milliseconds or more**

Refer to the specific DTC information. (P1658, P1659)

Malfunction Threshold

P1658 and/or P1659 is stored.

Possible Cause

Refer to the specific DTC information. (P1658, P1659)

Diagnosis Details

Conditions for setting the DTC

The DTC is stored at the same time when DTC P1658 or P1659 is stored. Refer to the specific DTC information.

Conditions for clearing the DTC

The DTC is cleared at the same time when DTC P1658 and P1659 are cleared. Refer to the specific DTC information.

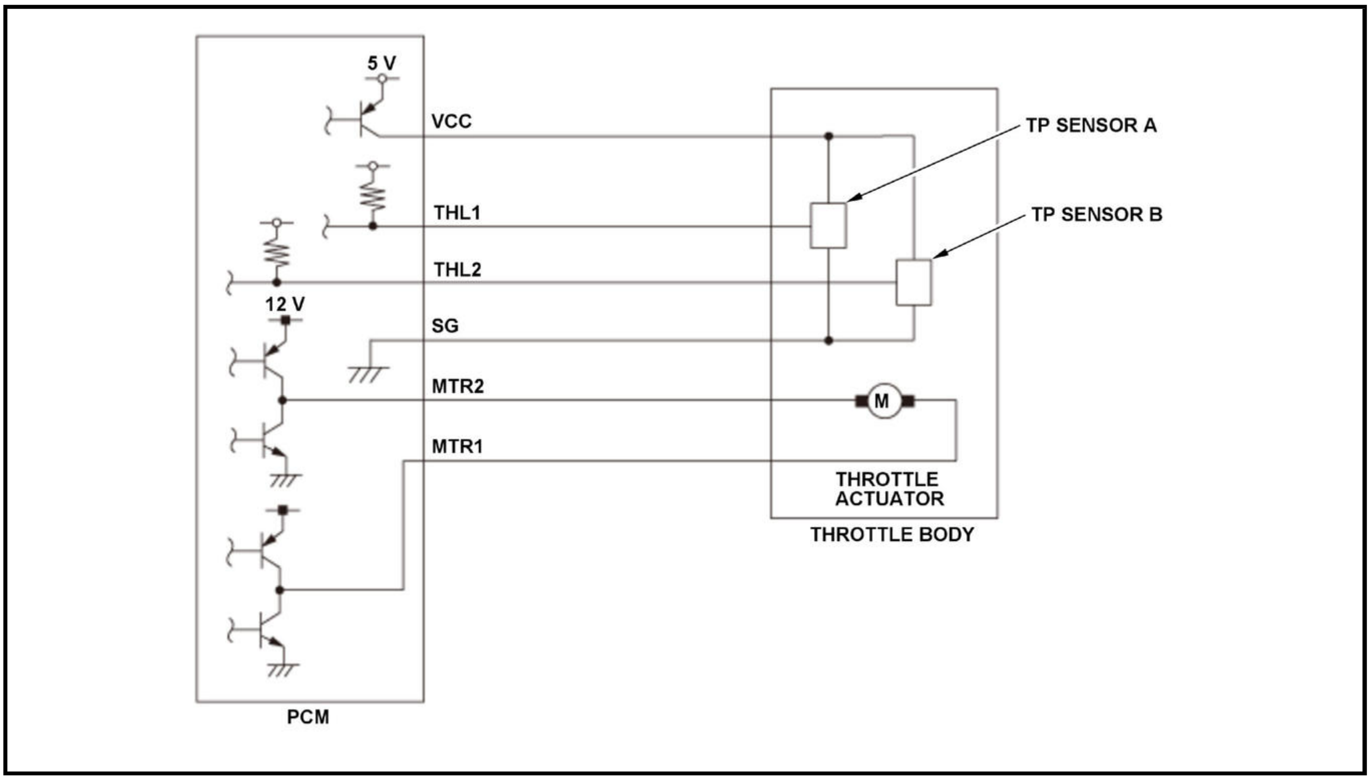
DTC P2118 (1.5 L ENGINE)

DTC P2118: Throttle Actuator Current Range/Performance Problem

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor A/B, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor A/B detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor A/B and transmitted to the PCM to compute the target position. The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). When the output current to the throttle valve actuator exceeds the specification for a set time, the PCM detects a malfunction of the electronic throttle control system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	6.0 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

The current flow to the throttle actuator is 9 A or more for at least 200 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure
- Throttle actuator MTR1 line short
- Throttle actuator MTR2 line short
- Throttle actuator MTR1 line short to throttle actuator MTR2 line
- Throttle body internal failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the ON mode.
- Slowly press the accelerator pedal to the floor.

With the HDS

None.

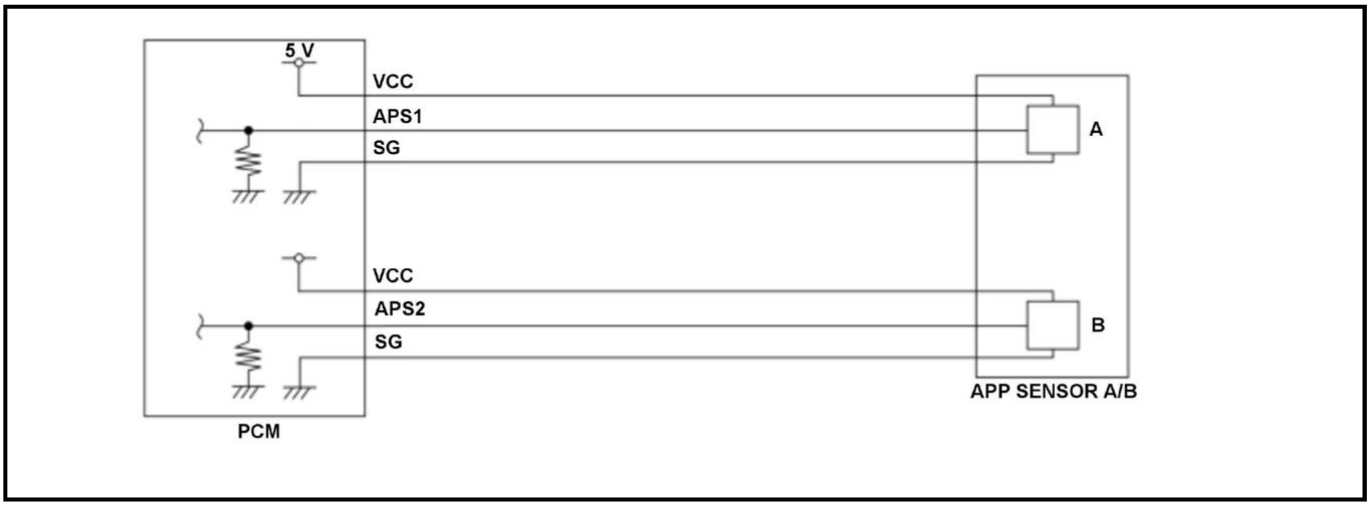
DTC P2121 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P2121: Accelerator Pedal Position (APP) Sensor A (Throttle Position (TP) Sensor D) Out of Range

General Description



Accelerator pedal position (APP) sensor A is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor A is a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The APP sensor A output voltage [APP SENSOR A] is 0.69 V or less, or 4.99 V or more for at least 6.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- APP sensor A failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

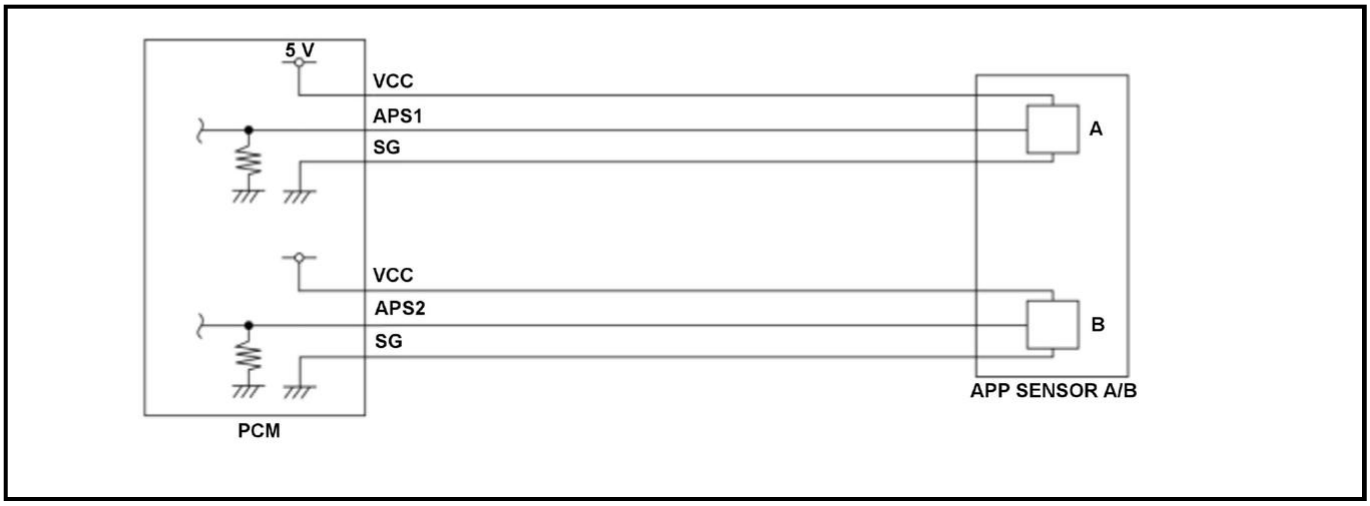
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2121 (2.4 L ENGINE) (2018 2019)

DTC P2121: Accelerator Pedal Position (APP) Sensor A (Throttle Position (TP) Sensor D) Out of Range

General Description



Accelerator pedal position (APP) sensor A is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor A is a set value, the PCM detects a malfunction and stores a DTC.

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

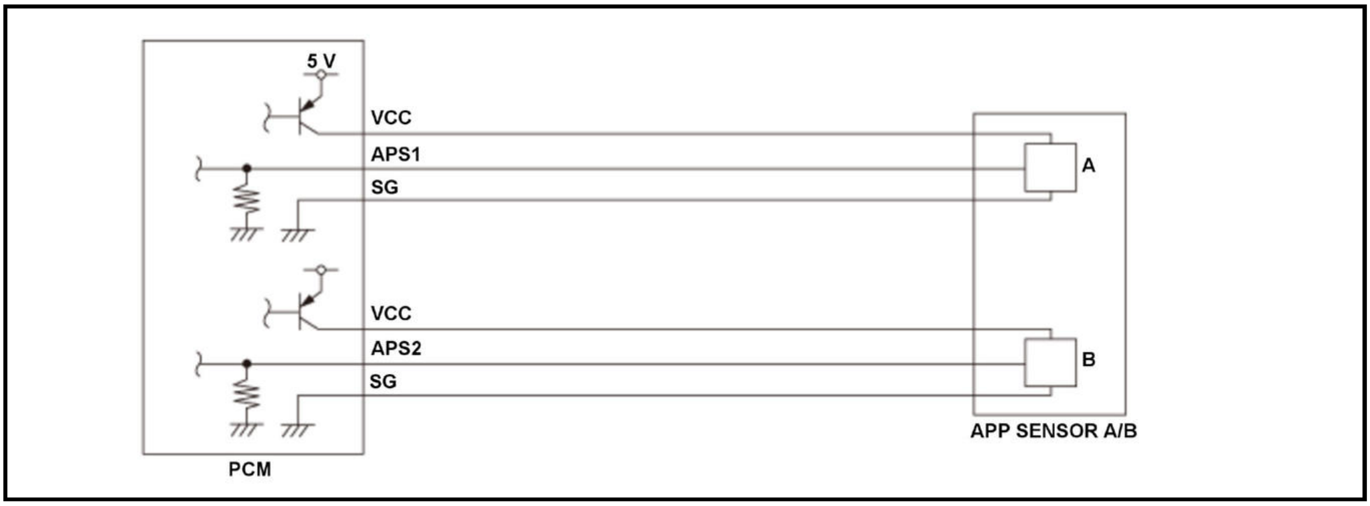
DTC P2127, P2128 (1.5 L ENGINE)

DTC P2127: Accelerator Pedal Position (APP) Sensor B (Throttle Position (TP) Sensor E) Circuit Low Voltage
DTC P2128: Accelerator Pedal Position (APP) Sensor B (Throttle Position (TP) Sensor E) Circuit High Voltage

General Description



Accelerator pedal position (APP) sensor B is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor B is a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

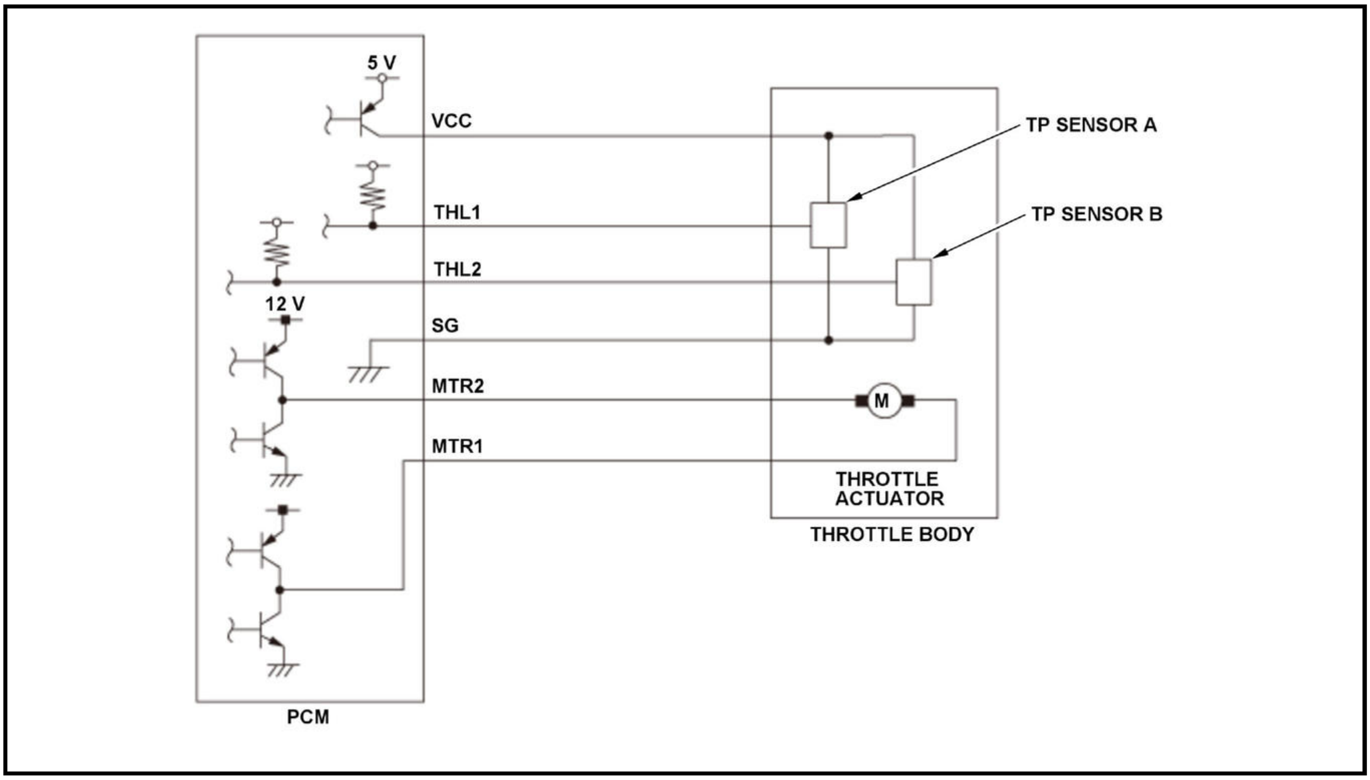
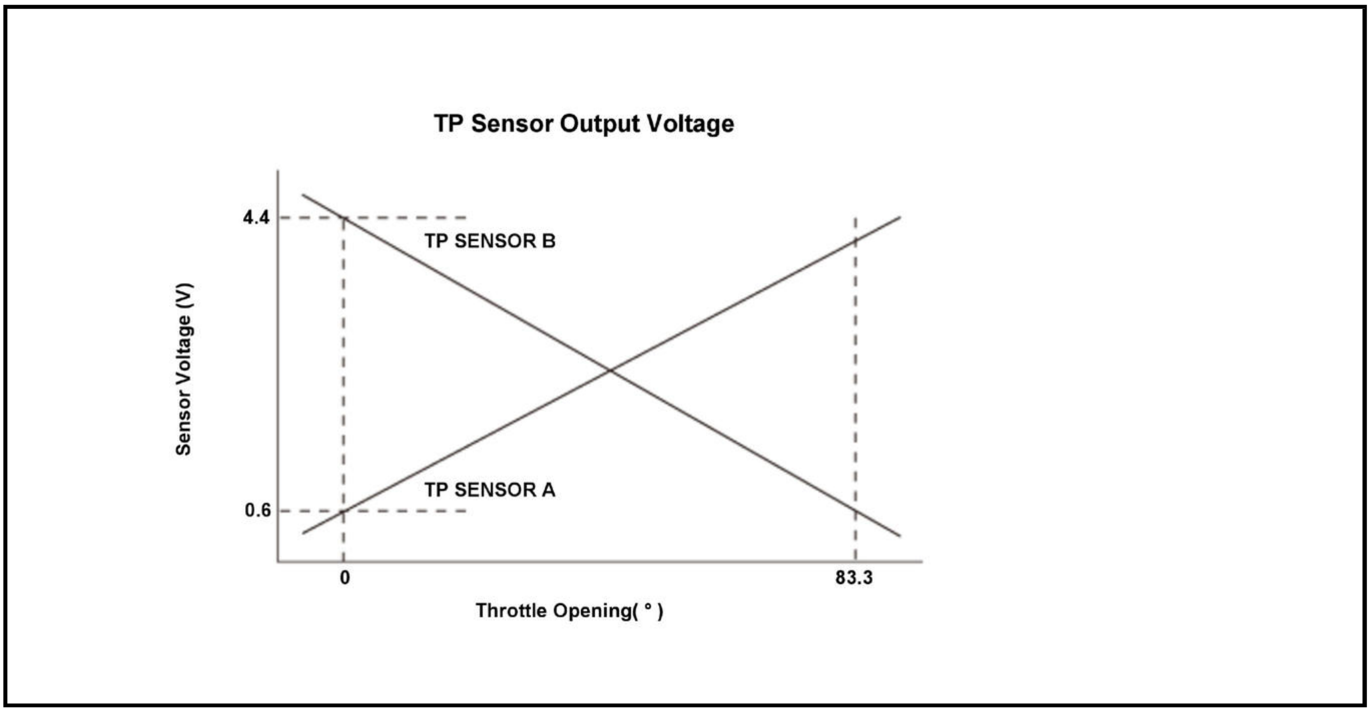
DTC P2135 (1.5 L ENGINE)

DTC P2135: Throttle Position (TP) Sensor A/B Incorrect Voltage Correlation

General Description



5 V
VCC
THL1
THL2
12 V
SG
MTR2
MTR1
PCM
TP SENSOR A
TP SENSOR B
M
THROTTLE ACTUATOR
THROTTLE BODY



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor A/B, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor A/B detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor A/B and transmitted to the PCM to compute the target position. The PCM then operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). The PCM adds the TP sensor A and TP sensor B values, and compares the addition value with 5 V. If the deviation exceeds a certain value for a specified time, the PCM detects a malfunction in the relationship between TP sensor A and TP sensor B, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

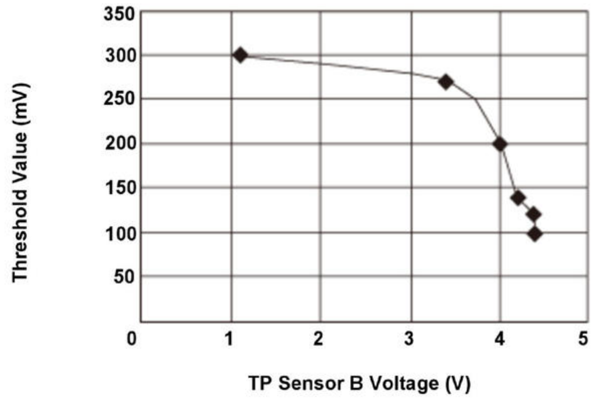
Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The deviation between 5 V and addition value of TP sensor A and TP sensor B exceeds the threshold value which depends on TP sensor B voltage for at least 200 milliseconds as shown in the following graph.



Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TP sensor A THL1 line short to TP sensor B THL2 line
- TP sensor A failure
- TP sensor B failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

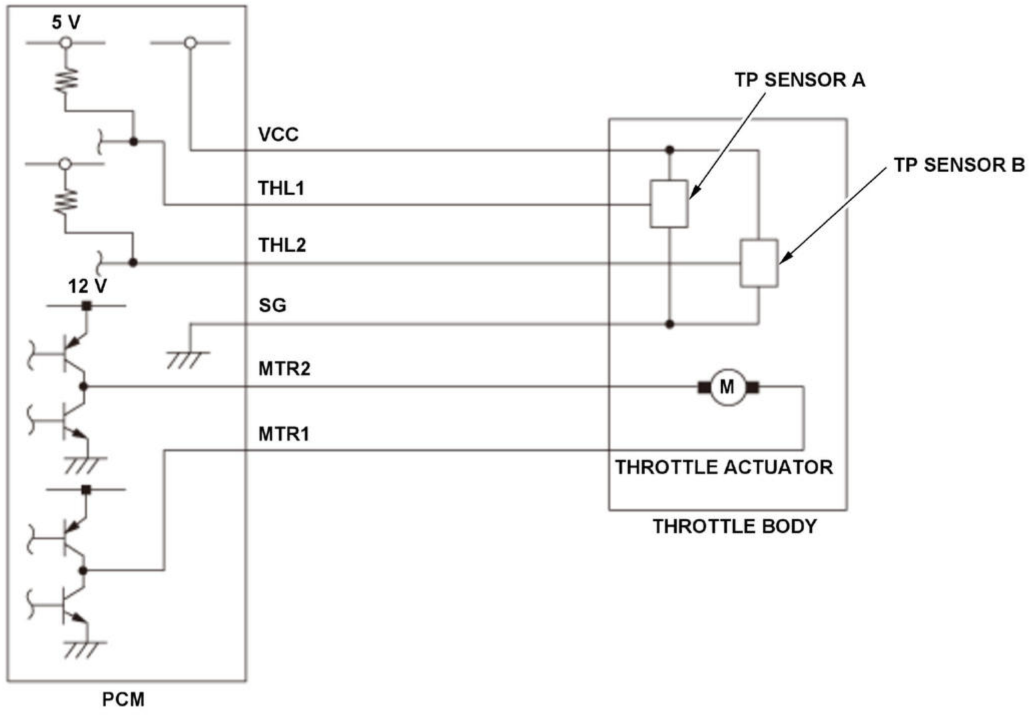
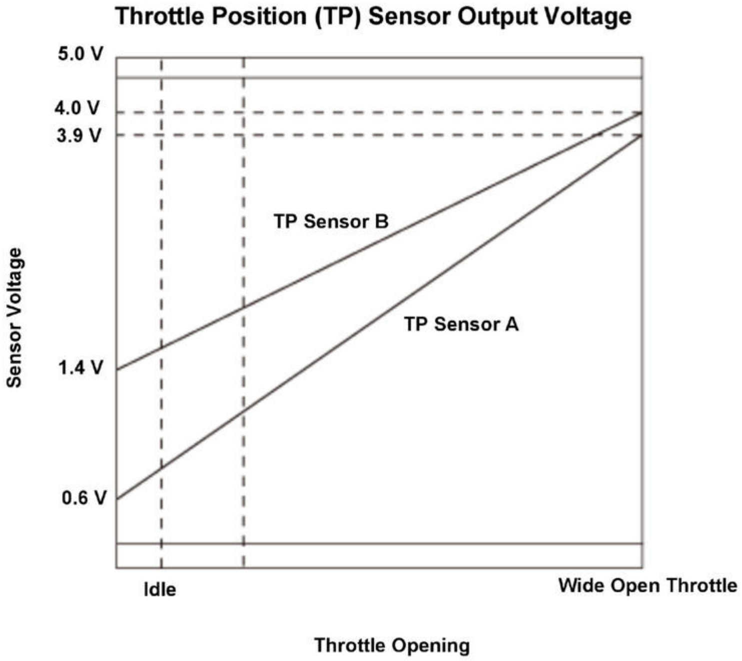
DTC P2135 (2.4 L ENGINE) (2017 2018 2019)

DTC P2135: Throttle Position (TP) Sensor A/B Incorrect Voltage Correlation

General Description





The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The PCM then operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). The PCM compares the voltages and the throttle valve positions of TP sensor A and TP sensor B. If the difference of the throttle valve positions is a certain value for a set time, the PCM detects a malfunction in the relationship between TP sensor A and TP sensor B, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
TP sensor B voltage [TP SENSOR B]	-	2.3 V
Vehicle	ON mode	
Other	After the throttle valve fully closed position registration is completed	

[ ]: HDS Parameter

Malfunction Threshold

The throttle valve position difference between TP sensor A and TP sensor B which depends on the throttle valve position of TP sensor A exceeds the value shown in the table for at least 200 milliseconds.

Throttle valve position determined by TP sensor A	Difference between TP sensor A and TP sensor B
0 deg.	1.8 deg. or more

Throttle valve position determined by TP sensor A	Difference between TP sensor A and TP sensor B
83.3 deg.	14.7 deg. or more

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TP sensor A/B failure
- TP sensor A THL1 line short to TP sensor B THL2 line
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the ON mode.
- Operate the accelerator pedal.

With the HDS

Do the ETCS TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

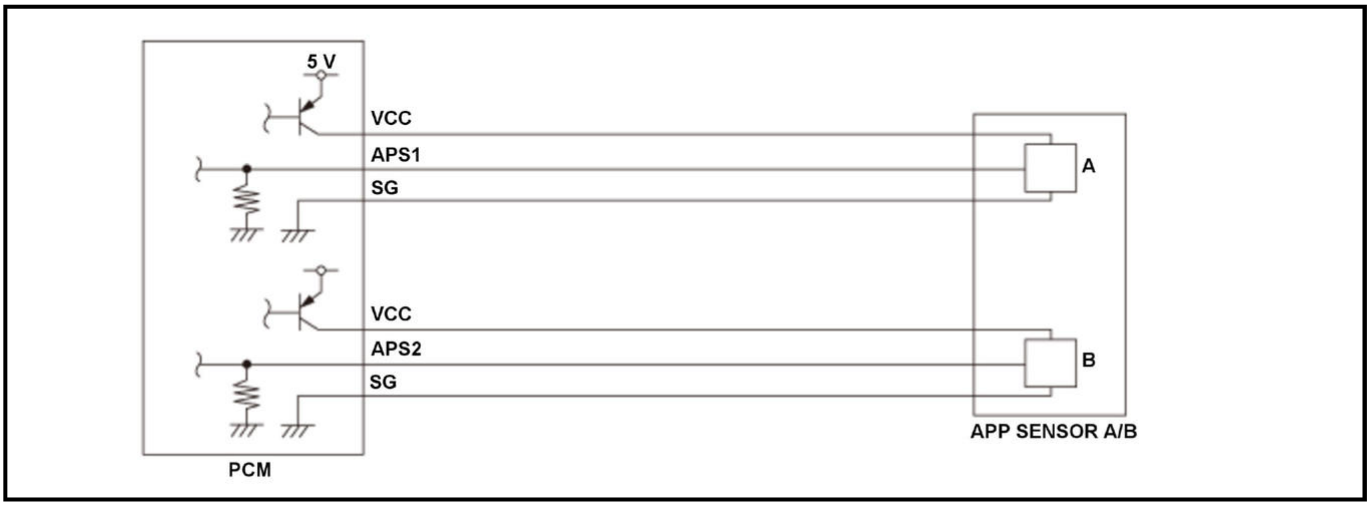
Conditions for clearing the DTC

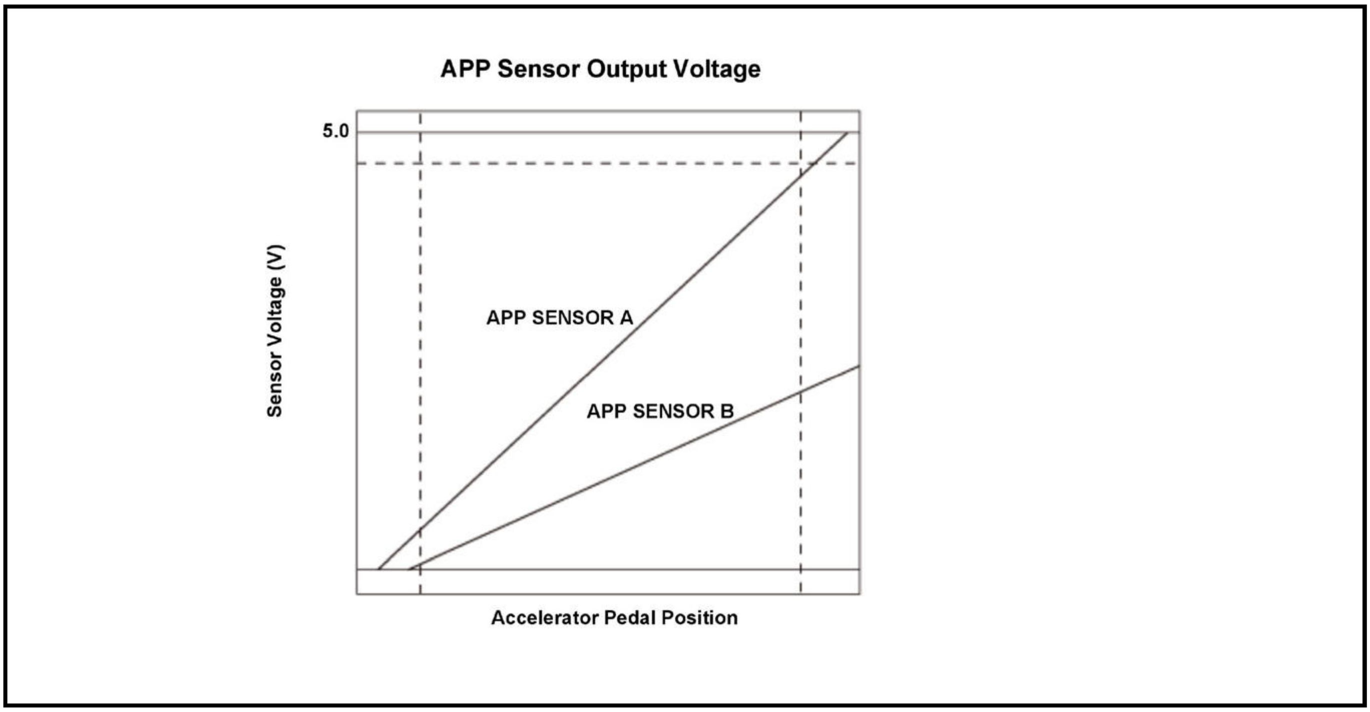
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2138 (1.5 L ENGINE)

DTC P2138: Accelerator Pedal Position (APP) Sensor A/B (Throttle Position (TP) Sensor D/E) Incorrect Voltage Correlation

General Description





Accelerator pedal position (APP) sensor A and accelerator pedal position (APP) sensor B are potentiometers. They are installed on the accelerator pedal. When the accelerator pedal is pressed, APP sensors A and B detect the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in APP sensors A and B and transmitted to the powertrain control module (PCM) to compute the target position. APP sensor A is the primary control, and APP sensor B is a back-up of APP sensor A in case it malfunctions. Both sensors compare their output voltage to each other for malfunction detection. When the voltage difference of APP sensor B is out of a fixed range for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	300 milliseconds or more

DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

One of these conditions is met for at least 300 milliseconds:

- The APP sensor B voltage [APP SENSOR B] is 0 V or less, or 0.37 V or more when APP sensor A voltage [APP SENSOR A] is 0.37 V.
- The APP sensor B voltage [APP SENSOR B] is 2.31 V or less, or 2.69 V or more when APP sensor A voltage [APP SENSOR A] is 5.0 V.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- APP sensor A/B failure
- APP sensor A APS1 line short to APP sensor B APS2 line
- PCM internal circuit failure

Current detection
PCM

The powertrain control module (PCM) uses main CPU power and regenerative energy generated from the high pressure fuel pump to supply the boost voltage for the direct injector. The damper circuit built into the PCM lowers the voltage when the boosted voltage is too high. If the boosted voltage is a specified voltage for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	0.03 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The boosted voltage is 54 V or more for at least 0.03 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

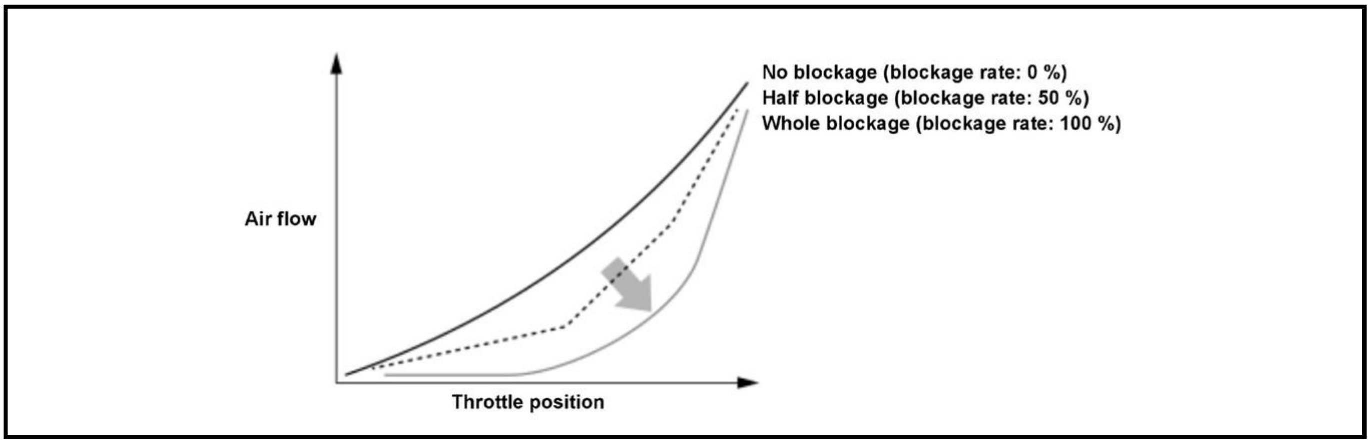
Conditions for clearing the DTC

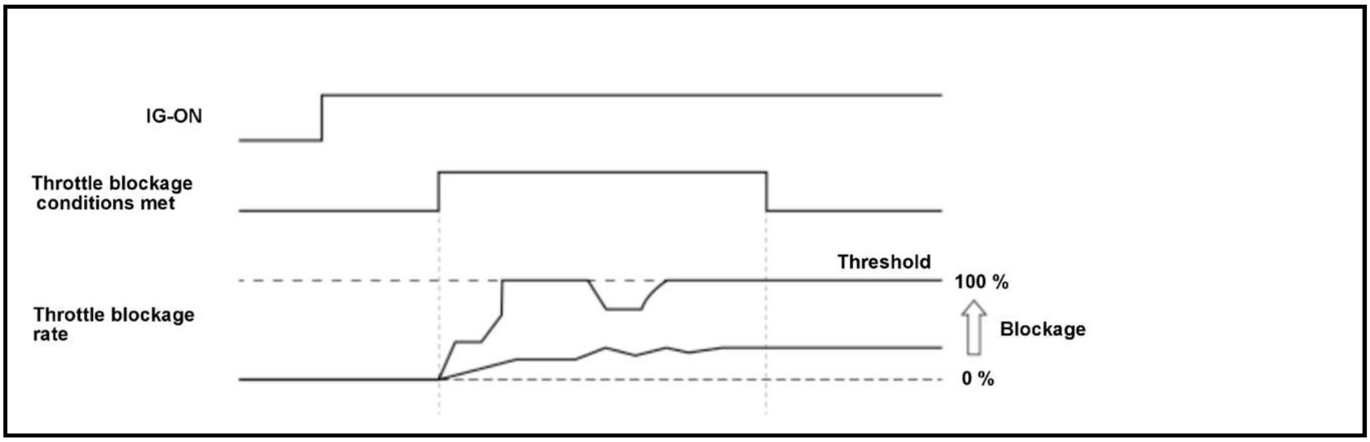
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2175 (1.5 L ENGINE) (2020 2021)

DTC P2175: Throttle Actuator Control System Low Air Flow Detected

General Description





When the throttle body blockage occurs, the air flow decreases compared to a predetermined value per throttle position. From this characteristic, the powertrain control module (PCM) presumes a blockage of the throttle body. If the throttle body blockage rate reaches 100 % of the predetermined threshold, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

Sequence	None
Duration	0.5 second or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Other	At idle

Malfunction Threshold

The throttle body blockage rate is 1.0 or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle body blockage
- Air cleaner blocked

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Turn the vehicle to the OFF (LOCK) mode.
- Start the engine and let it idle for at least 1 minute.
- Repeat Driving Pattern steps 2 through 3, 20 times.
- Start the engine and let it idle for at least 10 minutes.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

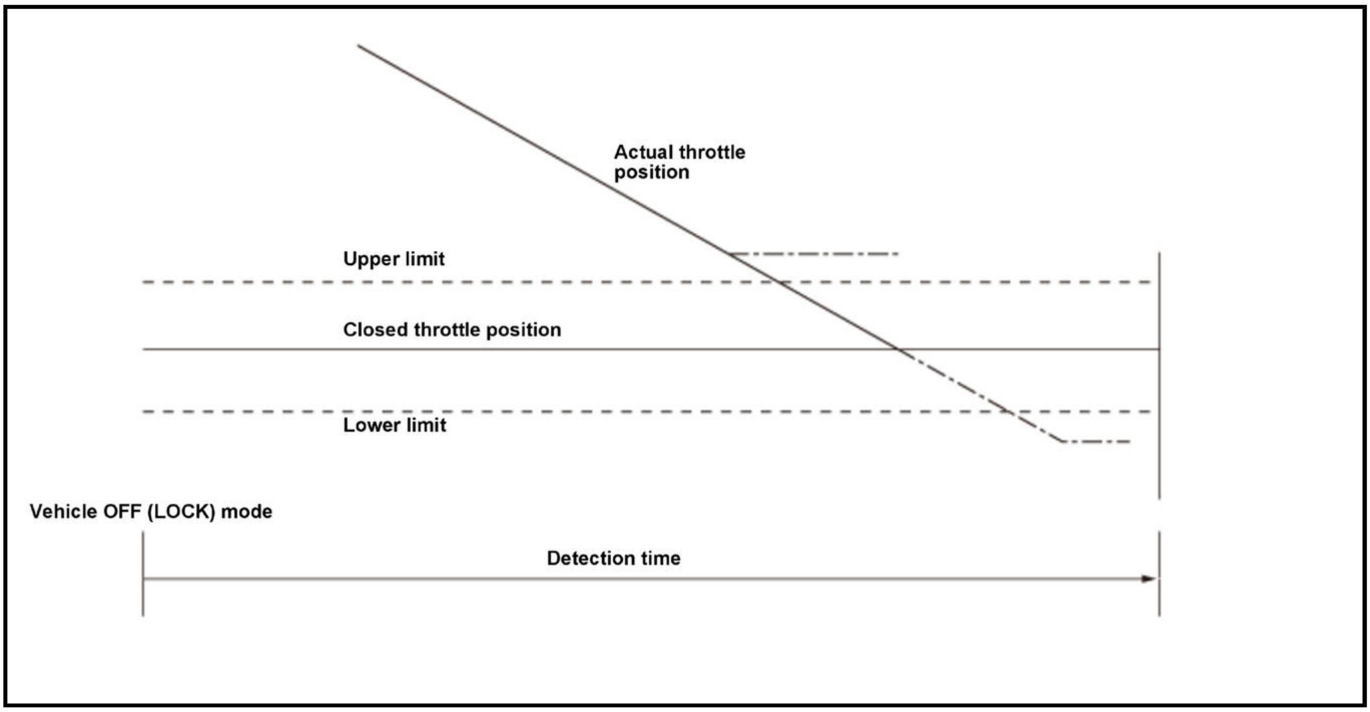
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2176 (1.5 L ENGINE)

DTC P2176: Throttle Actuator Control System Idle Position Not Learned

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor A/B, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor A/B detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor A/B and transmitted to the PCM to compute the target position. The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensors A and B (installed in the throttle body). The PCM transmits a signal to the throttle actuator and moves the throttle valve to the fully closed position to register the throttle valve fully closed position after the vehicle is turned to the OFF (LOCK) mode. When the registration of the throttle valve fully closed position is not completed within a predetermined time after the vehicle is turned to the OFF (LOCK) mode, also the registered value is out of predetermined range, the PCM detects a malfunction in the electronic throttle control system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle

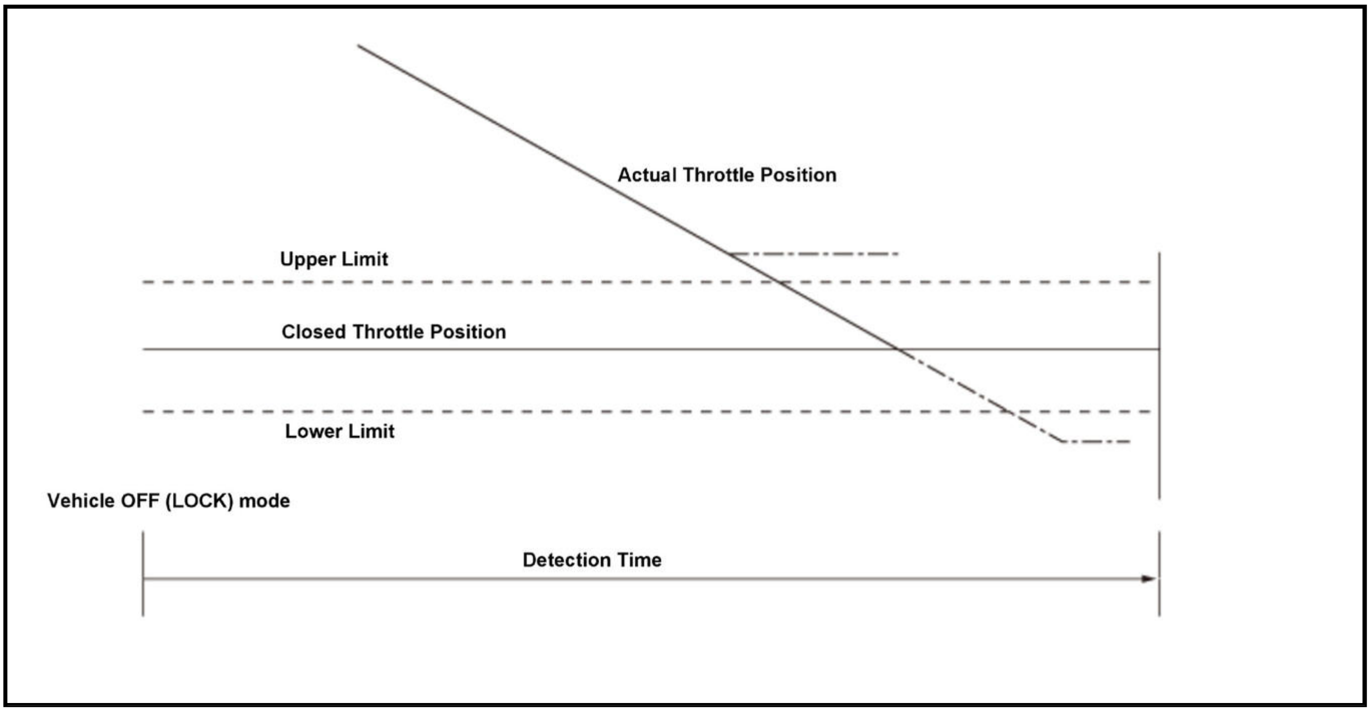
DTC P2176 (2.4 L ENGINE) (2017 2018 2019)

DTC P2176: Throttle Actuator Control System Idle Position Not Learned

General Description



Actual Throttle Position
Upper Limit
Closed Throttle Position
Lower Limit
Vehicle OFF (LOCK) mode
Detection Time

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the electronic throttle control system (ETCS) control relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensors A and B (installed in the throttle body). The PCM transmits a signal to the throttle actuator and moves the throttle valve to the fully closed position to register the throttle valve fully closed position after the vehicle condition is turned to the OFF (LOCK) mode. When the registration of the throttle valve fully closed position is not completed within a predetermined time or the registered value is out of predetermined range after the vehicle condition is turned to the OFF (LOCK) mode, the PCM detects a malfunction in the electronic throttle control system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle

- Throttle actuator MTR2 line failure
- Throttle actuator failure
- TP sensor A/B failure
- Throttle body failure
- PCM failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

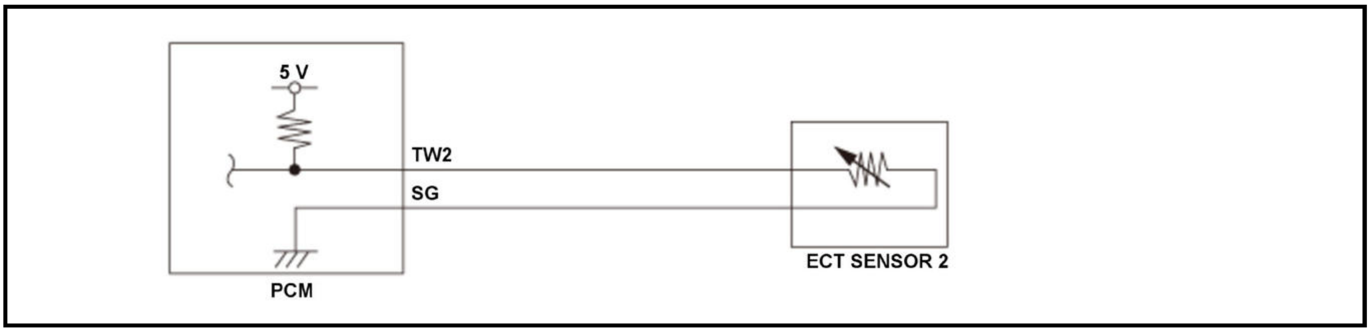
Conditions for clearing the DTC

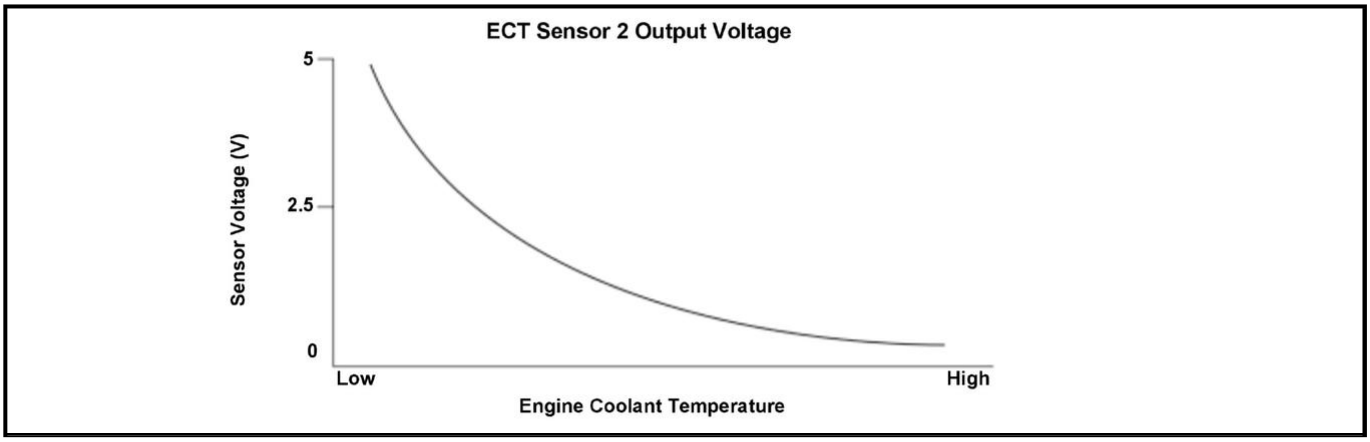
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2182 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P2182: Engine Coolant Temperature (ECT) Sensor 2 Out of Range

General Description





Engine coolant temperature (ECT) sensor 2 is a thermistor attached to the radiator. The powertrain control module (PCM) applies voltage (about 5 V) to the TW2 signal circuit through a pull-up resistor. As the engine coolant temperature cools, the ECT sensor 2 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 2 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 2 output voltage is a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The ECT sensor 2 output voltage [ECT SENSOR 2] is 0.14 V or less, or 4.99 V or more for at least 6.0 seconds.

Time
Failure
ECT1
Δ> Malfunction threshold
ECT2
IAT
Δ< Malfunction threshold

Two engine coolant temperature (ECT) sensors and one intake air temperature (IAT) sensor are used by the powertrain control module (PCM). When the engine is stopped and enough time has passed, the temperature of the engine will equalize to ambient temperature. ECT sensor 1 and IAT sensor are compared to ECT sensor 2, and if an inappropriate temperature is read, the PCM detects a malfunction in the corresponding sensor and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on

*: After the system is activated

**: After the engine is started

Enable Conditions

Condition	Minimum	Maximum
Engine off time	6 hours	-

Malfunction Threshold

A malfunction is detected if the following conditions are present after the engine has stopped and the vehicle condition has been turned to the OFF (LOCK) mode, for at least 6 hours before restarting the engine:

Temperature difference between each sensor values		Malfunction judgment		
ECT1* - ECT2**	**IAT*** - ECT2****	**ECT sensor 1**	**IAT sensor**	**ECT sensor 2**
Higher than 32 deg. C (57 deg. F)	Higher than 57 deg. F (32 deg. C)	Normal	Normal	Failure
	From -43 deg. F (-24 deg. C) to 57 deg. F (32 deg. C)	Failure	Normal	Normal
	Lower than -43 deg. F (-24 deg. C)	Failure	Failure	Normal
From -24 deg. C (-43 deg. F) to 32 deg. C (57 deg. F)	Higher than 57 deg. F (32 deg. C)	Normal	Failure	Normal
	From -43 deg. F (-24 deg. C) to 57 deg. F (32 deg. C)	Normal	Normal	Normal
	From -44 deg. F (-25 deg. C) to -108 deg. F (-60 deg. C)	Normal	Failure	Normal
			Suspended****	
	Lower than -108 deg. F (-60 deg. C)	Normal	Failure	Normal
Lower than -24 deg. C (-43 deg. F)	Higher than 57 deg. F (32 deg. C)	Failure	Failure	Normal
	From -43 deg. F (-24 deg. C) to 57 deg. F (32 deg. C)	Failure	Normal	Normal
	Lower than -43 deg. F (-24 deg. C)	Normal	Normal	Failure

*: [ECT SENSOR 1]

**: [ECT SENSOR 2]

***: [IAT Sensor (1)]

****: Malfunction judgment is suspended because the cooled air introduced after engine start lowers the intake air temperature; the ambient temperature condition does not stay equal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- ECT sensor 2 failure
- IAT sensor failure
- Engine block heater attachment (non-genuine part)

Confirmation Procedure

Operating Condition

- Turn the vehicle to the OFF (LOCK) mode, and wait at least 6 hours.
- Enter the maintenance mode, then start the engine and let it idle for at least 10 seconds.

- Do not use an engine block heater because the engine coolant temperature will not stay equal during engine stop.

- When freeze data or the on-board snapshot is stored, test the vehicle under an ambient temperature close to the intake air temperature in the freeze data or the on-board snapshot.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2183 (2.4 L ENGINE) (2017 2018 2019)

DTC P2183: Engine Coolant Temperature (ECT) Sensor 2 Circuit Range/Performance Problem

After predetermined time
Monitor condition completed
Sensor Output [°F (°C)]
ECT1: Characteristic abnormality
ECT2: Normal
IAT: Normal
Engine Stopped
Time
Failure
ECT1
Δ> Malfunction threshold
ECT2
IAT
Δ< Malfunction threshold

Two engine coolant temperature (ECT) sensors and one intake air temperature (IAT) sensor are used by the powertrain control module (PCM). When the engine is stopped and enough time has passed, the temperature of the engine will equalize to ambient temperature. ECT sensor 1 and IAT sensor are compared to ECT sensor 2, and if an inappropriate temperature is read, the PCM detects a malfunction in the corresponding sensor and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

Condition	Minimum	Maximum
Engine off time	6 hours	-

Malfunction Threshold

A malfunction is detected if the following conditions are present after the engine has stopped and the vehicle condition has been turned to the OFF (LOCK) mode for at least 6 hours before restarting the engine:

Temperature difference between each sensor values		Malfunction judgment		
ECT1* - ECT2**	IAT*** - ECT2**	ECT sensor 1	IAT sensor	ECT sensor 2
Higher than 57 deg. F (32 deg. C)	Higher than 57 deg. F (32 deg. C)	Normal	Normal	Failure
	From -43 deg. F (-24 deg. C) to 57 deg. F (32 deg. C)	Failure	Normal	Normal
	Lower than -43 deg. F (-24 deg. C)	Failure	Failure	Normal
From -43 deg. F (-24 deg. C) to 57 deg. F (32 deg. C)	Higher than 57 deg. F (32 deg. C)	Normal	Failure	Normal
	From -43 deg. F (-24 deg. C) to 57 deg. F (32 deg. C)	Normal	Normal	Normal
	From -44 deg. F (-25 deg. C) to -108 deg. F (-60 deg. C)	Normal	Failure	Normal
			Suspended****	
	Lower than -108 deg. F (-60 deg. C)	Normal	Failure	Normal
Lower than -43 deg. F (-24 deg. C)	Higher than 57 deg. F (32 deg. C)	Failure	Failure	Normal
	From -43 deg. F (-24 deg. C) to 57 deg. F (32 deg. C)	Failure	Normal	Normal
	Lower than -43 deg. F (-24 deg. C)	Normal	Normal	Failure

*: [ECT SENSOR 1]

**: [ECT SENSOR 2]

***: [IAT SENSOR (1)]

****: Malfunction judgment is suspended because the cooled air introduced after engine start lowers the intake air temperature; the ambient temperature condition does not stay equal.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- ECT sensor 2 failure
- IAT sensor failure
- Engine block heater attachment (non-genuine part)

Confirmation Procedure

With the HDS

None.

Operating Condition

- Turn the vehicle to the OFF (LOCK) mode, and wait at least 6 hours.
- Start the engine, and let it idle for at least 10 seconds.

- Do not use an engine block heater because the engine coolant temperature will not stay equal during engine stop.
- When freeze data is stored, test the vehicle under an ambient temperature close to the intake air temperature in the freeze data.
- When an ambient temperature extremely changes, malfunction judgment may not execute. Avoid extreme temperature changing condition after or before engine start. (When the vehicle is parked in the garage, open the shutter to introduce outside air; then start the engine.)

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

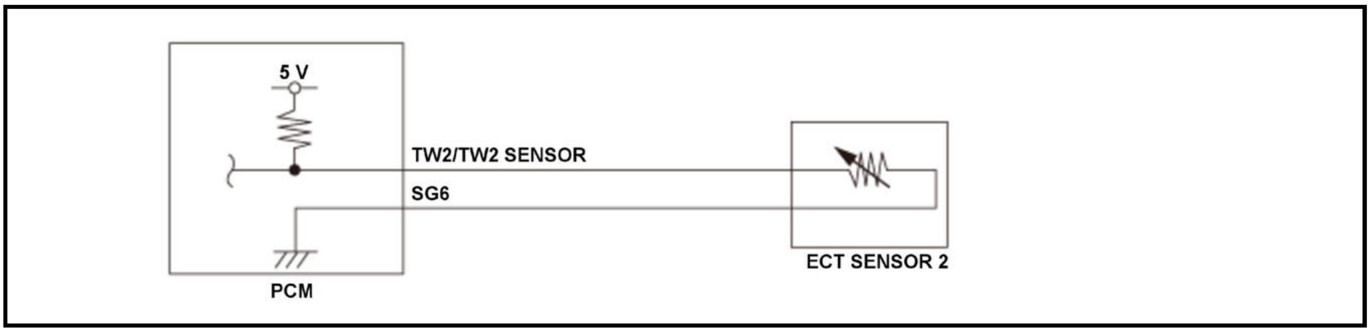
Conditions for clearing the DTC

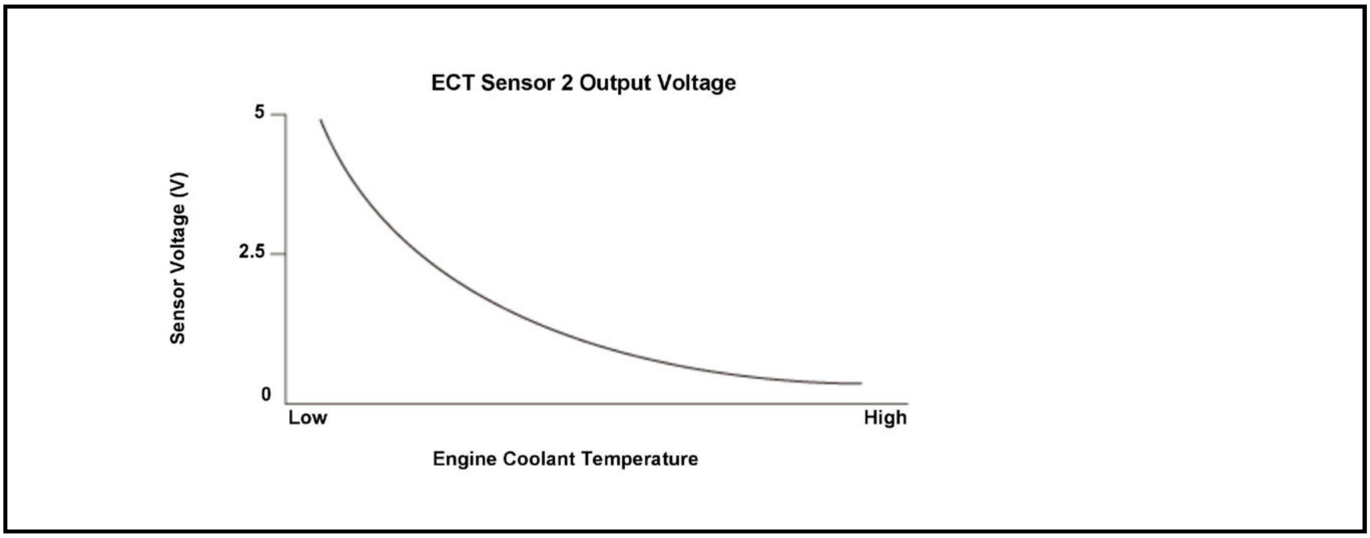
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2184, P2185 (1.5 L ENGINE)

DTC P2184: Engine coolant temperature (ECT) Sensor 2 Circuit Low Voltage **DTC P2185:** Engine coolant temperature ECT Sensor 2 Circuit High Voltage

General Description





Engine coolant temperature (ECT) sensor 2 is a thermistor attached to the radiator. The powertrain control module (PCM) applies voltage (about 5 V) to the TW2 signal circuit through a pull-up resistor. As the engine coolant temperature cools, ECT sensor 2 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the sensor resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 2 output voltage is a set value when the engine coolant temperature is high or low, the PCM detects a malfunction and stores a DTC.

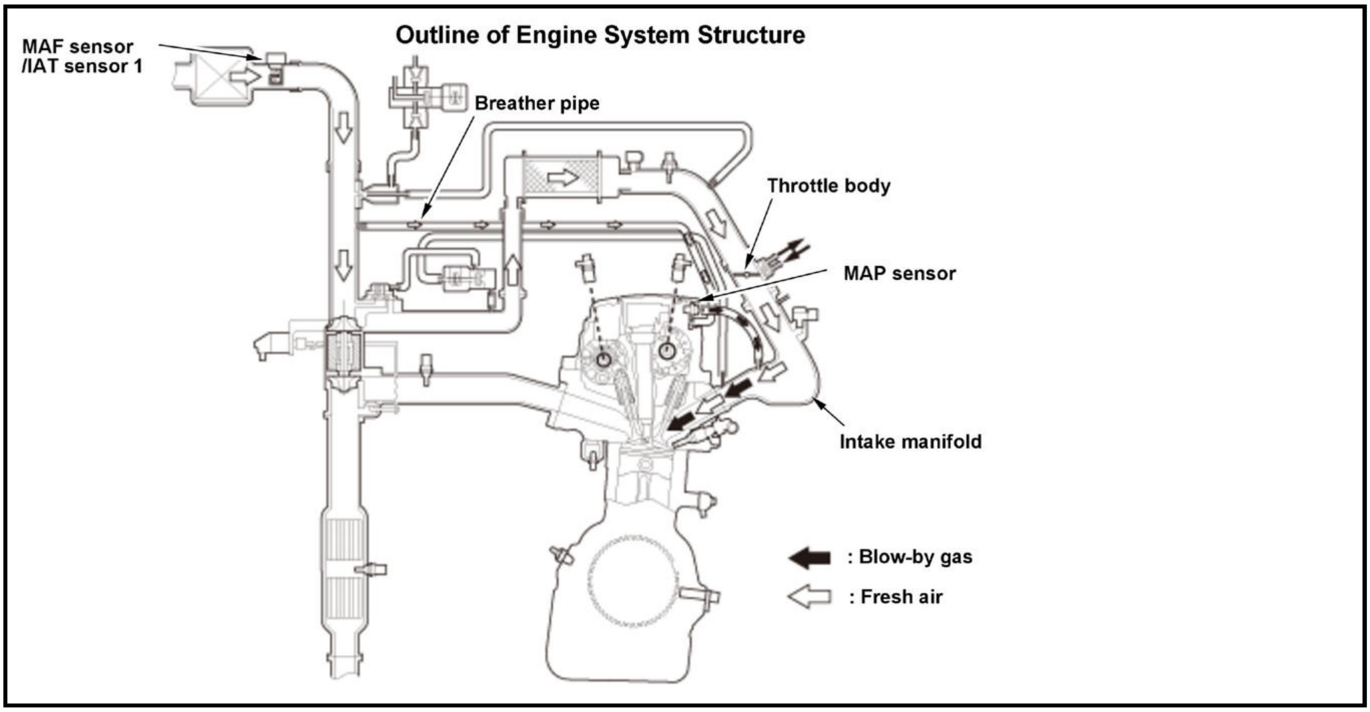
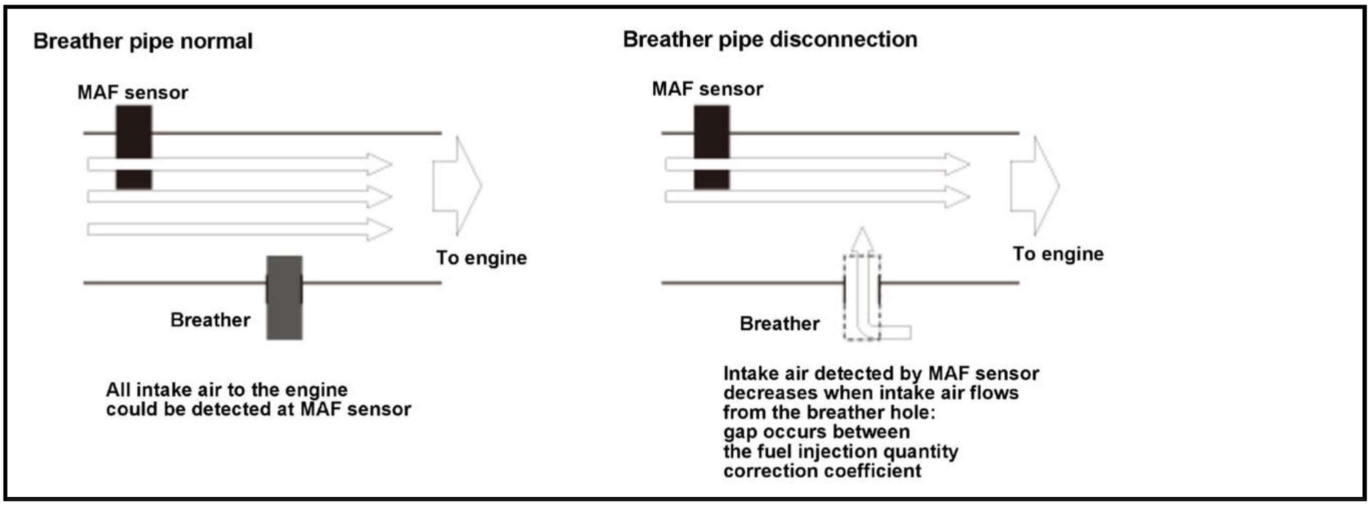
DTC P2187 (1.5 L ENGINE)

DTC P2187: Fuel System Too Lean at Idle

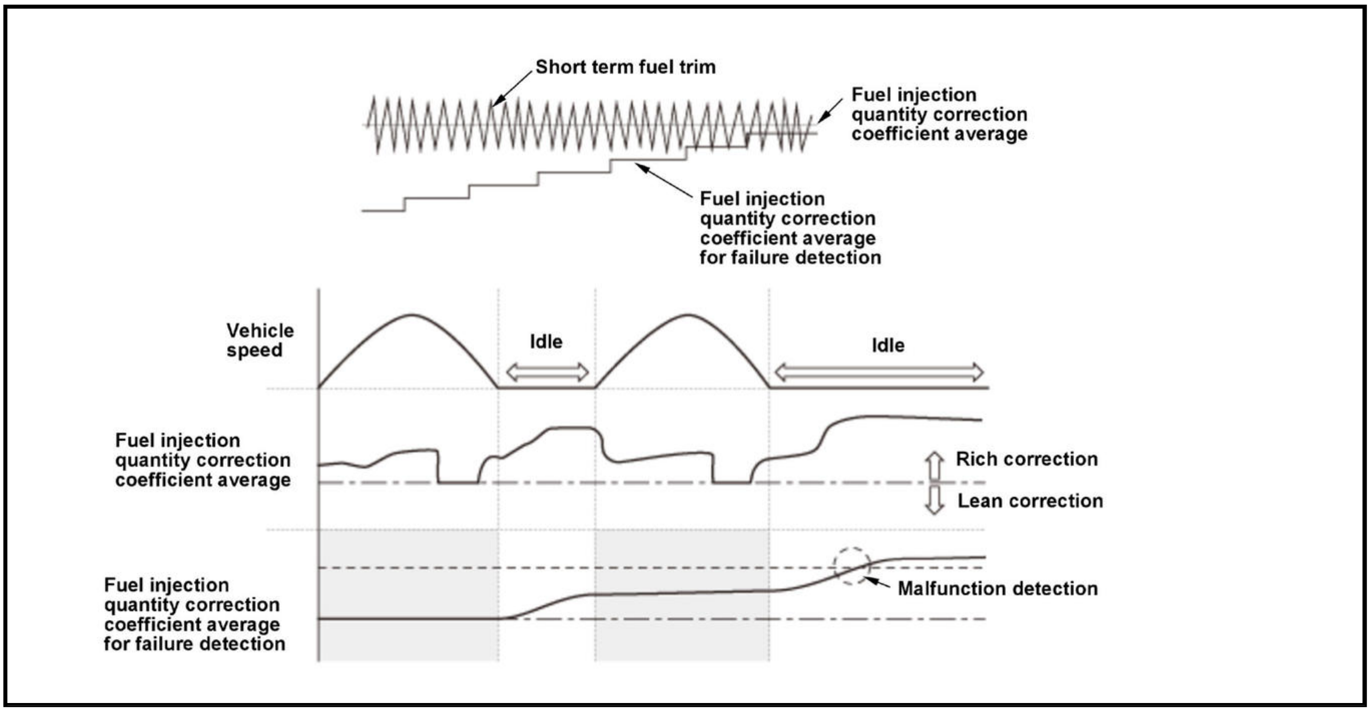
General Description



Outline of Engine System Structure
MAF sensor /IAT sensor 1
Breather pipe
Throttle body
MAP sensor
Intake manifold
: Blow-by gas
: Fresh air



Breather pipe normal
MAF sensor
To engine
Breather
All intake air to the engine could be detected at MAF sensor
Breather pipe disconnection
MAF sensor
To engine
Breather
Intake air detected by MAF sensor decreases when intake air flows from the breather hole: gap occurs between the fuel injection quantity correction coefficient



The powertrain control module (PCM) detects the oxygen content in the exhaust gas from the air/fuel ratio (A/F) sensor (sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions. In case the breather pipe is disconnected, air amount at the mass airflow (MAF) sensor decreases and basic fuel amount decreases; as a result, fuel injection quantity correction coefficient becomes larger to compensate the gap. This condition could be seen prominently at low load which the intake air amount is small. The detection of breather pipe disconnection is done by monitoring the gap which is determined by fuel injection quantity correction coefficient average during idle and continuously updating fuel injection quantity correction coefficient. If the fuel injection quantity correction coefficient exceeds a threshold value, the PCM detects a malfunction and stores a DTC. The purge is stopped by fuel injection quantity correction coefficient to exclude the influence of purging during the detection.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle*
Sequence	None
Duration	Every 7.0 seconds
DTC Type	Two drive cycles, MIL on

*: The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT Sensor (1)]	18 deg. F (-7 deg. C)	-
MAP value [MAP SENSOR]	16 kPa (120 mmHg, 4.7 inHg)	-
Intake air amount	-	4.0 g/second (0.14 oz/second)
Fuel feedback	Closed loop	

[ ]: HDS Parameter

Malfunction Threshold

Long term fuel trim is 1.33 (+33 %) or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel pump failure
- Fuel injector failure
- Fuel pressure regulator failure
- Fuel line failure
- Fuel supply system failure
- MAF sensor range/performance problem
- Manifold absolute pressure (MAP) sensor range/performance problem
- A/F sensor (sensor 1) failure
- Secondary HO2S (sensor 2) failure
- Vacuum hose misinstalled
- Throttle body air leak
- Intake manifold air leak
- EVAP canister purge valve failure
- Breather pipe disconnection

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive at a steady speed between 15 - 75 mph (25 - 120 km/h) for at least 15 minutes, and watch the long term fuel trim. If the long term fuel trim stays at about 1.0, the vehicle is OK or it is a very minor problem. If a significant fault is still present, the long term fuel trim will move up or down while driving.
- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- After clearing the DTC by disconnecting the 12 volt battery or using the scan tool, drive at steady speed between 15 - 55 mph (25 - 88 km/h) for at least 40 minutes to allow time for long term fuel trim to recover.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

NG
ECT 1: ECT sensor 1
ECT 2: ECT sensor 2
R IAT 1: Right IAT sensor 1
L IAT 1: Left IAT sensor 1
IAT 2: IAT sensor 2

Two engine coolant temperature (ECT) sensors and three intake air temperature (IAT) sensors are used by the powertrain control module (PCM). When the engine is stopped and enough time has passed, the temperatures at ECT sensor 1, ECT sensor 2, and IAT sensor 2 will equalize to ambient temperature. In addition, since right IAT sensor 1, left IAT sensor 1, IAT sensor 2 are located on the same intake airflow route, shows a close temperature value after the engine is started. Utilizing these characteristics, ECT sensor 1 and IAT sensor 2 are compared to ECT sensor 2 when the system is activated after the vehicle has been left for certain duration. If it is determined as normal, right IAT sensor 1 and left IAT sensor 1 are compared to IAT sensor 2 when the engine is started. If their correlations are abnormal, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Varied air fuel ratio extracted band pass filter output
Filter output gain
Cycle
Integrated value
Cycle

The powertrain control module (PCM) measures the air/fuel ratio by the signal from the air/fuel ratio (A/F) sensor (sensor 1). If the air/fuel ratio varies between the cylinders, the signal from the A/F sensor (sensor 1) fluctuates while all cylinders complete the combustion cycle (two engine revolutions as one cycle). The PCM varies the engine air/fuel ratio at a specified frequency to measure the dispersion between the cylinders, and obtained air/fuel ratio fluctuation are filtered to extract the value. If the ratio between the integrated filtered output and the integrated varied air fuel ratio is a set value or more, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	At least 6.1 seconds, but not more than 9.3 seconds

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-

Condition		Minimum	Maximum
Engine speed [ENGINE SPEED]		-	2, 500 rpm
Intake air amount	1, 000 rpm	0.013 oz (0.37 g)	0.017 oz (0.50 g)
	1, 800 rpm	0.008 oz (0.22 g)	0.020 oz (0.57 g)

[ ]: HDS Parameter

Malfunction Threshold

The integrated A/F sensor (sensor 1) output variation value is 5.61 or more in 9.3 seconds.

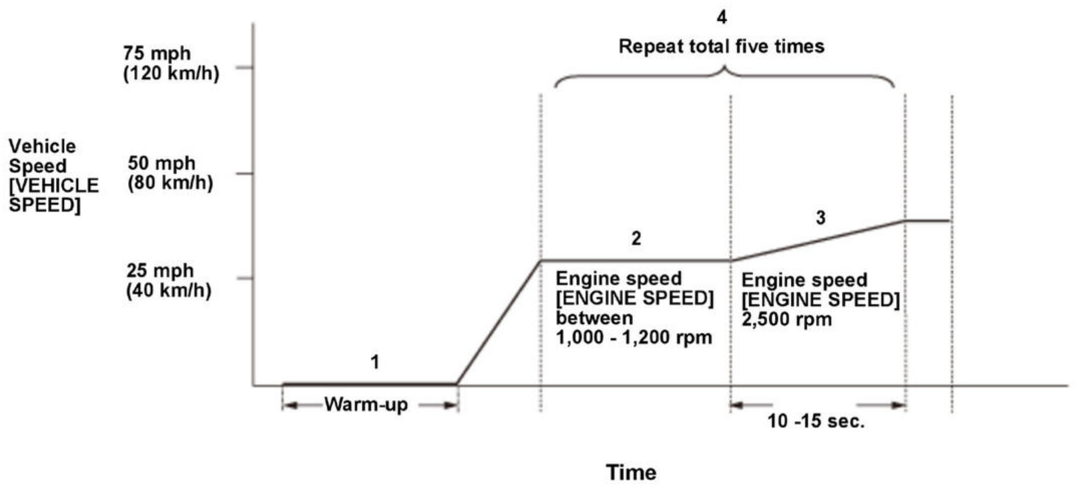
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel injector failure
- Engine compression abnormal
- Valve clearance incorrect

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle in 4th gear at a steady engine speed [ENGINE SPEED] 1, 000 - 1, 200 rpm.
- Take 10 - 15 seconds to accelerate up to engine speed [ENGINE SPEED] 2, 500 rpm.
- When the diagnosis does not finish, repeat driving pattern steps 2 through 3, five times.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P219C, P219D, P219E, P219F (1.5 L ENGINE)

DTC P219C: No. 1 Cylinder Air-Fuel Ratio Variation **DTC P219D:** No. 2 Cylinder Air-Fuel Ratio Variation **DTC P219E:** No. 3 Cylinder Air-Fuel Ratio Variation **DTC P219F:** No. 4 Cylinder Air-Fuel Ratio Variation

A/F sensor
output
Frequency
analyzer
0.5-order
1.0-order
0.8-order
Imbalance
component
Excitation
component
Imbalance value is proportion to:
Imbalance component/Excitation component

The powertrain control module (PCM) detects the imbalance amount from the sizes of the 0.5-order and 1.0-order components compared to 0.8-order excitation input by the fuel injection to determine the air/fuel ratio variation between the cylinder. The obtained components are used to learn the fuel coefficient of each cylinder and performs the imbalance reduction control. If it is not possible to suppress the variation even if the imbalance reduction control is performed; resulting the imbalance amount is large and the fuel coefficient is a specified value or more, the PCM detects as imbalance failure.

- When the imbalance amount is a specified value (about 10 %) or less:
-

    - -

      Fuel coefficient of each cylinder is higher than the threshold value: Failure on corresponding cylinder

-
    - -

      Fuel coefficient of each cylinder is lower than the threshold value: Pass

- When the imbalance amount is a specified value (about 10 %) or more:
-
    - -

      Performs imbalance reduction control and fuel coefficient is higher than the threshold value: failure on corresponding cylinder

-
    - -

      Performs imbalance reduction control and fuel coefficient of each cylinder is lower than the threshold value: re-performs imbalance reduction control for a specified time and re-determines the failure by the fuel coefficient of each cylinder. If the imbalance amount is a specified value or less after imbalance reduction control is performed for a specified time, the determination is suspended. If the imbalance amount is a specified value or more after imbalance reduction control is performed for a specified time, the imbalance reduction control is performed again and if the fuel coefficient of each cylinder is higher than a specified value, the PCM detects the failure on corresponding cylinder.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg. F (-25 deg. C)	-
Engine speed [ENGINE SPEED]	1, 350 rpm	3, 400 rpm
Engine speed variation during 1 cycle	-	80 rpm
Fuel trim	0.75	1.47
Intake air amount variation	-	0.05 g (0.001 oz)
Fuel feedback	Closed loop at stoichiometric	
Monitoring priority	P0133, P0420	

[ ]: HDS Parameter

Malfunction Threshold

Fuel correction coefficient of each cylinder is 0.83 or less, or 1.15 or more.

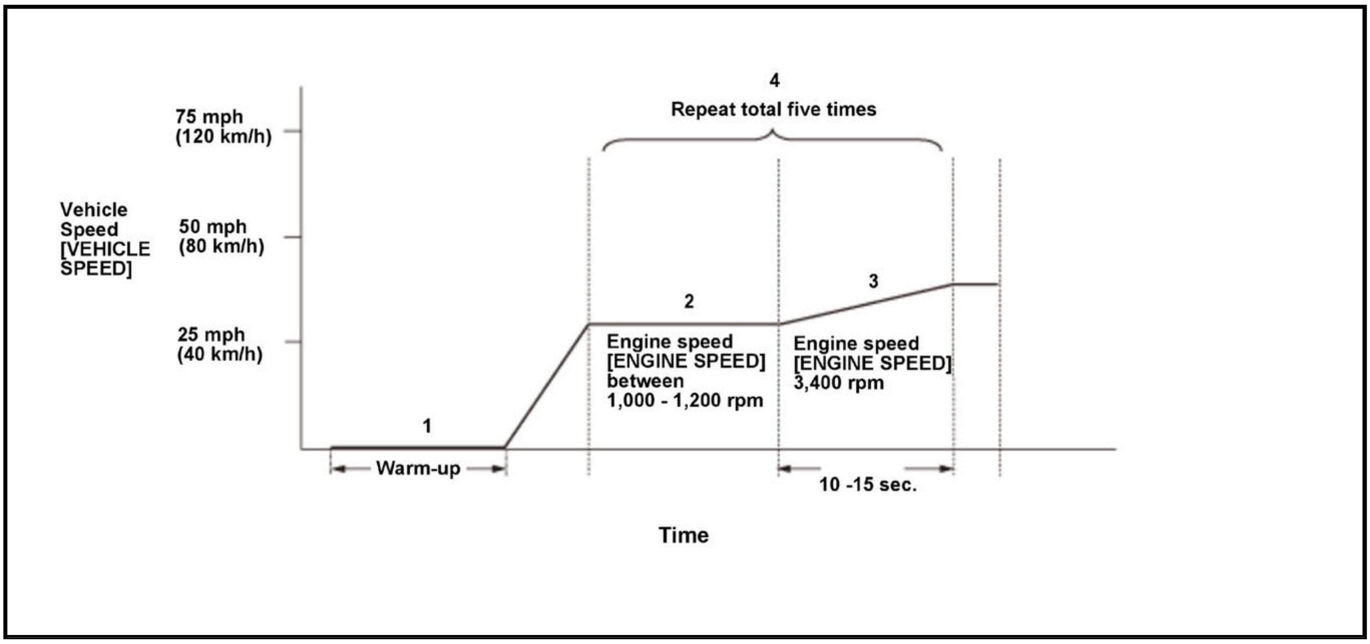
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel injector failure
- Fuel rail clogged
- Intake manifold air leak/clogged
- Cam lift failure
- Ignition system failure
- Engine compression abnormal
- Valve clearance incorrect

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle in 4th gear at a steady engine speed [ENGINE SPEED] 1, 000 - 1, 200 rpm.
- Take 10 - 15 seconds to accelerate up to engine speed [ENGINE SPEED] 3, 400 rpm.
- When the diagnosis does not finish, repeat Driving Pattern steps 2 through 3, five times.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

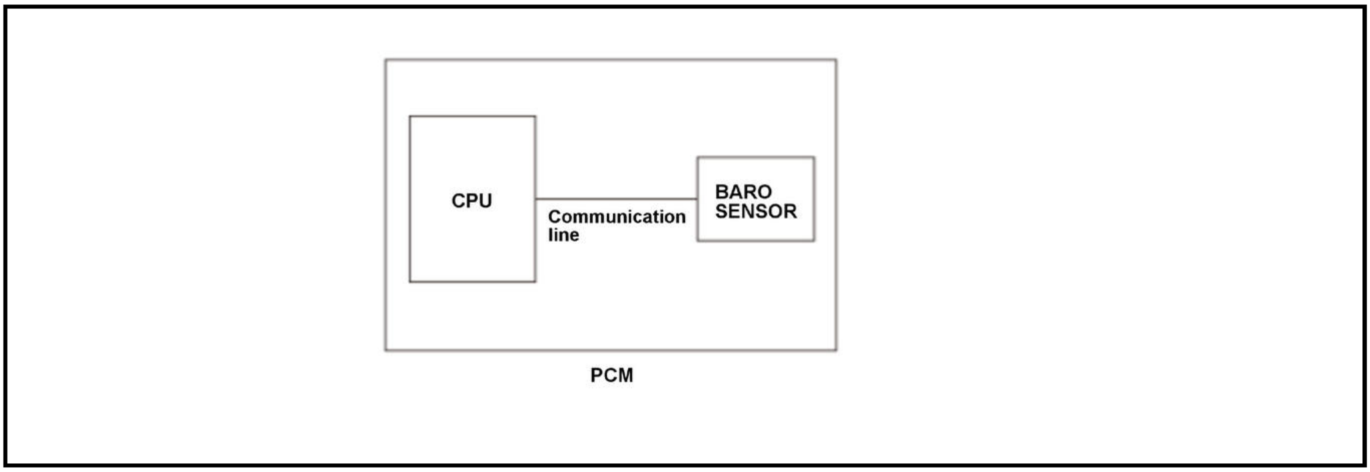
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2226 (1.5 L ENGINE)

DTC P2226: Barometric Pressure (BARO) Sensor Circuit Malfunction

General Description



The barometric pressure (BARO) sensor is built into the powertrain control module (PCM), and it monitors atmospheric pressure. The BARO sensor output voltage is converted to A/D in the sensor inside, and transmitted to a CPU by serial communication. When the signal is not sent from the BARO sensor or when the signal sent from the BARO sensor is abnormal and this condition continues for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

One of these conditions is met at least 2.0 seconds:

- The PCM does not receive signals.
- The signal sent from the BARO sensor is abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor failure

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2227 (2.4 L ENGINE) (2017 2018 2019)

DTC P2227: Barometric Pressure (BARO) Sensor Circuit Out of Range High

General Description

The barometric pressure (BARO) sensor is built into the power control module (PCM), and it monitors atmospheric pressure. The monitoring function checks the signal of the BARO sensor for implausible values by means of diverse criteria. If the difference between measured ambient pressure and the reference pressure is a specified value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Tow drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode
Other	Short to power or short to ground errors are not received from BARO sensor

Malfunction Threshold

Either of the conditions occurs:

- Difference between measured ambient pressure and the maximum reference pressure is greater than 2.5 kPa (19 mmHg, 0.8 inHg).
- Difference between the minimum reference pressure and the measured ambient pressure is greater than 2.5 kPa (19 mmHg, 0.8 inHg).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

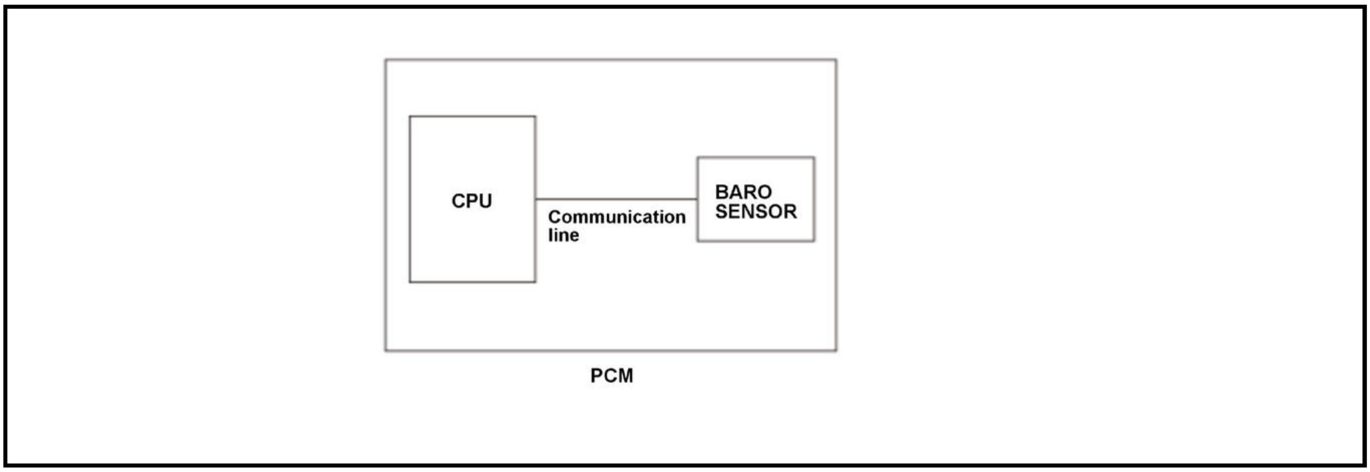
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P2228, P2229 (1.5 L ENGINE)

DTC P2228: Barometric Pressure (BARO) Sensor Circuit Low Voltage **DTC P2229:** Barometric Pressure (BARO) Sensor Circuit High Voltage

General Description



The barometric pressure (BARO) sensor is built into the powertrain control module (PCM), and it monitors atmospheric pressure. The BARO sensor output voltage is converted to A/D in the sensor inside, and transmitted to a CPU by serial communication. If the atmospheric pressure value sent from the BARO sensor is abnormal, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P2228

The BARO sensor output value [Baro Sensor] is 44 kPa (336 mmHg, 13.2 inHg) or less for at least 2.0 seconds.

DTC: P2229

The BARO sensor output value [Baro Sensor] is 116 kPa (865 mmHg, 34.1 inHg) or more for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor failure
- PCM internal circuit failure

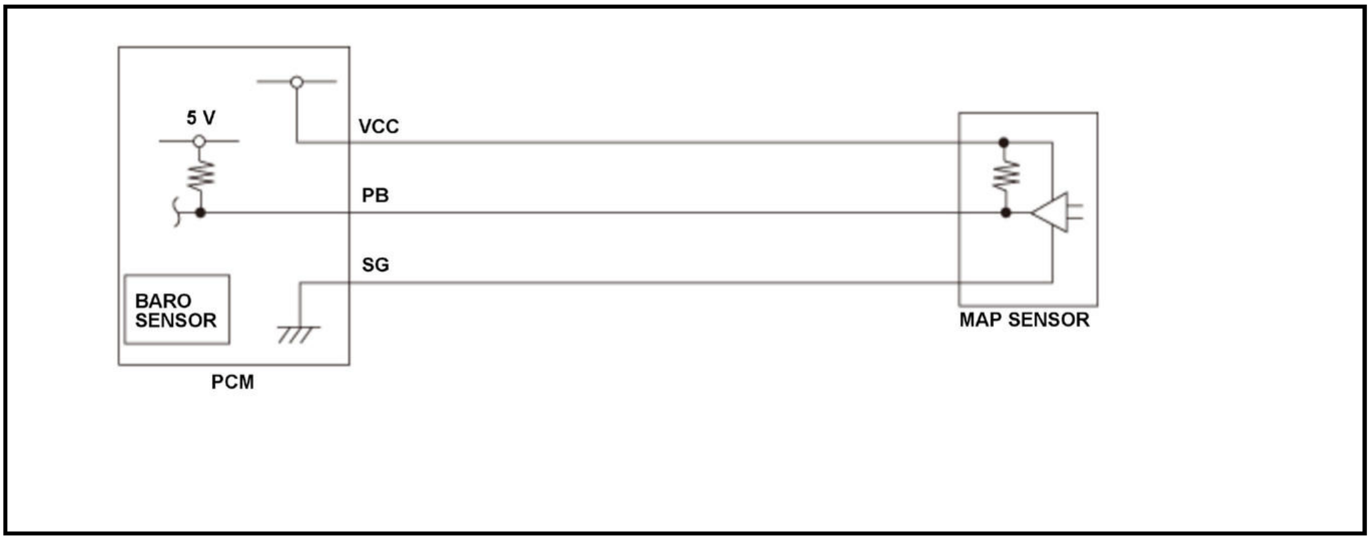
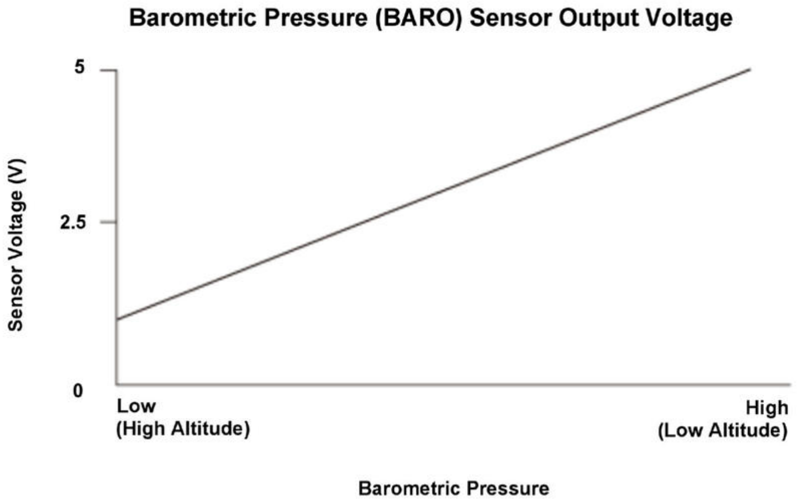
DTC P2228, P2229 (2.4 L ENGINE) (2017 2018 2019)

DTC P2228: Barometric Pressure (BARO) Sensor Circuit Low Voltage **DTC P2229:** Barometric Pressure (BARO) Sensor Circuit High Voltage

General Description





The barometric pressure (BARO) sensor is built into the powertrain control module (PCM), and it monitors atmospheric pressure. The PCM estimates appropriate intake airflow from the manifold absolute pressure (MAP) sensor output voltage and the BARO sensor output voltage. If the BARO sensor output voltage is a specified value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P2228

The BARO sensor output voltage [BARO SENSOR] is 1.31 V or less for at least 2.0 seconds.

DTC: P2229

The BARO sensor output voltage [BARO SENSOR] is 4.49 V or more for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

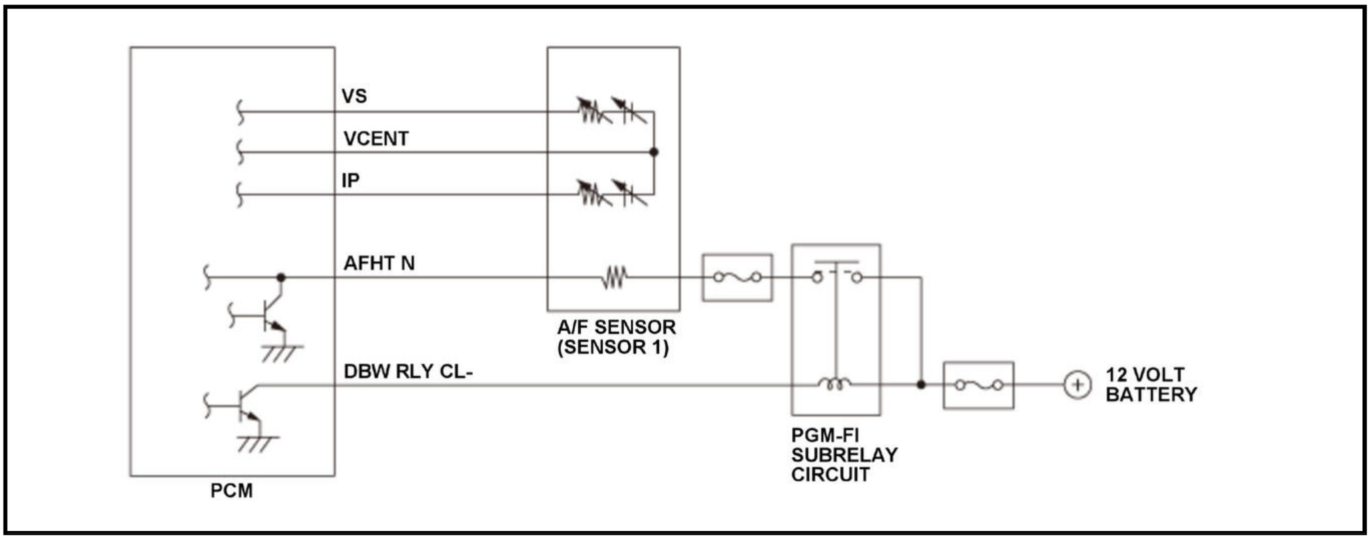
DTC P2237 (1.5 L ENGINE)

DTC P2237: Air/Fuel Ratio A/F Sensor (Sensor 1) IP Circuit High Voltage

General Description



The air/fuel ratio (A/F) sensor (sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The A/F sensor (sensor 1) transmits a signal to the powertrain control module (PCM), and the PCM controls fuel injection duration by comparing the target air/fuel ratio with the A/F sensor (sensor 1) signal. If the IP terminal voltage is within a specified range when the A/F sensor (sensor 1) pump cell voltage is excessively high, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	15 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	9.0 V	-
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

The IP terminal voltage is between 2.18 V to 2.41 V for at least 15 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) failure
- A/F sensor (sensor 1) IP line open
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 2 minutes.

[ ]: HDS Parameter

With the HDS

None.

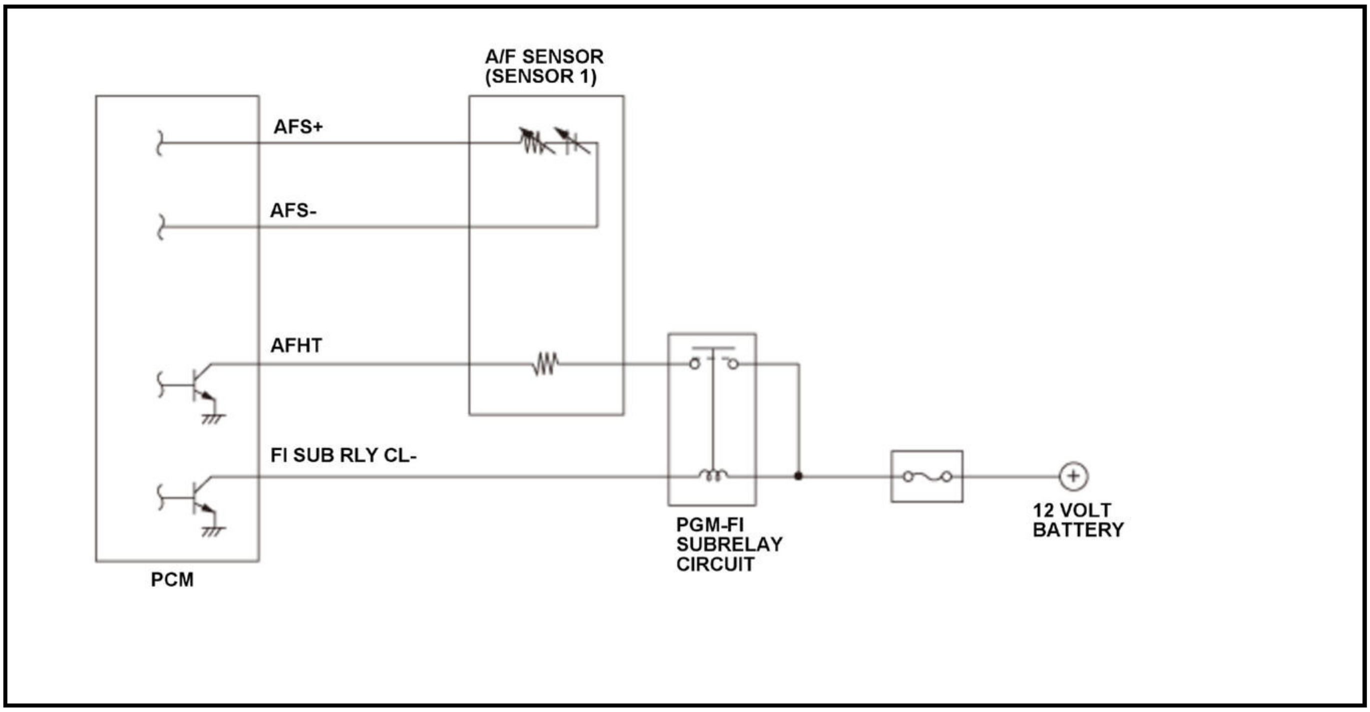
DTC P2238 (2.4 L ENGINE) (2017 2018 2019)

DTC P2238: Air Fuel Ratio (A/F) Sensor (Sensor 1) AFS+ Circuit Low Voltage

General Description



The air/fuel ratio (A/F) sensor (sensor 1) is installed in the exhaust system and detects oxygen content in the exhaust gas. The A/F sensor (sensor 1) transmits a signal to the powertrain control module (PCM). A heater for the sensor element is embedded in the A/F sensor (sensor 1). It heats the sensor to stabilize and speed up the detection of oxygen content. The increase in current through the heater levels off as the voltage applied to the electrode reaches a certain range because the amount of oxygen that goes through the diffusion layer is limited. The current is proportional to the oxygen content in the exhaust gas, so the air/fuel ratio is detected by the measurement of the current. The PCM compares the set target air/fuel ratio to the detected air/fuel ratio and adjusts the fuel injection duration. If the A/F sensor (sensor 1) voltage is low, the air/fuel ratio is lean, and the PCM uses air/fuel ratio feedback control to issue a Rich command. If the A/F sensor (sensor 1) voltage is high, the air/fuel ratio is rich, and the PCM uses air/fuel ratio feedback control to issue a Lean command. If the element is not activated or the PCM terminal voltage is a set value for a set time when power is applied to the A/F sensor (sensor 1) heater, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

Malfunction Threshold

The AFS- terminal voltage is 0.40 V or less for at least 4 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) AFS- line open
- A/F sensor (sensor 1) failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

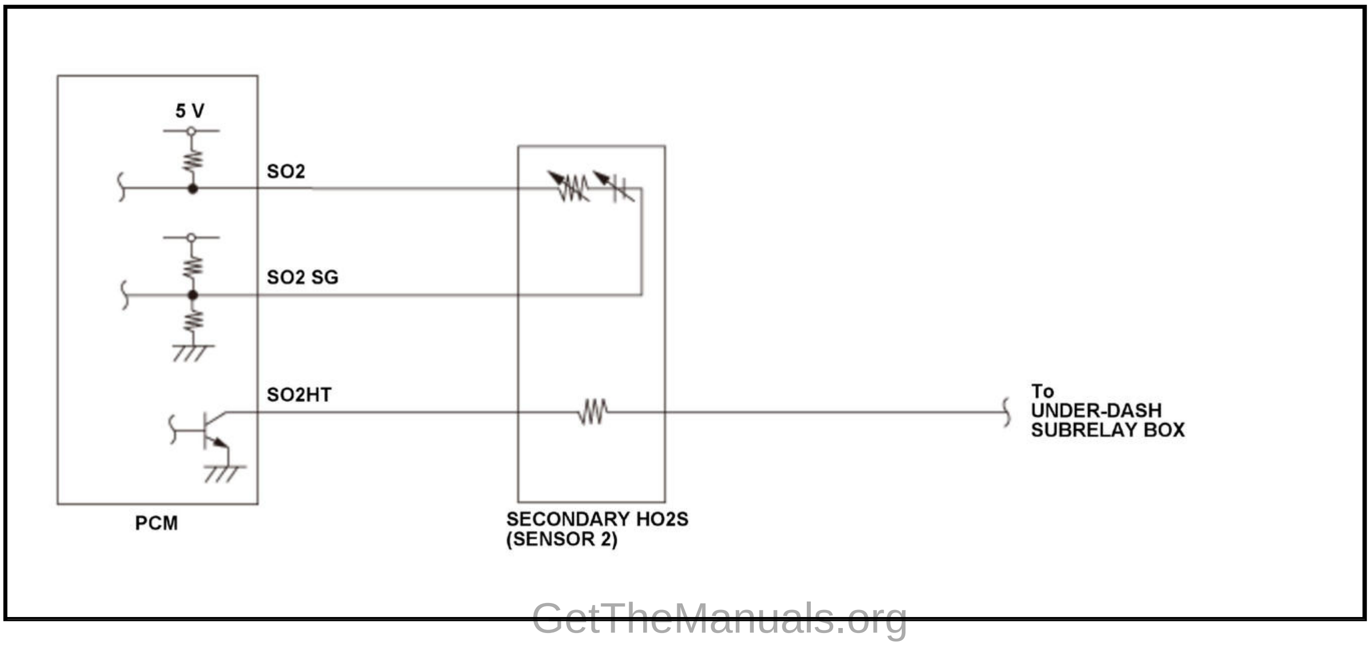
Conditions for clearing the DTC

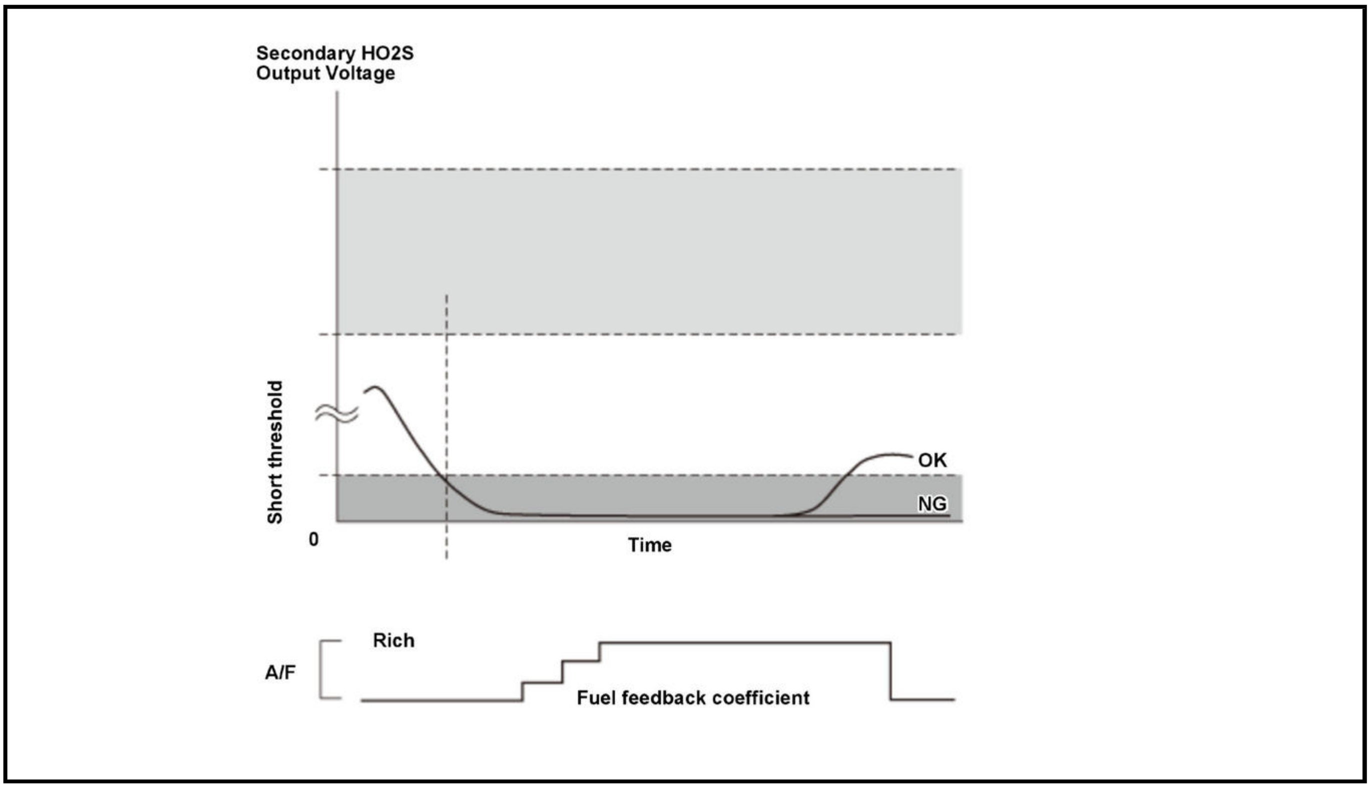
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2270 (1.5 L ENGINE)

DTC P2270: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Circuit Signal Stuck Lean

General Description





The secondary heated oxygen sensor (secondary HO2S (sensor 2)) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control. The powertrain control module (PCM) controls the air/fuel ratio from the air/fuel ratio (A/F) sensor (sensor 1) output voltage to optimize the TWC efficiency. When power is applied to the secondary HO2S (sensor 2) heater, if the secondary HO2S (sensor 2) output continues to be low (lean) during feedback control, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	30.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time that secondary HO2S activity is not monitored after starting the engine	15 seconds	-
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg. F (-25 deg. C)	-
Fuel trim	0.75	1.47
Fuel feedback	Closed loop	
Other	Cruise load or more	

[ ]: HDS Parameter

Malfunction Threshold

The secondary HO2S (sensor 2) output voltage [HO2S S2] is 0.05 V or less for at least 30.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) lean side stuck

Confirmation Procedure

Operating Condition

- Start the engine, and let it idle until the radiator fan comes on.
- Drive immediately at a steady engine speed [ENGINE SPEED] between 1, 500 - 3, 000 rpm for at least 30 seconds.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

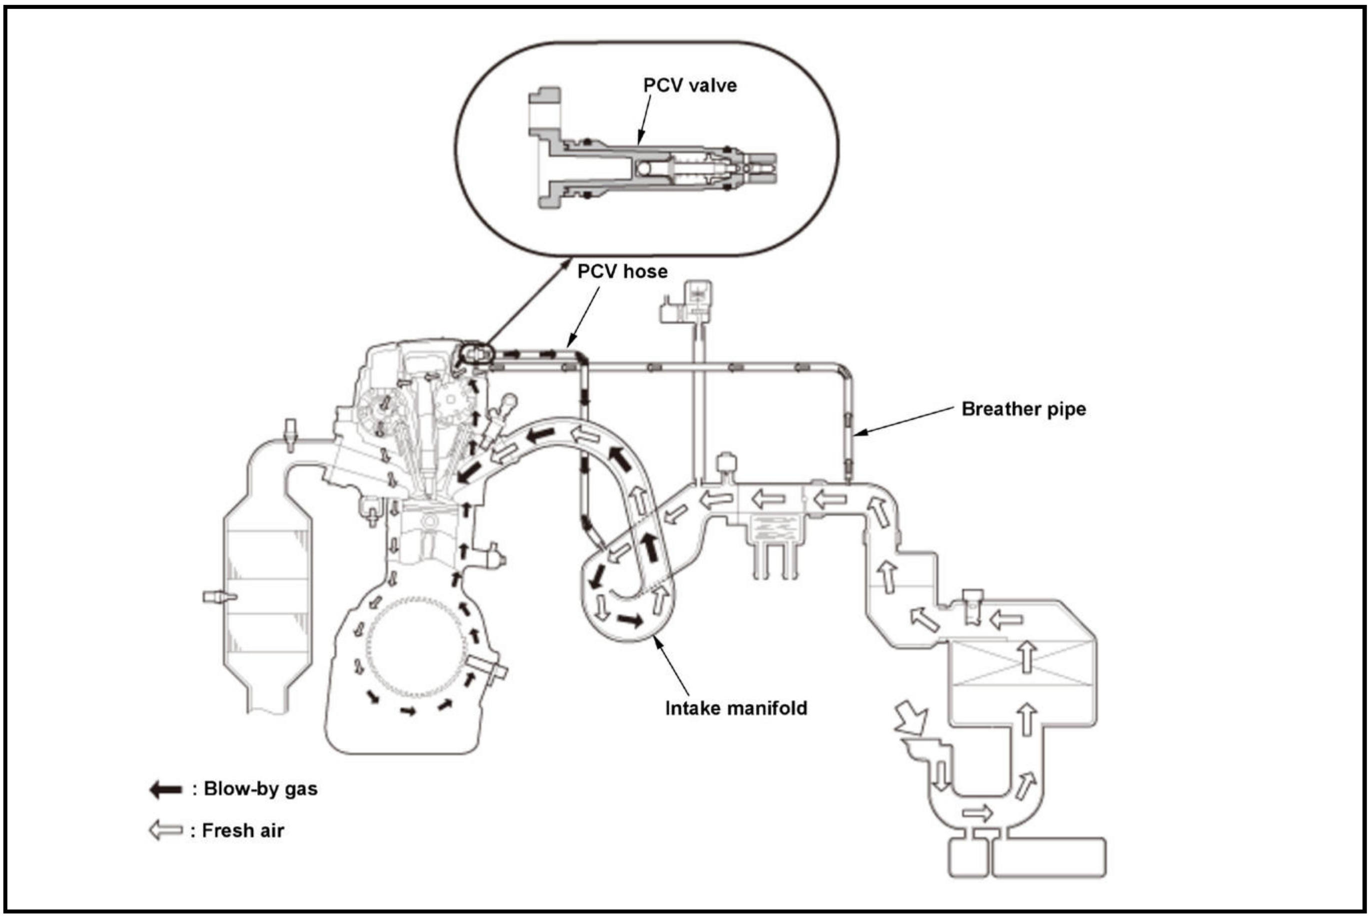
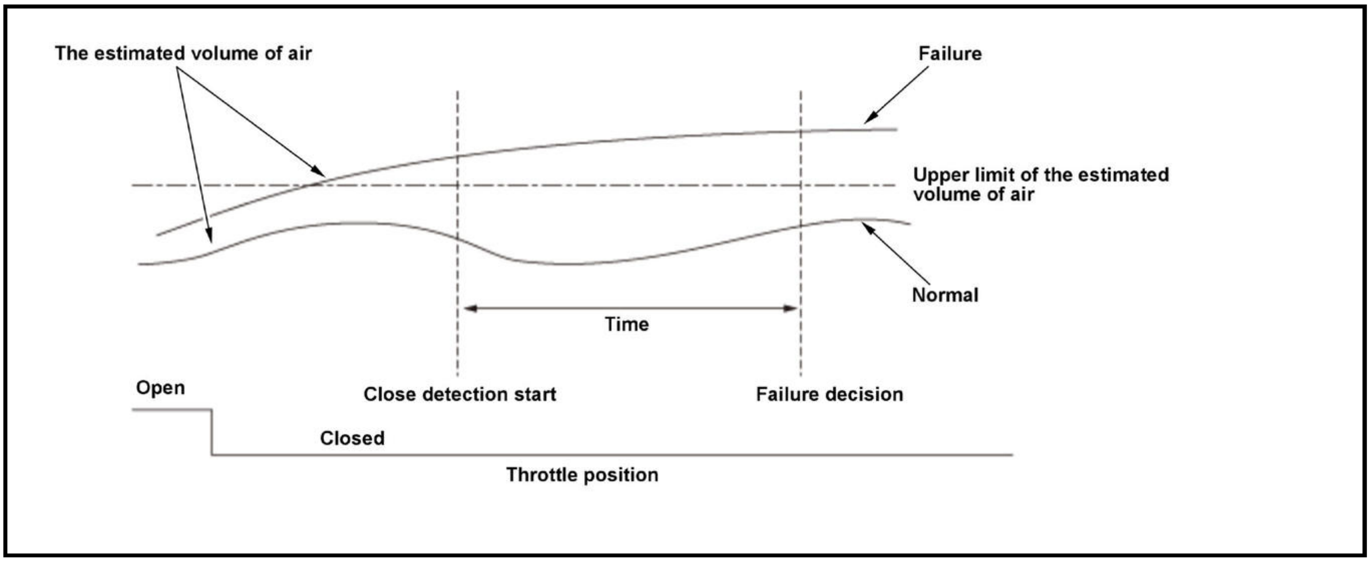
DTC P2279 (1.5 L ENGINE) (2017 2018)

DTC P2279: Intake Air System Leak

General Description





The positive crankcase ventilation (PCV) system reduces hydrocarbon (HC) emissions. The PCV system recirculates unburned air/fuel mixture (blow-by vapor) into the intake manifold so that it is drawn into the engine and burned, thus reducing HC. If the PCV hose comes off at idle with the throttle closed, the amount of air supplied to the engine is considerably more than the amount of air the idle control system supplies. The powertrain control module (PCM) estimates the amount of air supplied to the engine while the throttle valve is fully closed, and if the estimated amount is more than the upper limit, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	22 seconds or more

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	15 seconds	-
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-

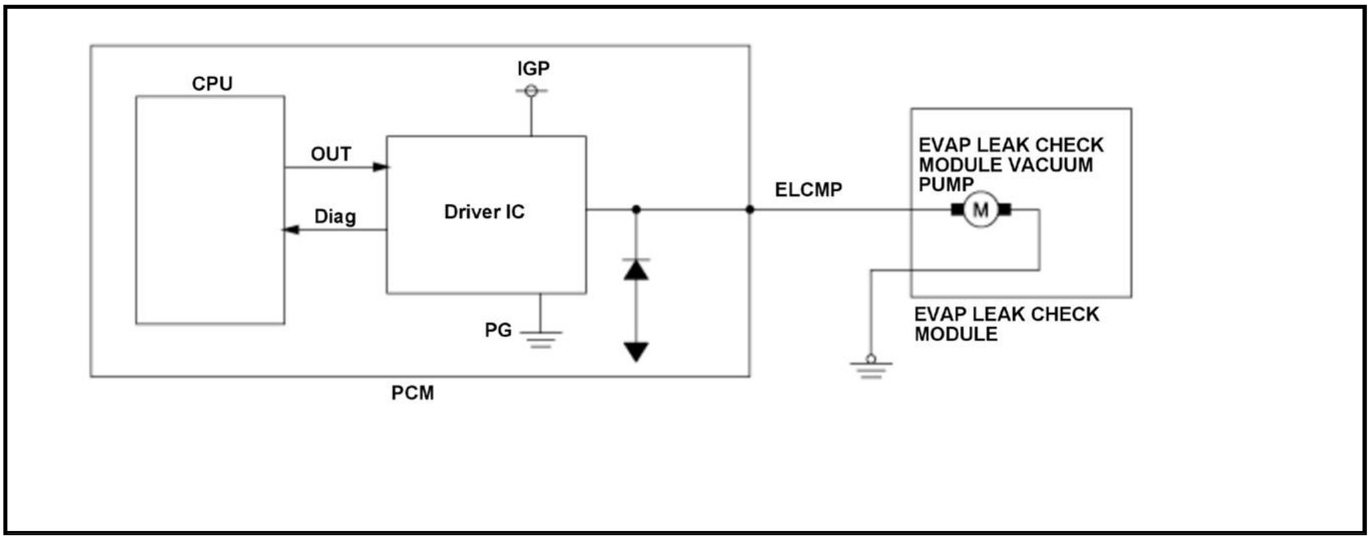
DTC P2401, P2402 (1.5 L ENGINE)

DTC P2401: Evaporative Emission (EVAP) Leak Check Pump Control Circuit Low Voltage **DTC P2402:** Evaporative Emission (EVAP) Leak Check Pump Control Circuit High Voltage

General Description



The evap leak check module vacuum pump is installed in the evap leak check module to create negative pressure in the EVAP passage when performing the evap leak check. The vacuum pump is normally non-energized and inactive. It is only activated when performing the evap leak check. The powertrain control module (PCM) detects a malfunction and stores a DTC when the diagnostic signal of the driver IC of the PCM internal circuit is low continuously for the prescribed time though operation signal is output to the evap leak check module vacuum pump.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more

Malfunction Judgment Flowchart of FTP Sensor and EVAP Canister Vent Shut Valve

FTP Sensor ZERO point shift failure?
Pass
FTP Sensor: Pass
Possibility of failure
EVAP Canister Vent Shut Valve failure?
Fail
Pass
FTP Sensor: Fail
EVAP Canister Vent Shut Valve: Pass
EVAP Canister Vent Shut Valve: Fail
FTP Sensor: Pass

The fuel tank pressure (FTP) sensor output is near atmospheric pressure (0 kPa (0 inHg, 0 mmHg)) before purge starts since the evaporative emission (EVAP) canister vent shut valve is normally open (to the atmosphere). The sensor indicates a negative pressure value (vacuum) while purging. When the FTP sensor indicates vacuum after the engine starts, an FTP sensor zero point shift failure or an EVAP canister vent shut valve stuck closed can occur. To prevent these failures, the powertrain control module (PCM) monitors the FTP sensor output after purge starts. The PCM detects a malfunction of the EVAP canister vent shut valve if the output indicates excessive vacuum. However, if the fuel tank internal pressure is below the specified value (excessive vacuum is detected) when starting the engine, the malfunction detection should be done as follows because it is difficult to distinguish between FTP sensor range problem (P1454) and an EVAP canister vent shut valve stuck closed problem (P2422).

- If neither Pending DTCs (P1454 nor P2422) are stored, both Pending DTCs are stored when excessive vacuum is detected at engine start.
- If both Pending DTCs (P1454 and P2422) are stored and excessive vacuum is detected, both Confirmed DTCs are stored.
- If either Pending DTC (P1454 or P2422) is stored and excessive vacuum is detected, the PCM stores the Confirmed DTC which the Pending DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence**	P0452, P0453 are judged as OK
Duration	1.04*, 8.0** seconds or more
DTC Type	Two drive cycles, MIL on

*: Elapsed time after the FTP sensor output exceeds the malfunction threshold.

**: Excessive negative pressure is detected.

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine**	10 seconds	-
Engine coolant temperature [ECT SENSOR 1]***	131 deg. F (55 deg. C)	-
12 volt battery voltage [BATTERY]*	10.5 V	-
Fuel feedback	Closed loop	

Condition	Minimum	Maximum
Other**	The EVAP canister vent shut valve is open	
	The EVAP canister purge valve is closed (the system is not purging)	

***: Condition to start the purge control

[ ]: HDS Parameter

Malfunction Threshold

The output from the FTP sensor [FTP SENSOR] is -4 kPa (-1.0 inHg, -25 mmHg)*, -2 kPa (-0.4 inHg, -10 mmHg)** or less for at least 1.04*, 8.0** seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister vent shut valve closed stuck
- EVAP canister drain tube clogged

Confirmation Procedure

Operating Condition

- Start the engine, and let it idle until the radiator fan comes on.
- When the diagnosis does not finish at idle, drive at 30 - 75 mph (48 - 120 km/h) at EVAP canister purge valve duty [EVAP PC DUTY] 20 % or more.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

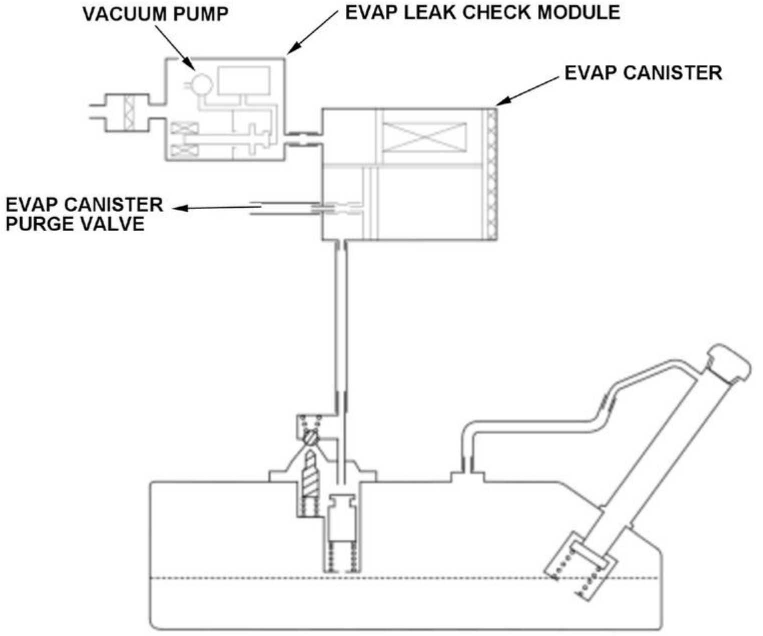
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

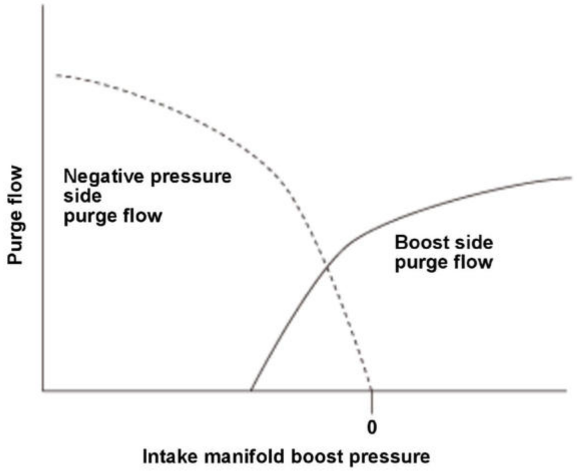
DTC P2450 (1.5 L ENGINE)

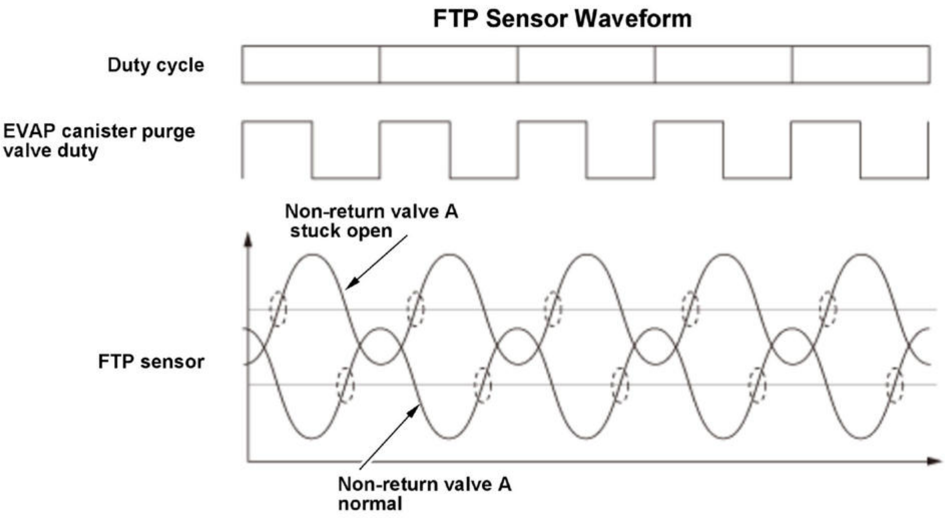
DTC P2450: Evaporative Emission (EVAP) System Purge Line Non-return Valve A Stuck Open

General Description



VACUUM PUMP
EVAP LEAK CHECK MODULE
EVAP CANISTER
EVAP CANISTER PURGE VALVE





Negative side purge flow	Boost side purge flow	Purge back-flow (P2450)	Condition
Flowing	Flowing	OK	Purge line normal, EVAP canister purge valve

Negative side purge flow	Boost side purge flow	Purge back-flow (P2450)	Condition
			normal
Flowing	Flowing	NG (P2450)	Non-return valve A abnormal
Not flowing	Flowing	-	Negative side purge line abnormal
Flowing	Not flowing	-	Boost side purge line abnormal
Not flowing	Not flowing	-	Purge line abnormal, EVAP canister purge valve open

The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine.

The PCM checks the purge flow conditions on both negative and boost pressure sides. If either side of the purge flow is detected as abnormal, it is determined that there is a clog or disconnection on the abnormal side of the purge line. If both sides of the purge flow are detected as abnormal, it is determined that the purge lines are abnormal or the EVAP canister purge valve is stuck opened.

If non-return valve A is stuck opened, the boost pressure flows back to the fuel tank when purge controlled in boost condition. At the time, the FTP sensor pulse waveform shows opposite phase to the usual phase. The PCM detects a malfunction by calculating the phase time difference, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Low load duration time	10 seconds	-

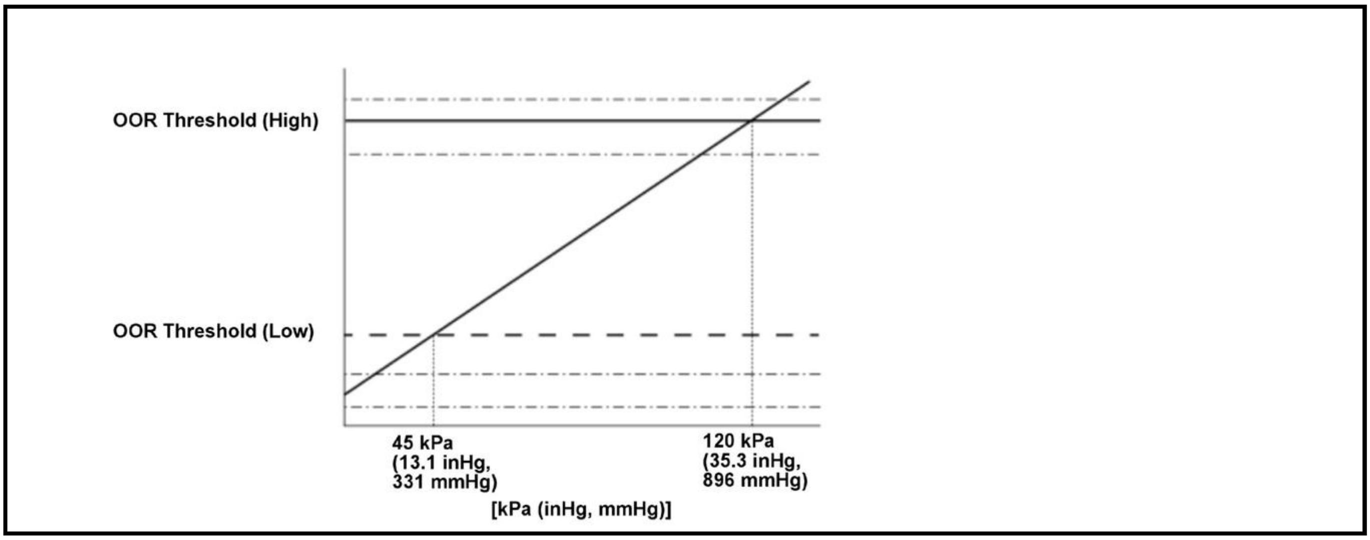
PCM
LEAK DETECTION PRESSURE SENSOR



The evaporative emission (EVAP) leak check module pressure sensor is a sensor used for leak detection of the fuel tank. The limit of the EVAP leak check module pressure sensor output is specified. If the output is exceed that limit, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The leak check pressure sensor output level is 45 kPa (13.1 inHg, 331 mmHg) or less, or 120 kPa (35.3 inHg, 896 mmHg) or more for at least 6 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Leak check pressure sensor ELCMPA line short to power
- Leak check pressure sensor ELCMPA line open
- Leak check pressure sensor ELCMPA line short to ground
- Leak check pressure sensor SG line open
- Leak check pressure sensor VCC line open
- Leak check pressure sensor out of range

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 6 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

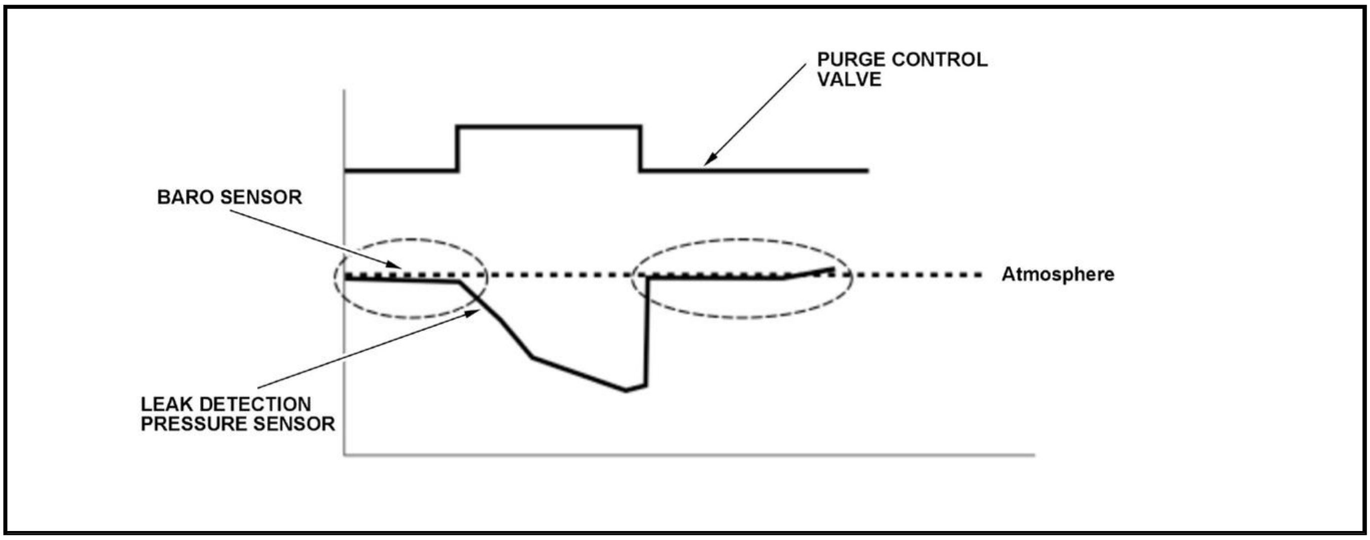
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P24B9 (1.5 L ENGINE)

DTC P24B9: Evaporative Emission (EVAP) Leak Check Module Absolute Pressure Sensor Range/Performance Problem

General Description



The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine.

The PCM checks the purge flow conditions on both negative and boost pressure sides. If either side of the purge flow is detected as abnormal, it is determined that there is a clog or disconnection on the abnormal side of the purge line. If both sides of the purge flow are detected as abnormal, it is determined that the purge lines are abnormal or the EVAP canister purge valve is stuck opened.

If non-return valve A is stuck opened, the boost pressure flows back to the fuel tank when purge controlled in boost condition. At the time, the FTP sensor pulse waveform shows opposite phase to the usual phase. The PCM detects a malfunction by calculating the phase time difference, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	4 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the engine start.	10 seconds	-
Leak detection sensor - BARO sensor value	-	17 kPa (125 mmHg, 4.9 inHg)

Malfunction Threshold

When a difference in pressure of the leak detection sensor and the BARO sensor became more than 17 kPa (125 mmHg, 4.9 inHg).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor range/performance problem
- Leak detection module absolute pressure sensor range/performance problem

- Purge control solenoid failure
- Air cleaner element clogged
- Valve timing incorrect
- Throttle body air leak
- Intake manifold air leak

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 18 seconds.
- Decelerate with the throttle valve fully closed for at least 8 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Select the EVAP TEST in the INSPECTION MENU, then select the FUNCTION TEST with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

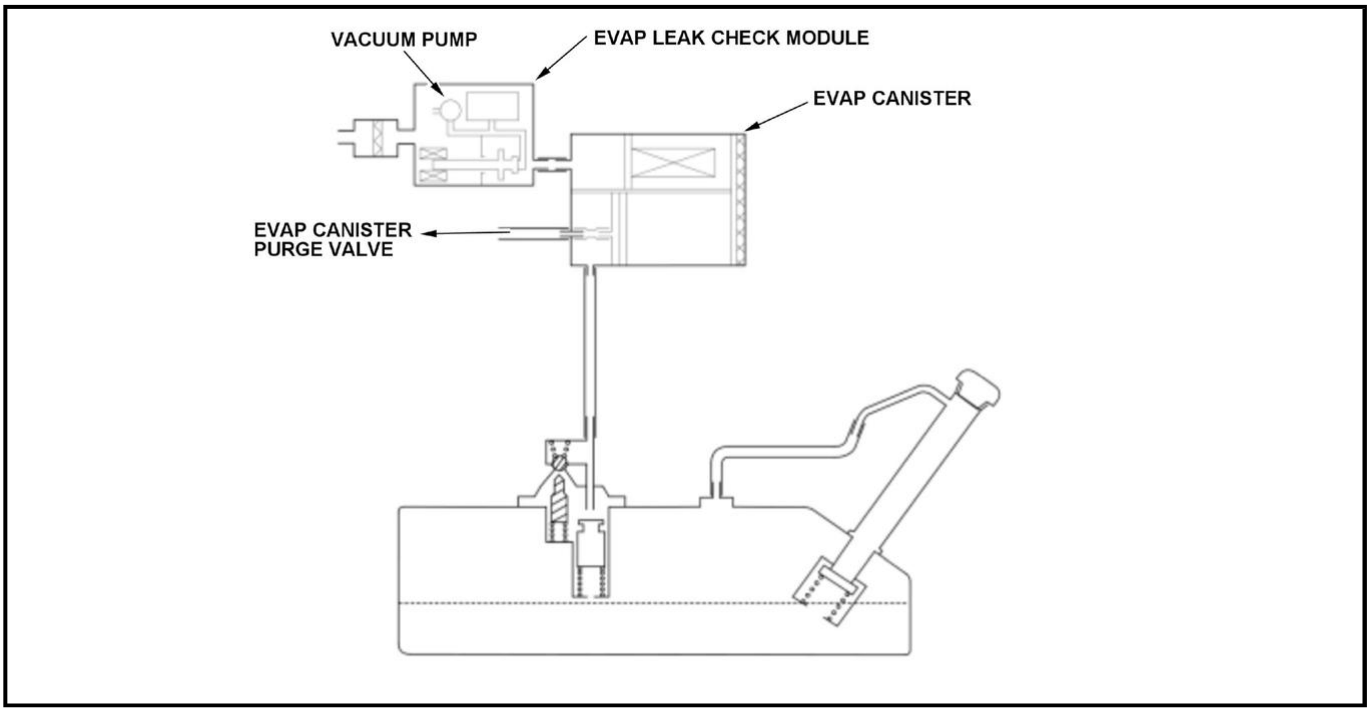
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

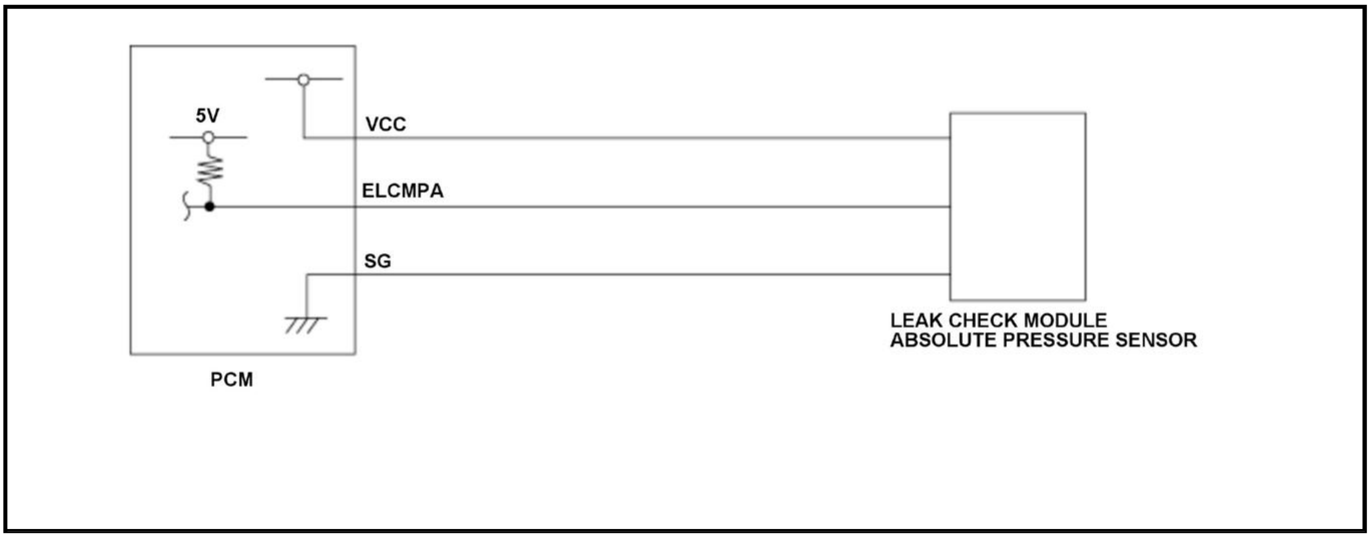
DTC P24BA, P24BB (1.5 L ENGINE) (2017)

DTC P24BA: Evaporative Emission (EVAP) Leak Check Module Absolute Pressure Sensor Circuit Low Voltage **DTC P24BB:** Evaporative Emission (EVAP) Leak Check Module Absolute Pressure Sensor Circuit High Voltage

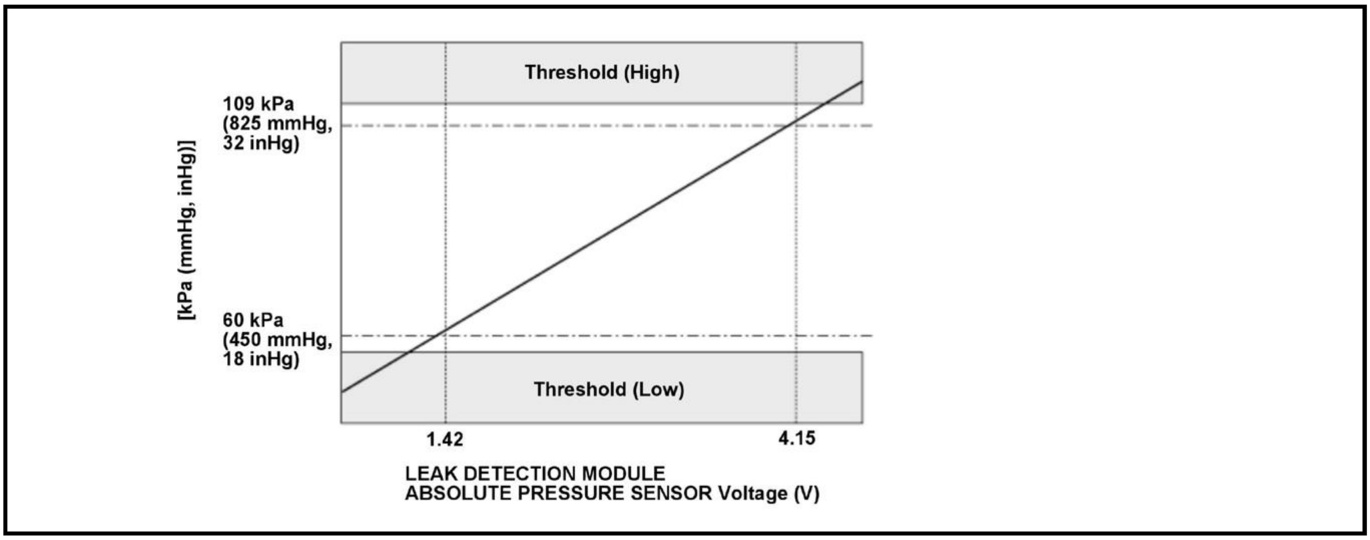
General Description



VACUUM PUMP
EVAP LEAK CHECK MODULE
EVAP CANISTER
EVAP CANISTER PURGE VALVE



5V
VCC
ELCMPA
SG
PCM
LEAK CHECK MODULE ABSOLUTE PRESSURE SENSOR



The barometric pressure (BARO) sensor, and leak check sensor all measure barometric pressure when the engine is stopped. The sensor outputs are compared to detect malfunction. If the BARO sensor and the leak check sensor are within an acceptable range of each other, then conditions are normal. If the BARO sensor and the leak check sensor are out of range, then the out of range sensor is judged as abnormal. When a DTC is set, use these values to determine the abnormal sensor. If any of these values are out of range, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	3 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P24BA

The leak check module absolute pressure sensor output level is 50 kPa (380 mmHg, 15 inHg) or less for at least 3 seconds.

DTC: P24BB

The leak check module absolute pressure sensor output level is 119 kPa (899 mmHg, 35 inHg) or more for at least 3 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Leak check module absolute pressure sensor ELCMP line short to power
- Leak check module absolute pressure sensor ELCMP line open
- Leak check module absolute pressure sensor ELCMP line short to ground
- Leak check module absolute pressure sensor SG line open
- Leak check module absolute pressure sensor VCC line open
- Leak check module absolute pressure sensor out of range

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 3 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P24BA, P24BB (1.5 L ENGINE) (2018 2019)

DTC P24BA: Evaporative Emission (EVAP) Leak Check Module Absolute Pressure Sensor Circuit Low Voltage **DTC P24BB:** Evaporative Emission (EVAP) Leak Check Module Absolute Pressure Sensor Circuit High Voltage

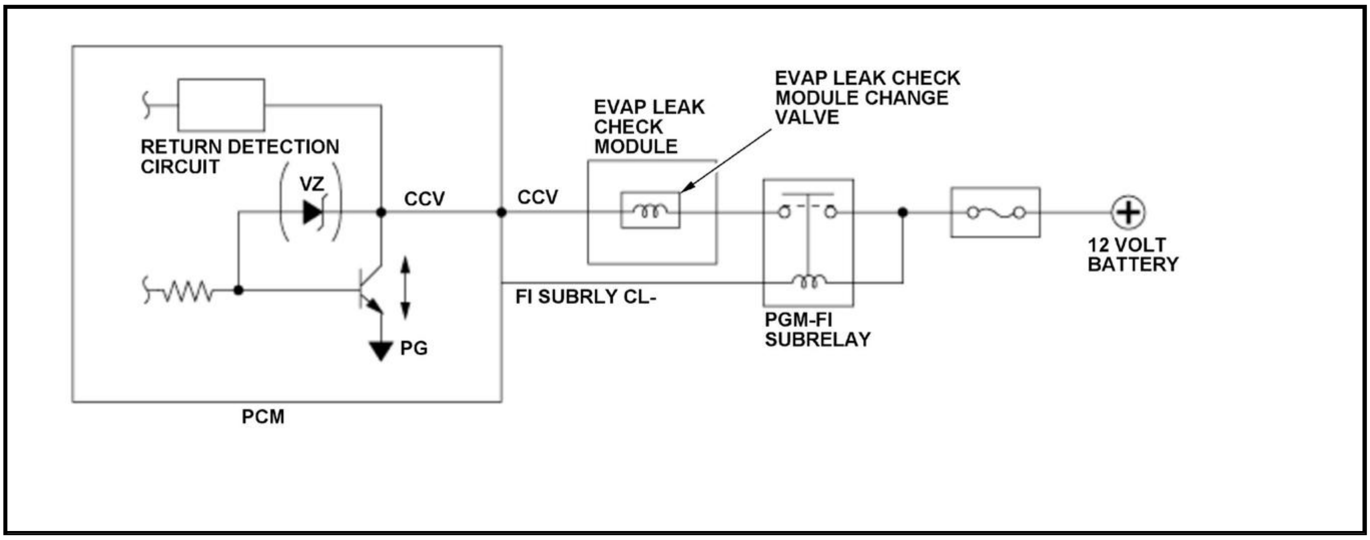
DTC P24BE (1.5 L ENGINE)

DTC P24BE: Canister Change Over Valve Control Circuit Low Voltage

General Description



The evap leak check module change valve is installed in the evap leak check module and used to seal up the EVAP passage when performing the evap leak check. The evap leak check module change valve is normally open (open to the atmosphere) and only closed (sealed) when performing the evap leak check. The powertrain control module (PCM) detects a malfunction and stores a DTC when the close signal is returned continuously for the prescribed time or more though close signal is not output to the evap leak check module change valve.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 Volt Battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

When close signal is returned continuously for 2.0 seconds or more though close signal is not output to the EVAP leak check module change valve.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP leak check module CCV line open
- EVAP leak check module power supply line open
- EVAP leak check module internal circuit open
- EVAP leak check module CCV line short
- EVAP leak check module power supply line short to ground
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode.

With the HDS

Select the EVAP TEST in the INSPECTION MENU, then select the FUNCTION TEST with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

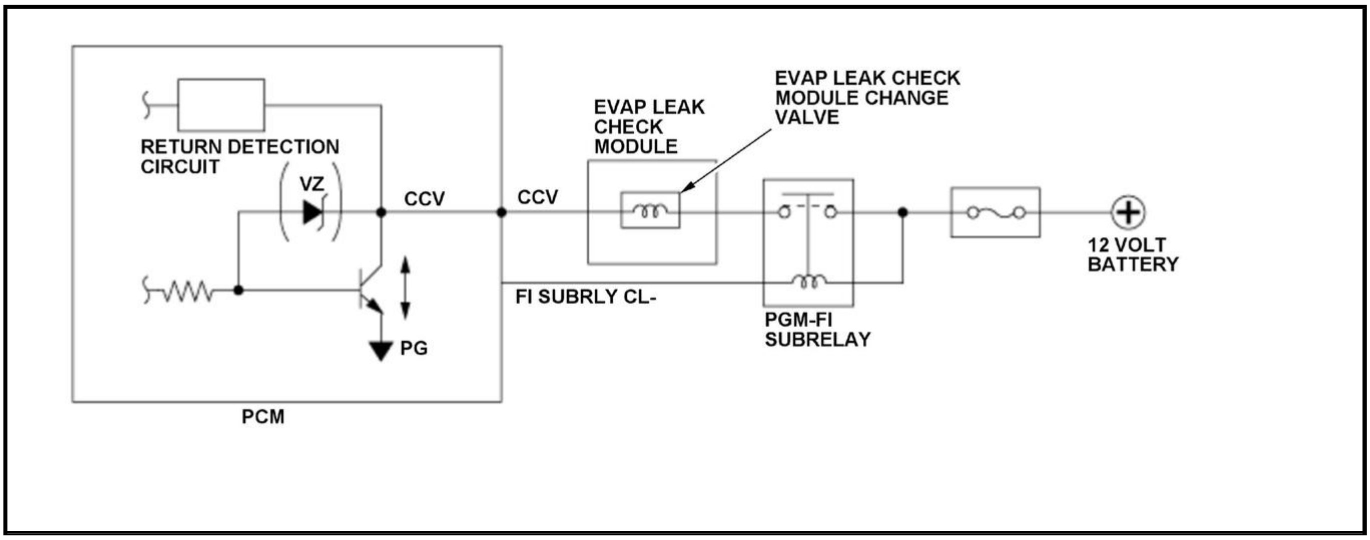
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P24BF (1.5 L ENGINE)

DTC P24BF: Canister Change Over Valve Control Circuit High Voltage

General Description



The evap leak check module change valve is installed in the evap leak check module and used to seal up the EVAP passage when performing the evap leak check. The evap leak check module change valve is normally open (open to the atmosphere) and only closed (sealed) when performing the evap leak check. The powertrain control module (PCM) detects a malfunction and stores a DTC when the close signal is returned continuously for the prescribed time or more though close signal is not output to the evap leak check module change valve.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

When open signal is returned continuously for 2.0 seconds or more though close signal is output to the EVAP leak check module change valve.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP LEAK CHECK MODULE CCV line short to power
- EVAP leak check module change valve internal circuit leak
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode.

With the HDS

Select the EVAP TEST in the INSPECTION MENU, then select the FUNCTION TEST with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

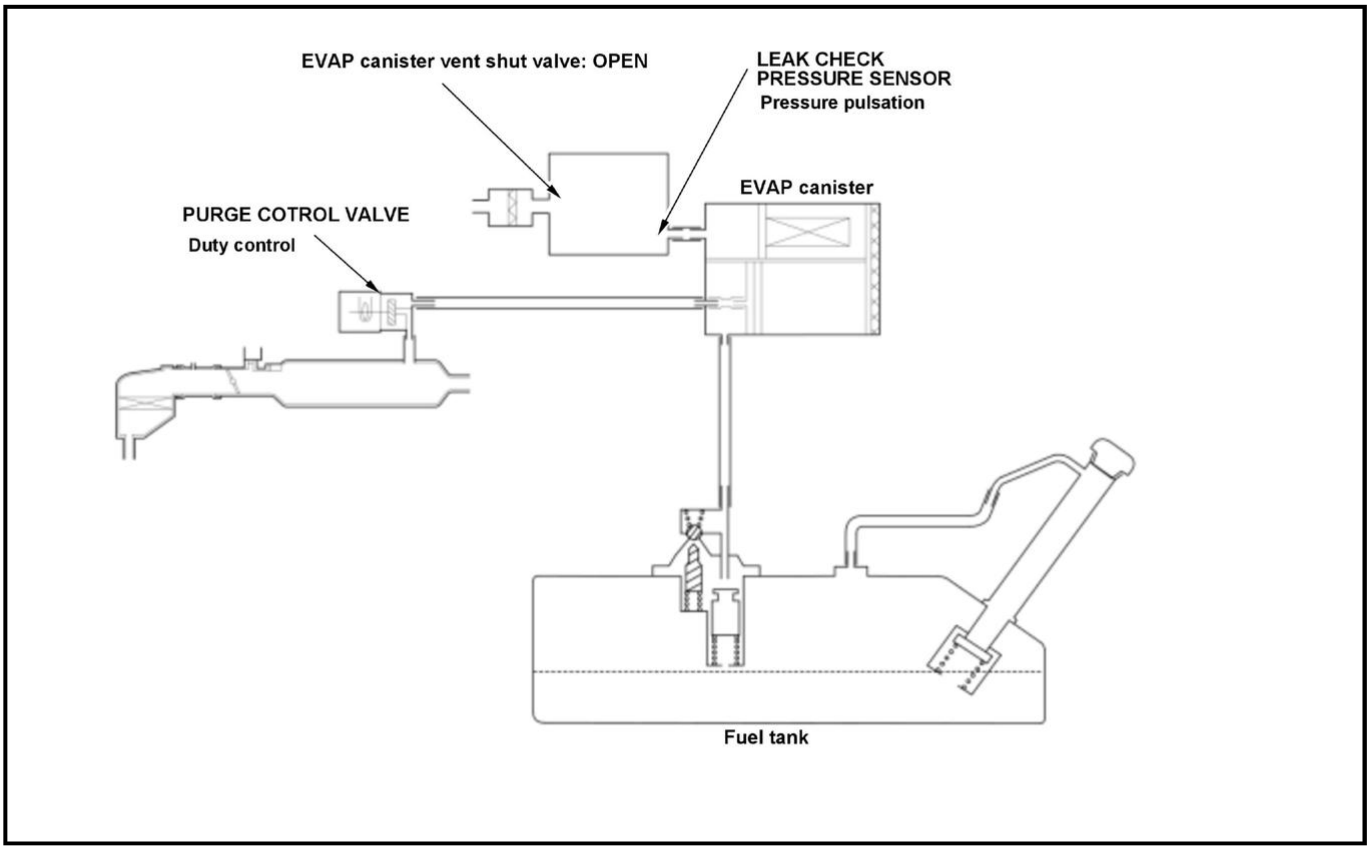
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P24C0 (1.5 L ENGINE)

DTC P24C0: Canister Change Over Valve Close Malfunction

General Description



EVAP canister vent shut valve: OPEN
LEAK CHECK PRESSURE SENSOR
Pressure pulsation
EVAP canister
PURGE COTROL VALVE
Duty control
Fuel tank

Relative pressure calculated from evap leak check module the pressure sensor is smaller than the failure determination value, if the state has continued for a predetermined time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Relative pressure which is calculated from the pressure sensor in the ELCM failure determination value or more, the integrated purge flow rate reaches a predetermined amount, properly determined.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Low load duration time	1 seconds	-
Engine coolant temperature [ECT SENSOR 1] before EVAP purge control starts	131 deg. F (55 deg. C)	-
Evap leak check module pressure sensor	-4.4 kPa (-33.6 mmHg, -1.2 inHg)	-
12 volt battery voltage [BATTERY]	10.5 V	-

[ ]: HDS Parameter

Malfunction Threshold

The evap leak check module pressure sensor in the 1 second or more the pressure reduction is -4.4 kPa (-33.6 mmHg, -1.2 inHg) or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Control valve failure
- Dust filter closed

Confirmation Procedure

Operating Condition

- Let it engine idle until the radiator fan comes on.
- Drive immediately at a steady speed between 30 - 75 mph (48 - 120 km/h).

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

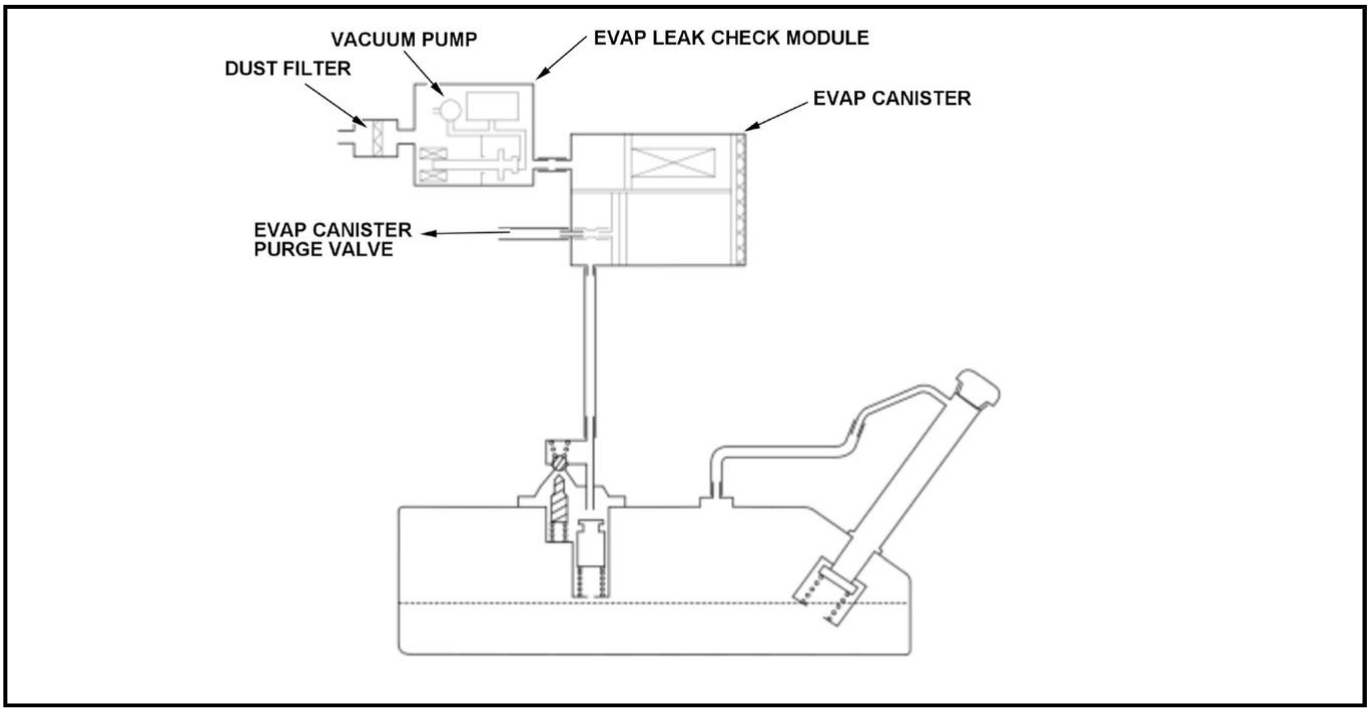
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

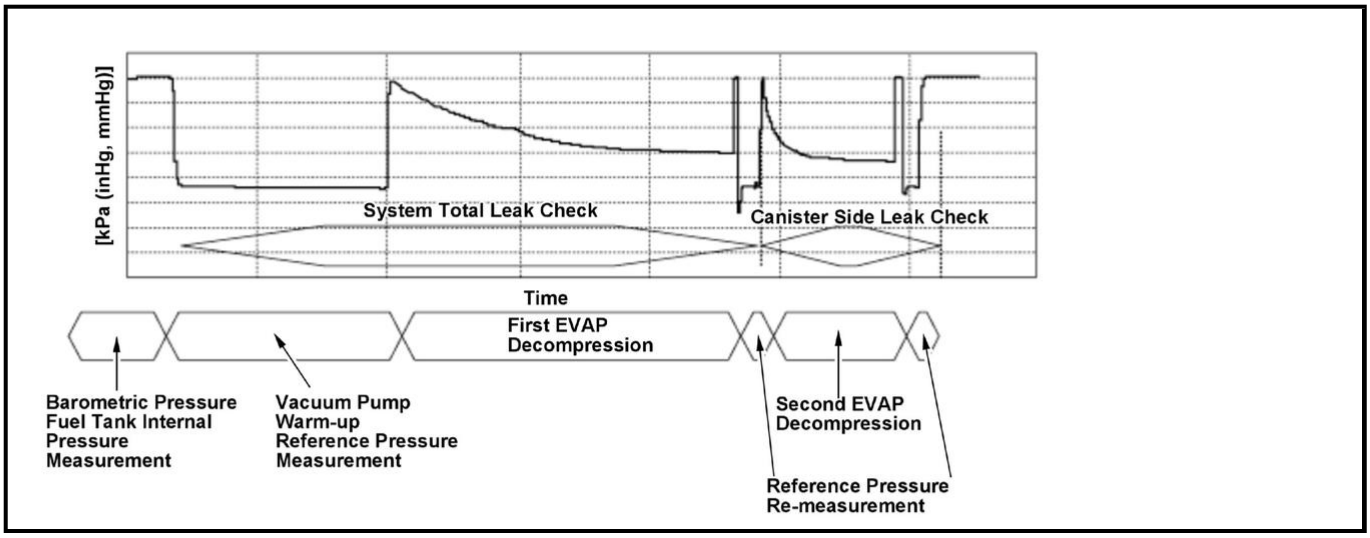
DTC P24C1 (1.5 L ENGINE)

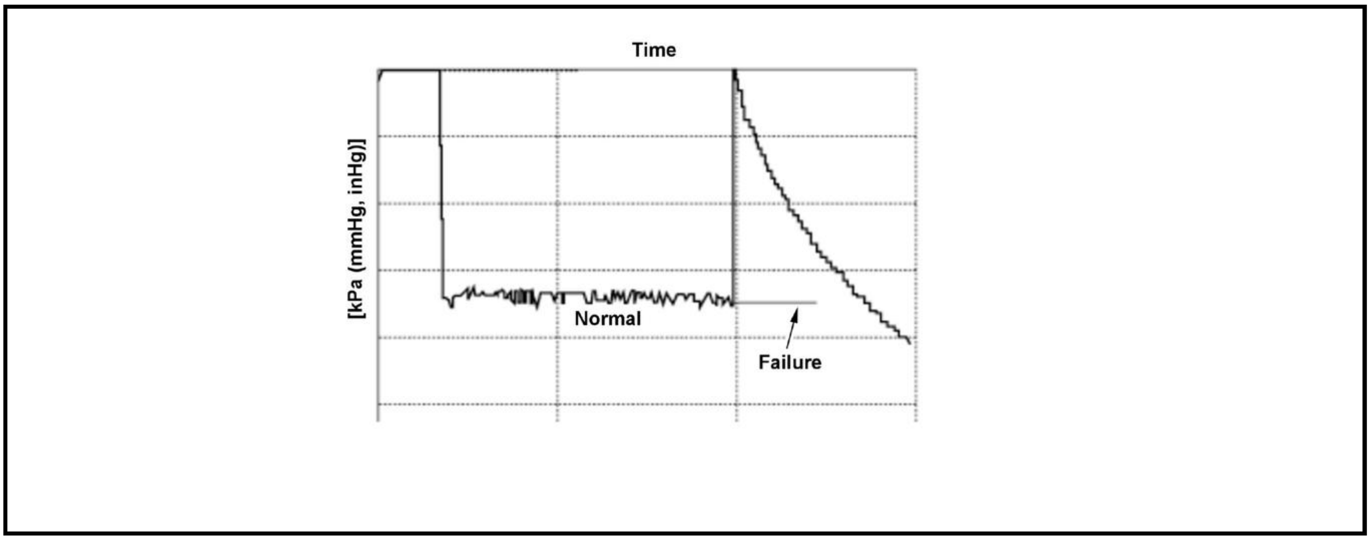
DTC P24C1: Canister Change Over Valve Stuck Close

General Description



VACUUM PUMP
EVAP LEAK CHECK MODULE
DUST FILTER
EVAP CANISTER
EVAP CANISTER PURGE VALVE





The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT SENSOR 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere. If pressure is reduced with the fuel vapor containment valve open, the entire EVAP system will be diagnosed, and if the fuel vapor containment valve is closed, only the EVAP canister side will be diagnosed.

A malfunction is detected and a DTC is stored when the max and min values of the pressure measurements within the prescribed time during reference pressure measurement is equal to or more than the prescribed value.

EVAP leak detection module operation flow

- Reference pressure measurement : Malfunction detection in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction : Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement : Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the vacuum pump during detection.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	At least 6 minutes, 40 seconds but not more than 18 minutes, 55 seconds
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after turn the vehicle to the ON mode	10 minutes	-
Elapsed time after turn the vehicle to the OFF (LOCK) mode	5 hours	-
Barometric pressure[BARO SENSOR]	76 kPa (569 mmHg, 22.5 inHg)	-
Battery voltage [BATTERY]	10.5 V	-

[ ]: HDS Parameter

Malfunction Threshold

When the change in the pressure 6 minutes, 40 seconds after starting the system pressure reduction is 0.3 kPa (2.3 mmHg, 0.09 inHg) or less.

Possible Cause

- Vacuum pump failure
- Vacuum pump (Motor) failure
- Control valve failure
- Reference orifice flow quantity is excessive

Confirmation Procedure

Operating Condition

- With the engine coolant temperature [ECT SENSOR 1] within the specified range, turn the vehicle to the ON mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes, 55 seconds.

With the HDS

Select the EVAP TEST in the INSPECTION MENU, then select the FUNCTION TEST with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

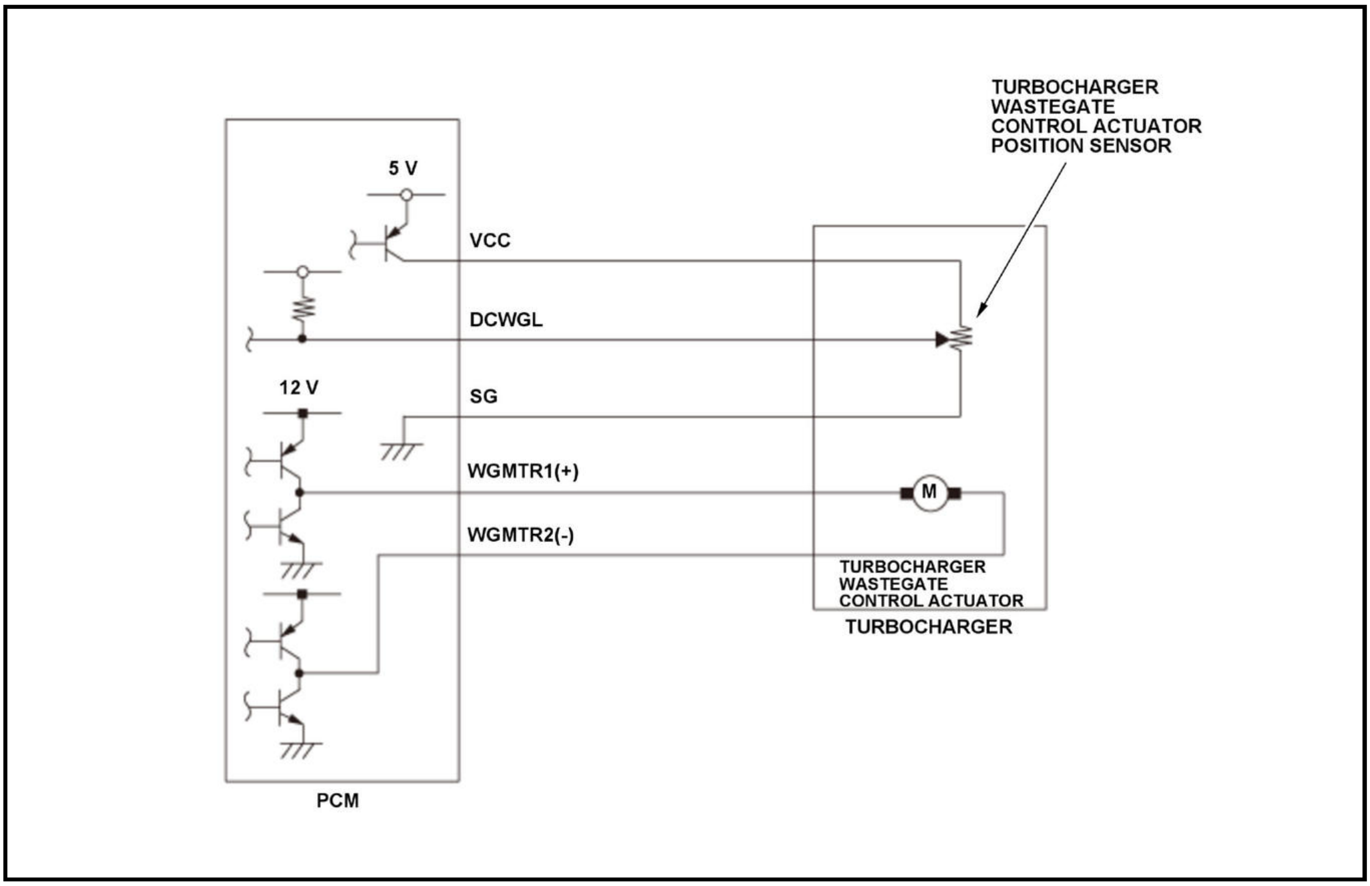
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

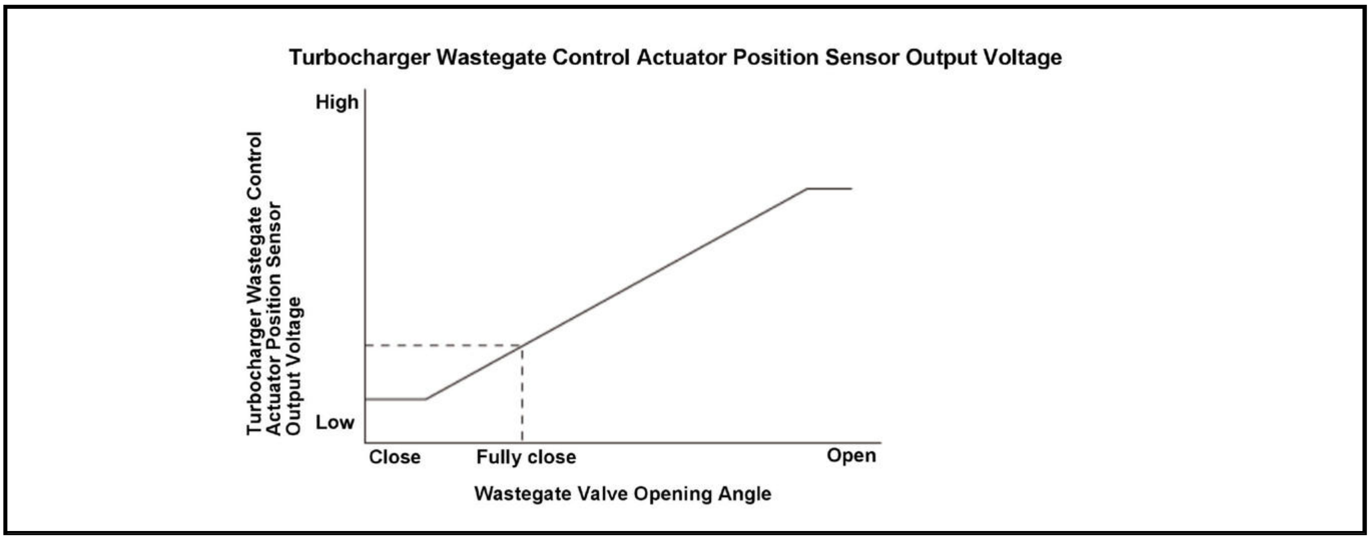
DTC P2563 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P2563: Turbocharger Wastegate Control Actuator Position Sensor Out of Range

General Description



TURBOCHARGER
WASTEGATE
CONTROL ACTUATOR
POSITION SENSOR
5 V
VCC
DCWGL
12 V
SG
WGMTR1(+)
M
WGMTR2(-)
TURBOCHARGER
WASTEGATE
CONTROL ACTUATOR
TURBOCHARGER
PCM



The powertrain control module (PCM) adjusts the boost pressure by controlling the turbocharger wastegate control actuator of the turbocharger. Boost pressure becomes higher by fully closing the turbocharger wastegate control valve driven by the turbocharger wastegate control actuator. The turbocharger wastegate control valve position is detected by the turbocharger wastegate control actuator position sensor and the signal is input to the PCM for target position feedback control. The turbocharger wastegate control actuator position sensor value when the turbocharger wastegate control valve is fully closed is stored as fully closed learning value. Target and actual positions are represented by the relative value from the fully closed position. The PCM sets a target position, and outputs a drive signal to the driver IC and drives the turbocharger wastegate control actuator to be equal to the target position. If the turbocharger wastegate control actuator position sensor output voltage is a set value for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The turbocharger wastegate control actuator position sensor output voltage [EWG VOLTAGE FROM LIFT SENSOR] is 0.31 V or less, or 4.78 V or more for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Turbocharger wastegate control actuator position sensor DCWGL line open
- Turbocharger wastegate control actuator position sensor SG line open
- Turbocharger wastegate control actuator position sensor failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2564, P2565 (1.5 L ENGINE)

DTC P2564: Turbocharger Wastegate Control Actuator Position Sensor Circuit Low Voltage **DTC P2565:** Turbocharger Wastegate Control Actuator Position Sensor Circuit High Voltage

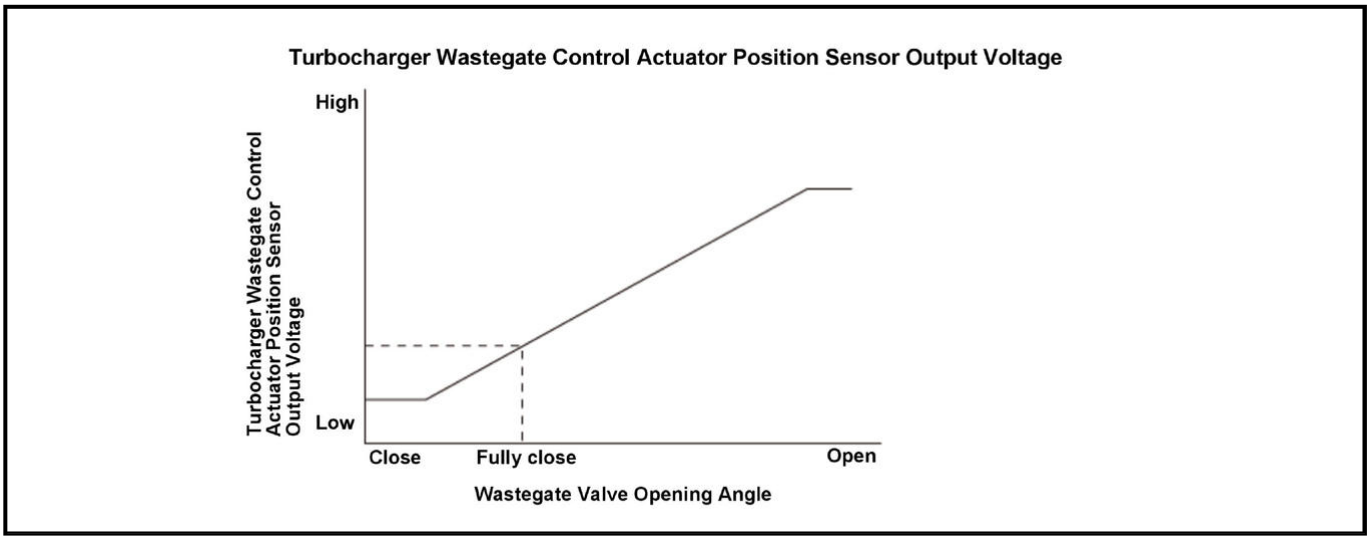
TURBOCHARGER WASTEGATE CONTROL ACTUATOR
TURBOCHARGER
PCM



The powertrain control module (PCM) adjusts the boost pressure by controlling the turbocharger wastegate control actuator of the turbocharger. Boost pressure becomes higher by fully closing the turbocharger wastegate control valve driven by the turbocharger wastegate control actuator. The turbocharger wastegate control valve position is detected by the turbocharger wastegate control actuator position sensor and the signal is input to the PCM for target position feedback control. The turbocharger wastegate control actuator position sensor value when the turbocharger wastegate control valve is fully closed is stored as fully closed learning value. Target and actual positions are represented by the relative value from the fully closed position. The PCM sets a target position, and outputs a drive signal to the driver IC and drives the turbocharger wastegate control actuator to be equal to the target position. If the turbocharger wastegate control actuator position sensor output voltage is out of normal range for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P2564

The turbocharger wastegate control actuator position sensor output voltage [EWG VOLTAGE FROM LIFT SENSOR] is 0.16 V or less for at least 2 seconds.

DTC: P2565

The turbocharger wastegate control actuator position sensor output voltage [EWG VOLTAGE FROM LIFT SENSOR] is 4.87 V or more for at least 2 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P2564

- Turbocharger wastegate control actuator position sensor DCWGL line short to ground
- Turbocharger wastegate control actuator position sensor VCC line open

DTC: P2565

- Turbocharger wastegate control actuator position sensor DCWGL line open
- Turbocharger wastegate control actuator position sensor SG line open

Common

- Turbocharger wastegate control actuator position sensor failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

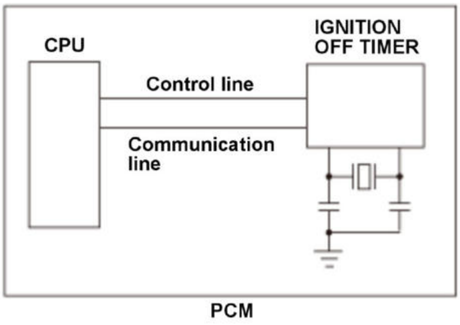
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2610 (1.5 L ENGINE)

DTC P2610: Powertrain Control Module (PCM) Ignition Off Internal Timer Malfunction

General Description



The powertrain control module (PCM) has a built-in ignition off timer that measures the duration from ignition off to the next ignition on. The measured duration is used for evaporative emission (EVAP) leak check and temperature assumption of the catalytic converter. The CPU in the PCM accesses the ignition off timer when reading the measured duration. If the access process to the ignition off timer fails, or an abnormality is found in the read data, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle*	ON mode

*: Excludes after the 12 volt battery is reconnected.

Malfunction Threshold

The access process to the ignition off timer fails, or an abnormality is found in the read data for at least 10 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

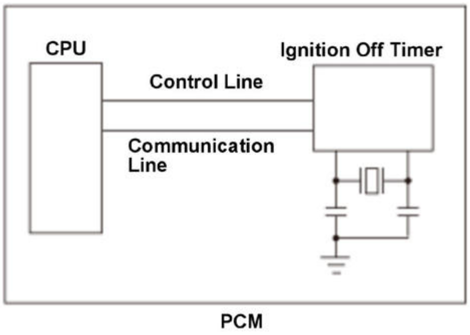
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2610 (2.4 L ENGINE) (2017 2018 2019)

DTC P2610: Powertrain Control Module (PCM) Ignition Off Internal Timer Malfunction

General Description



The powertrain control module (PCM) has a built-in ignition off timer that measures the duration from ignition off to the next ignition on. The measured duration is used for evaporative emission (EVAP) leak check and temperature assumption of the catalytic converter. The CPU in the PCM accesses the ignition off timer when reading the measured duration. If the access process fails, a malfunction is detected and a DTC is stored. When an abnormality is found in the read data, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

Condition	B
Vehicle*	ON mode

*: Excludes after the 12 volt battery is reconnected.

Malfunction Threshold

The access process to the ignition off timer fails, or a malfunction is found in the read data for at least 10 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

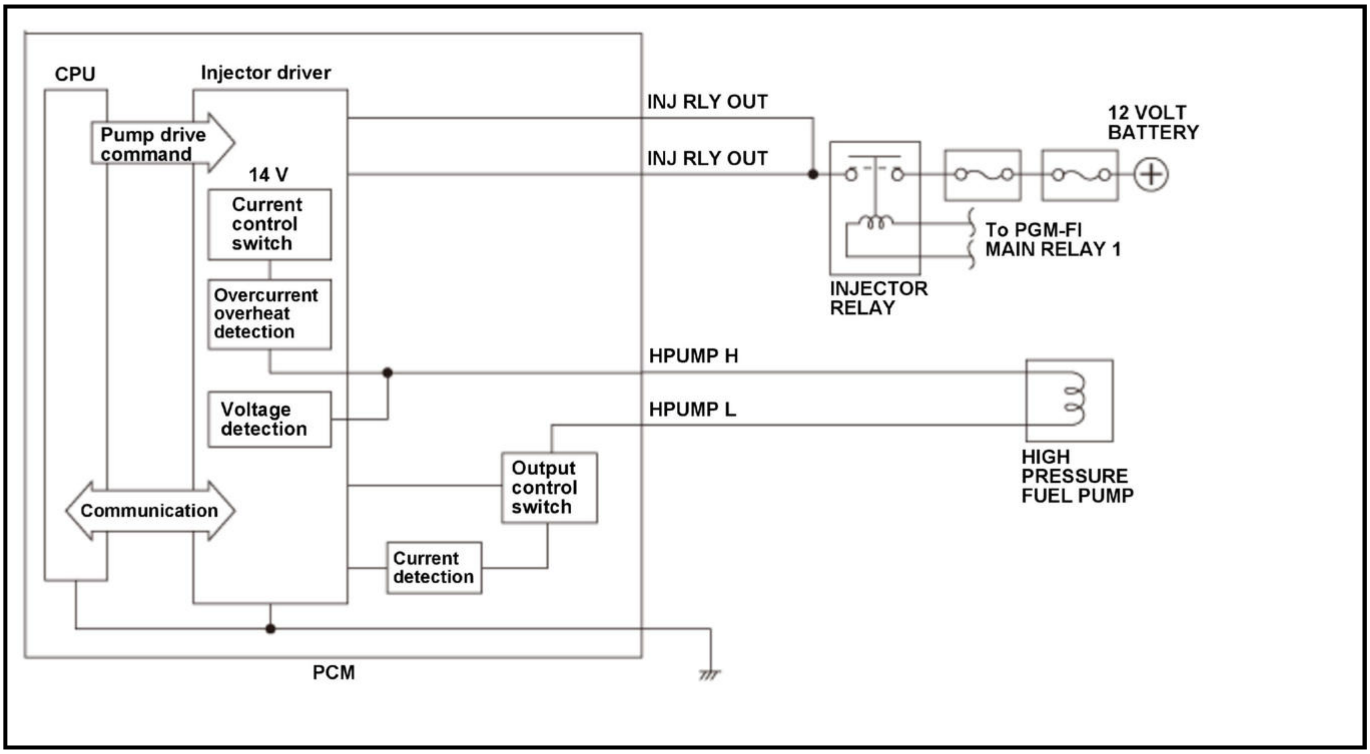
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2623 (1.5 L ENGINE)

DTC P2623: High Pressure Fuel Pump Spill Valve Malfunction

General Description



CPU
Injector driver
Pump drive command
14 V
Current control switch

Output control switch
Current detection
PCM
INJ RLY OUT
INJ RLY OUT
INJECTOR RELAY
12 VOLT BATTERY
To PGM-FI MAIN RELAY 1
HPUMP H
HPUMP L
HIGH PRESSURE FUEL PUMP

The fuel pressure is adjusted by high pressure fuel pump output ON/OFF which is controlled by the powertrain control module (PCM). In the PCM, the injector driver receives drive commands from the CPU and drives the high pressure fuel pump. The CPU monitors high pressure fuel pump currents and return signal from the injector driver to monitor a terminal voltage of PCM. If the monitored conditions are abnormal for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

Either of the conditions occurs at least 100 times (counts 4 times per engine cycle):

- Symptom: High pressure fuel pump current not flowing

  The pump solenoid current is 0.4 A to 1.5 A or less*.

- Symptom: High pressure fuel pump overcurrent

  The pump solenoid current is 19.7 A to 30.5 A or more*.

- Symptom: PCM terminal (to high pressure fuel pump) short to ground

  The PCM terminal (to high pressure fuel pump) voltage is 1.8 V to 2.2 V or less*.

- Symptom: PCM terminal (to high pressure fuel pump) short to power

  The PCM terminal (to high pressure fuel pump) voltage is (12 volt battery voltage - 3.2) V to (12 volt battery voltage - 2.2) V or more*.

*: Varies with driving condition.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High pressure fuel pump failure
- High pressure fuel pump HPUMP H line open
- High pressure fuel pump HPUMP H line short to ground
- High pressure fuel pump HPUMP H line short to power
- High pressure fuel pump HPUMP L line open
- High pressure fuel pump HPUMP L line short to ground
- High pressure fuel pump HPUMP L line short to power
- Injector relay failure
- PCM internal circuit failure (injector driver power supply line open)

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

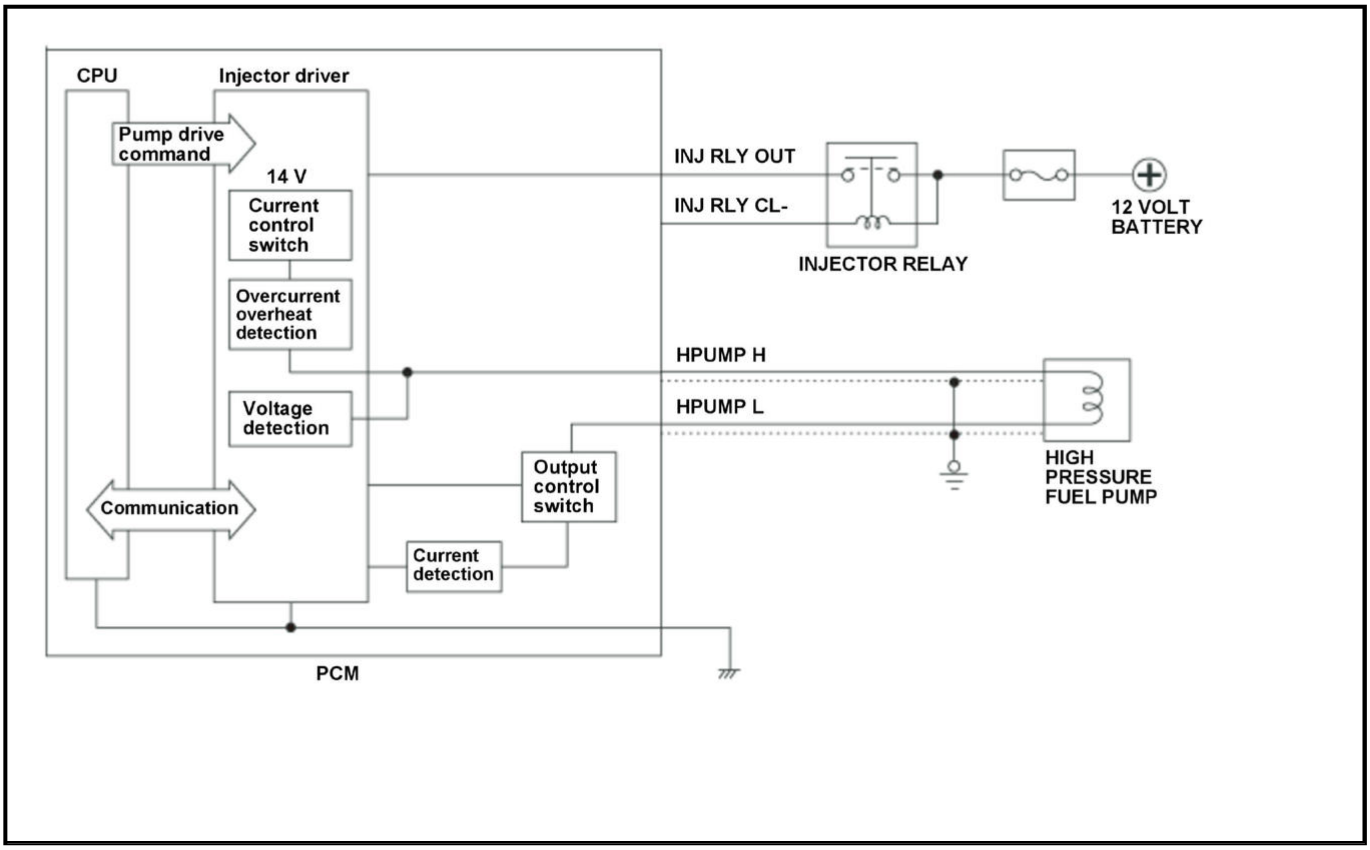
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P2623 (2.4 L ENGINE) (2017 2018 2019)

DTC P2623: High Pressure Fuel Pump Spill Valve Malfunction

General Description



CPU
Injector driver
Pump drive command
14 V
Current control switch
Overcurrent overheat detection
Voltage detection
Communication
Output control switch
Current detection
PCM
INJ RLY OUT
INJ RLY CL-
INJECTOR RELAY
12 VOLT BATTERY
HPUMP H
HPUMP L
HIGH PRESSURE FUEL PUMP

The fuel pressure is adjusted by high pressure fuel pump output ON/OFF which is controlled by the powertrain control module (PCM). In the PCM, the injector driver receives drive commands from the CPU and drives the high pressure fuel pump. Also, the injector driver monitors pump solenoid current and voltage, and transmits results to the CPU. If the monitored pump solenoid currents or voltages are abnormal for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

Malfunction Threshold

Either of the conditions occurs at least 100 times (counts 4 times per engine cycle).

- Symptom: High pressure fuel pump current not flowing

  The pump solenoid current is 0.2 - 1 A* or less.

- Symptom: High pressure fuel pump overcurrent

  The pump solenoid current is 12 - 20 A* or more.

- Symptom: PCM terminal (to high pressure fuel pump) short to ground

  The PCM terminal (to high pressure fuel pump) voltage is 1 - 1.3 V* or less.

- Symptom: PCM terminal (to high pressure fuel pump) short to power

  The PCM terminal (to high pressure fuel pump) voltage is 4.6 - 5 V* or more.

*: Varies with driving condition.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- High pressure fuel pump failure
- High pressure fuel pump HPUMP H line open
- High pressure fuel pump HPUMP L line open
- High pressure fuel pump HPUMP H line short to ground
- High pressure fuel pump HPUMP L line short to ground
- High pressure fuel pump HPUMP H line short to power
- High pressure fuel pump HPUMP L line short to power
- Injector relay failure
- PCM internal circuit failure (injector driver power supply line open)

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

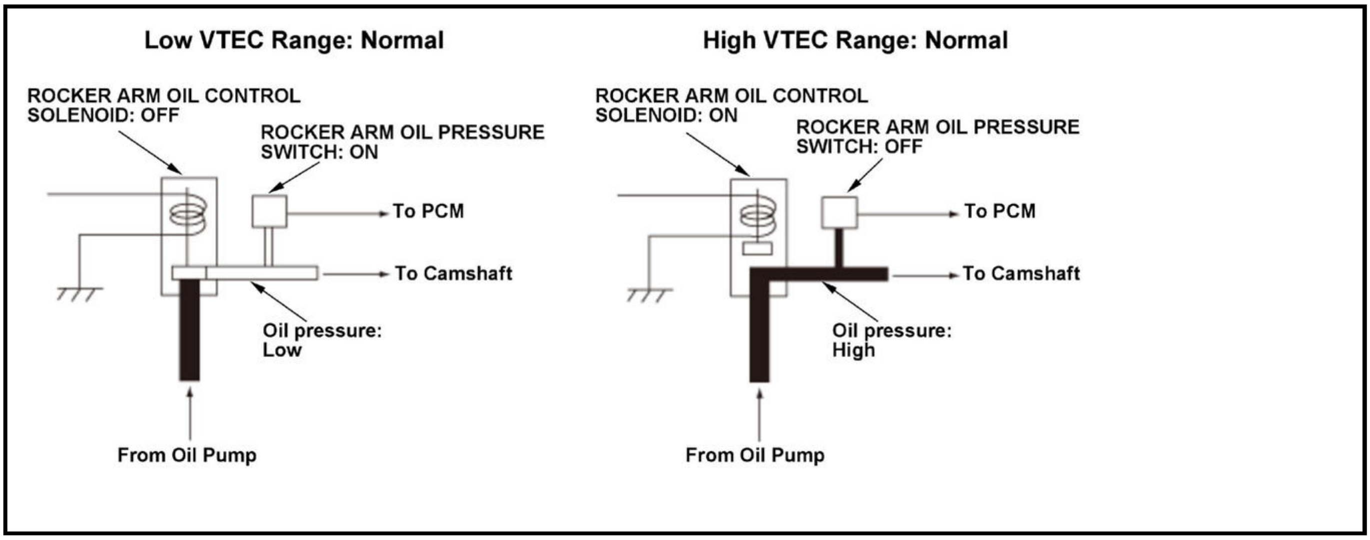
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2646 (2.4 L ENGINE) (2017 2018 2019)

DTC P2646: Rocker Arm Oil Pressure Switch Circuit Low Voltage

General Description



Low VTEC Range: Normal
ROCKER ARM OIL CONTROL SOLENOID: OFF
ROCKER ARM OIL PRESSURE SWITCH: ON
To PCM
To Camshaft
Oil pressure: Low
From Oil Pump
High VTEC Range: Normal
ROCKER ARM OIL CONTROL SOLENOID: ON
ROCKER ARM OIL PRESSURE SWITCH: OFF
To PCM
To Camshaft
Oil pressure: High
From Oil Pump

Logic Decision	Rocker Arm Oil Pressure Switch	
	'ON'	'OFF'
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

The VTEC system activates the rocker arm oil control solenoid with a command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch downstream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit determined by the PCM command and the oil pressure condition determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	7 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	140 deg. F (60 deg. C)	-
Engine speed [ENGINE SPEED]*	4, 900 rpm	-
Vehicle speed [VEHICLE SPEED]	7 mph (10 km/h)	-
12 volt battery voltage [BATTERY]	10.5 V	-

Condition	Minimum	Maximum
Shift lever position	Other than P or N	

*: Variable that is depending on the engine load.

[ ]: HDS Parameter

Malfunction Threshold

When the rocker arm oil control solenoid is ON, the rocker arm oil pressure switch remains ON.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Rocker arm oil control solenoid failure
- Rocker arm oil control solenoid VTS line open
- Rocker arm oil control solenoid VTS line short
- Rocker arm oil pressure switch failure
- Rocker arm oil pressure switch VTM line open
- Rocker arm oil pressure switch VTM line short
- Oil passage clogged

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at an engine speed [ENGINE SPEED] 4, 900 rpm or more for at least 7 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Do the VTEC TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

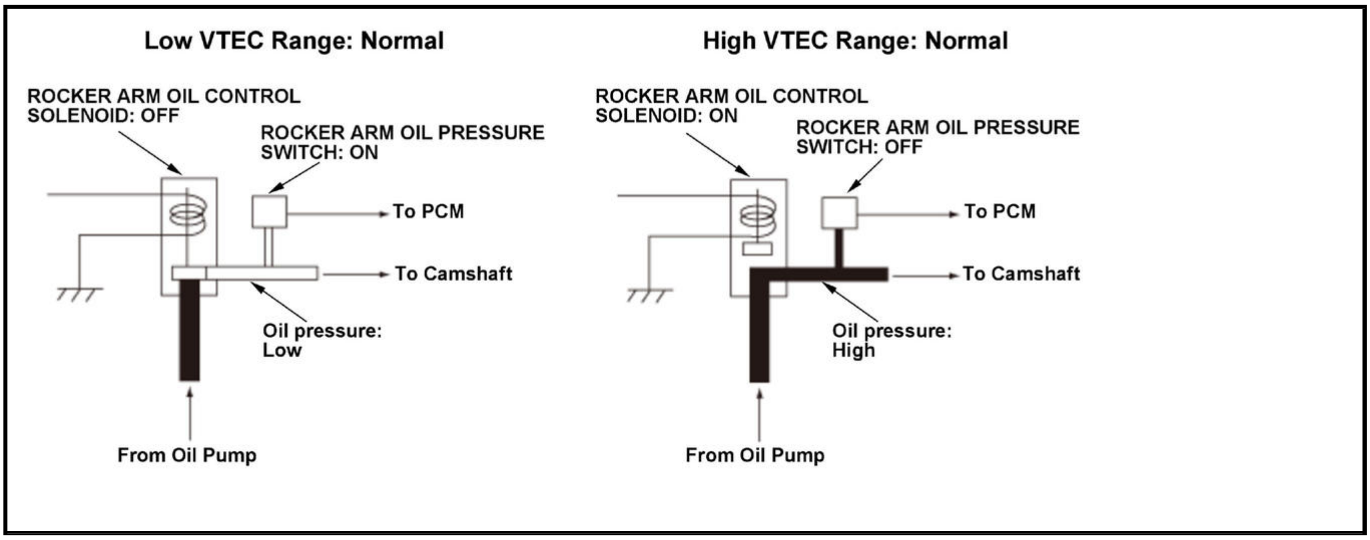
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2647 (2.4 L ENGINE) (2017 2018 2019)

DTC P2647: Rocker Arm Oil Pressure Switch Circuit High Voltage

General Description



Low VTEC Range: Normal
ROCKER ARM OIL CONTROL SOLENOID: OFF
ROCKER ARM OIL PRESSURE SWITCH: ON
To PCM
To Camshaft
Oil pressure: Low
From Oil Pump
High VTEC Range: Normal
ROCKER ARM OIL CONTROL SOLENOID: ON
ROCKER ARM OIL PRESSURE SWITCH: OFF
To PCM
To Camshaft
Oil pressure: High
From Oil Pump

Logic Decision	Rocker Arm Oil Pressure Switch	
	'ON'	'OFF'
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

The VTEC system activates the rocker arm oil control solenoid with a command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch downstream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit determined by the PCM command and the oil pressure condition determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	7 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.5 V	-
Other	At idle	

[ ]: HDS Parameter

Malfunction Threshold

When the rocker arm oil control solenoid is OFF, the rocker arm oil pressure switch remains OFF.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Rocker arm oil control solenoid failure

- Rocker arm oil control solenoid VTS line open
- Rocker arm oil control solenoid VTS line short
- Rocker arm oil pressure switch failure
- Rocker arm oil pressure switch VTM line open
- Rocker arm oil pressure switch VTM line short
- Oil passage clogged

Confirmation Procedure

Operating Condition

Start the engine, and let it idle for at least 7 seconds.

With the HDS

Do the VTEC TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

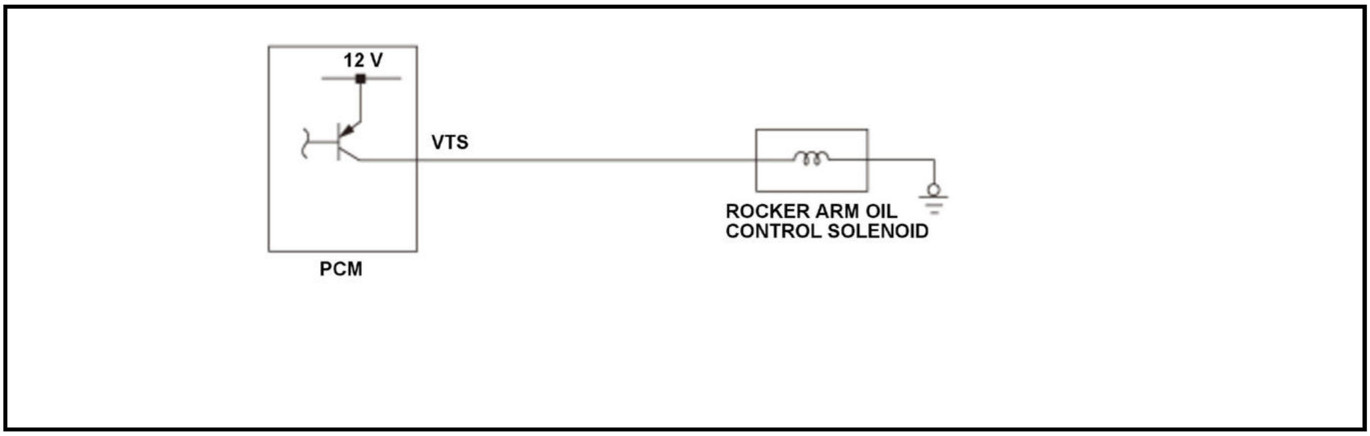
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2648 (2.4 L ENGINE) (2017 2018 2019)

DTC P2648: Rocker Arm Oil Control Solenoid A Circuit Low Voltage

General Description



The VTEC system activates the rocker arm oil control solenoid by a command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is OFF (low) when the PCM outputs the ON (high) signal to the rocker arm oil control solenoid, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The return signal is OFF (low) for at least 2.0 seconds when the PCM outputs the ON (high) signal to the rocker arm oil control solenoid.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Rocker arm oil control solenoid VTS line short to ground
- Rocker arm oil control solenoid failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive immediately at a steady engine speed [ENGINE SPEED] 4, 800 - 5, 000 rpm or more for at least 2 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Do the VTEC TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

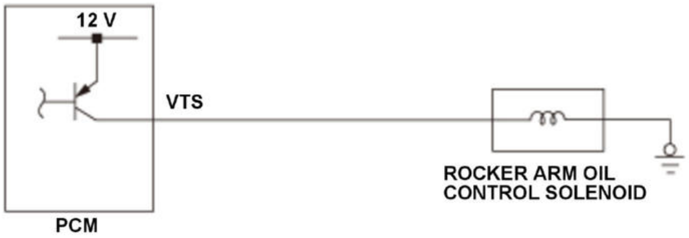
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2649 (2.4 L ENGINE) (2017 2018 2019)

DTC P2649: Rocker Arm Oil Control Solenoid A Circuit High Voltage

General Description



The VTEC system activates the rocker arm oil control solenoid by a command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is ON (high) when the PCM outputs the OFF (low) signal to the rocker arm oil control solenoid, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.0 V	-
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

The return signal is ON (high) for at least 2.0 seconds when the PCM outputs the OFF (low) signal to the rocker arm oil control solenoid.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Rocker arm oil control solenoid VTS line open
- Rocker arm oil control solenoid failure
- Rocker arm oil control solenoid ground line open
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine, and let it idle for at least 2 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

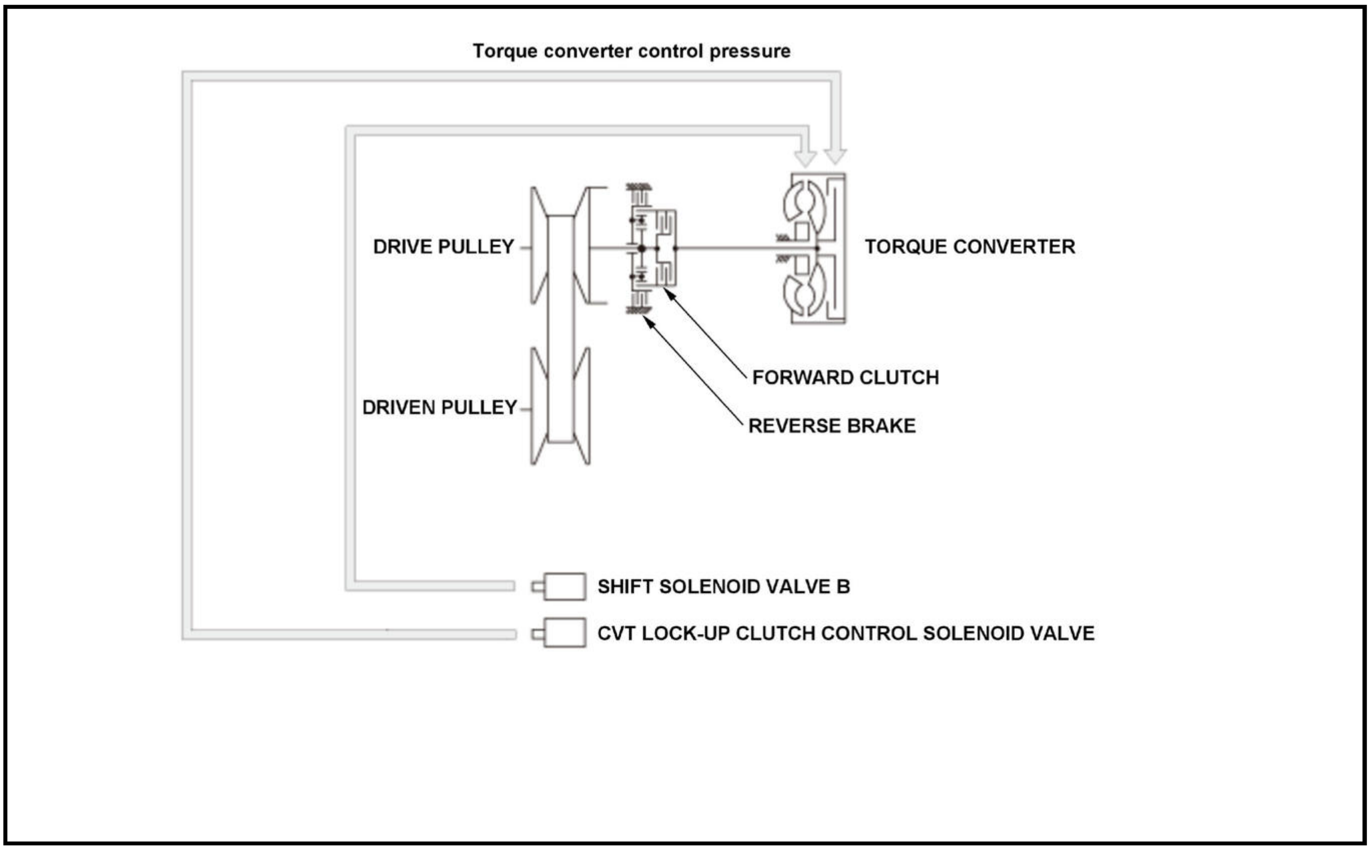
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2715 (CVT (ECM/PCM))

DTC P2715: Pressure Control Solenoid D Stuck On

General Description



Torque converter control pressure
DRIVE PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
DRIVEN PULLEY
REVERSE BRAKE
SHIFT SOLENOID VALVE B
CVT LOCK-UP CLUTCH CONTROL SOLENOID VALVE

The CVT lock-up clutch control solenoid valve controls hydraulic pressure to the torque converter clutch. The CVT lock-up clutch control solenoid valve is controlled by duty cycle output. The spool in the CVT lock-up clutch control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. To supply proper torque converter clutch oil pressure, the powertrain control module (PCM) outputs a CVT lock-up clutch control solenoid valve oil pressure control signal. If the torque converter clutch is judged as stuck ON, the PCM detects a CVT lock-up clutch control solenoid valve stuck ON malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

Sequence	None
Duration	Depending on the driving conditions
DTC Type* 1	Two drive cycles, MIL on, Shift position indicator blinks
DTC Type* 2	Two drive cycles, MIL off, Shift position indicator blinks

*1: KA model

*2: Except KA models

Enable Conditions

Condition	Minimum	Maximum
Engine speed [ENGINE SPEED]	500 rpm	-
Vehicle speed [VEHICLE SPEED]*	-	13 mph (21 km/h)
Acceleration**	-	0.98 m/s 2 (3.2 ft/s 2)
Throttle position	4 deg.	42 deg.
Accelerator pedal position variation	-	13 deg./1 second
Shift lever position/mode	D, S, L	

*: Symptom 1

**: Symptom 2

[ ]: HDS Parameter

Malfunction Threshold

Symptom 2 occurs after Symptom 1 occurs:

- Symptom 1: Actual torque converter slip rate is more than 99 %, or less than 130 % for at least 600 milliseconds when target torque converter slip rate is less than 97 %.
- Symptom 2: Actual torque converter slip rate is more than 99 %, or less than 130 % for at least 1 second.

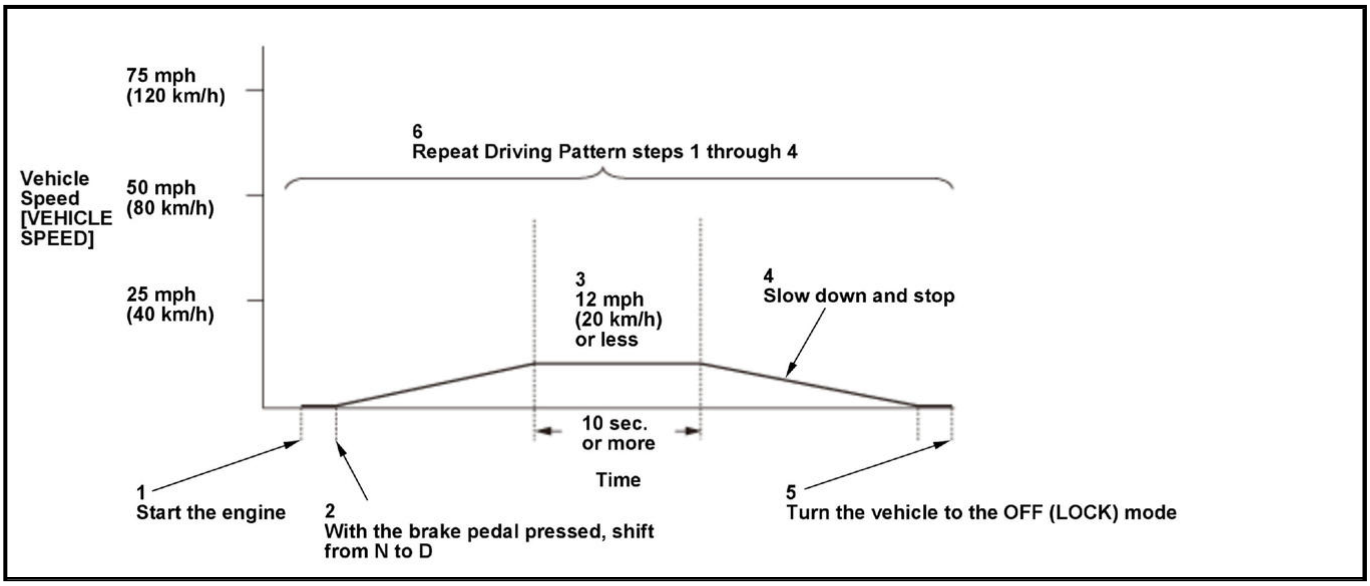
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT lock-up clutch control solenoid valve stuck on

Confirmation Procedure

Operating Condition



- Start the engine.
- With the brake pedal pressed, place the shift lever from N to D position/mode.
- Drive the vehicle at 12 mph (20 km/h) or less for at least 10 seconds.
- Slow down and stop the vehicle.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 4.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details* 1

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

Diagnosis Details* 2

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

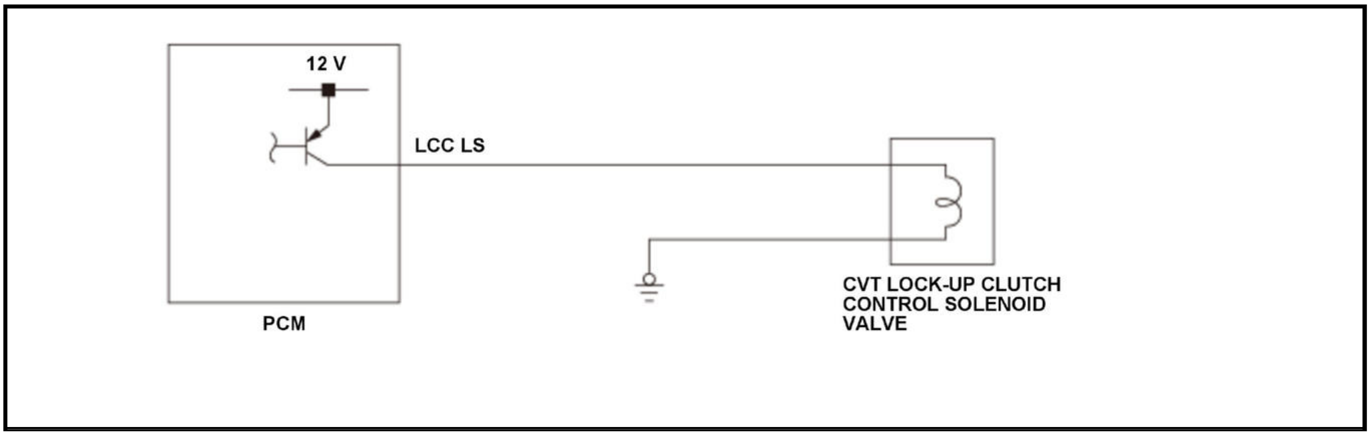
Conditions for clearing the DTC

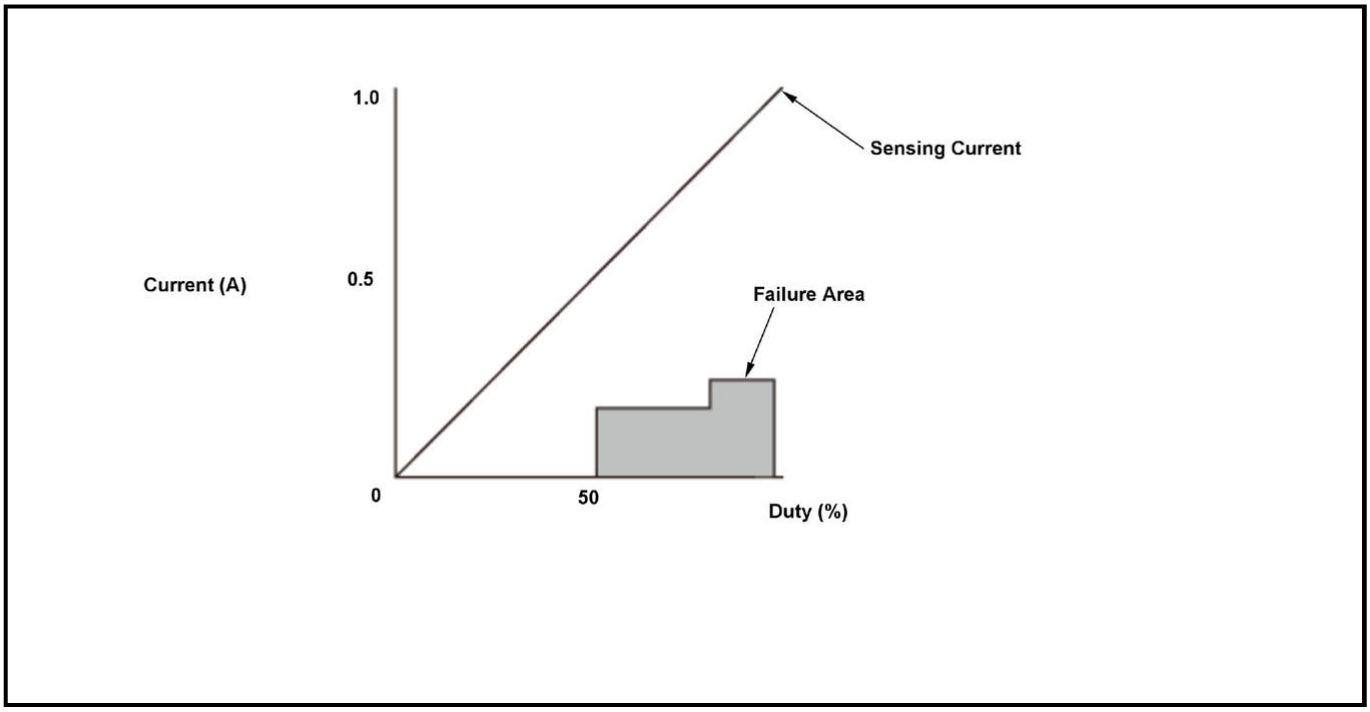
The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2720 (CVT (ECM/PCM))

DTC P2720: Pressure Control Solenoid D Control Circuit Low

General Description





The CVT lock-up clutch control solenoid valve controls hydraulic pressure to the torque converter clutch. The CVT lock-up clutch control solenoid valve is controlled by duty cycle output. The spool in the CVT lock-up clutch control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. The powertrain control module (PCM) measures the current that passes through the CVT lock-up clutch control solenoid valve and uses feedback control to compensate for the difference between the measured current and the commanded one. If the measured current is not equal to the duty cycle command, the PCM detects a malfunction (open, short to ground) and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type* 1	Two drive cycles, MIL on, Shift position indicator blinks
DTC Type* 2	Two drive cycles, MIL off, Shift position indicator blinks

*1: KA model

*2: Except KA models

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY VOLTAGE]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The measured current for the PCM's command value is as specified here for at least 1 second.

Duty (%)	Current (A)	Failure mode
56.5 - 90.2	Less than 0.19	Low Input
More than 90.2	Less than 0.27	Low Input

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT lock-up clutch control solenoid valve LCC LS line open (includes connector loose connection or disconnection)
- CVT lock-up clutch control solenoid valve LCC LS line short to ground
- CVT lock-up clutch control solenoid valve power supply line failure (includes fuse blown)
- CVT lock-up clutch control solenoid valve internal circuit short
- CVT lock-up clutch control solenoid valve internal circuit open
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine, and wait for at least 1 second.

With the HDS

None.

Diagnosis Details* 1

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

Diagnosis Details* 2

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

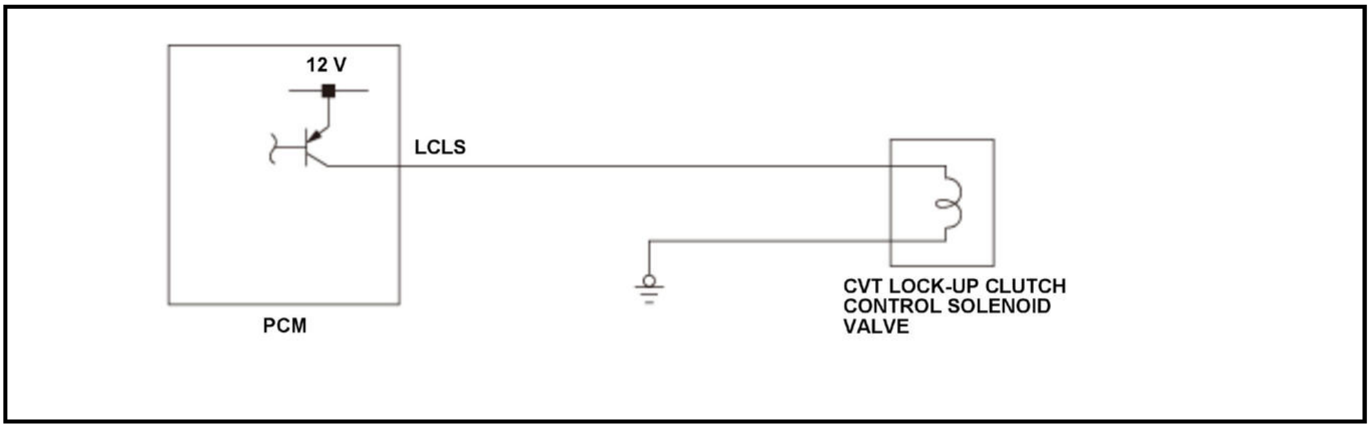
Conditions for clearing the DTC

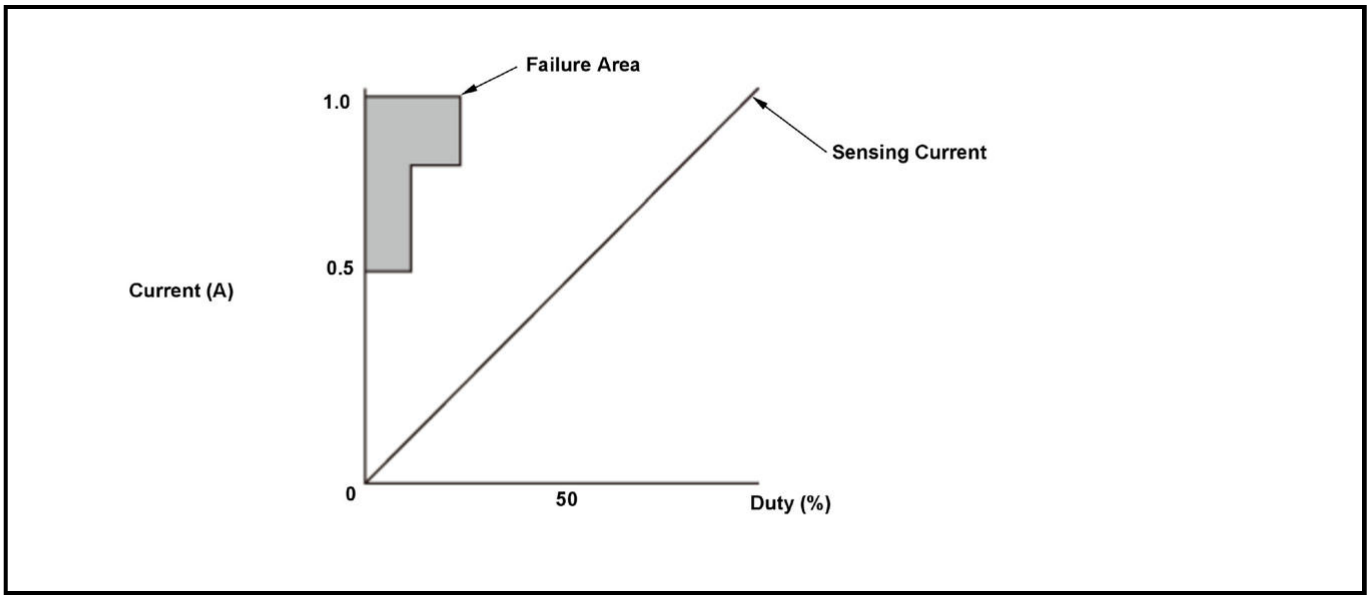
The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2721 (CVT (ECM/PCM))

DTC P2721: Pressure Control Solenoid D Control Circuit High

General Description





The CVT lock-up clutch control solenoid valve controls hydraulic pressure to the torque converter clutch. The CVT lock-up clutch control solenoid valve is controlled by duty cycle output. The spool in the CVT lock-up clutch control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. The powertrain control module (PCM) measures the current that passes through the CVT lock-up clutch control solenoid valve and uses feedback control to compensate for the difference between the measured current and the commanded one. If the measured current is not equal to the duty cycle command, the PCM detects a malfunction (CVT lock-up clutch control solenoid valve failure, PCM failure) and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

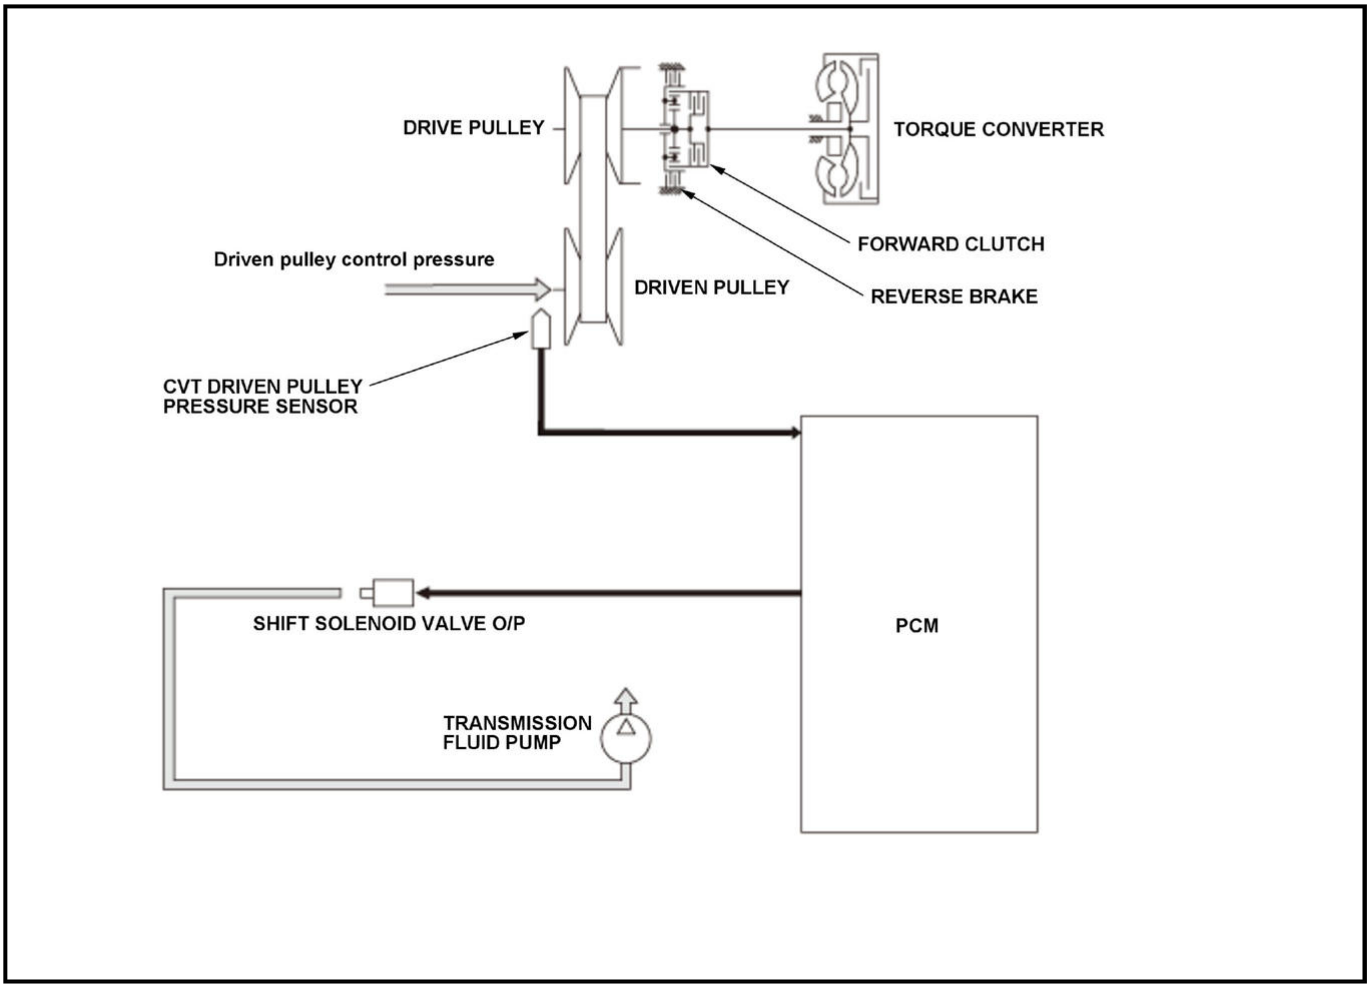
DTC P2817 (CVT (ECM/PCM))

DTC P2817: Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck Off

General Description



DRIVE PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
Driven pulley control pressure
DRIVEN PULLEY
REVERSE BRAKE
CVT DRIVEN PULLEY PRESSURE SENSOR
SHIFT SOLENOID VALVE O/P
PCM
TRANSMISSION FLUID PUMP

Transmission fluid pump volume changes by shift solenoid valve O/P ON/OFF control

Transmission fluid pump volume	Shift Solenoid Valve O/P
High	OFF
Low	ON

The shift solenoid valve O/P controls the drain circuit close/open commanded by the powertrain control module (PCM) ON/OFF commands. The transmission fluid pump volume is changed by switching the shift solenoid valve O/P ON/OFF control. The PCM commands the driver circuit to turn on the shift solenoid valve O/P. The PCM temporarily increases the driven pulley pressure up to target value. As the commanded driven pulley pressure reaches the target value, the PCM monitors the driven pulley pressure when the shift solenoid valve O/P is ON and OFF. If the driven pulley pressure does not change, the PCM detects a shift solenoid valve O/P stuck OFF malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or less
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [ENGINE SPEED]	700 rpm	750 rpm
Transmission fluid temperature [CVTF TEMPERATURE]	248 deg. F (120 deg. C)	-
Vehicle speed [VEHICLE SPEED]	-	1 mph (3 km/h)
Shift lever position/mode	D	
Other	Accelerator pedal released	
	Brake pedal pressed	

[ ]: HDS Parameter

Malfunction Threshold

Judgments 1 and 2 are executed sequentially, and if the driven pulley pressure does not change when the shift solenoid valve O/P is ON and OFF.

Judgment	Shift solenoid valve O/P	Commanded driven pulley pressure	Driven pulley pressure	Detection time
1	OFF	About 1, 961 kPa (20.0 kgf/cm 2, 284 psi)	About 1, 961 kPa (20.0 kgf/cm 2, 284 psi)	5.0 seconds
2	ON	About 1, 961 kPa (20.0 kgf/cm 2, 284 psi)	About 1, 961 kPa (20.0 kgf/cm 2, 284 psi)	5.0 seconds

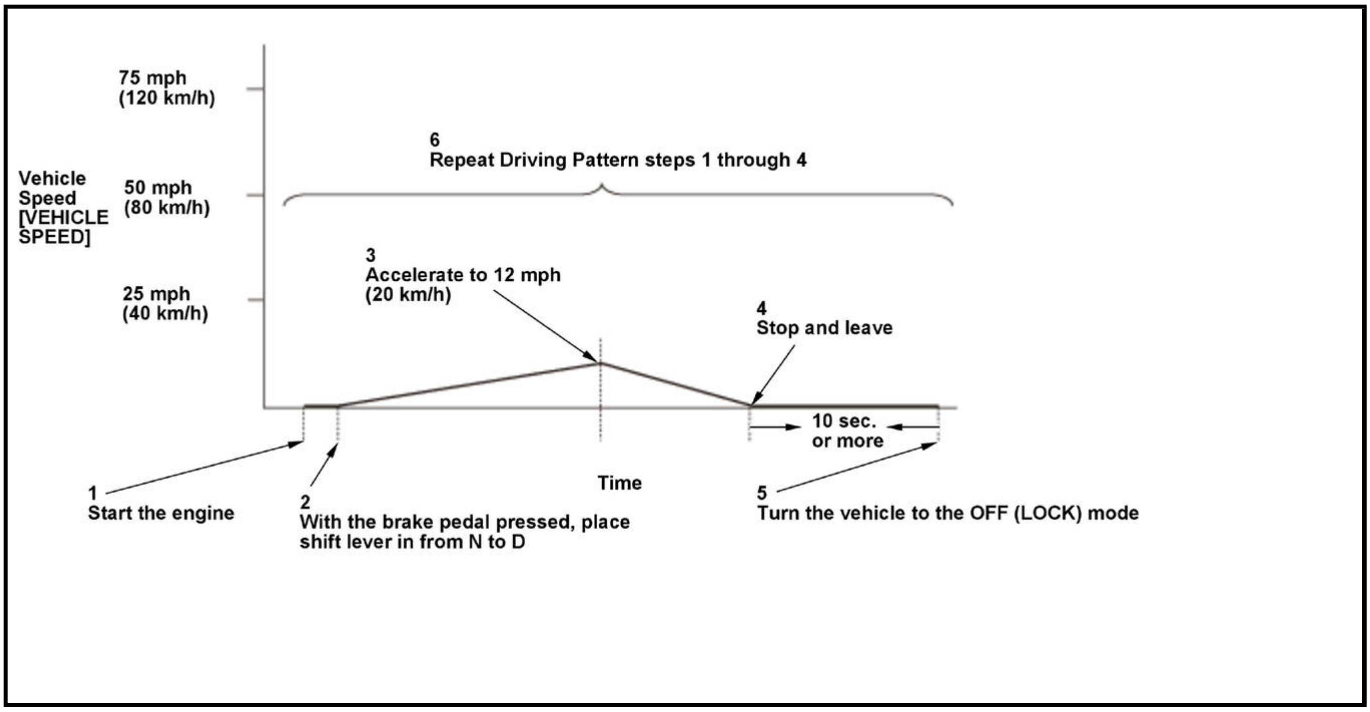
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve O/P stuck off

Confirmation Procedure

Operating Condition



- Start the engine.
- With the brake pedal pressed, place the shift lever from N to D position/mode.
- Accelerate the vehicle to 12 mph (20 km/h).
- Stop and leave the vehicle for at least 10 seconds.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 4.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

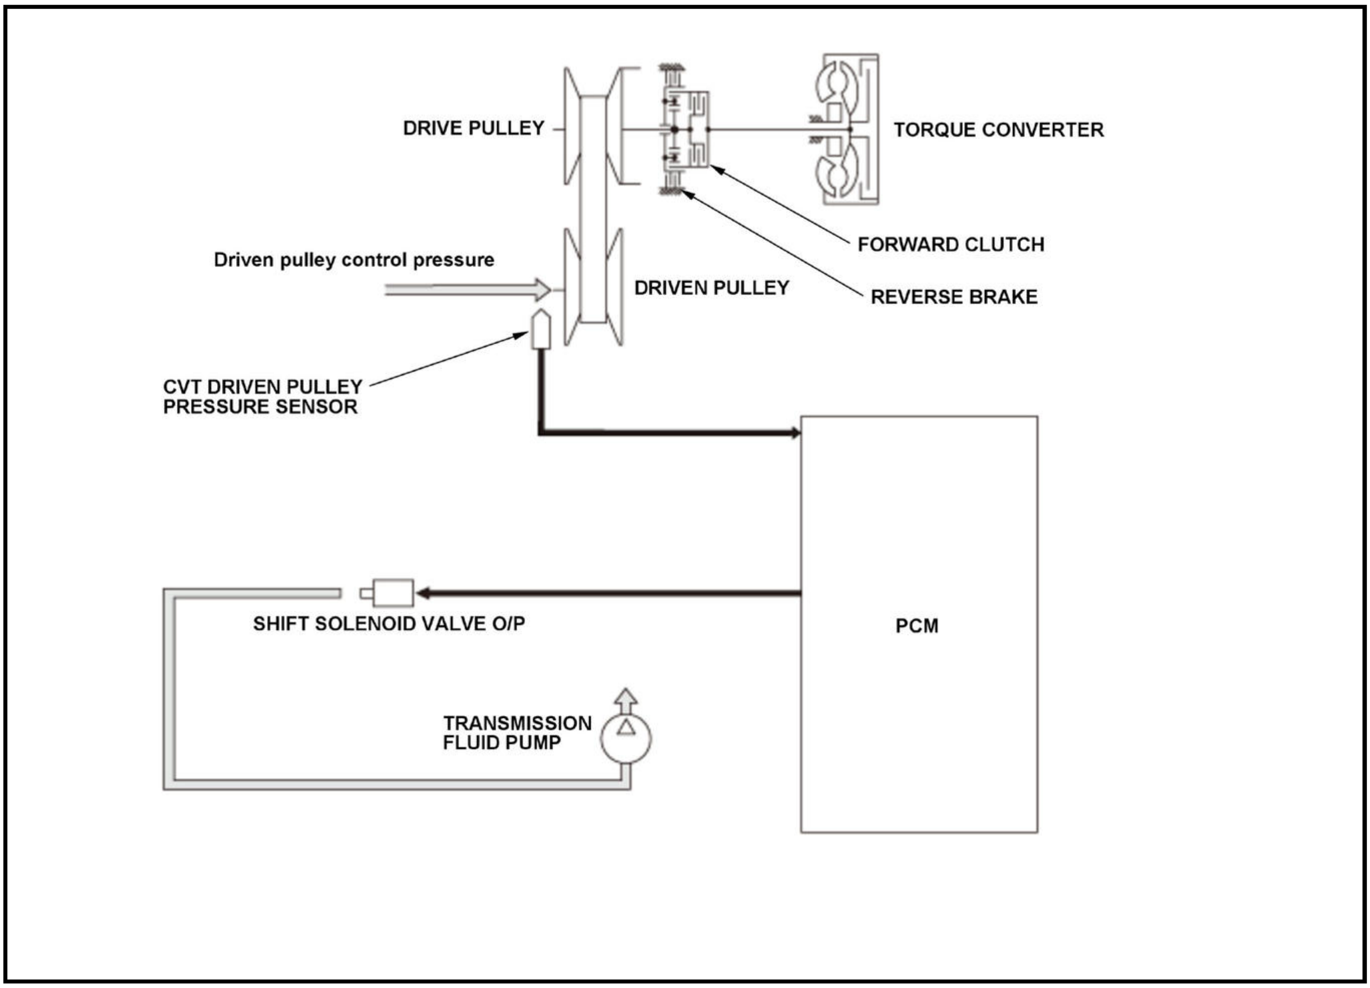
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2818 (CVT (ECM/PCM))

DTC P2818: Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck On

General Description



DRIVE PULLEY

[ ]: HDS Parameter

Malfunction Threshold

One of these symptoms occurs:

Symptom 1: Judgments 1 and 2 are executed sequentially, and if the driven pulley pressure does not change when the shift solenoid valve O/P is ON and OFF.

Judgment	Shift solenoid valve O/P	Commanded driven pulley pressure	Driven pulley pressure	Detection time
1	OFF	About 1, 961 kPa (20.0 kgf/cm 2, 284 psi)	About 1, 177 kPa (12.0 kgf/cm 2, 171 psi)	5.0 seconds
2	ON	About 1, 961 kPa (20.0 kgf/cm 2, 284 psi)	About 1, 177 kPa (12.0 kgf/cm 2, 171 psi)	5.0 seconds

Symptom 2: The pulley ratio is less than 2.0 when the vehicle is stopped.

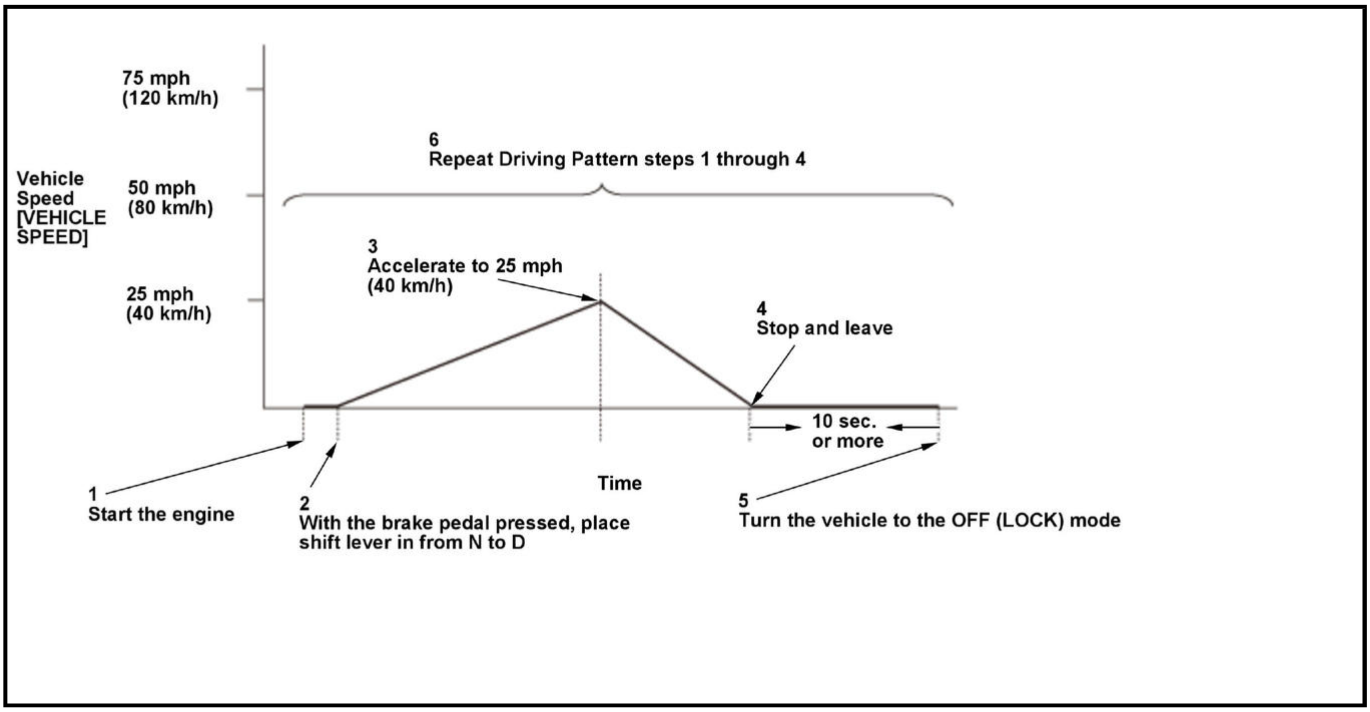
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve O/P stuck on

Confirmation Procedure

Operating Condition



- Start the engine.
- With the brake pedal pressed, place the shift lever from N to D.
- Accelerate the vehicle to 25 mph (40 km/h).
- Stop and leave the vehicle for at least 10 seconds.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 4.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

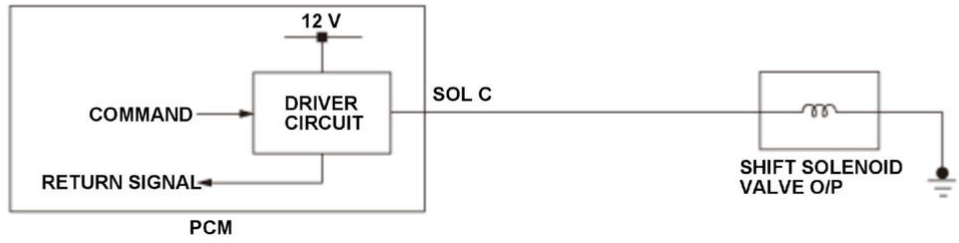
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P281D (CVT (ECM/PCM))

DTC P281D: Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit Low

General Description



Transmission fluid pump volume changes by shift solenoid valve O/P ON/OFF control

Transmission fluid pump volume	Shift Solenoid Valve O/P
High	OFF
Low	ON

The shift solenoid valve O/P controls the drain circuit close/open commanded by the powertrain control module (PCM) ON/OFF commands. The transmission fluid pump volume is changed by switching the shift solenoid valve O/P ON/OFF control. The PCM commands the driver circuit to turn on the shift solenoid valve O/P. The circuit diagnoses malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn ON the shift solenoid valve O/P, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY VOLTAGE]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The return signal does not match the command to turn ON shift solenoid valve O/P for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve O/P SOL C line short to ground
- Shift solenoid valve O/P internal circuit short
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine.
- With the brake pedal pressed, place the shift lever in P position/mode for at least 30 seconds.

With the HDS

Select the Shift Solenoid Valve O/P Test in the Miscellaneous Test Menu, and check that the shift solenoid valve O/P operates with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

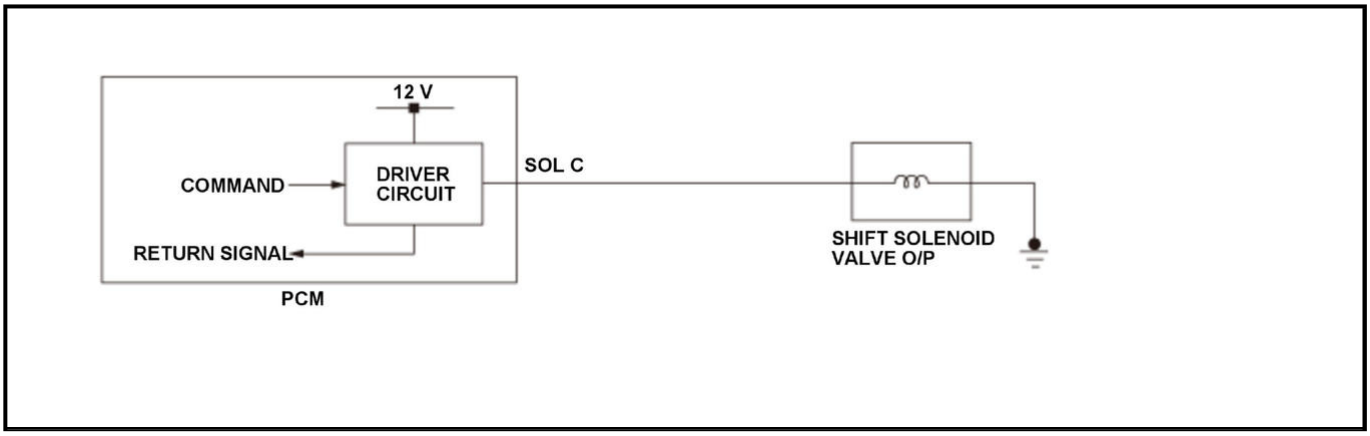
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P281E (CVT (ECM/PCM))

DTC P281E: Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit High

General Description



Transmission fluid pump volume changes by shift solenoid valve O/P ON/OFF control

Transmission fluid pump volume	Shift Solenoid Valve O/P
High	OFF
Low	ON

The shift solenoid valve O/P controls the drain circuit close/open commanded by the powertrain control module (PCM) ON/OFF commands. The transmission fluid pump volume is changed by switching the shift solenoid valve O/P ON/OFF control. The PCM commands the driver circuit to turn on the shift solenoid valve O/P. The circuit diagnoses malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn OFF the shift solenoid valve O/P, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more

DTC Type	One drive cycle, MIL off, Shift position indicator blinks

Malfunction Threshold

The return signal does not match the command to turn OFF shift solenoid valve O/P for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve O/P SOL C line open (includes connector loose connection or disconnection)
- Shift solenoid valve O/P internal circuit open
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine.
- Shift to P position/mode, and wait for at least 1 second.

With the HDS

Select the Shift Solenoid Valve O/P Test in the Miscellaneous Test Menu, and check that the shift solenoid valve O/P operates with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

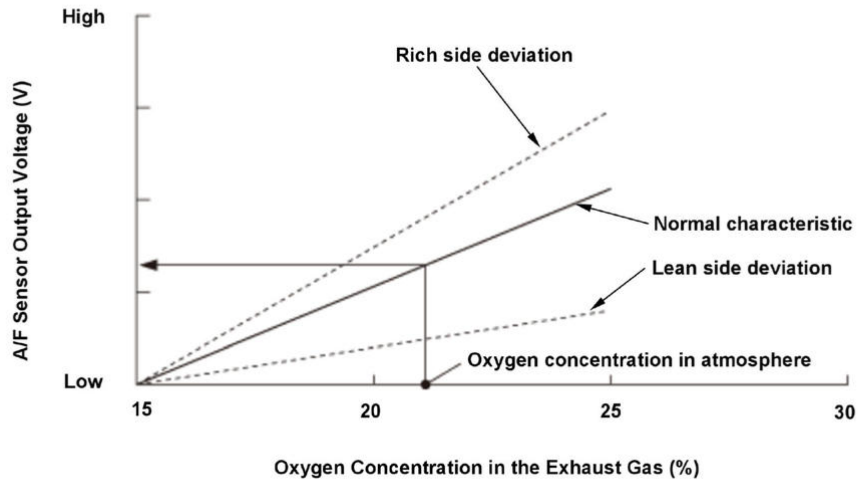
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2A00 (1.5 L ENGINE)

DTC P2A00: Air/Fuel ratio A/F Sensor (Sensor 1) Circuit Range/Performance Problem

General Description



The air/fuel ratio (A/F) sensor (sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the A/F sensor (sensor 1) output voltage and uses fuel feedback control to improve exhaust emissions. The PCM monitors the A/F sensor (sensor 1) output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

NOTE: Output to the scan tool exhibits a relationship between the A/F sensor (sensor 1) output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage, as the stoichiometric ratio is 0.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	5 seconds	-
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg. F (-25 deg. C)	-
Engine speed [ENGINE SPEED]	500 rpm	2, 700 rpm
Vehicle speed [VEHICLE SPEED]	30 mph (48 km/h)	-
Fuel feedback	During deceleration with throttle fully closed	

[ ]: HDS Parameter

Malfunction Threshold

The A/F sensor (sensor 1) output voltage is 2.55 V or less, or 4.11 V or more.

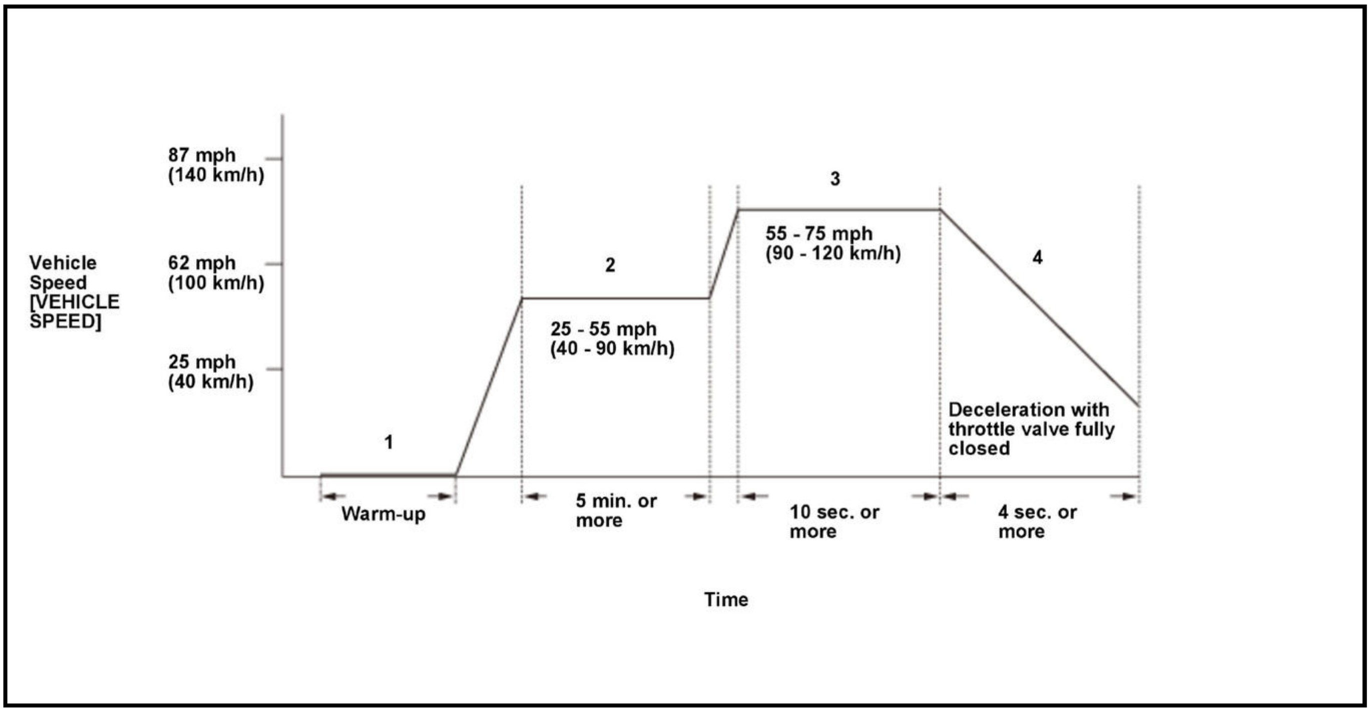
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) failure

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a speed between 25 - 56 mph (40 - 90 km/h) for at least 5 minutes.
- Drive immediately at a steady speed between 56 - 75 mph (90 - 120 km/h) for at least 10 seconds.
- Decelerate with the throttle valve fully closed for at least 4 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

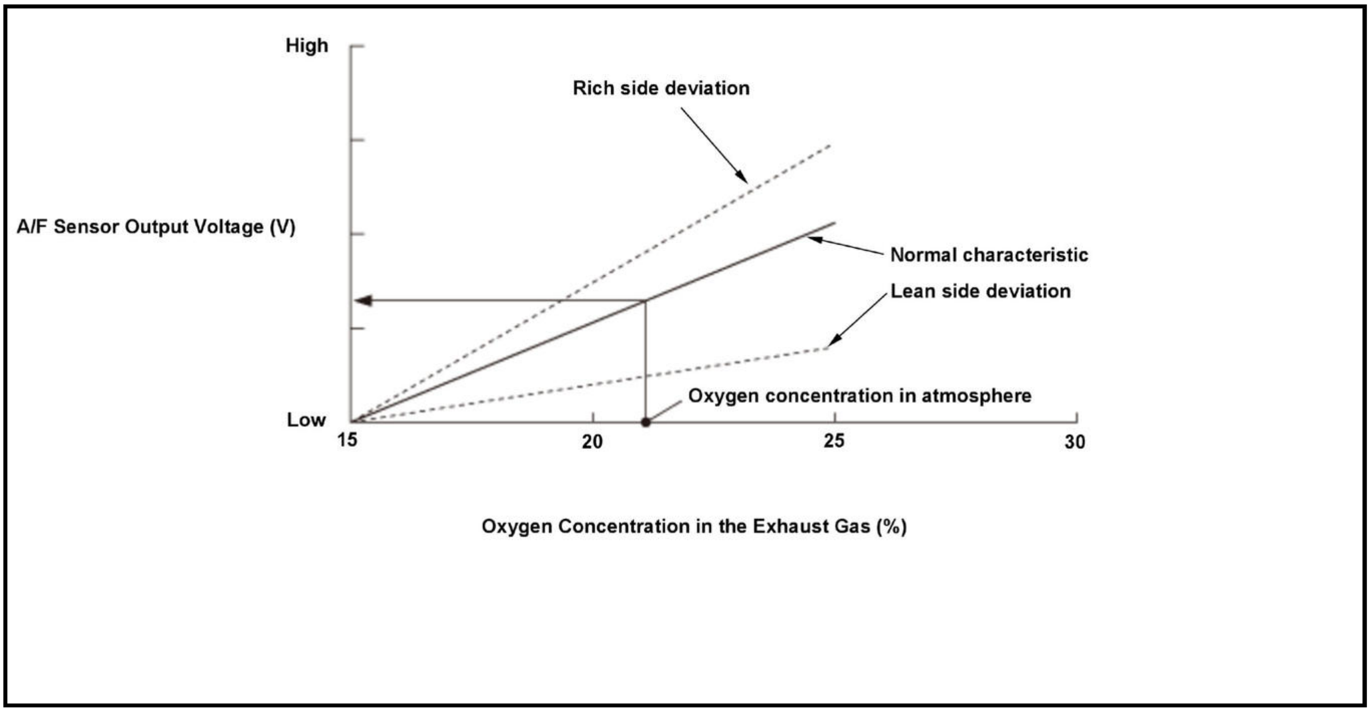
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2A00 (2.4 L ENGINE) (2017 2018 2019)

DTC P2A00: Air/Fuel ratio (A/F) Sensor (Sensor 1) Circuit Range/Performance Problem

General Description



The air/fuel ratio (A/F) sensor (sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the A/F sensor (sensor 1) output voltage and uses fuel feedback control to improve exhaust emissions. The PCM monitors the A/F sensor (sensor 1) output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

NOTE: Output to the scan tool exhibits a relationship between the A/F sensor (sensor 1) output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage, as the stoichiometric ratio is 0.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	4.5 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	60 seconds	-
Engine coolant temperature [ECT SENSOR 1]	156 deg. F (69 deg. C)	-
Intake air temperature [IAT SENSOR (1)]	-13 deg. F (-25 deg. C)	-
Engine speed [ENGINE SPEED]	500 rpm	4, 000 rpm

Condition	Minimum	Maximum
Vehicle speed [VEHICLE SPEED]	19 mph (30 km/h)	-

Malfunction Threshold

The A/F sensor (sensor 1) output voltage is 3.0 V or less, or 4.80 V or more.

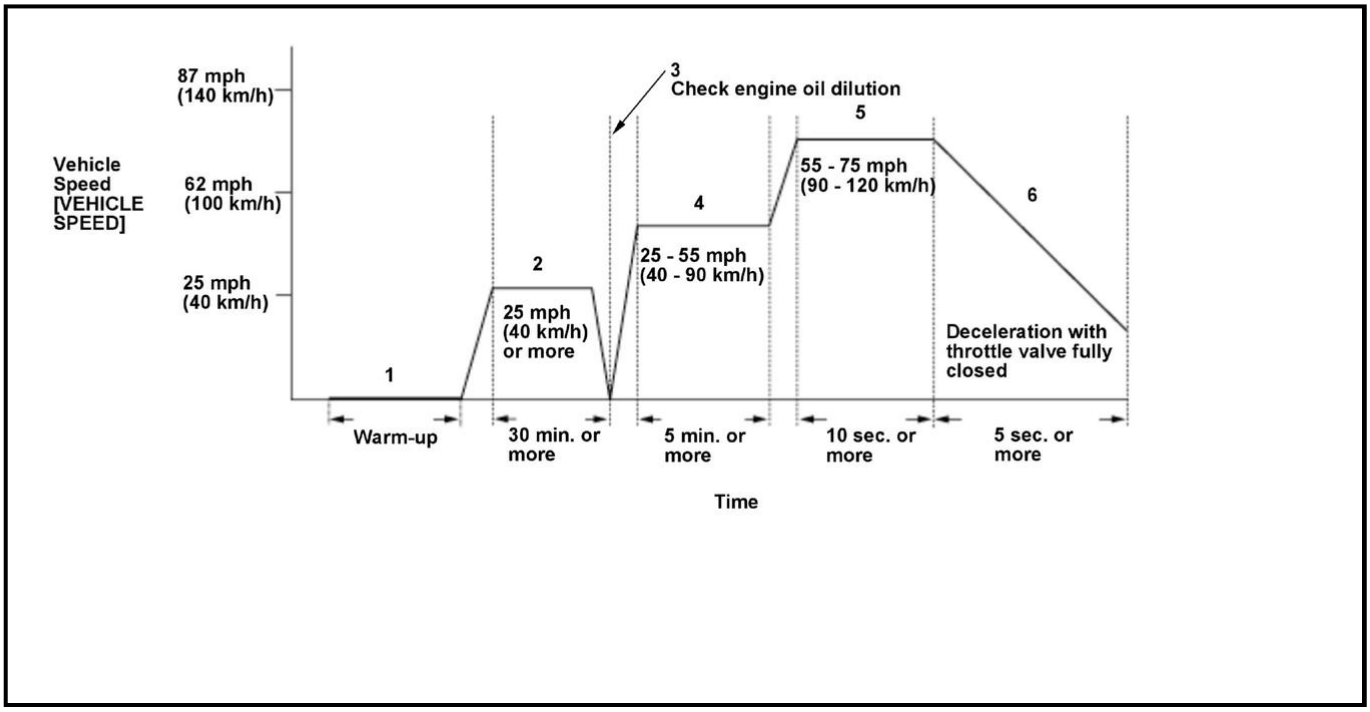
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) deterioration

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at 25 mph (40 km/h) or more for at least 30 minutes.
- Check the engine oil dilution with a scan tool. If it stays at a specific condition (the HDS parameter [ENGINE OIL DILUTION INFLUENCED RATE] is not 0 (no unit)), drive the vehicle additionally at 25 mph (40 km/h) or more.
- Drive the vehicle at a speed between 25 - 55 mph (40 - 90 km/h) for at least 5 minutes.
- Drive at a steady speed between 55 - 75 mph (90 - 120 km/h) for 10 seconds, then decelerate (with throttle fully closed) for 5 seconds or more.
- Decelerate with the throttle valve fully closed for at least 5 seconds.

- If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

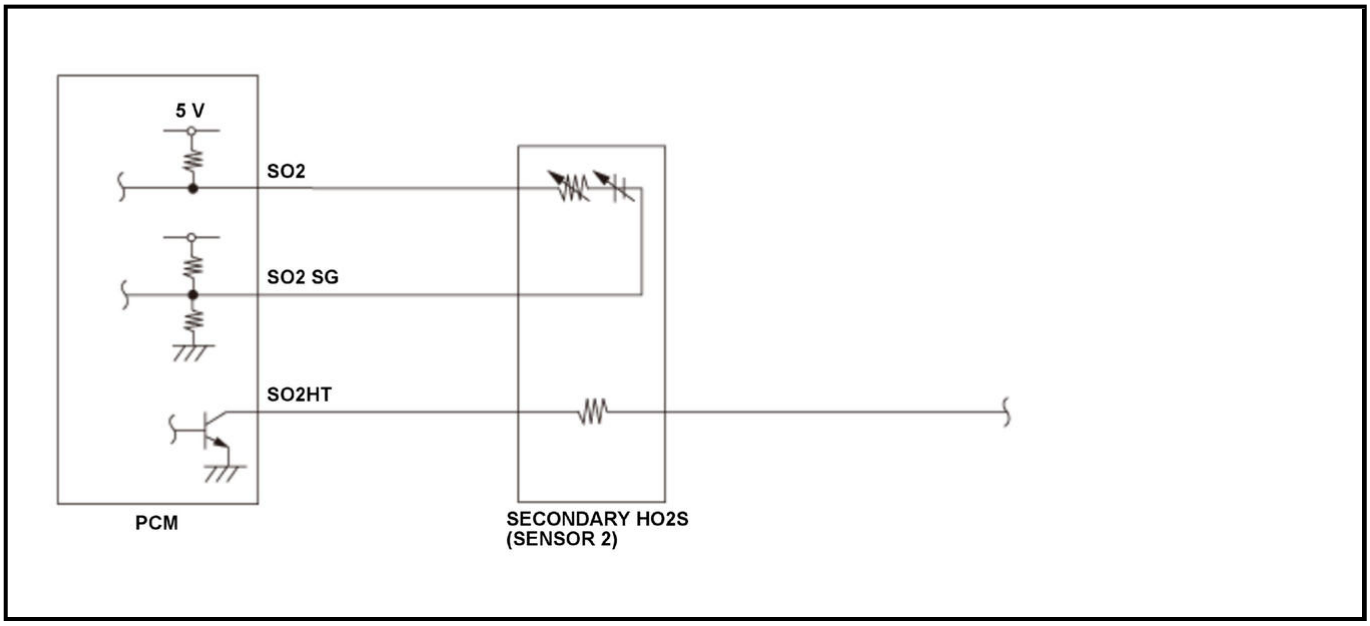
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2A01 (1.5 L ENGINE) (2018 2019 2020 2021)

DTC P2A01: Secondary Heated Oxygen Sensor (Secondary HO2S) (Sensor 2) Circuit Range/Performance Problem

General Description



The secondary heated oxygen sensor (secondary HO2S (sensor 2)) detects the oxygen density in the exhaust gas and converts it into electrical signals. If the secondary HO2S (sensor 2) output voltage is a set value for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Secondary HO2S (sensor 2) output voltage [HO2S S2]	-	1.0 V
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

The secondary HO2S (sensor 2) output voltage [HO2S S2] is 1.54 V or less for at least 6 seconds after the secondary HO2S (sensor 2) is judged that it is normally activated (1.0 V or less as a value).

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 min -1 (rpm) without load (in P or N) until the radiator fan comes on.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

The cold start emission reduction strategy controls air fuel ratio to lean when the engine is started at cold condition to lower the emission while the catalyst is not warmed up enough. If the actual air fuel ratio is too lean or too rich compared to the commanded air fuel ratio, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Duration of quick warm-up system operation after engine start-up	-	40 seconds
Engine coolant temperature [ECT SENSOR 1]	50 deg. F (10 deg. C)	122 deg. F (50 deg. C)
Throttle valve	Fully closed	
Accelerator pedal position	Released	
A/F sensor	Active	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

The ratio of actual air fuel ratio by commanded air fuel ratio is 0.87 or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Intake air duct breakage
- Intake air duct misinstalled
- Air cleaner breakage

- Air cleaner damage
- Air cleaner clogged
- Throttle body clogged
- Intake air system clogged
- Mass airflow (MAF) sensor failure
- Intake air temperature (IAT) sensor failure
- Engine coolant temperature (ECT) sensor 1 failure
- Air fuel ratio too rich
- Air fuel ratio to lean
- Ignition system failure

Confirmation Procedure

Operating Condition

- Leave the vehicle until the engine coolant temperature [ECT SENSOR 1] lowers to 122 deg. F (50 deg. C) or less.
- Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

- Engine coolant temperature (ECT) sensor 1 failure
- Air fuel ratio too rich
- Air fuel ratio to lean
- Ignition system failure

Confirmation Procedure

Operating Condition

- Leave the vehicle until the engine coolant temperature [ECT SENSOR 1] lowers to 122 deg. F (50 deg. C) or less.
- Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

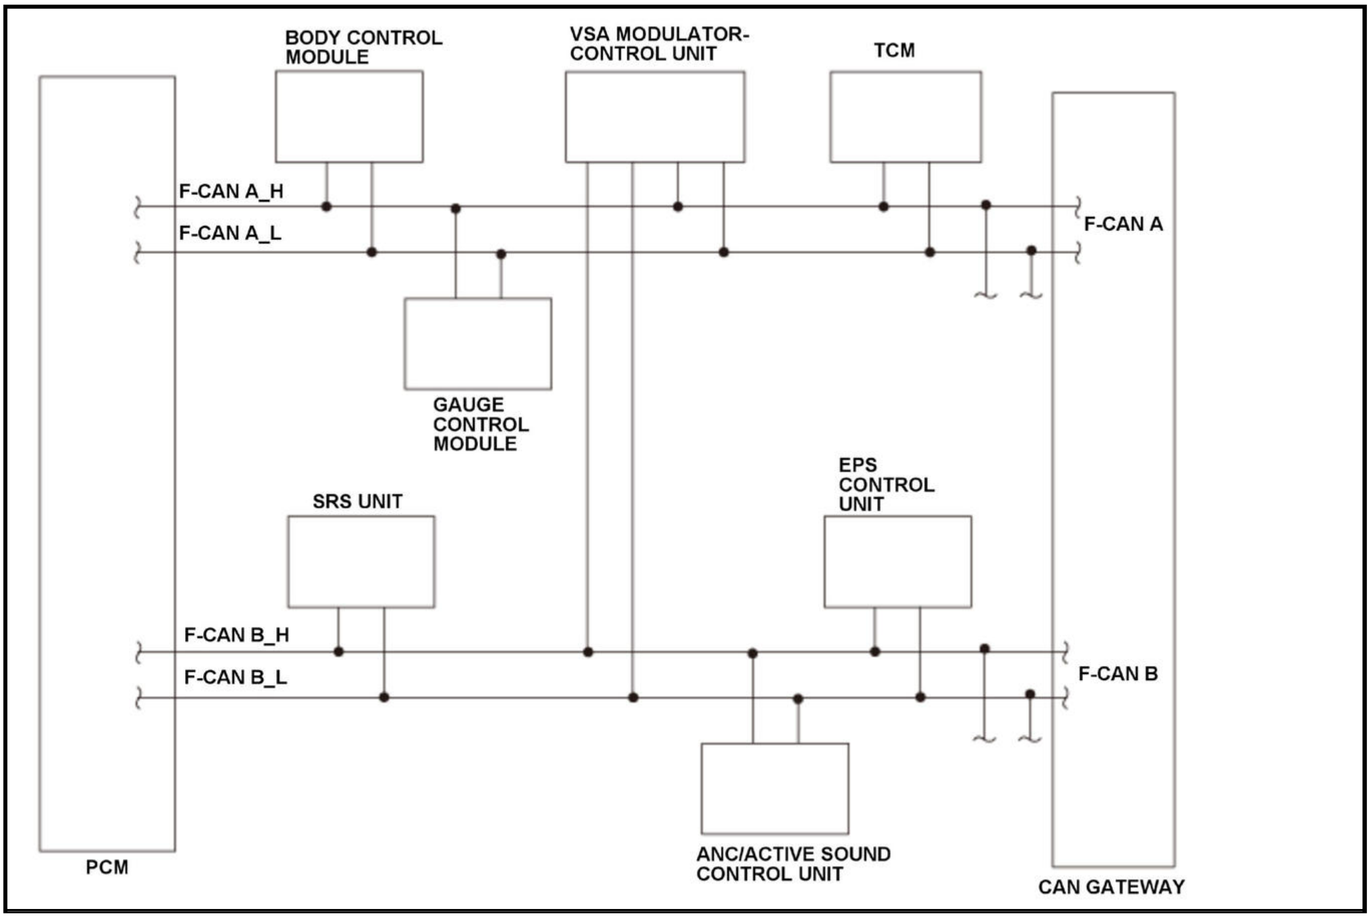
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0029 (1.5 L ENGINE)

DTC U0029: F-CAN Malfunction (BUS-OFF (Powertrain Control Module (PCM)))

General Description



BODY CONTROL MODULE
VSA MODULATOR-CONTROL UNIT
TCM
F-CAN A_H
F-CAN A_L
F-CAN A
GAUGE CONTROL MODULE
EPS CONTROL UNIT
SRS UNIT
F-CAN B_H
F-CAN B_L
F-CAN B
PCM
ANC/ACTIVE SOUND CONTROL UNIT
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using F-CAN A and B signal lines. When the powertrain control module (PCM) cannot send the signals via the F-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The PCM cannot send any signals via the F-CAN A lines for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A H line open
- F-CAN circuit F-CAN A L line open
- F-CAN circuit F-CAN A H line short to ground
- F-CAN circuit F-CAN A L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

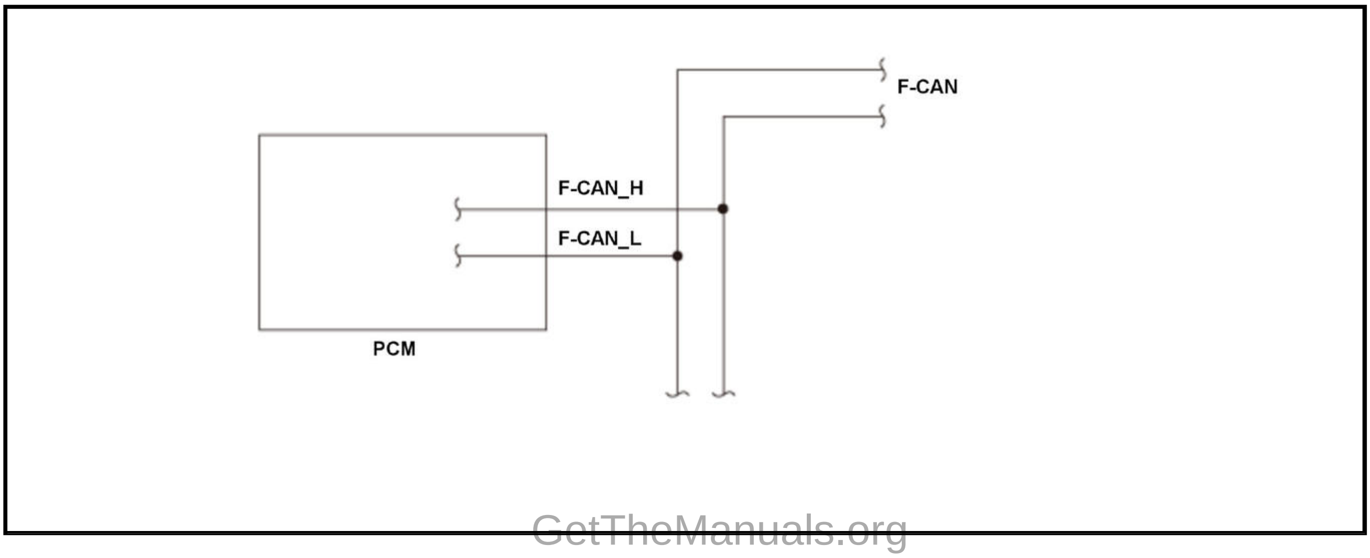
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0029 (2.4 L ENGINE) (2017 2018 2019)

DTC U0029: F-CAN Malfunction (BUS-OFF (Powertrain Control Module (PCM)))

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (F-CAN H and F-CAN L). When the powertrain control module (PCM) does not receive the signals via the F-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The PCM does not receive any signals via the F-CAN lines for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN H line open
- F-CAN circuit F-CAN L line open
- F-CAN circuit F-CAN H line short to ground
- F-CAN circuit F-CAN L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

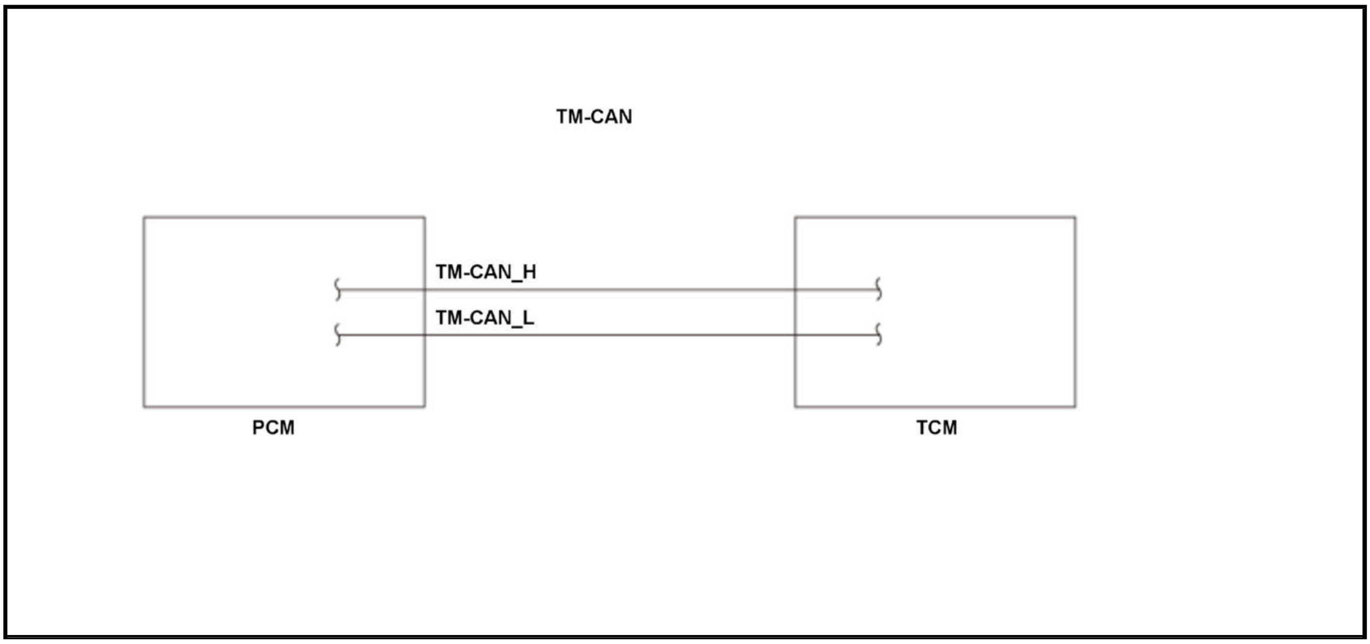
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0038 (1.5 L ENGINE)

DTC U0038: PT-CAN Malfunction (TCM ECU BUS-OFF)

General Description



The controller area network (CAN) transmits/receives pulse signals to/from the control modules simultaneously by using two signal lines (TM-CAN H and TM-CAN L). When the information is not sent from the transmission control module (TCM) unit via the TM-CAN lines and this condition continues for a specified time or when the information sent from the TCM unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The PCM does not receive any signals via the TM-CAN lines for at least 1 seconds.
- The information sent from the TCM unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TCM failure (include fuse fall-outs)
- TM-CAN circuit TM-CAN H line open

- TM-CAN circuit TM-CAN L line open
- TM-CAN circuit TM-CAN H line short to ground
- TM-CAN circuit TM-CAN L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using F-CAN A and B signal lines. When the information is not sent from the transmission control module (TCM) unit via the F-CAN lines and this condition continues for a specified time or when the information sent from the TCM unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The PCM does not receive any signals via the F-CAN lines unit for at least 1.5 seconds.
- The information sent from the TCM unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TCM failure (include fuse fall-outs)
- F-CAN circuit F-CAN A H line open
- F-CAN circuit F-CAN A L line open
- F-CAN circuit F-CAN A H line short to ground
- F-CAN circuit F-CAN A L line short to ground
- F-CAN circuit F-CAN B H line open
- F-CAN circuit F-CAN B L line open
- F-CAN circuit F-CAN B H line short to ground
- F-CAN circuit F-CAN B L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected the, MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

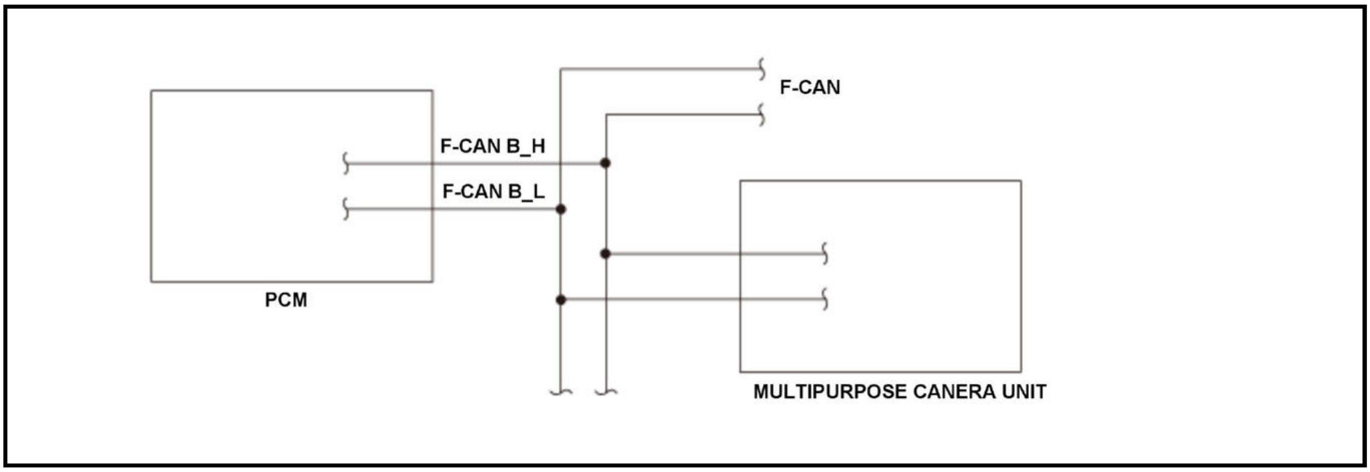
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0104 (1.5 L ENGINE)

DTC U0104: F-CAN Malfunction (Powertrain Control Module (PCM)-Driving Support System Control Unit)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (F-CAN B H and F-CAN B L). When the information is not sent from the multipurpose camera unit via the F-CAN lines and this condition continues for a specified time or when the information sent from the multipurpose camera unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The PCM does not receive any signals via the F-CAN lines for at least 1 second.
- The information sent from the multipurpose camera unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- multipurpose camera unit failure (include fuse fall-outs)
- F-CAN circuit F-CAN B H line open
- F-CAN circuit F-CAN B L line open
- F-CAN circuit F-CAN B H line short to ground
- F-CAN circuit F-CAN B L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

F-CAN B_L
F-CAN B
*1:
REAL TIME AWD CONTROL UNIT
PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using F-CAN B signal lines. When the powertrain control module (PCM) does not receive the signals from the AWD control unit via the F-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 second or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

- The PCM does not receive any signals via the F-CAN lines unit for at least 1.5 seconds.
- The information sent from the real time AWD control unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- AWD control unit failure (include fuse fall-outs)
- F-CAN circuit F-CAN B H line open

- F-CAN circuit F-CAN B L line open
- F-CAN circuit F-CAN B H line short to ground
- F-CAN circuit F-CAN B L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

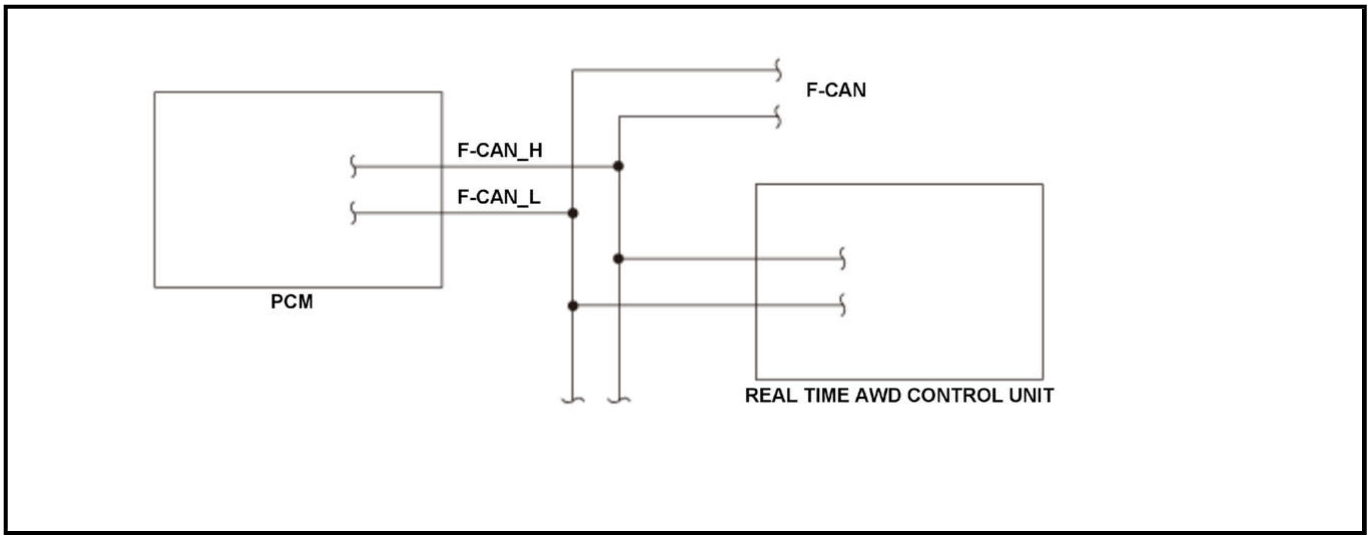
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0114 (2.4 L ENGINE) (2017 2018 2019)

DTC U0114: F-CAN Malfunction (Powertrain Control Module (PCM)-AWD Control Unit)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (F-CAN H and F-CAN L). When the powertrain control module (PCM) does not receive signals from the real time AWD control unit via the F-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The PCM does not receive any signals via the F-CAN lines for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN H line open
- F-CAN circuit F-CAN L line open
- F-CAN circuit F-CAN H line short to ground
- F-CAN circuit F-CAN L line short to ground
- Real time AWD control unit failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

*1:
REAL TIME AWD CONTROL UNIT
PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using F-CAN A and B signal lines. When the information is not sent from the VSA modulator-control unit via the F-CAN lines and this condition continues for a specified time or when the information sent from the VSA modulator-control unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The PCM does not receive any signals via the F-CAN lines for at least 1.5 seconds.
- The information sent from the VSA modulator-control unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VSA modulator-control unit failure (include fuse fall-outs)
- F-CAN circuit F-CAN A H line open
- F-CAN circuit F-CAN A L line open
- F-CAN circuit F-CAN A H line short to ground
- F-CAN circuit F-CAN A L line short to ground
- F-CAN circuit F-CAN B H line open
- F-CAN circuit F-CAN B L line open
- F-CAN circuit F-CAN B H line short to ground
- F-CAN circuit F-CAN B L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

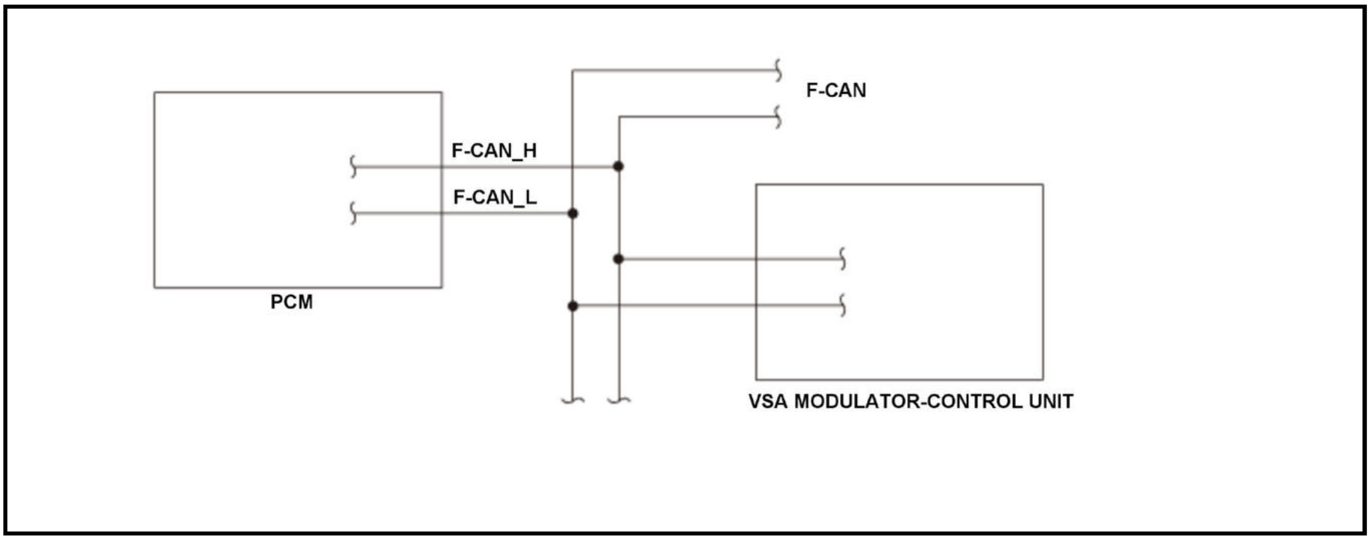
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0122 (2.4 L ENGINE) (2017 2018 2019)

DTC U0122: F-CAN Malfunction (Powertrain Control Module (PCM)-VSA Modulator-Control Unit)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (F-CAN H and F-CAN L). When the information is not sent from the VSA modulator-control unit via the F-CAN lines and this condition continues for a specified time or when the information sent from the VSA modulator-control unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The PCM does not receive any signals via the F-CAN lines for at least 1 second.
- The information sent from the VSA modulator-control unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN H line open
- F-CAN circuit F-CAN L line open
- F-CAN circuit F-CAN H line short to ground
- F-CAN circuit F-CAN L line short to ground
- VSA modulator-control unit failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

*1:
REAL TIME AWD CONTROL UNIT
PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using F-CAN A and B signal lines. If there is an abnormality in the electric brake booster system information transmitted from the electric brake booster via the F-CAN line for a specified duration, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

- There is an abnormality in the electric brake booster system information transmitted from the electric brake booster for at least 1.5 seconds.
- The information sent from the electric brake booster is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Precision all wheel steer control unit failure
- F-CAN circuit F-CAN A H line open
- F-CAN circuit F-CAN A L line open
- F-CAN circuit F-CAN A H line short to ground
- F-CAN circuit F-CAN A L line short to ground
- F-CAN circuit F-CAN B H line open
- F-CAN circuit F-CAN B L line open
- F-CAN circuit F-CAN B H line short to ground
- F-CAN circuit F-CAN B L line short to ground
- Electric brake booster failure
- CAN gateway internal failure (include fuse fall-outs)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

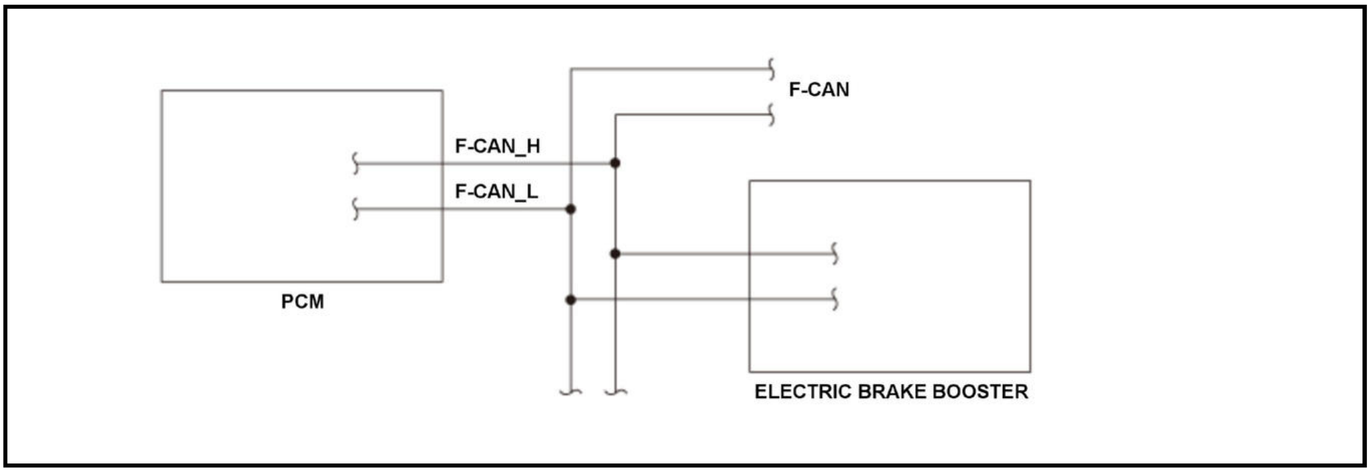
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0129 (2.4 L ENGINE) (2017 2018 2019)

DTC U0129: F-CAN Malfunction (Powertrain Control Module (PCM)-Electric Brake Booster)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using F-CAN signal lines. If there is an abnormality in the electric brake booster information transmitted from the electric brake booster via the F-CAN line for a specified duration, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

- There is an abnormality in the electric brake booster system information transmitted from the electric brake booster for at least 1.5 seconds.
- The information sent from the electric brake booster is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN H line open
- F-CAN circuit F-CAN L line open
- F-CAN circuit F-CAN H line short to ground
- F-CAN circuit F-CAN L line short to ground
- Electric brake booster failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

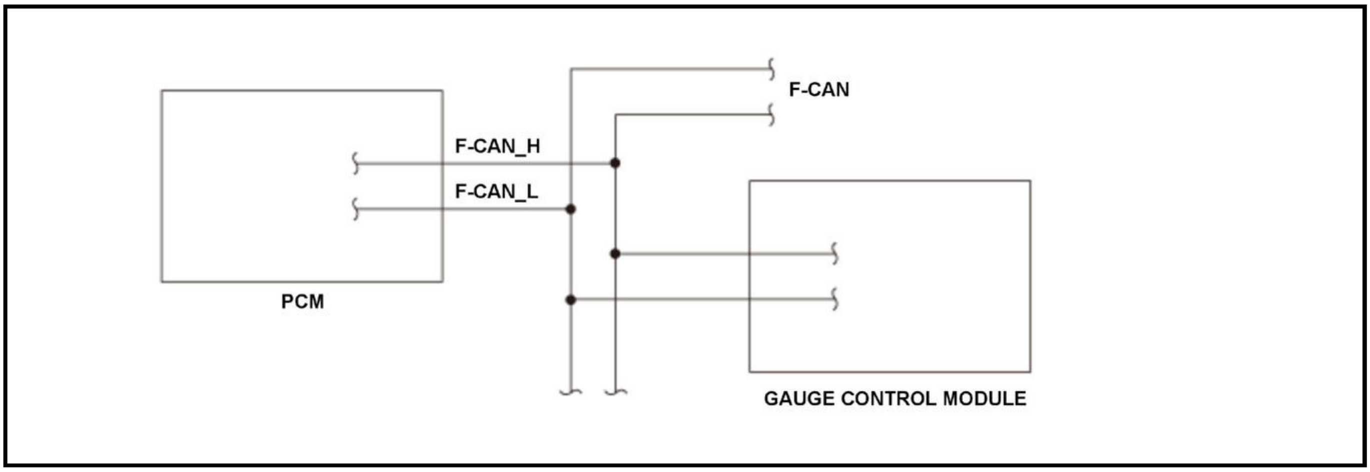
DTC U0155 (2.4 L ENGINE) (2017 2018 2019)

DTC U0155: F-CAN Malfunction (Powertrain Control Module (PCM)-Gauge Control Module)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (F-CAN H and F-CAN L). When the powertrain control module (PCM) does not receive the signals from the gauge control module via the F-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The PCM does not receive any signals via the F-CAN lines for at least 1.5 seconds.
- The information sent from the gauge control module is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN H line open
- F-CAN circuit F-CAN L line open
- F-CAN circuit F-CAN H line short to ground
- F-CAN circuit F-CAN L line short to ground
- Gauge control module failure (include fuse fall-outs)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

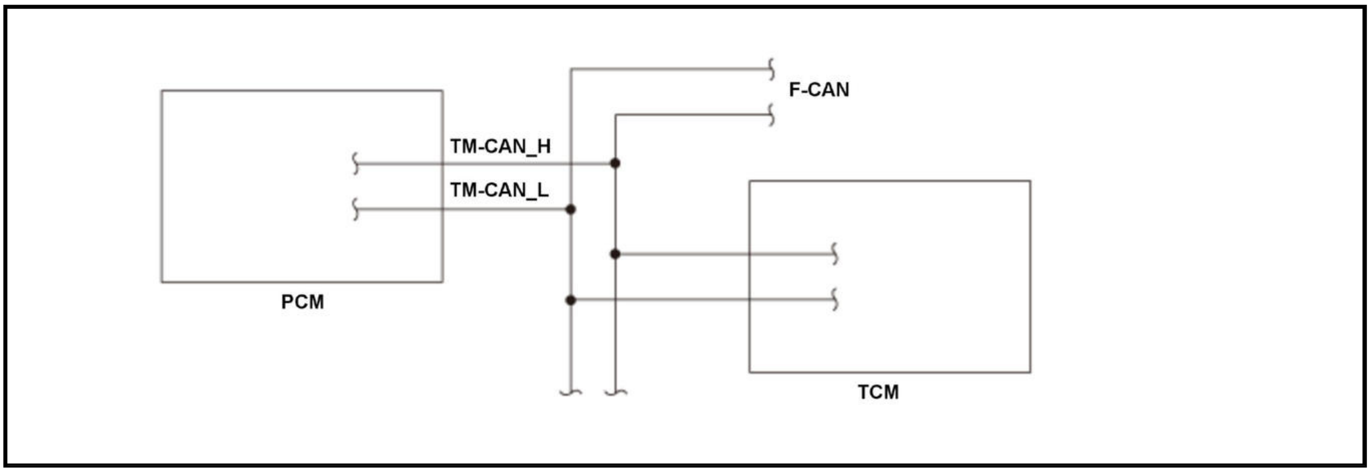
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0301 (1.5 L ENGINE)

DTC U0301: PGM-FI System and Transmission System Program Version Mismatch

General Description



The controller area network (CAN) uses two signal lines. TM-CAN H and TM-CAN L, and it receives and transmits multiple signals simultaneously to/from multiple control modules. When the software version in the powertrain control module (PCM) and the transmission control module (TCM) are mismatched for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The software version in the PCM and the TCM are mismatched for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM software data not updated

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using F-CAN A signal lines. When the information is not sent from the body control module via the F-CAN lines and this condition continues for a specified time or when the information sent from the body control module is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The PCM does not receive any signals via the F-CAN lines for at least 1.5 seconds.

- The information sent from the body control module is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A H line open
- F-CAN circuit F-CAN A L line open
- F-CAN circuit F-CAN A H line short to ground
- F-CAN circuit F-CAN A L line short to ground
- Body control module failure (include fuse fall-outs)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

ADVANCED DIAGNOSTICS

DTC P0010

DTC P0010: Variable Valve Timing Control (VTC) Malfunction

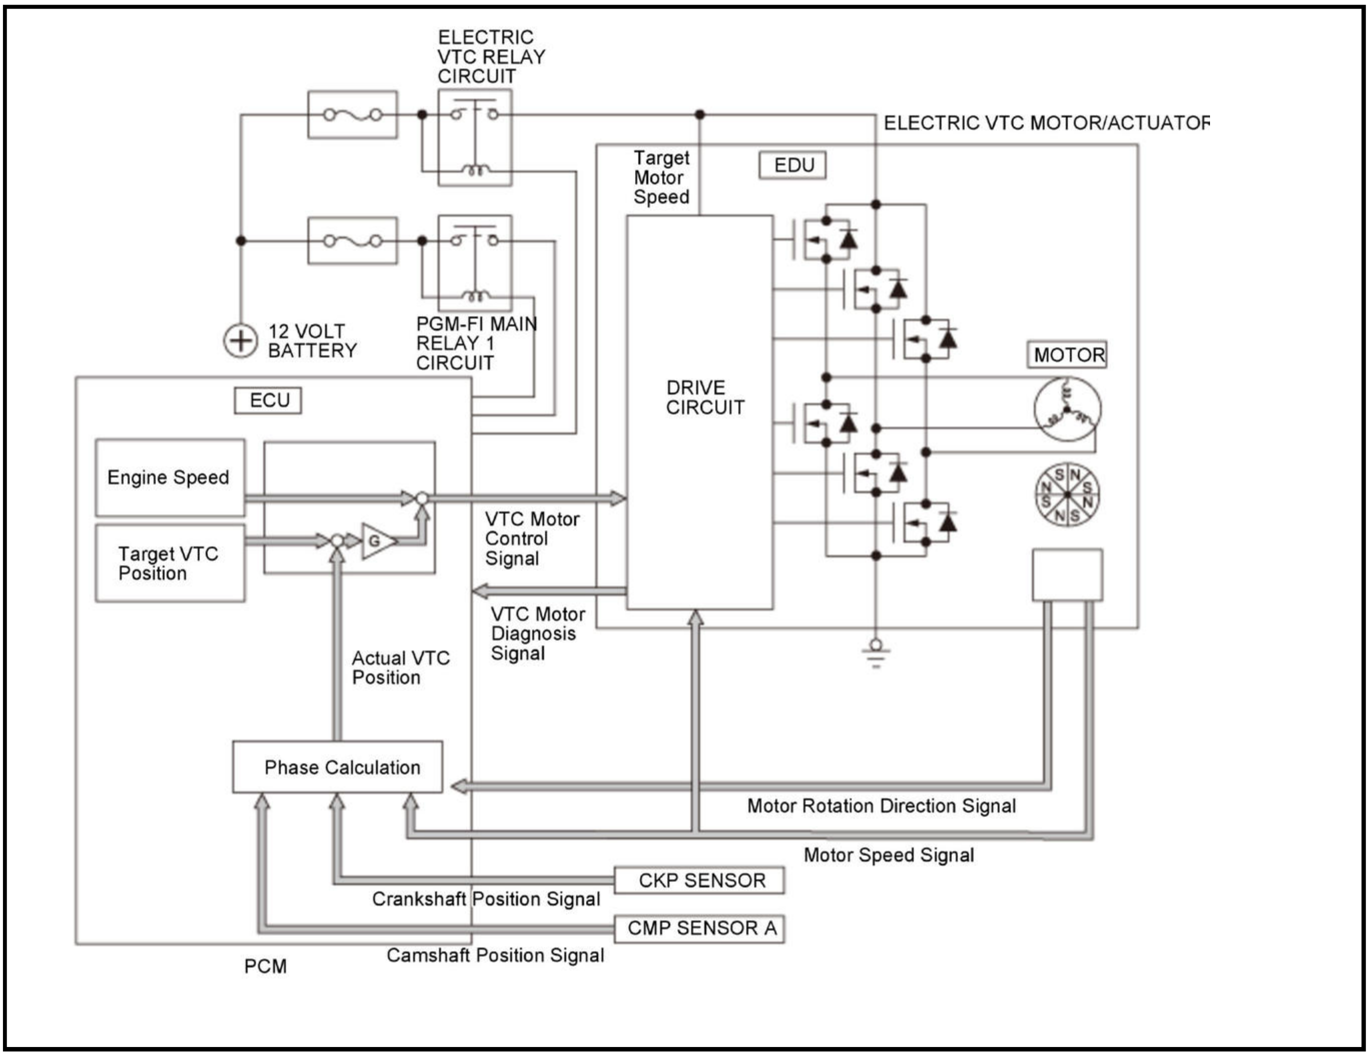
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the following DTC codes (P100A, P100B, P100C) are detected.

DTC P0011

DTC P0011: Variable Valve Timing Control (VTC) System Malfunction

General Description



ELECTRIC VTC RELAY CIRCUIT
ELECTRIC VTC MOTOR/ACTUATOR
Target Motor Speed
EDU
12 VOLT BATTERY
PGM-FI MAIN RELAY 1 CIRCUIT
DRIVE CIRCUIT
MOTOR
ECU
Engine Speed
Target VTC Position
G
VTC Motor Control Signal
VTC Motor Diagnosis Signal
Actual VTC Position
S
N
Phase Calculation
Motor Rotation Direction Signal
Motor Speed Signal
CKP SENSOR
Crankshaft Position Signal
CMP SENSOR A
Camshaft Position Signal
PCM

The variable valve timing control (VTC) system controls the phase of the intake camshaft. It uses motor to operate the VTC actuator so the valve timing is optimized depending on driving conditions. The powertrain control module (PCM) monitors the phase control command and the actual timing of the camshaft by using camshaft position (CMP) sensor A. If the phase difference between them is excessive for a certain time period, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	15 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	-	269.4 deg.F (131.9 deg.C)
Engine speed [Engine Speed]	500 rpm	-
12 volt battery voltage [Battery]	10.5 V	-

[ ]: HDS Parameter

Condition	Minimum	Maximum
VTC operating voltage	6 V	-

[ ]: HDS Parameter

Malfunction Threshold

The timing difference between the timing control command and the actual timing of the camshaft is 15 deg. or more for at least 15 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VTC actuator stuck
- VTC actuator response delay
- VTC actuator (EDU) internal circuit failure
- VTC motor stuck
- VTC motor failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 15 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Select the VTC TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

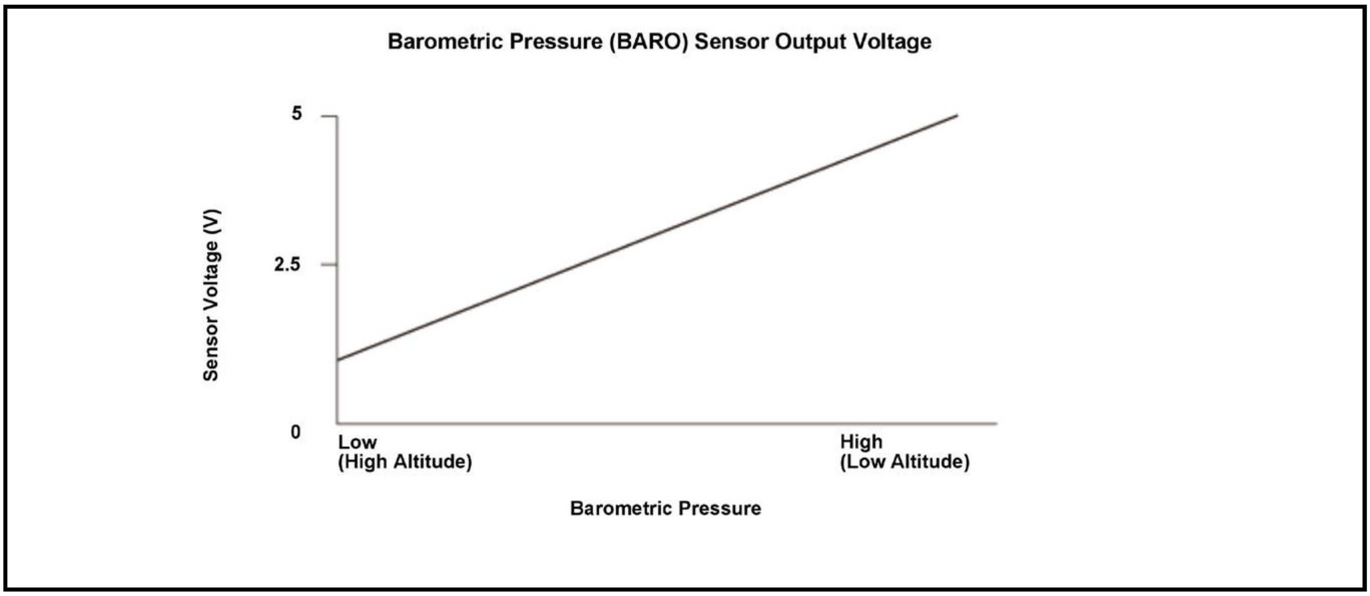
Conditions for clearing the DTC

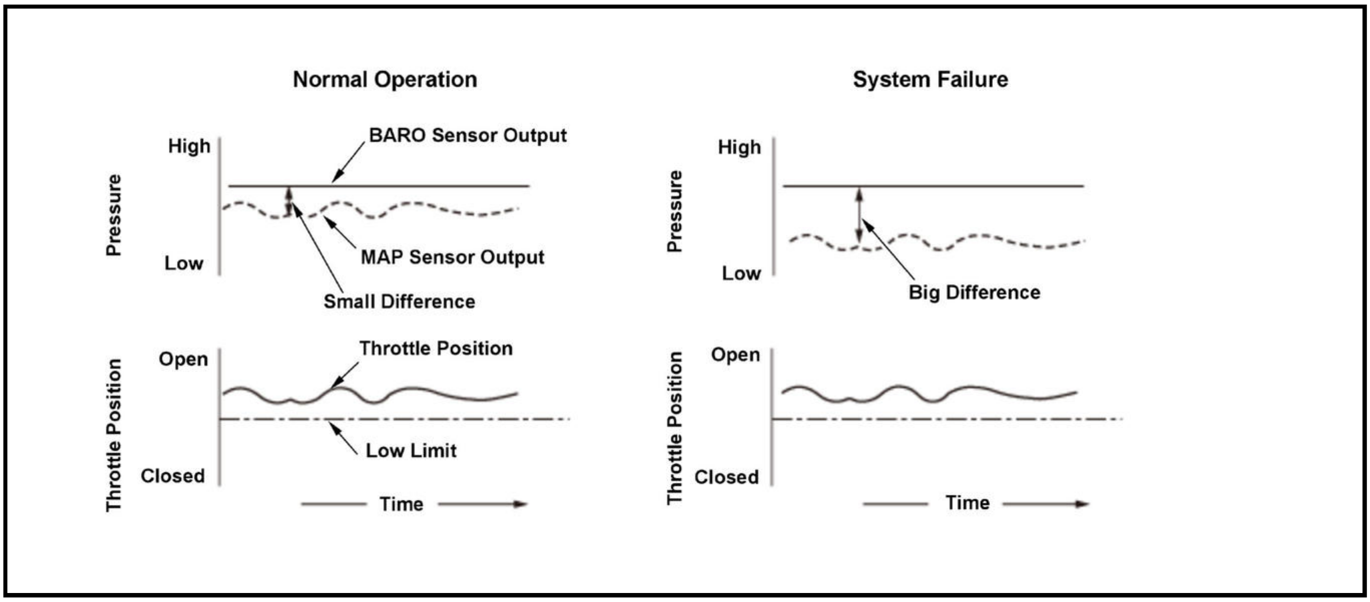
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0069

DTC P0069: Barometric Pressure (BARO) Sensor Circuit Range/Performance Problem

General Description





The barometric pressure (BARO) sensor is built into the powertrain control module (PCM) and monitors atmospheric pressure. When the throttle valve is wide open, the manifold absolute pressure (MAP) sensor output is nearly equal to the BARO sensor output. If the throttle position is beyond a value stored in the PCM that is used to detect "wide-open throttle", and if the difference between the MAP sensor output and the BARO sensor output is equal to or greater than a set value, the PCM detects a malfunction in the BARO sensor output and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition		Minimum	Maximum
Throttle position	1, 200 rpm	14.1 deg.	-
	4, 000 rpm	29.6 deg.	-

Malfunction Threshold

The difference between the BARO sensor output and the MAP sensor output is 28 kPa (8.1 inHg, 204 mmHg) or more for at least 2.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor failure
- Air cleaner element clogged

Confirmation Procedure

Operating Condition

- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle under Enable Conditions (see "Throttle position") for at least 2.5 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

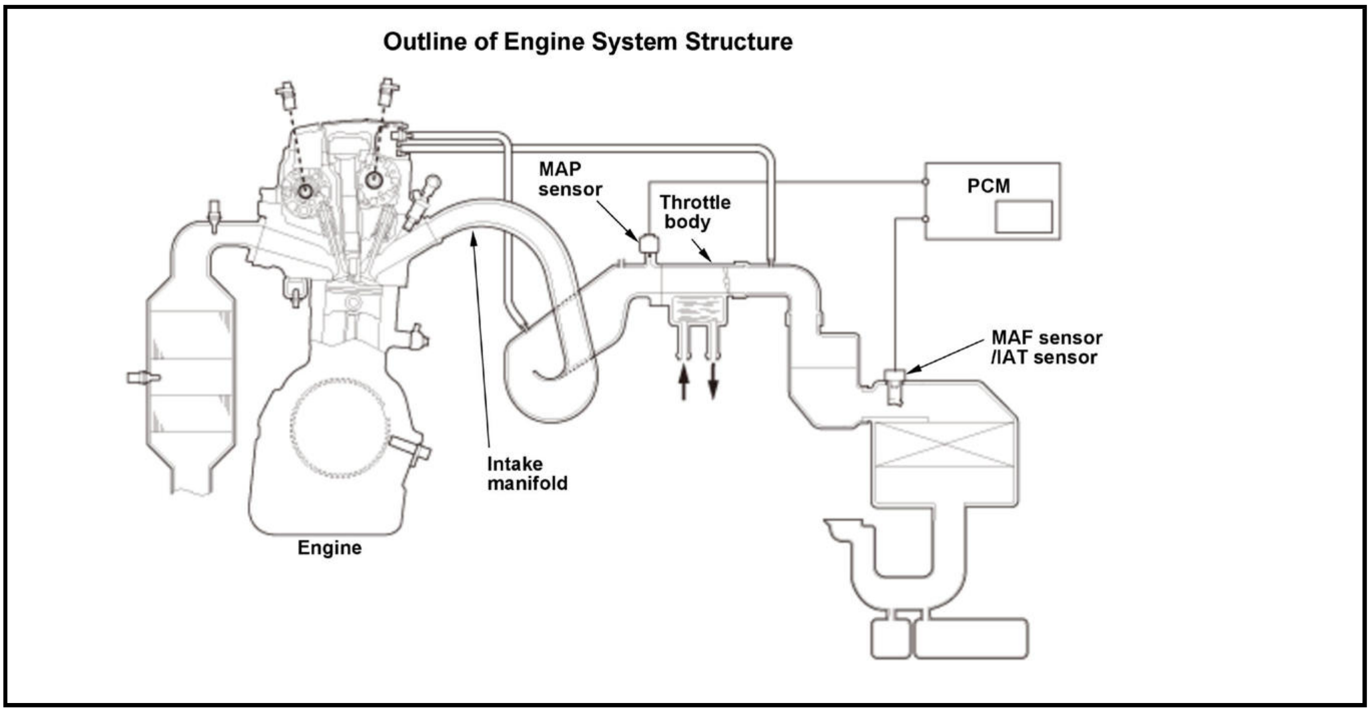
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

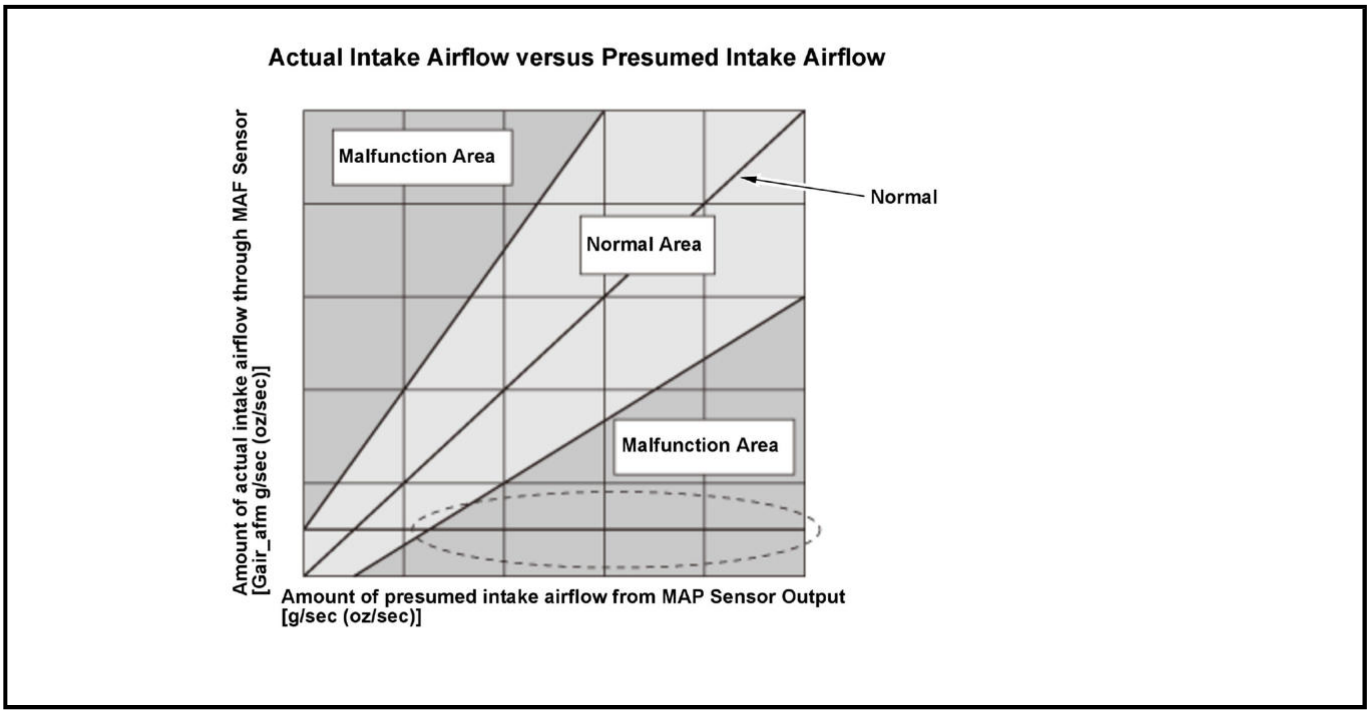
DTC P006A

DTC P006A: Mass Airflow (MAF) Sensor Circuit Range/Performance Problem

General Description



Outline of Engine System Structure
MAP sensor
Throttle body
PCM
MAF sensor /IAT sensor
Intake manifold
Engine



The mass airflow (MAF) sensor directly measures the amount of intake airflow into the engine, and the powertrain control module (PCM) controls the fuel injection based on the measured value. The manifold absolute pressure (MAP) sensor measures the intake manifold pressure, and the PCM calculates the amount of intake airflow from the MAP sensor output and the engine revolutions. The PCM compares the MAF sensor output (amount of intake airflow) and the amount of intake airflow calculated from MAP sensor output. If their difference is too large (in the malfunction area), the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	3.0 seconds	-
Engine coolant temperature [ECT Sensor 1]	155.9 deg.F (68.8 deg.C)	-
Engine speed [Engine Speed]	1, 100 rpm	6, 000 rpm

[ ]: HDS Parameter

Malfunction Threshold

The difference between the amount of intake air measured by the MAF sensor and the amount of intake air calculated from the MAP sensor output is out of the normal area for at least 5.0 seconds.

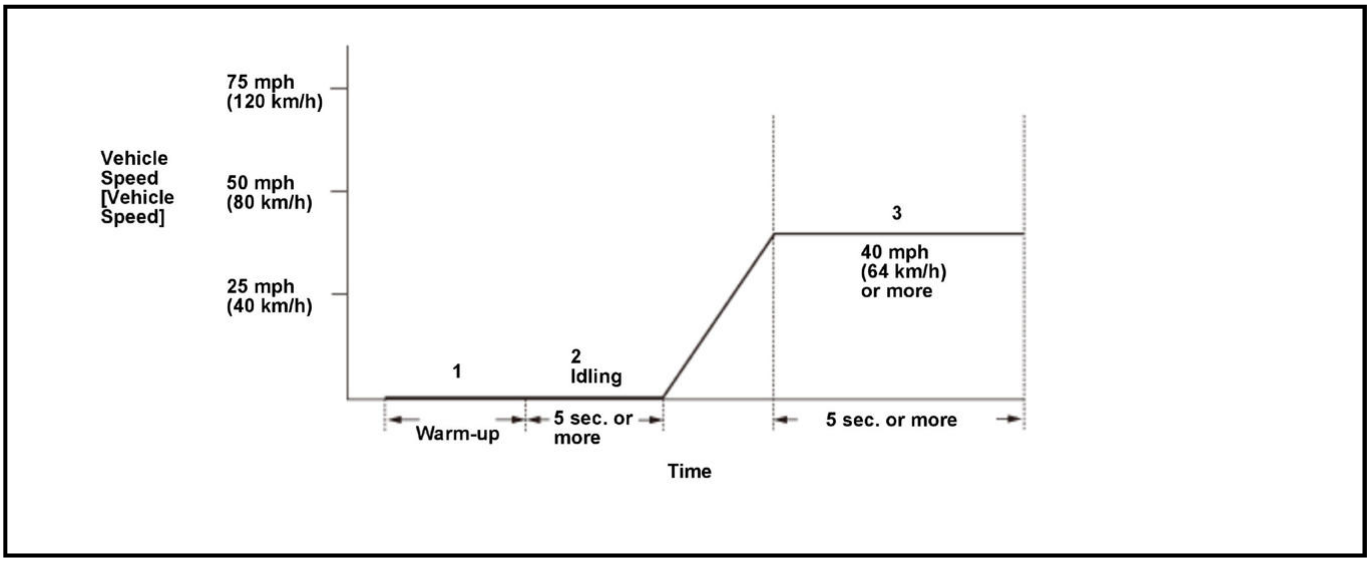
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Intake air duct improper assembly
- Intake air duct damage
- Evaporative emission (EVAP) canister hose improper assembly
- Intake manifold damage
- MAP sensor improper assembly
- Positive crankcase ventilation (PCV) hose improper assembly
- Air cleaner element damage
- Air cleaner element clogged
- MAF sensor element damage

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 5 seconds.
- Drive the vehicle at a steady speed of 40 mph (64 km/h) or more for at least 5 seconds.

- When freeze data or the on-board snapshot is stored, drive the vehicle under those conditions instead of Driving Pattern step 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

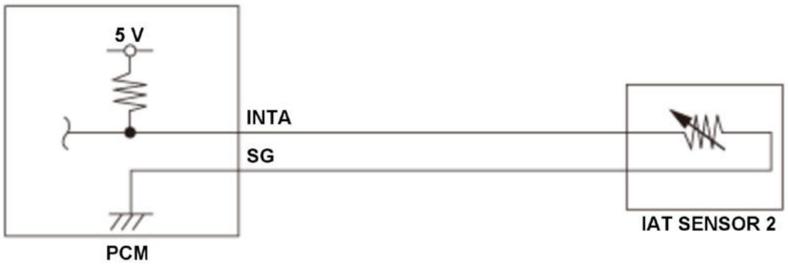
Conditions for clearing the DTC

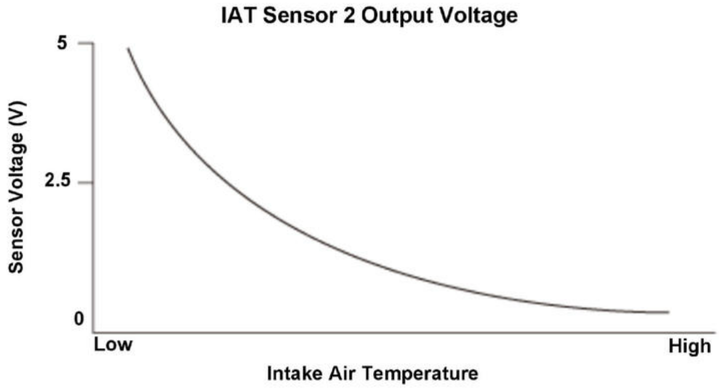
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0096

DTC P0096: Intake Air Temperature (IAT) Sensor 2 Circuit Range/Performance Problem

General Description





Intake air temperature (IAT) sensor 2 is a thermistor that detects intake air temperature, and it is used for air/fuel ratio feedback control to compensate for the atmospheric density fluctuations that accompany changes in intake air temperature. IAT sensor 2 resistance varies depending on temperature. The output voltage and the sensor resistance increase as the intake air temperature decreases. Conversely, the output voltage and the sensor resistance decrease as the intake air temperature increases. If the intake air temperature is a specified value for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The IAT sensor 2 output voltage [IAT Sensor (2) Voltage] is 0.21 V or less for at least 6.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- IAT sensor 2 failure (range/performance problem)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

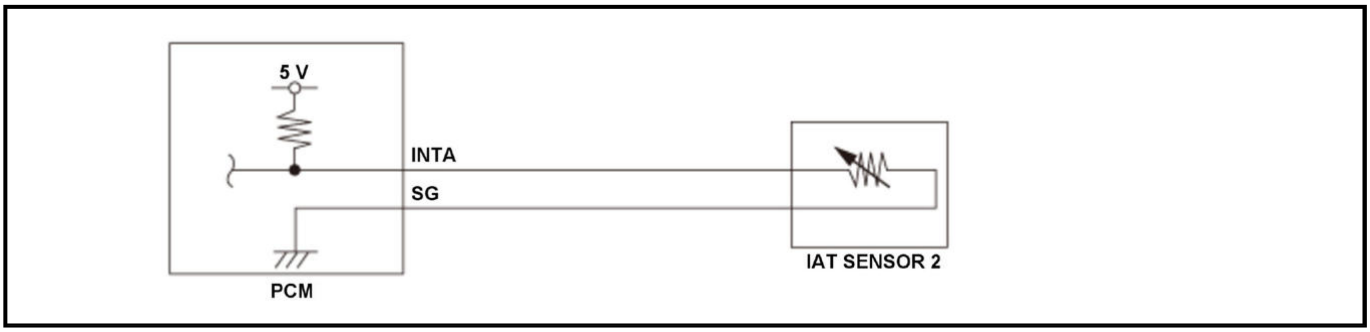
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

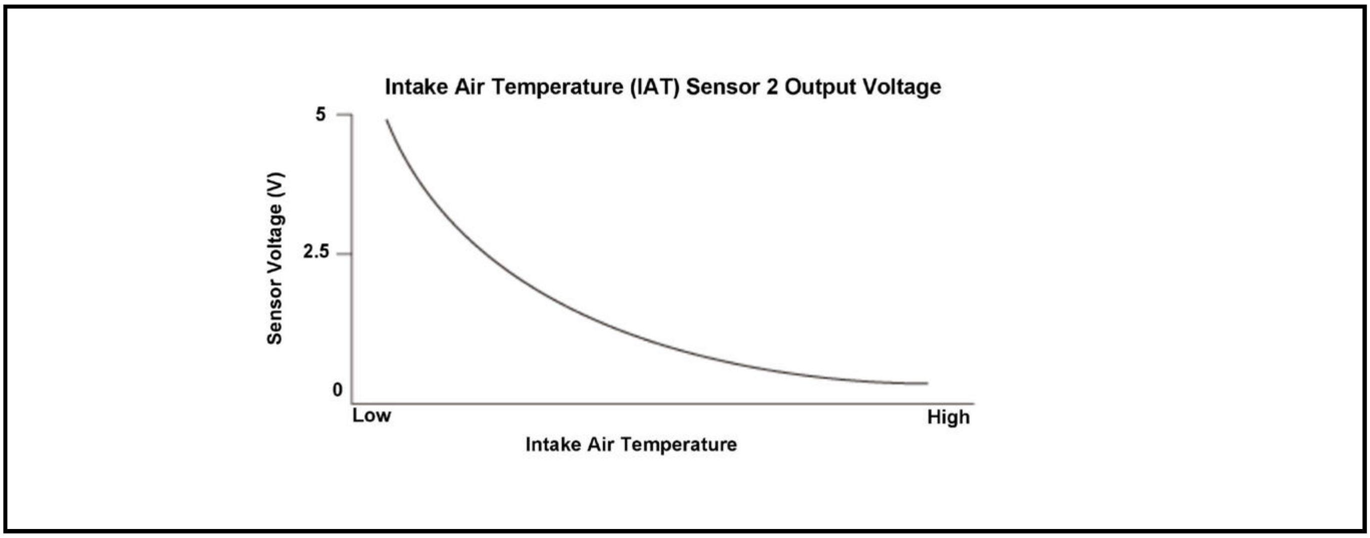
DTC P0097, P0098

DTC P0097: Intake Air Temperature (IAT) Sensor 2 Circuit Low Voltage

DTC P0098: Intake Air Temperature (IAT) Sensor 2 Circuit High Voltage

General Description





Intake air temperature (IAT) sensor 2 is a thermistor that detects intake air temperature, and it is used for air/fuel ratio feedback control to compensate for the atmospheric density fluctuations that accompany changes in intake air temperature. IAT sensor 2 resistance varies depending on temperature. The output voltage and the sensor resistance increase as the intake air temperature decreases. Conversely, the output voltage and the sensor resistance decrease as the intake air temperature increases. If the IAT sensor 2 output voltage is specified value, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P0097

The IAT sensor 2 output voltage [IAT Sensor (2) Voltage] is 0.08 V or less for at least 2.0 seconds.

DTC: P0098

The IAT sensor 2 output voltage [IAT Sensor (2) Voltage] is 4.92 V or more for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0097

- IAT sensor 2 INTA line short to ground

DTC: P0098

- IAT sensor 2 INTA line open
- IAT sensor 2 SG line open

Common

- IAT sensor 2 failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

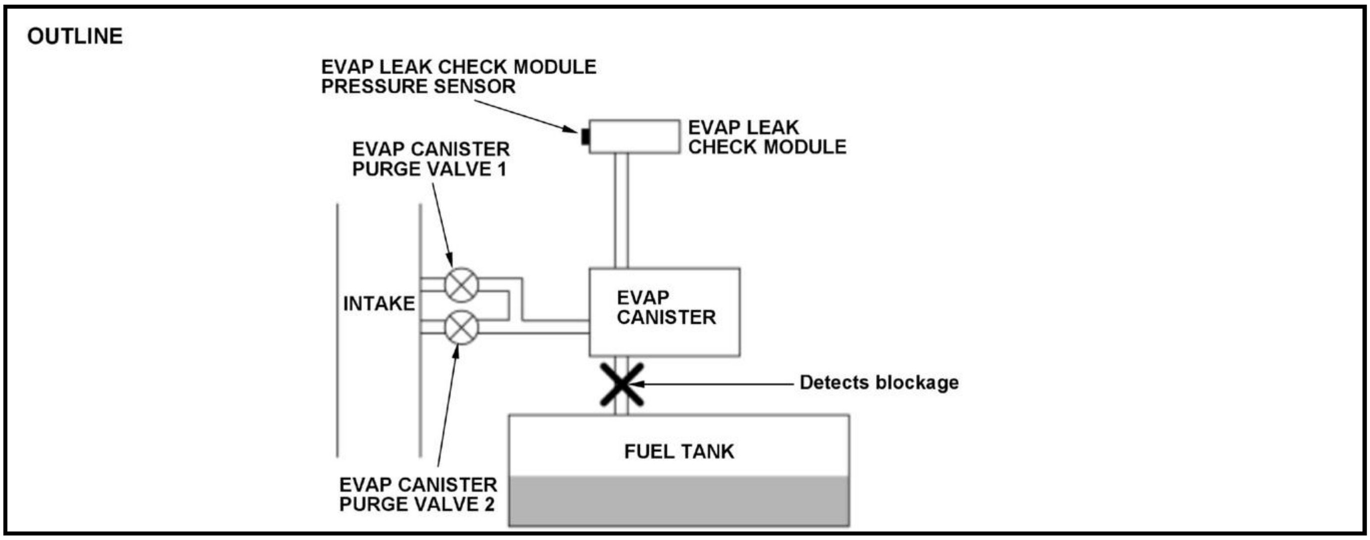
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

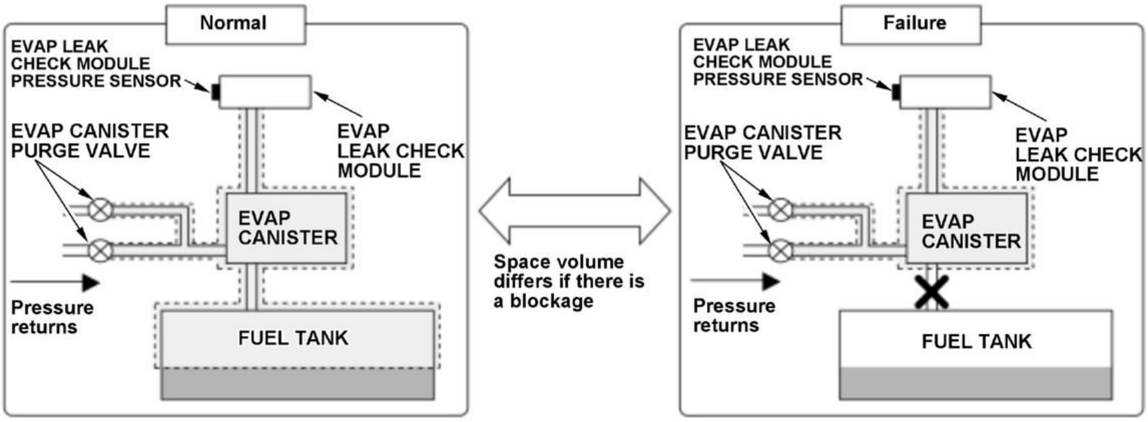
DTC P00FE

DTC P00FE: Evaporative Emission (EVAP) Vent Line Blockage

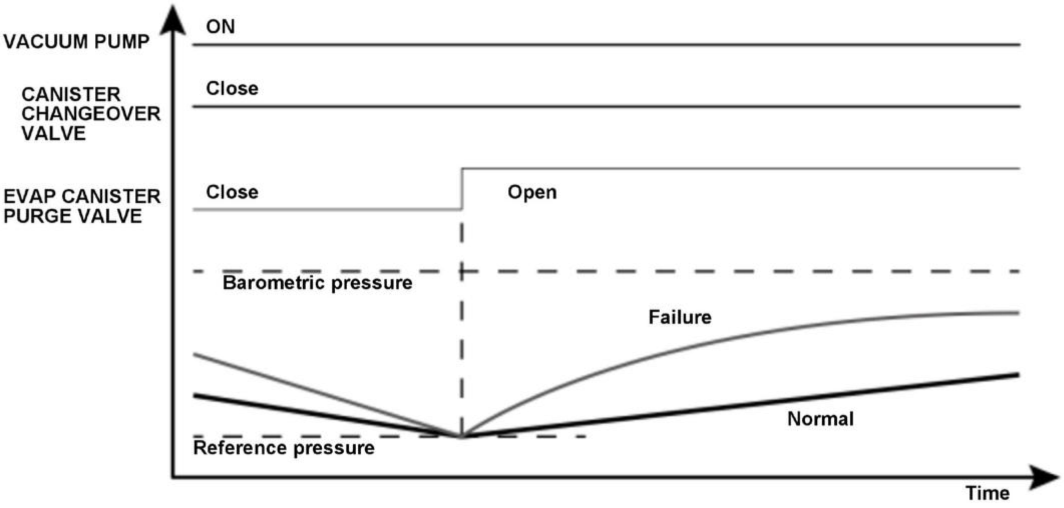
General Description



OUTLINE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP LEAK CHECK MODULE
EVAP CANISTER PURGE VALVE 1
INTAKE
EVAP CANISTER
Detects blockage
FUEL TANK
EVAP CANISTER PURGE VALVE 2



Normal
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP CANISTER PURGE VALVE
EVAP LEAK CHECK MODULE
EVAP CANISTER
Pressure returns
FUEL TANK
Space volume differs if there is a blockage
Failure
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP CANISTER PURGE VALVE
EVAP LEAK CHECK MODULE
EVAP CANISTER
Pressure returns
FUEL TANK



VENT blockage is determined by the change in the tank internal pressure. If there is a pressure change in the tank, the PCM determines as normal. If there is no pressure change, there is a possibility that the VENT blockage failure or the pressure in the tank is not applied.The PCM detects a blockage of vent line by estimating the volume of space in the evaporative emission (EVAP) system. If the volume of space is large, the EVAP leak check module is closed and decompressed by purge. If the volume of space is small, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	18 minutes 40 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Soak duration	5 hours	-
Elapsed time after the vehicle condition is turned to the ON mode	10 minutes	-
PCM wake up engine coolant temperature [ECT Sensor 1]	40.0 deg.F (5 deg.C)	95 deg.F (35 deg.C)
Barometric pressure[Baro Sensor]	76 kPa (22.5 inHg, 569 mmHg)	-
Drive distance after refueling	7 miles (10 km)	-
12 volt battery voltage [Battery]	10.5 V	-
Average fuel level [Fuel Level(Average)]	-	85 %

[ ]: HDS Parameter

Malfunction Threshold

When the calculated volume of space in the EVAP system is 6.8 L (1.8 US gal) or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP vent line blockage
- Vent shut float blockage

Confirmation Procedure

Operating Condition

- Average fuel level [Fuel Level(Average)] of 85 % or less, turn the vehicle to the ON mode, and wait for at least 10 minutes. Drive the vehicle at 7 miles (10 km/h) or more after refueling.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes 40 seconds.

- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

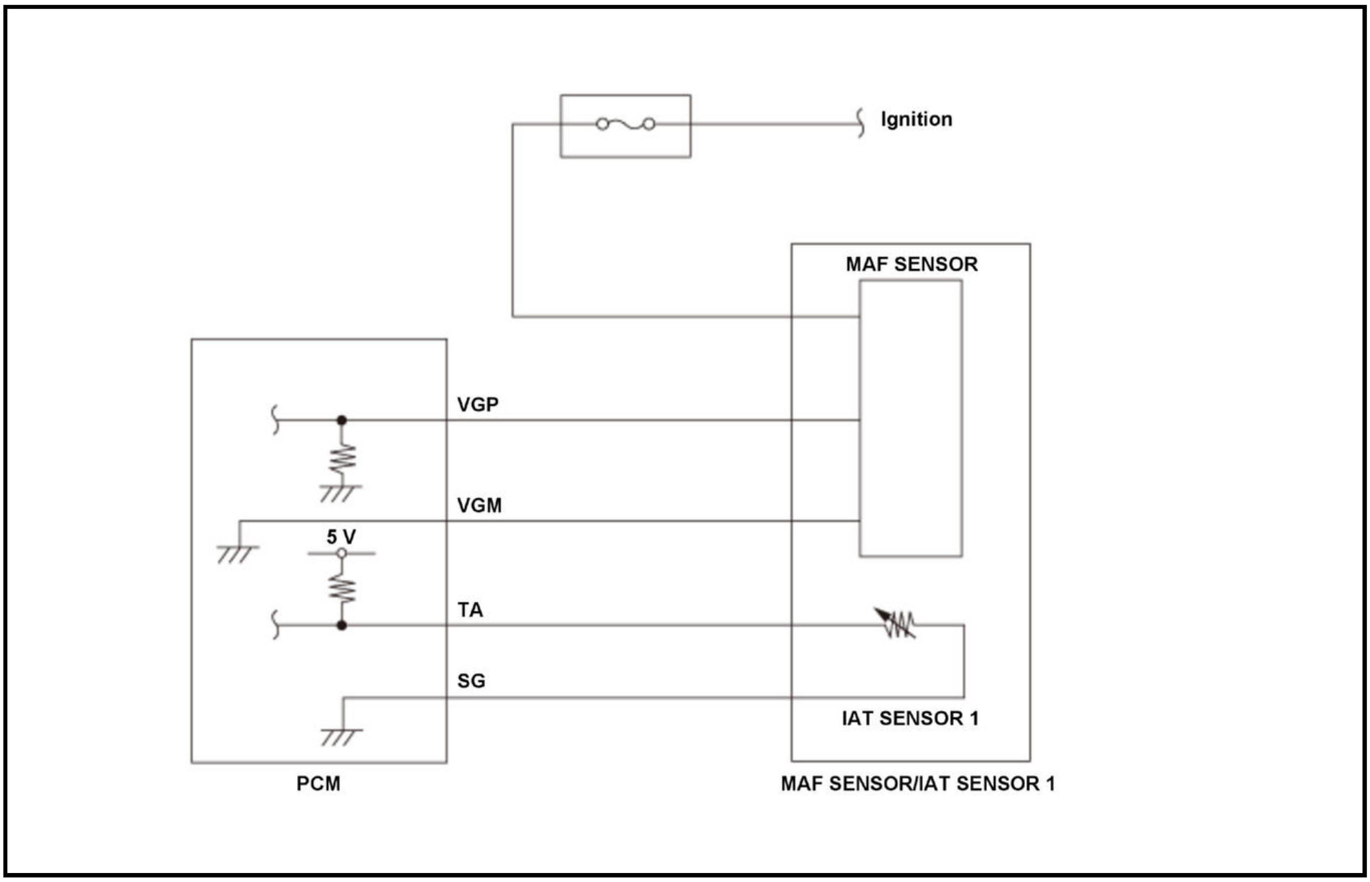
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P0101

DTC P0101: Mass Airflow (MAF) Sensor Circuit Range/Performance Problem (Out of Range)

General Description



The mass airflow (MAF) sensor is attached to the intake air passage, and it measures the amount of intake airflow. The MAF sensor is a hot wire airflow meter. The airflow cools the electrically heated wire that is mounted in the air passage. The powertrain control module (PCM) determines the amount of intake airflow by detecting the current that is required to keep the hot wire at a constant temperature. The lower or the upper limit of the MAF sensor output is specified. If the output is below that limit, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The MAF sensor output voltage [MAF Sensor Voltage] is 0.14 V or less for at least 6.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAF sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

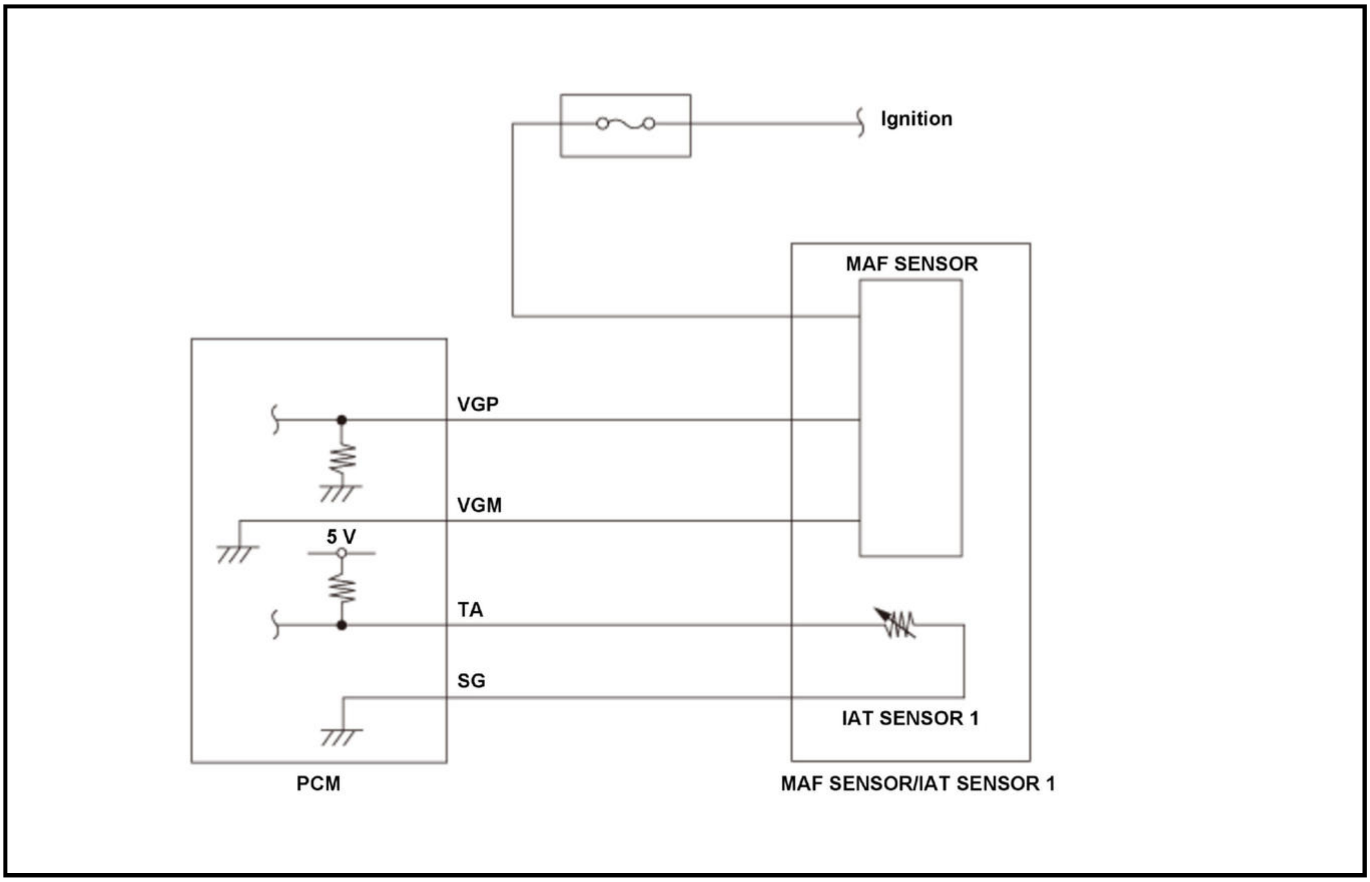
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

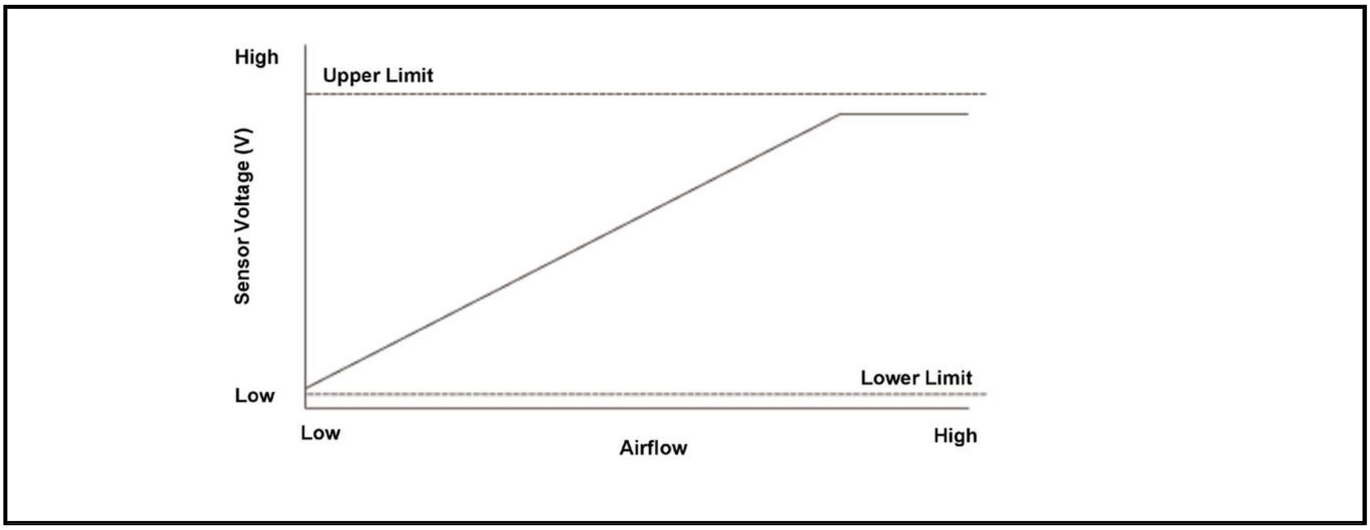
DTC P0102, P0103

DTC P0102: Mass Airflow (MAF) Sensor Circuit Low Voltage

DTC P0103: Mass Airflow (MAF) Sensor Circuit High Voltage

General Description





The mass airflow (MAF) sensor is attached to the intake air passage, and it measures the amount of intake airflow. The MAF sensor is a hot wire airflow meter. The airflow cools the electrically heated wire that is mounted in the air passage. The powertrain control module (PCM) determines the amount of intake airflow by detecting the current that is required to keep the hot wire at a constant temperature. The lower or the upper limit of the MAF sensor output is specified. If the output is below or above that limit, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P0102

The MAF sensor output voltage [MAF Sensor Voltage] is 0.10 V or less for at least 2.0 seconds.

DTC: P0103

The MAF sensor output voltage [MAF Sensor Voltage] is 4.89 V or more for at least 2.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0102

- MAF sensor VGP line short to ground
- MAF sensor VGP line open
- MAF sensor power supply line open

DTC: P0103

- MAF sensor VGM line open

Common

- MAF sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

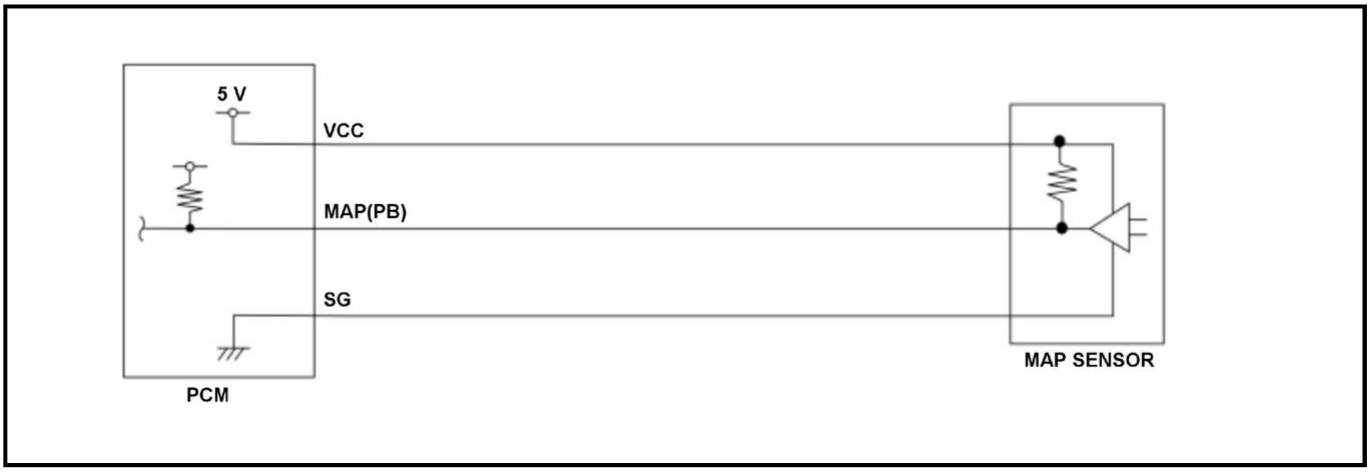
Conditions for clearing the DTC

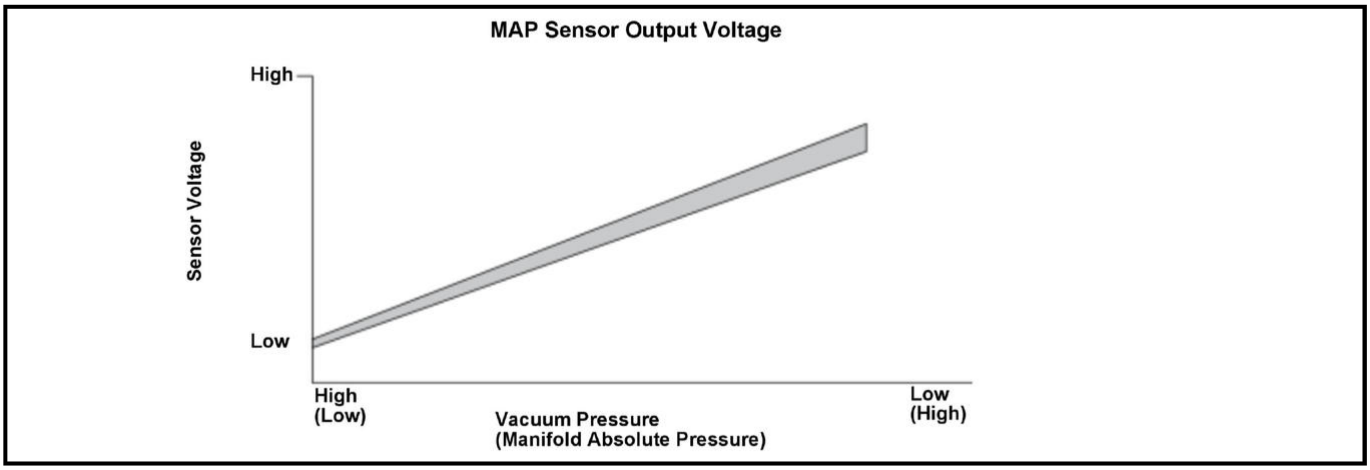
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0105

DTC P0105: Manifold Absolute Pressure (MAP) Sensor Out of Range

General Description





The manifold absolute pressure (MAP) sensor measures the pressure or vacuum in the manifold. This measurement is converted into an electrical signal which the powertrain control module (PCM) uses to monitor the engine. The MAP sensor outputs low signal voltage at high vacuum (throttle valve closed) and high signal voltage at low vacuum (throttle valve wide open). If the signal voltage from the MAP sensor is a set value for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The MAP sensor output voltage [MAP Sensor Voltage] is 3.29 V or more for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAP sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

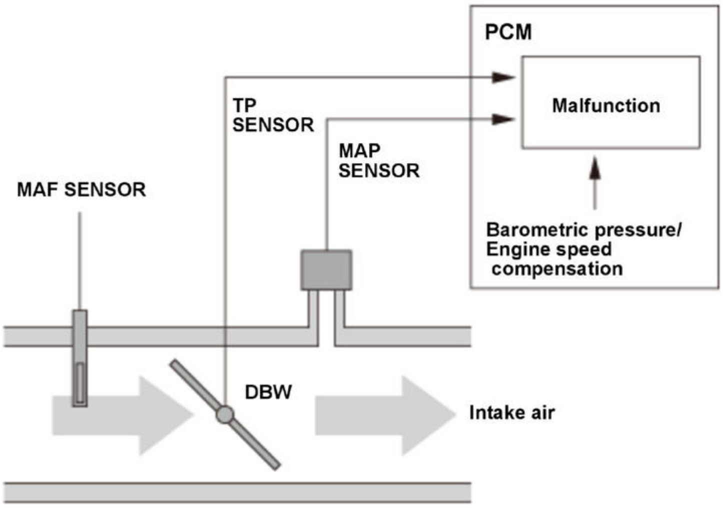
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

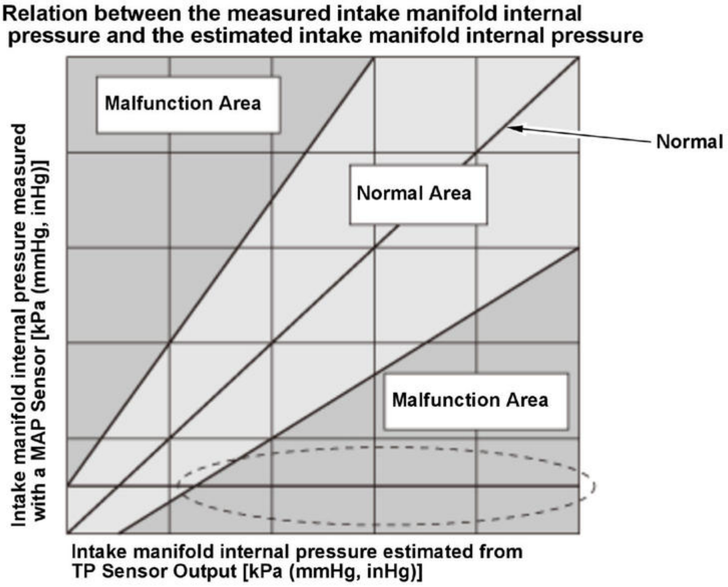
DTC P0106

DTC P0106: Manifold Absolute Pressure (MAP) Sensor Range/Performance Problem

General Description



PCM
Malfunction
TP SENSOR
MAP SENSOR
MAF SENSOR
Barometric pressure/ Engine speed compensation
DBW
Intake air



The amount of intake air is adjusted by the opening angle of the throttle valve, and the pressure inside the intake manifold is measured with the manifold absolute pressure (MAP) sensor. When the throttle valve is opened fully for quick acceleration, the intake manifold pressure suddenly drops to near atmospheric pressure, and the MAP sensor output reads near atmospheric pressure. The powertrain control module (PCM) compares the intake manifold internal pressure estimated from the output value of the MAP sensor (intake manifold inside pressure), the throttle position (TP) sensor, the barometric pressure (BARO) sensor output, and the engine speed. When the deviation is large (when it is in a malfunction area), the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg.F (69 deg.C)	-
Engine speed [ENGINE SPEED]	1, 100 rpm	5, 500 rpm

[ ]: HDS Parameter

Malfunction Threshold

The difference between the amount of intake air manifold pressure measured by the MAP sensor and the amount of intake air calculated from the TP sensor output is out of the normal area for at least 5.0 seconds.

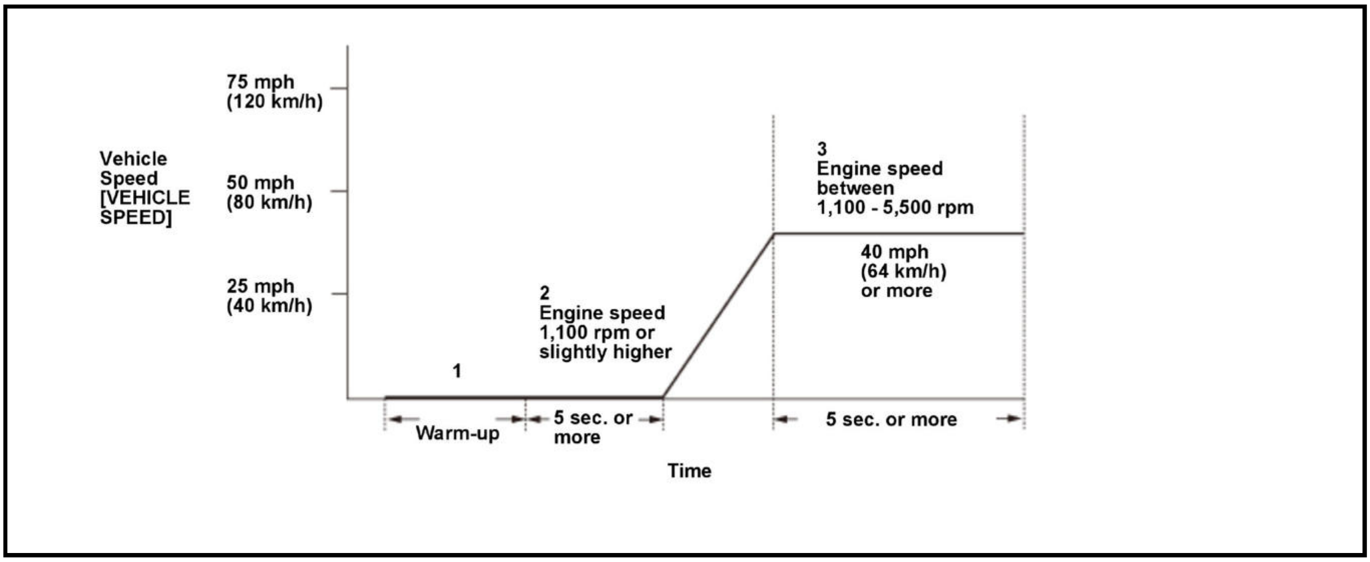
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- MAP sensor output signal low
- MAP sensor output signal high
- Intake air system clogged
- Evaporative emission (EVAP) canister purge valve failure
- Intake air system air leak
- Valve timing incorrect

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Hold the engine speed [Engine Speed] at 1, 100 rpm or slightly higher without load (in P or N) for at least 5 seconds.
- Drive the vehicle at a steady speed of 40 mph (64 km/h) or more and engine speed [Engine Speed] between 1, 100 - 5, 500 rpm for at least 5 seconds.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

- MAP sensor VCC line open
- MAP sensor MAP(PB) line short to ground

DTC: P0108

- MAP sensor MAP(PB) line open
- MAP sensor SG line open

Common

- MAP sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

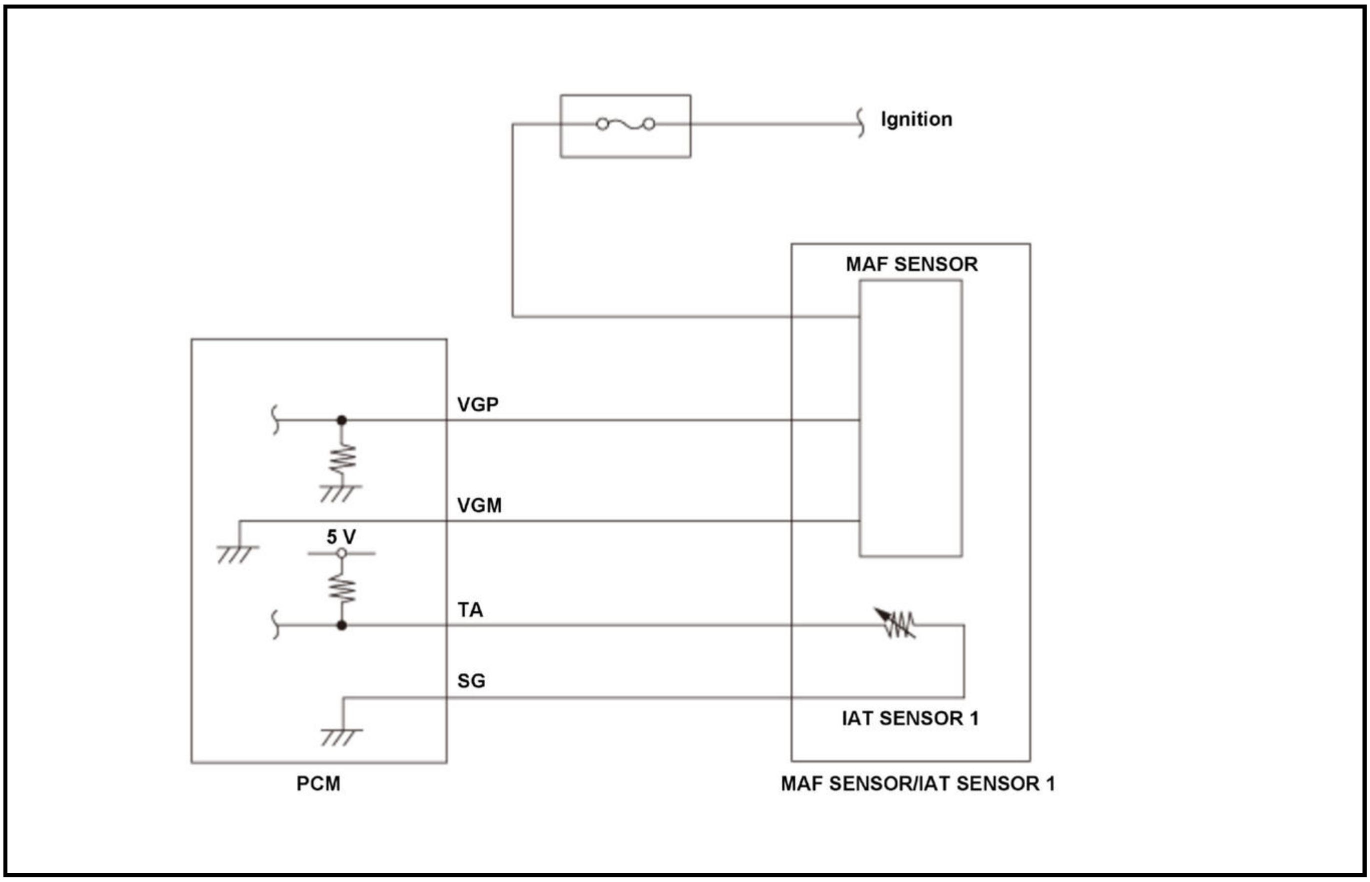
Conditions for clearing the DTC

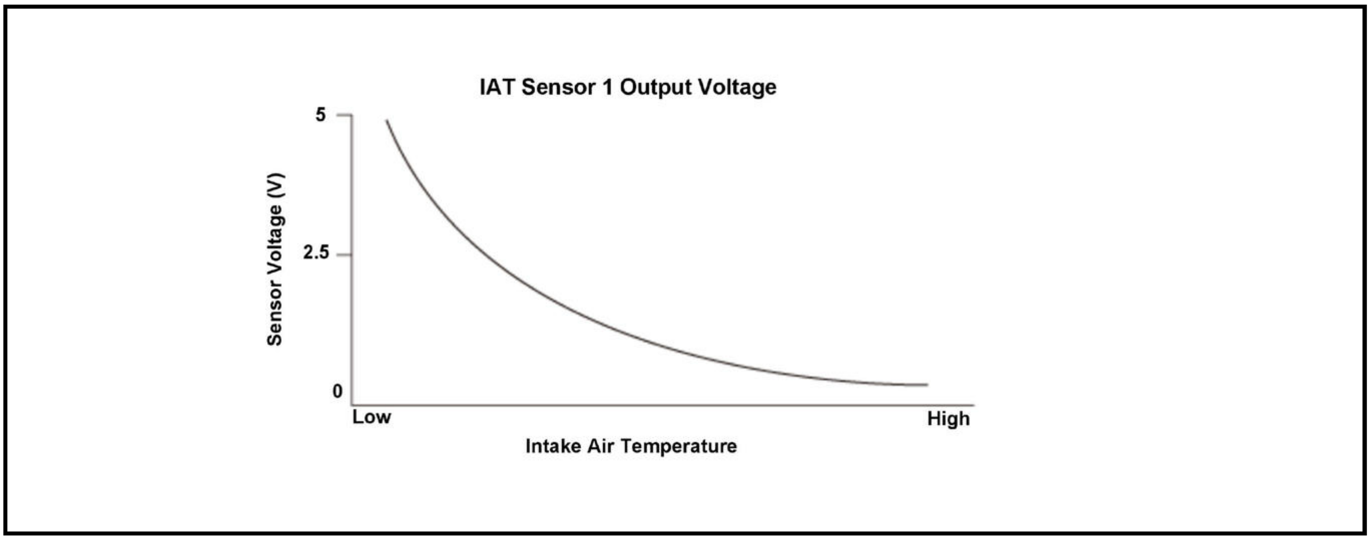
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0111

DTC P0111: Intake Air Temperature (IAT) Sensor 1 Circuit Range/Performance Problem

General Description





Intake air temperature (IAT) sensor 1 is a thermistor that detects intake air temperature, and it is used for air/fuel ratio feedback control to compensate for the atmospheric density fluctuations that accompany changes in intake air temperature. IAT sensor 1 resistance varies depending on temperature. The output voltage and the sensor resistance increase as the intake air temperature decreases. Conversely, the output voltage and the sensor resistance decrease as the intake air temperature increases. If the IAT sensor 1 output voltage is excessively low, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0112

- IAT sensor 1 TA line short to ground

DTC: P0113

- IAT sensor 1 TA line open
- IAT sensor 1 SG line open

Common

- IAT sensor 1 failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

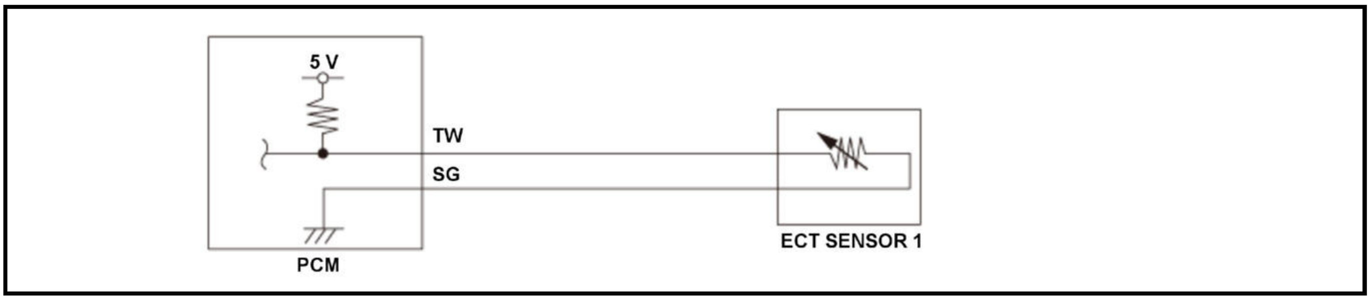
Conditions for clearing the DTC

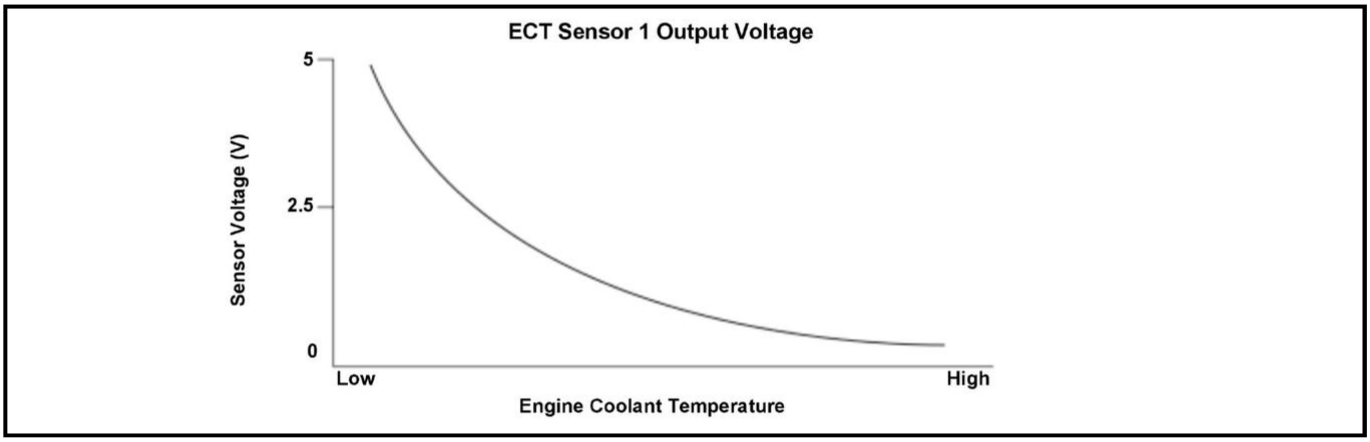
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0115

DTC P0115: Engine Coolant Temperature (ECT) Sensor 1 Out of Range

General Description





Engine coolant temperature (ECT) sensor 1 is used for air/fuel ratio feedback control, ignition timing control, idle speed control, and other functions. The ECT sensor 1 resistance varies depending on the engine coolant temperature. As the engine coolant cools, the ECT sensor 1 resistance increases, and the powertrain control module (PCM) detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 1 output voltage is a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The ECT sensor 1 output voltage [ECT Sensor 1 Voltage] is 0.14 V or less for at least 6 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

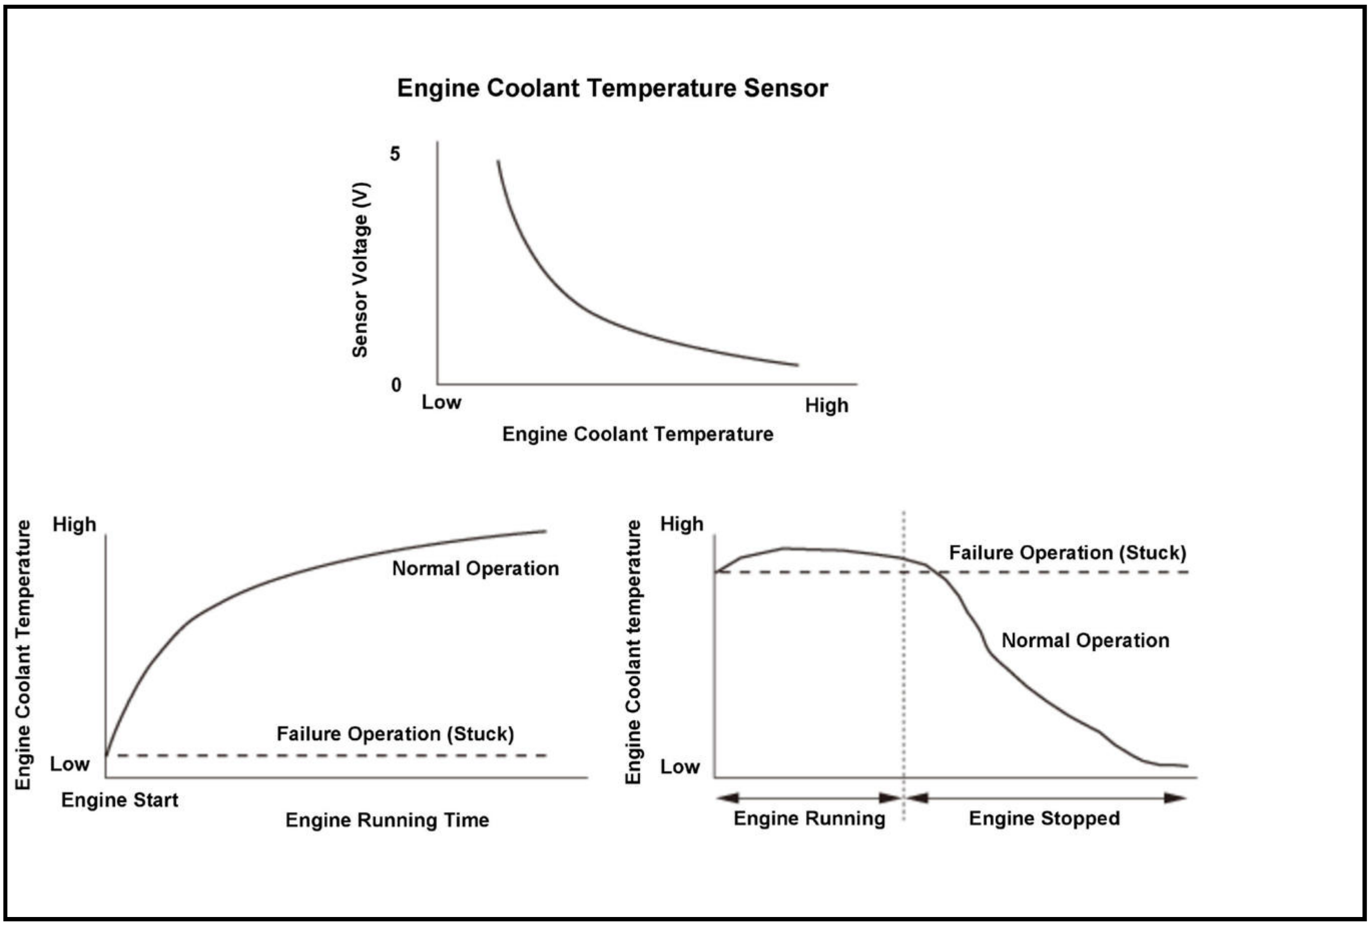
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0116

DTC P0116: Engine Coolant Temperature (ECT) Sensor 1 Circuit Range/Performance Problem

General Description



The powertrain control module (PCM) supplies voltage to the engine coolant temperature signal circuit (about 5 V) through a pull-up resistor. As the engine coolant cools, the engine coolant temperature (ECT) sensor 1 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 1 output voltage does not reach a set temperature after starting the engine and driving a set time, or when the difference between the ECT sensor 1 output voltage while driving and the output voltage of ECT sensor 1 after the engine has been stopped a certain length of time does not change a certain amount, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	24 minutes or more

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	10 seconds	-
Fuel feedback	Other than during fuel cut-off operation	
Other	With a completely cooled engine (one that has been off for at least 6 hours): Judgment is made after the engine has run for at least 24 minutes or been driven at least 3 miles (4 km), turn the vehicle to the OFF (LOCK) mode and wait for at least 10 seconds, then start and run again for at least 10 seconds.	
	With a partially cooled engine (one that has been off for less than 6 hours): Judgment is made after the engine has run for at least 24 minutes or been driven at least 3 miles (4 km), turn the vehicle to the OFF (LOCK) mode and wait for at least 6 hours then start and run again for at least 10 seconds.	

Malfunction Threshold

Malfunction determination 1:

With a completely cooled engine (one that has been off for at least 6 hours):

When the change in coolant temperature after 24 minutes or more of running time or 3 miles (4 km) or more of driving distance is 18 deg.F (10 deg.C) or less, a malfunction is detected.

Malfunction determination 2:

With a partially cooled engine (one that has been off for less than 6 hours):

When the difference between the coolant temperature after 24 minutes or more of running time or 3 miles (4 km) or more of driving distance the coolant temperature after the engine has been off for 6 hours and then run for 10 seconds is 18 deg.F (10 deg.C) or less, a malfunction is detected.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure

Confirmation Procedure

Operating Condition

With a completely cooled engine (one that has been off for at least 6 hours).

- Enter the maintenance mode, then start the engine, and let it idle for at least 24 minutes or drive for at least 3 miles (4 km).
- Turn the vehicle to the OFF (LOCK) mode for 10 seconds, then restart the engine and let it idle for at least 10 seconds.

With a partially cooled engine (one that has been off for less than 6 hours).

- Enter the maintenance mode, then start the engine, and let it idle for at least 24 minutes or drive for at least 3 miles (4 km).

- Turn the vehicle to the OFF (LOCK) mode for 6 hours then restart the engine and let it idle for at least 10 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

The powertrain control module (PCM) is equipped with two engine coolant temperature (ECT) sensors and two intake air temperature (IAT) sensors in order to measure engine temperature. The ECT sensor 1/ECT sensor 2 and the IAT sensor 2 temperatures are nearly the same as the air temperature after sufficient time has passed. Furthermore, the IAT sensor 1/IAT sensor 2 values equalize after starting the engine since they are located in the same air intake path. When the system is started after the prescribed time stopped, the IAT sensor 2 detects a malfunction comparing the ECT sensor 1 and ECT sensor 2. When the sensors are normal, the PCM detects a malfunction in the IAT sensor 1 and stores a DTC comparing temperatures from the IAT 1 sensor and IAT 2 sensor after starting the engine.

Monitor Execution, Sequence, Duration, DTC Type

	From -43 deg.F (-24 deg.C) to 57 deg.F (32 deg.C)	Failure	Normal	Normal
	Lower than -43 deg.F (-24 deg.C)	Normal	Normal	Failure

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- ECT sensor 2 failure
- IAT sensor 1 failure
- IAT sensor 2 failure
- Engine block heater attachment (besides a genuine part)

Confirmation Procedure

Operating Condition

- Turn the vehicle to the OFF (LOCK) mode, and wait at least 6 hours.
- Enter the maintenance mode, then start the engine, and let it idle for at least 10 seconds.

- Do not use an engine block heater because the engine coolant temperature will not stay equal during engine stop.
- When freeze data is stored, test the vehicle under an ambient temperature close to the intake air temperature in the freeze data.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

Operating Condition

- Turn the vehicle to the OFF (LOCK) mode, and wait at least 6 hours.
- Enter the maintenance mode, then start the engine, and let it idle for at least 10 seconds.

- Do not use an engine block heater because the engine coolant temperature will not stay equal during engine stop.
- When freeze data is stored, test the vehicle under an ambient temperature close to the intake air temperature in the freeze data.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

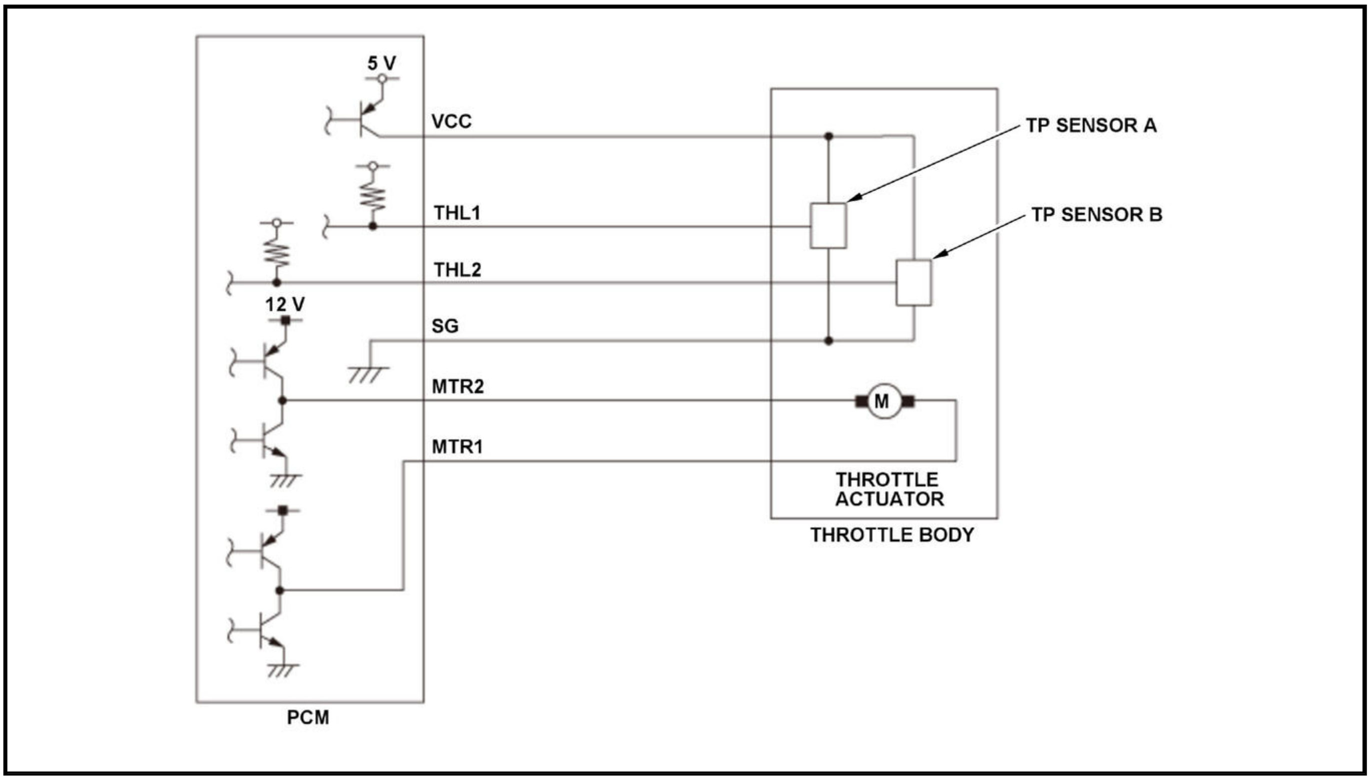
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0121

DTC P0121: Throttle Position (TP) Sensor A Out of Range

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). TP sensor A is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position. The throttle valve position signal from TP sensor A is transmitted to the PCM for target position feedback control. If the signal from TP sensor A is a fixed value for a set time, the PCM detects a TP sensor A malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

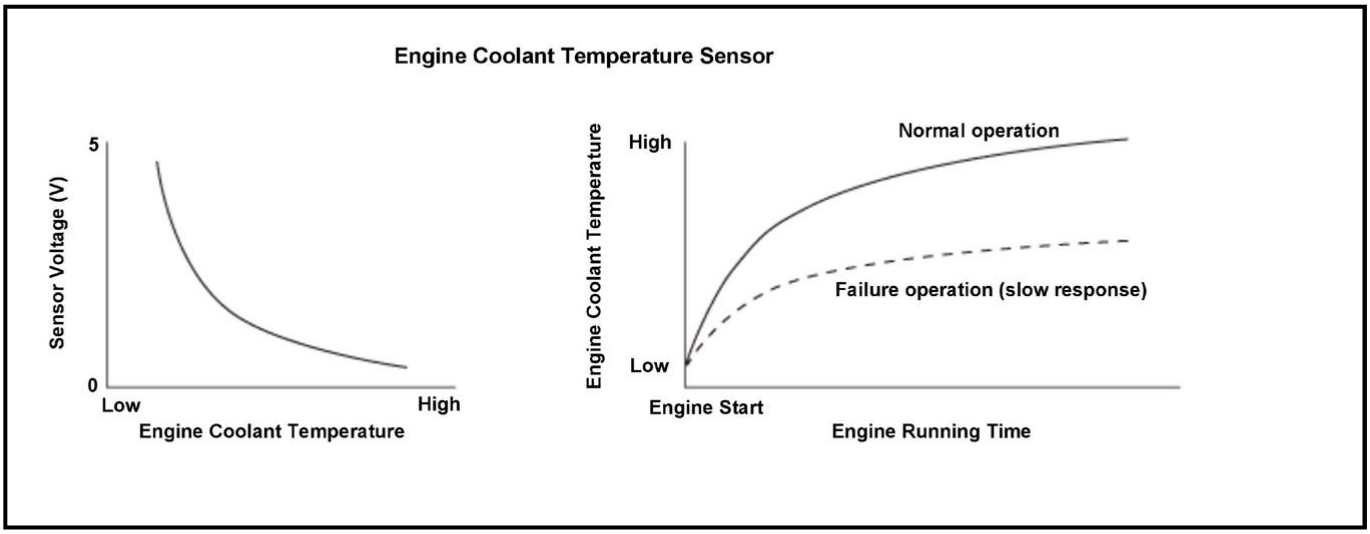
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0125

DTC P0125: Engine Coolant Temperature (ECT) Sensor 1 Malfunction/Slow Response

General Description



The powertrain control module (PCM) supplies voltage to the engine coolant temperature signal circuit (about 5 V) through a pull-up resistor. As the engine coolant cools, the engine coolant temperature (ECT) sensor 1 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 1 output voltage does not reach a specified temperature at which closed loop control for stoichiometric air/fuel ratio starts within a set time, depending on the initial engine coolant temperature after starting the engine, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	20 minutes or less
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Initial engine coolant temperature [ECT Sensor 1]	-	0 deg.F (-18 deg.C)
Fuel feedback	Other than during fuel cut-off operation	

[ ]: HDS Parameter

Malfunction Threshold

The engine running time before the engine coolant temperature [ECT Sensor 1] reaches 0 deg.F (-18 deg.C), based on the initial engine coolant temperatures [ECT Sensor 1] is as follows:

Initial engine coolant temperature [ECT Sensor 1]	Engine running time
-55 deg.F (-48 deg.C)	5 minutes or more
-35 deg.F (-37 deg.C)	5 minutes or more
0 deg.F (-18 deg.C)	1 minutes or more

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- Thermostat stuck open

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine under Enable Conditions (see "Initial engine coolant temperature [ECT Sensor 1]").
- Let the engine idle for at least 20 minutes.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

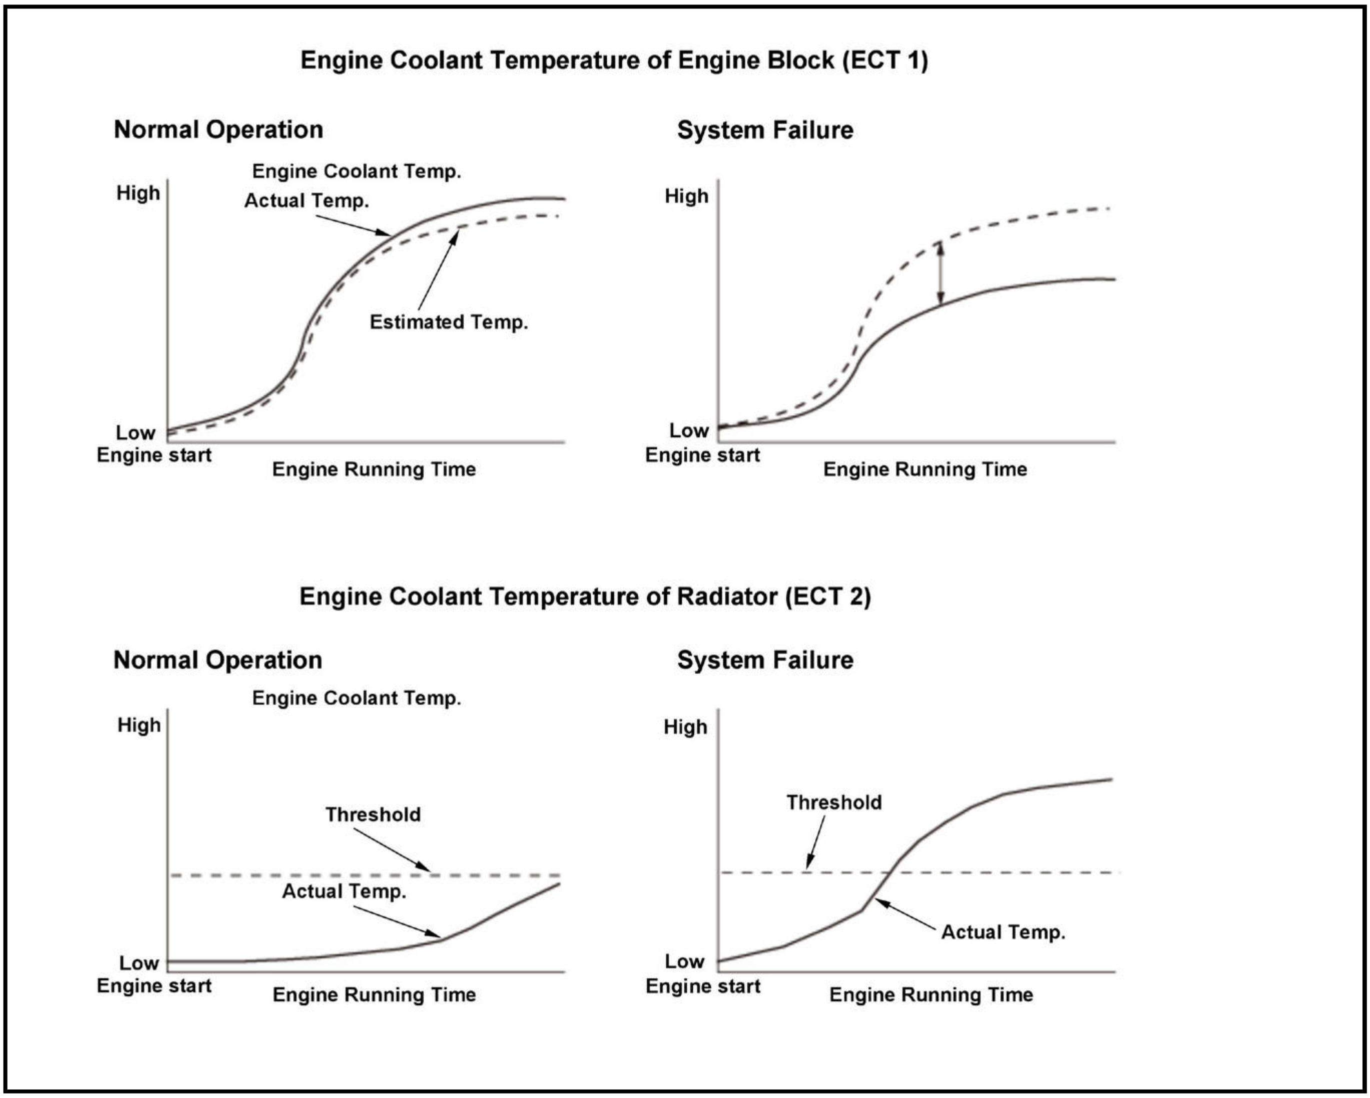
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0128

DTC P0128: Cooling System Malfunction

General Description



The thermostat is closed when the engine coolant temperature is low, and it stops the circulation of engine coolant to speed engine warm up. When the engine coolant temperature increases, the thermostat opens and circulates engine coolant to control its temperature. When the engine coolant temperature decreases, the opening area of the thermostat is reduced to regulate the engine coolant temperature. If the thermostat sticks open, engine warm up is delayed, and exhaust emissions are adversely affected. The powertrain control module (PCM) measures the rise in the coolant temperature after the engine starts at the engine block and at the radiator, and it estimates the characteristics of the engine coolant temperature by calculations based on those two temperatures and the driving conditions. When ECT 2 immediately increases from the starting value, it is defined as the thermostat stuck open. When ECT 1 does not reach a specified value at a certain condition, it is defined as a thermostat malfunction.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine off time	6 hours	-
Estimated initial outside air temperature	19.9 deg.F (-6.7 deg.C)	-
Initial engine coolant temperature (ECT 1) [ECT Sensor 1]	-	123.0 deg.F (50.6 deg.C)
The difference between initial intake air temperature [IAT Sensor (1)] and current intake air temperature [IAT Sensor (1)]	-	36 deg.F (2.0 deg.C)*
		41 deg.F (5.0 deg.C)**

*: Intake air temperature decrease judgment when there is no driving record of 25 mph (40 km/h) in this drive cycle.**: Intake air temperature decrease judgment when there is a driving record of 25 mph (40 km/h) in this drive cycle.[ ]: HDS Parameter

Malfunction Threshold

Malfunction determination 1:

The difference between the current engine coolant temperature at the radiator (ECT 2) [ECT Sensor 2] and the initial engine coolant temperature at the radiator (ECT 2) [ECT Sensor 2] is at least 14.4 deg.F (8.0 deg.C) when either of these condition is met:

- When the estimated engine coolant temperature [EST ECT1] reached to 160.0 deg.F (71.1 deg.C).
- When the estimated engine coolant temperature [EST ECT1] changed 66.9 deg.F (19.4 deg.C).

Malfunction determination 2:

The estimated engine coolant temperature [EST ECT1] reaches to 158 deg.F (70 deg.C) before the actual engine coolant temperature at the engine (ECT 1) [ECT Sensor 1] reaches to 158 deg.F (70 deg.C).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Thermostat failure
- Engine coolant temperature (ECT) sensor 1 failure
- Intake air temperature (IAT) sensor failure
- Manifold absolute pressure (MAP) sensor failure
- Crankshaft position (CKP) sensor failure
- Barometric pressure (BARO) sensor failure
- Ignition system failure
- Fuel supply system failure
- VTEC system failure

- Radiator fan failure
- Hood opened

Confirmation Procedure

Operating Condition

- Start the engine under Enable Conditions (see "Engine off time", "Estimated initial outside air temperature", "Initial engine coolant temperature (ECT 1) [ECT Sensor 1]", and "The difference between initial intake air temperature [IAT Sensor (1)] and current intake air temperature [IAT Sensor (1)]").
- Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 30 minutes.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC, and the freeze data are stored.

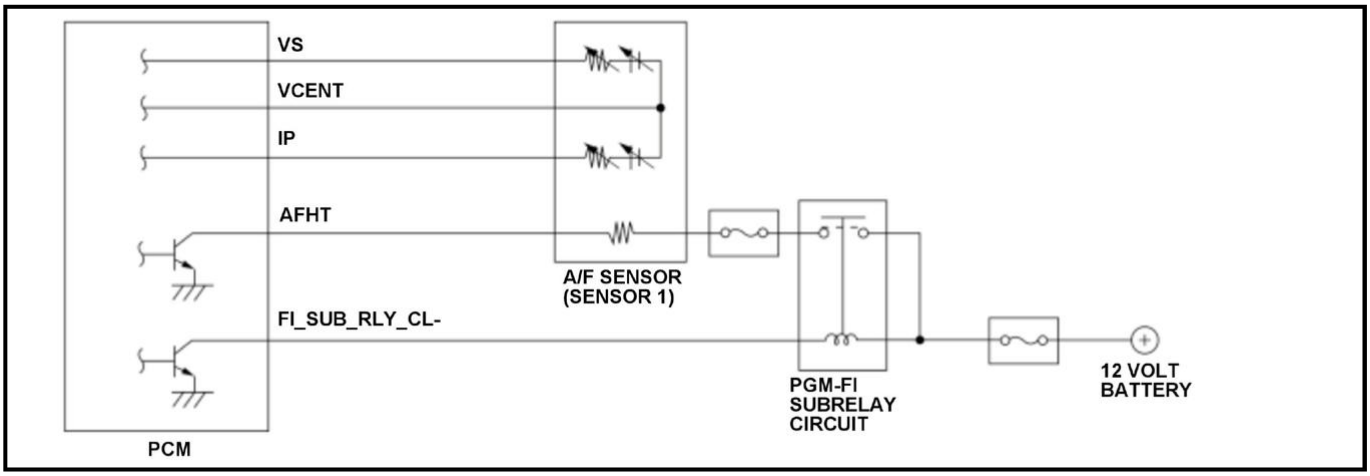
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0130

DTC P0130: Air/Fuel Ratio (A/F) Sensor (Sensor 1) Out of Range

General Description



The air/fuel ratio (A/F) sensor (sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The A/F sensor (sensor 1) transmits a signal to the powertrain control module (PCM), and the PCM controls fuel injection duration by comparing the target air/fuel ratio with the A/F sensor (sensor 1) signal. When power is applied to the A/F sensor (sensor 1) heater, if the A/F sensor (sensor 1) output voltage continues to exceed the upper limit, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Deteriorated response sensor
Time
Normal
Deteriorated response

The air/fuel ratio (A/F) sensor (sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the A/F sensor (sensor 1) output voltage and uses fuel feedback control to improve exhaust emissions. The PCM compares the response characteristics against the A/F sensor (sensor 1) output. If the total A/F sensor (sensor 1) output is a specified value for a specified time, the PCM detects a deteriorated response and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	8.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after application of power to A/F sensor heater starts	5.0 seconds	-
Engine coolant temperature [ECT Sensor 1]	156 deg.F (69 deg.C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg.F (-25 deg.C)	-
Engine speed [Engine Speed]	2, 100 rpm	3, 000 rpm
Vehicle speed [Vehicle Speed]	23 mph (37 km/h)	-
Fuel trim	0.69	1.47
Fuel feedback	Closed loop at stoichiometric	
Other	Without excessive load change	

[ ]: HDS Parameter

Malfunction Threshold

The total A/F sensor (sensor 1) output value is 0 - 0.00084* or less in 8.0 seconds.

*: Depending on engine speed and load.

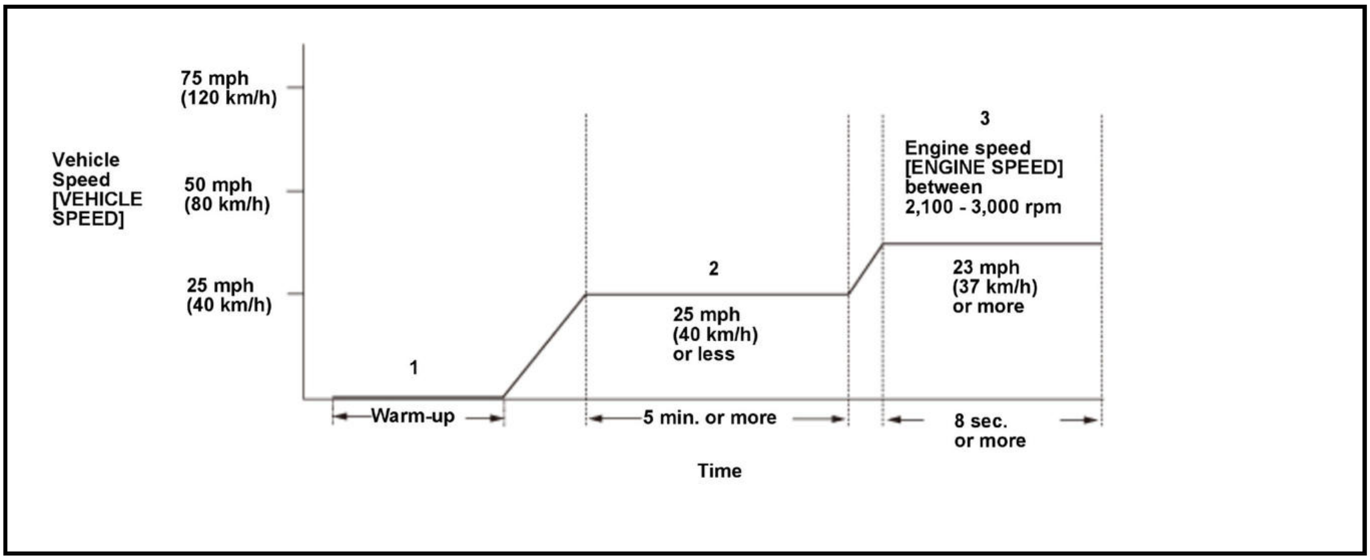
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) deterioration

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady speed of 25 mph (40 km/h) or less, for at least 5 minutes.
- Drive immediately at a steady speed of 23 mph (37 km/h) or more and engine speed [Engine Speed] between 2, 100 - 3, 000 rpm for at least 8 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

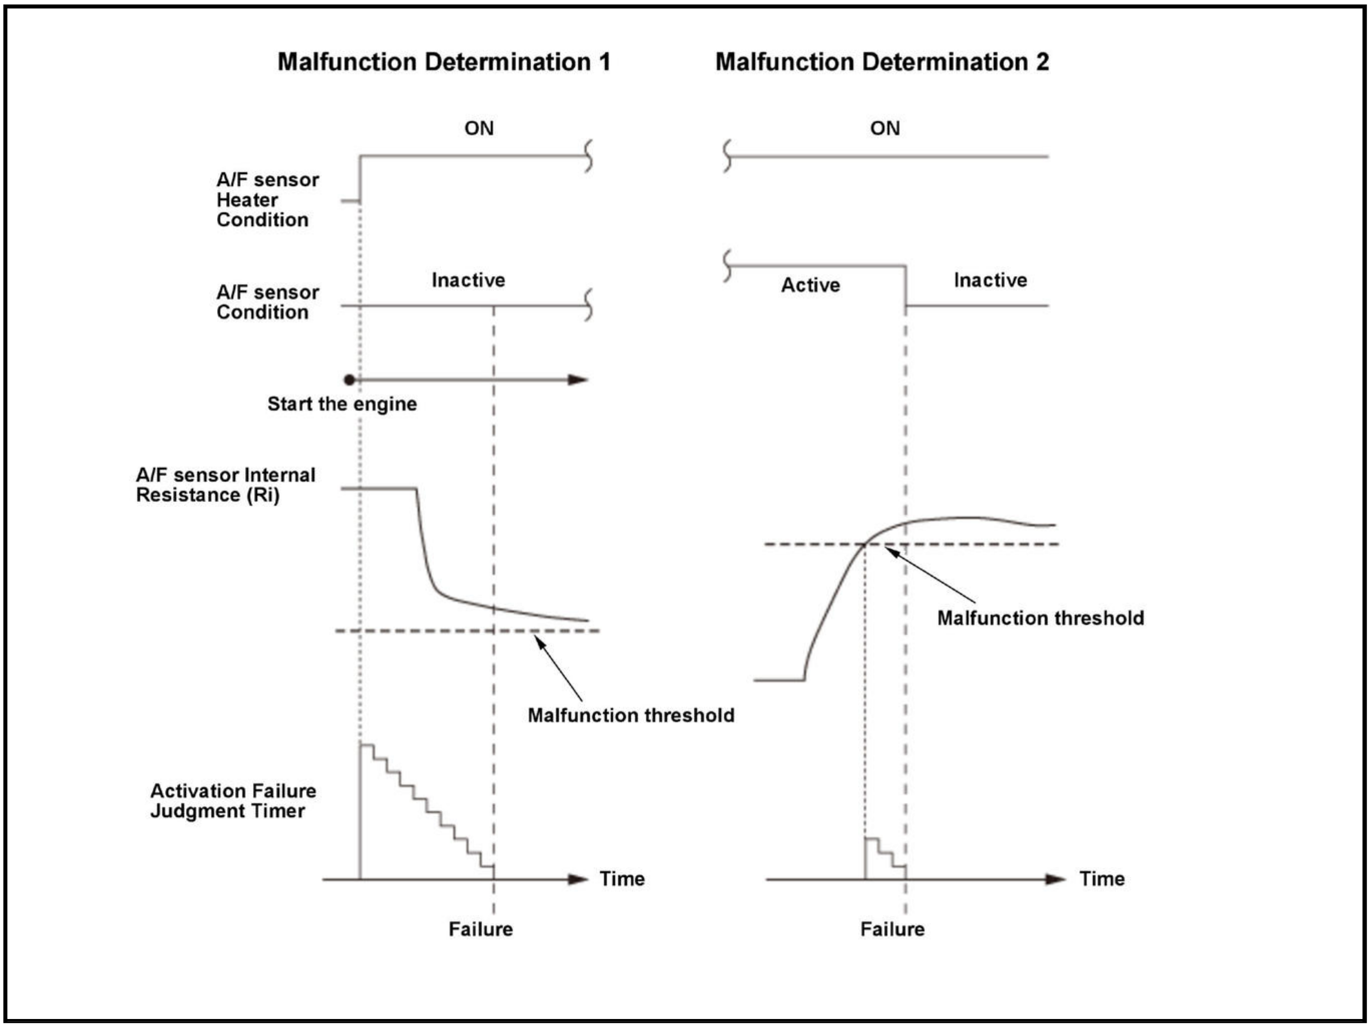
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0134

DTC P0134: Air/Fuel Ratio (A/F) Sensor (Sensor 1) Heater System Malfunction

General Description



The air/fuel ratio (A/F) sensor (sensor 1) is activated by warming the element with a heater and by maintaining a steady high temperature to accurately calculate the air/fuel ratio. If the heater does not properly heat the element, the A/F sensor (sensor 1) does not activate, and the exhaust emissions deteriorate. The powertrain control module (PCM) monitors the A/F sensor (sensor 1) internal resistance.

- When the A/F sensor (sensor 1) does not activate for a set time after the A/F sensor (sensor 1) heater is turned on (with high A/F sensor (sensor 1) internal resistance), a malfunction of the A/F sensor (sensor 1) heater is detected, and a DTC is stored.
- When the A/F sensor (sensor 1) heater cycles ON and OFF for a set time, and the resistance remains high when the heater is ON, a malfunction of the A/F sensor (sensor 1) heater is detected, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	90 seconds or more*, 1.0 second or more**
DTC Type	Two drive cycles, MIL on

: Malfunction determination 1

*: Malfunction determination 2

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.5 V	-
Fuel feedback	Other than during fuel cut-off operation	

[ ]: HDS Parameter

Malfunction Threshold

- Malfunction determination 1 - From start up

  The A/F sensor (sensor 1) internal resistance value is 200 Ω or more for at least 90 seconds right after the engine starts.

- Malfunction determination 2 - Hot

  The A/F sensor (sensor 1) internal resistance value is 270 Ω or more for at least 1.0 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) VS line open
- A/F sensor (sensor 1) heater failure
- A/F sensor (sensor 1) element failure

Confirmation Procedure

Operating Condition

Enter the maintenance mode, then start the engine, and let it idle for at least 1 minute. When engine coolant temperature [ECT Sensor 1] is less than 5 deg.F (-15 deg.C), let the engine idle for at least 6 minutes.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

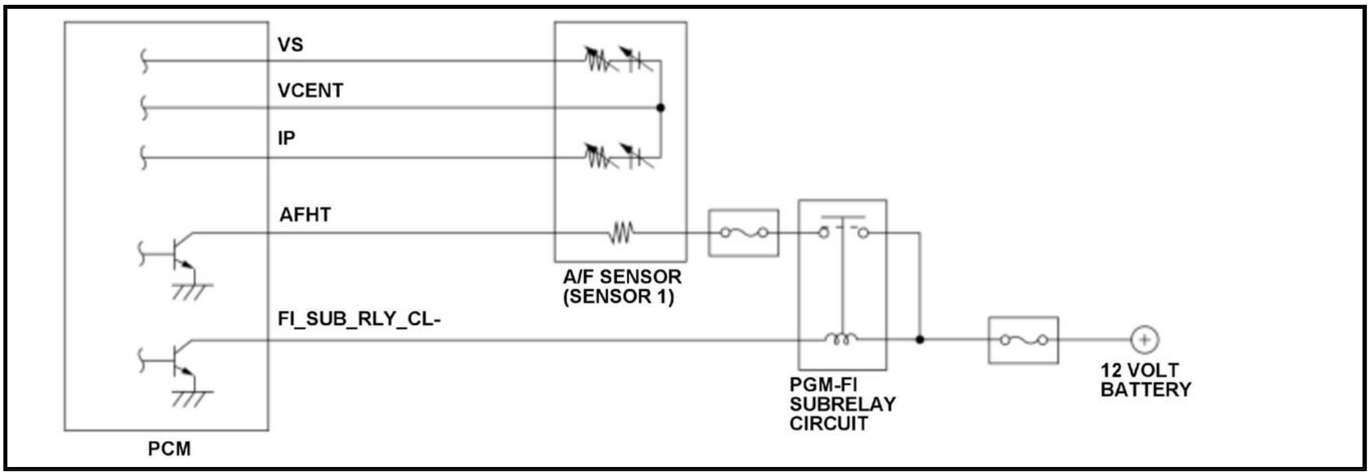
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0135

DTC P0135: Air/Fuel Ratio (A/F) Sensor (Sensor 1) Heater Circuit Malfunction

General Description



A heater for the sensor element is embedded in the air/fuel ratio (A/F) sensor (sensor 1), and it is controlled by the powertrain control module (PCM). It is activated and heats the sensor to stabilize and speed up the detection of oxygen content when the exhaust gas temperature is cold. The PCM monitors the A/F sensor (sensor 1) heater output (return check). If the return signals do not meet the command value (for heater activation) for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	9.0 V	-
State of the engine	Running	
Other	During A/F sensor (sensor 1) heater operation	

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions must be met for at least 5 seconds:

- No return signal HIGH is detected when the PCM output duty is less than 5 %.
- Return signal does not change when the PCM output duty 5 %* or more.

*: PCM output duty is limited to 95 % when it exceeds 95 %.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) AFHT line open
- A/F sensor (sensor 1) AFHT line short to ground
- A/F sensor (sensor 1) failure
- PGM-FI subrelay circuit failure (includes fuse blown)

Confirmation Procedure

Operating Condition

Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

With the HDS

None.

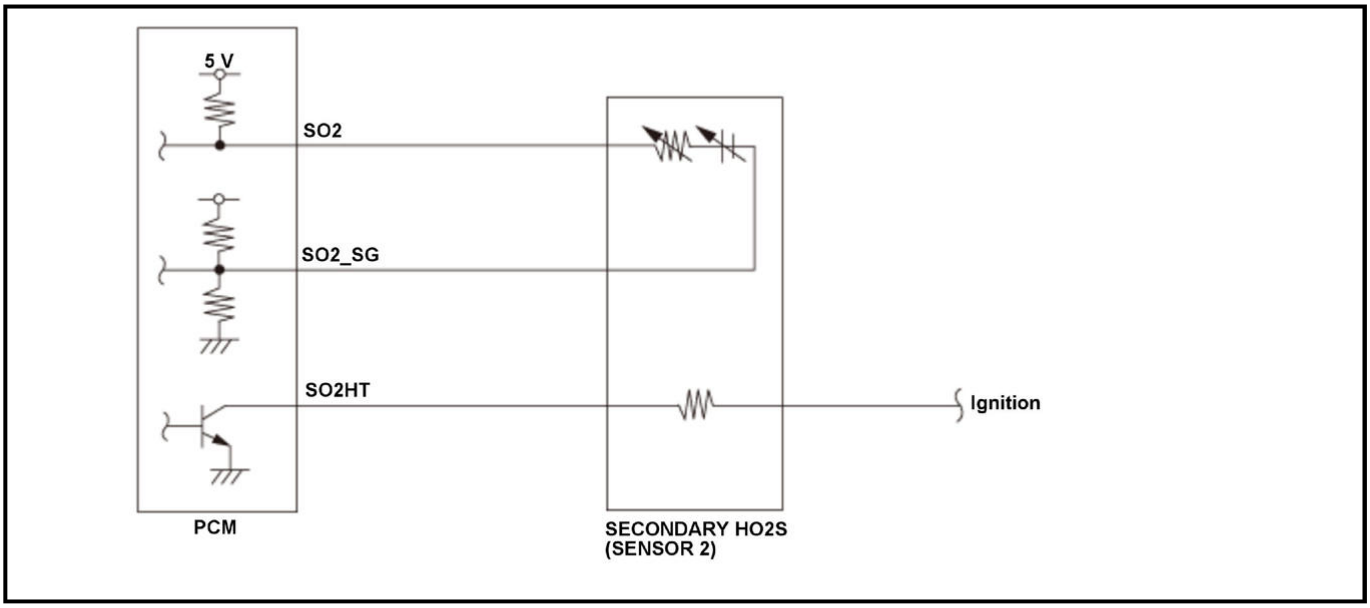
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0137

DTC P0137: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Circuit Low Voltage

General Description



The secondary heated oxygen sensor (secondary HO2S (sensor 2)) detects the oxygen density in the exhaust gas and converts it into electrical signals. If the secondary HO2S (sensor 2) output voltage is a specified value for a set time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running
Other	At least 55 seconds must be passed after the secondary HO2S (sensor 2) output voltage reaches 1.0 V or less

Malfunction Threshold

The secondary HO2S (sensor 2) output voltage [HO2S S2] is less than 0.15 V for at least 5 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) SO2 line short to ground
- Secondary HO2S (sensor 2) SO2_SG line short to ground
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

With the HDS

None.

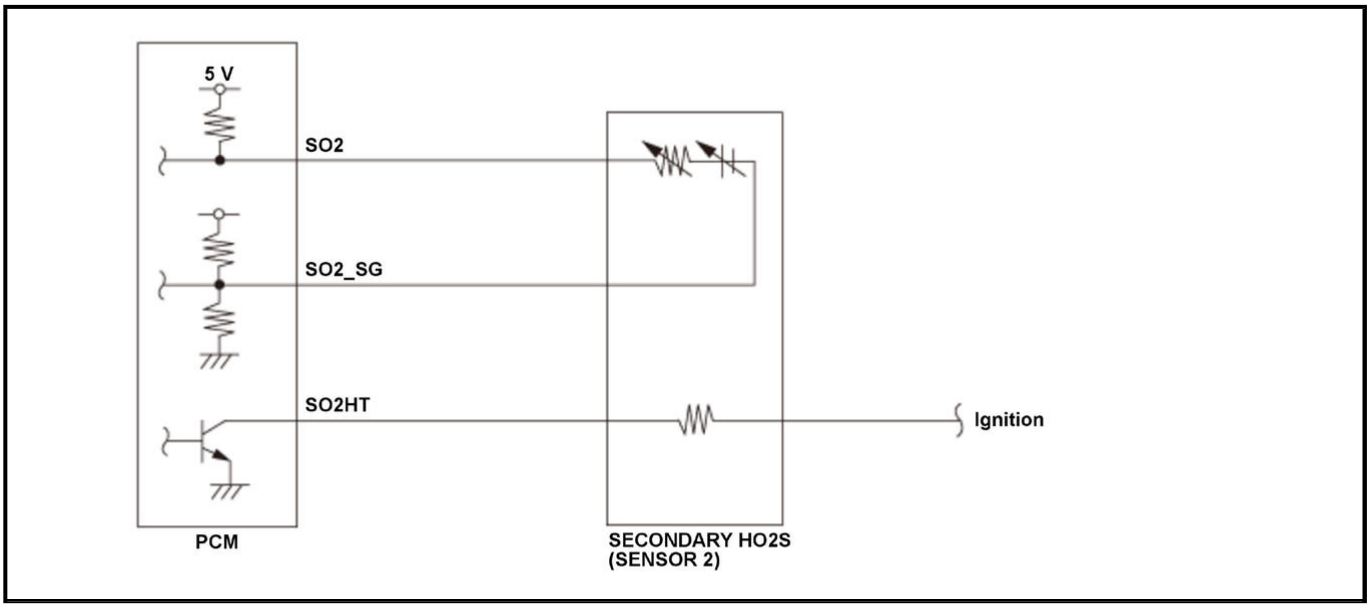
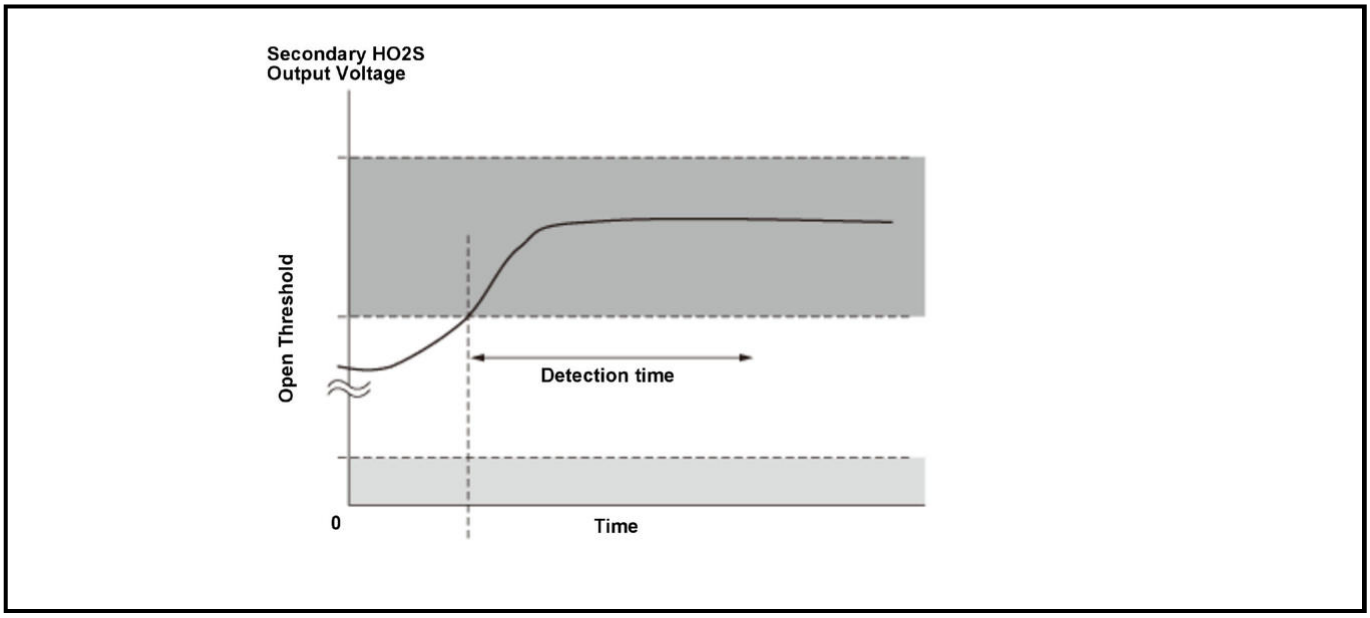
DTC P0138

DTC P0138: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Circuit High Voltage

General Description





The secondary heated oxygen sensor (secondary HO2S (sensor 2)) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control. The powertrain control module (PCM) controls the air/fuel ratio from the air/fuel ratio (A/F) sensor (sensor 1) output voltage so that the TWC efficiency is optimized. When power is applied to the secondary HO2S (sensor 2) heater, if the secondary HO2S (sensor 2) output voltage is high or the SO2_SG terminal voltage is high during feedback control, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

Either of the condition continues for at least 5 seconds:

- The secondary HO2S (sensor 2) output voltage (voltage difference between SO2 and SO2_SG terminals) is 3.22 V or more.
- The SO2_SG terminal voltage is 3.49 V or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) SO2 line open
- Secondary HO2S (sensor 2) SO2 line short to power
- Secondary HO2S (sensor 2) SO2_SG line open
- Secondary HO2S (sensor 2) SO2_SG line short to power
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

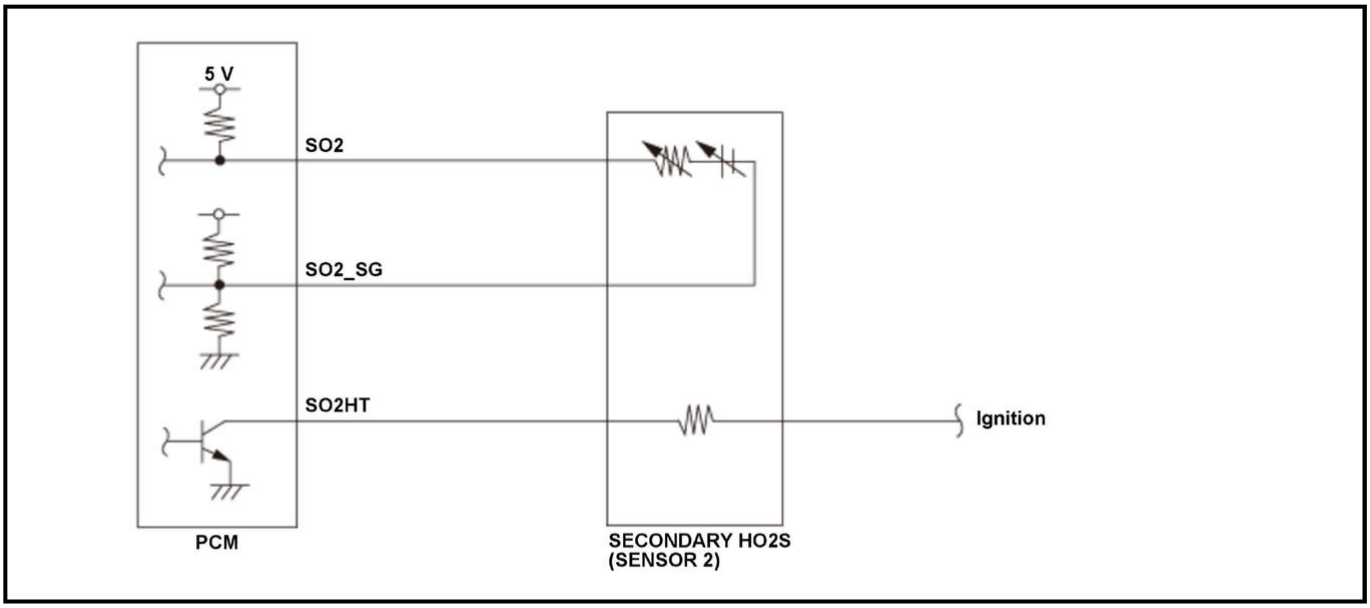
Conditions for clearing the DTC

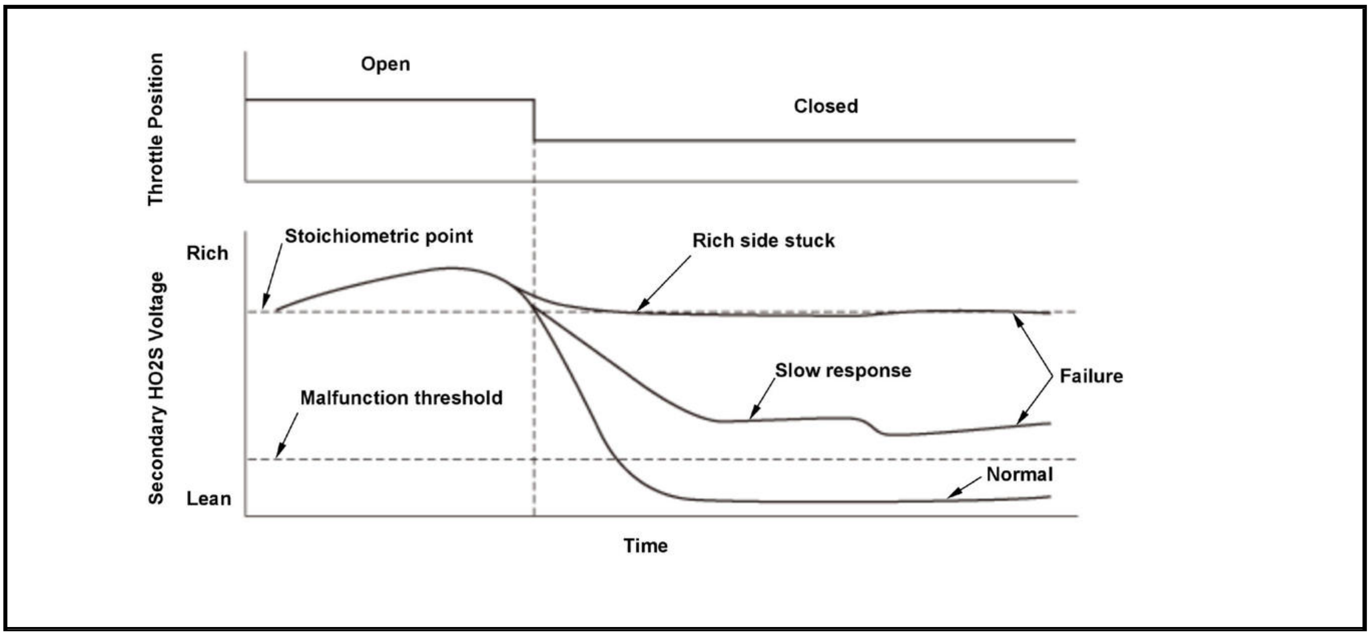
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0139

DTC P0139: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Slow Response

General Description





The secondary heated oxygen sensor (secondary HO2S (sensor 2)) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control. The powertrain control module (PCM) controls the air/fuel ratio with the air/fuel ratio (A/F) sensor (sensor 1) output voltage to optimize the TWC's efficiency. When the secondary HO2S (sensor 2) does not change during lean air/fuel ratio when the throttle is closed, after full current is applied to the secondary HO2S (sensor 2) heater, and output remains within the specified range continuously, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	P0138 is judged as OK
Duration	10 seconds or more

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	1 minute	-
Engine coolant temperature [ECT Sensor 1]	156 deg.F (69 deg.C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg.F (-25 deg.C)	-
Engine speed [Engine Speed]	-	4, 000 rpm
Secondary HO2S output voltage [HO2S S2]	0.05 V	-
Intake air amount	1 g/second (0.04 oz/second)	-
Fuel feedback	During deceleration	

[ ]: HDS Parameter

Malfunction Threshold

The secondary HO2S (sensor 2) output voltage [HO2S S2] is 0.05 V or more for at least 10 seconds.

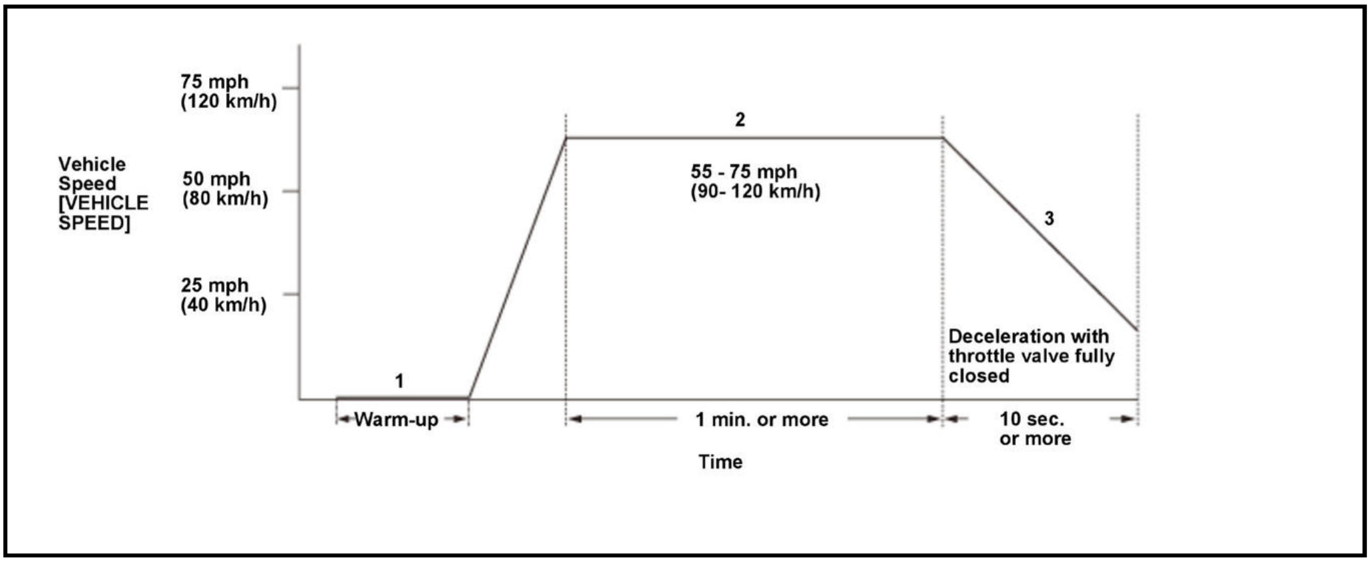
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) responsive deterioration
- Exhaust system failure (exhaust gas leak)

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady speed between 55 - 75 mph (90 - 120 km/h) for at least 1 minute.
- Decelerate with the throttle valve fully closed for at least 10 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

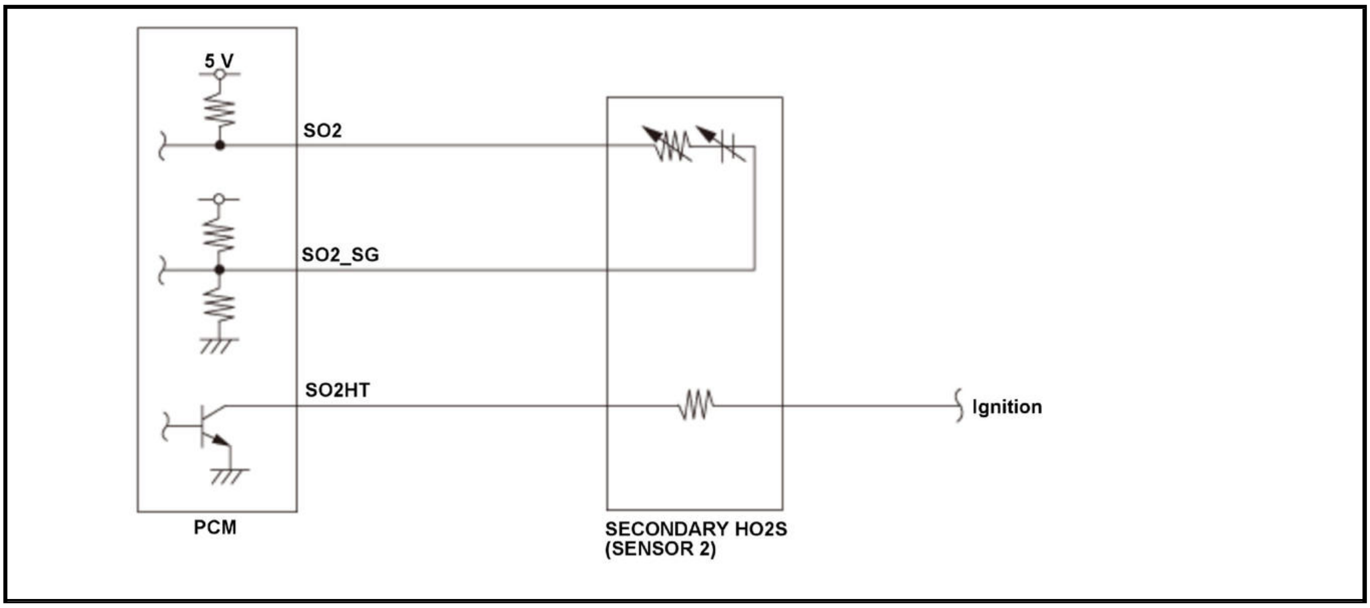
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0141

DTC P0141: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Heater Circuit Malfunction

General Description



A heater for the zirconia element is embedded in the secondary heated oxygen sensor (secondary HO2S (sensor 2)), and it is controlled by the powertrain control module (PCM). When activated, it heats the sensor to stabilize and speed up the detection of oxygen content when the exhaust gas temperature is cold. If the secondary HO2S (sensor 2) heater draws other than a specified amperage, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	41 deg.F (5 deg.C)	-
12 volt battery voltage [Battery] (FI_MAIN_RLY_OUT terminal of PCM)	4.67 V	-

[ ]: HDS Parameter

Malfunction Threshold

The secondary HO2S (sensor 2) heater output is 0.38 A or less, or 3.33 A or more, for at least 5.0 seconds when the heater is on.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) SO2HT line open
- Secondary HO2S (sensor 2) SO2HT line short to ground
- Secondary HO2S (sensor 2) heater power supply line open (includes fuse blown)
- Secondary HO2S (sensor 2) heater failure
- Body control module failure

- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Enter the maintenance mode, then start the engine in a cold condition, and let it idle until the radiator fan comes on.

With the HDS

None.

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

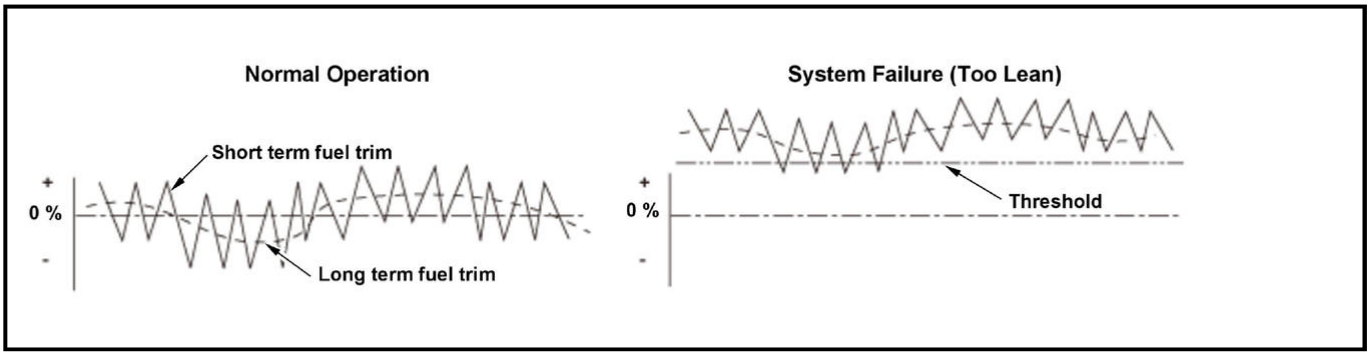
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0171

DTC P0171: Fuel System Too Lean

General Description



The powertrain control module (PCM) detects the oxygen content in the exhaust gas from the air/fuel ratio (A/F) sensor (sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions. Long term fuel trim is computed from short term fuel trim and is used to regulate long term deviation from the stoichiometric air/fuel ratio, which occurs when fuel metering components deteriorate with age or system failures occur. In addition, long term fuel trim is stored in the PCM memory and is used to determine when fuel metering components malfunction. When long term fuel trim is higher than normal, which is about 1.0 (0 %), the amount of injected fuel must be increased, and when lower than normal, it must be decreased. If long term fuel trim is higher than normal (too lean), the PCM detects a malfunction in the fuel metering components and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle*

Sequence	None
Duration	Every 7.0 seconds
DTC Type	Two drive cycles, MIL on

*: The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	156 deg.F (69 deg.C)	-
Intake air temperature [IAT Sensor (1)]	19 deg.F (-7 deg.C)	-
Engine speed [Engine Speed]	1, 100 rpm	4, 000 rpm
MAP value [MAP Sensor]	21 kPa (160 mmHg, 6.3 inHg)	-
Fuel feedback	Closed loop	
Monitoring priority	P0133, P0400, P0420	

[ ]: HDS Parameter

Malfunction Threshold

Long term fuel trim is higher than 1.30 (+30 %).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel pump failure
- Fuel injector failure
- Fuel pressure regulator failure
- Fuel line failure
- Fuel supply system failure
- Mass airflow (MAF) sensor range/performance problem
- Manifold absolute pressure (MAP) sensor range/performance problem
- A/F sensor (sensor 1) failure
- Secondary HO2S (sensor 2) failure
- Vacuum hose miss installed
- Throttle body air leak
- Intake manifold air leak
- Evaporative emission (EVAP) canister purge valve failure
- Valve timing incorrect

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive at a steady speed between 15 - 75 mph (25 - 120 km/h) for at least 15 minutes, and watch the long term fuel trim. If the long term fuel trim stays at about 1.0, the vehicle is OK or it is a very minor

problem. If a significant fault is still present, the long term fuel trim will move up or down while driving.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- After clearing the DTC by disconnecting the 12 volt battery or using the scan tool, drive at steady speed between 15 - 55 mph (25 - 88 km/h) for at least 40 minutes to allow time for long term fuel trim to recover.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

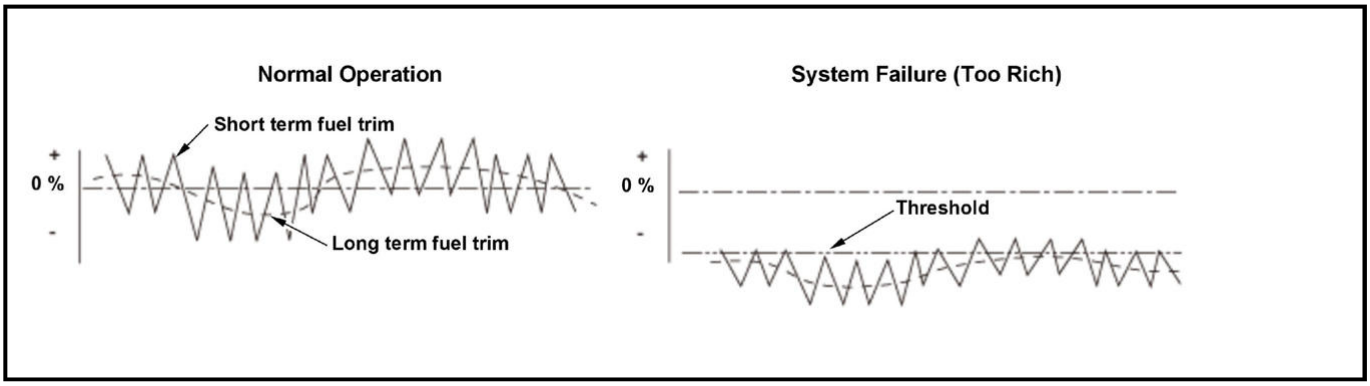
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0172

DTC P0172: Fuel System Too Rich

General Description



The powertrain control module (PCM) detects the oxygen content in the exhaust gas from the air/fuel ratio (A/F) sensor (sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions. Long term fuel trim is computed from short term fuel trim and is used to regulate long term deviation from the stoichiometric air/fuel ratio, which occurs when fuel metering components deteriorate with age or system failures occur. In addition, long term fuel trim is stored in the PCM memory and is used to determine when fuel metering components malfunction. When long term fuel trim is higher than normal, which is about 1.0 (0 %), the amount of injected fuel must be increased, and when lower than normal, it must be decreased. If long term fuel trim is lower than normal (too rich), the PCM detects a malfunction in the fuel metering components and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle*
Sequence	None
Duration	20 seconds or more
DTC Type	Two drive cycles, MIL on

*: The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.

Enable Conditions

Condition	Minimum	Maximum

Common

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

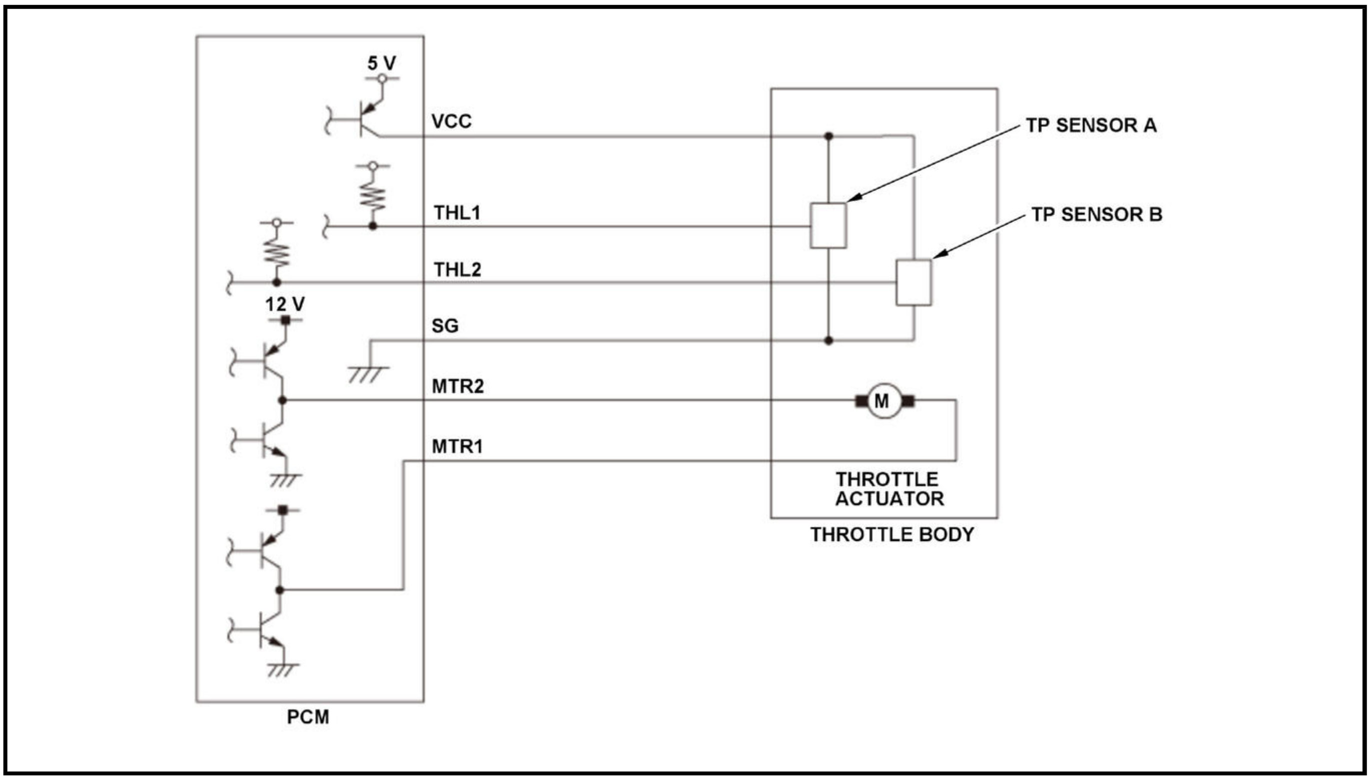
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0221

DTC P0221: Throttle Position (TP) Sensor B Out of Range

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). TP sensor B is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position. The throttle valve position signal from TP sensor B is transmitted to the PCM for target position feedback control. If the signal from TP sensor B is a fixed value for a set time, the PCM detects a TP sensor B malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The TP sensor B output voltage [TP Sensor B] is 0.5 V or less, or 4.63 V or more for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle body internal failure (TP sensor B)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

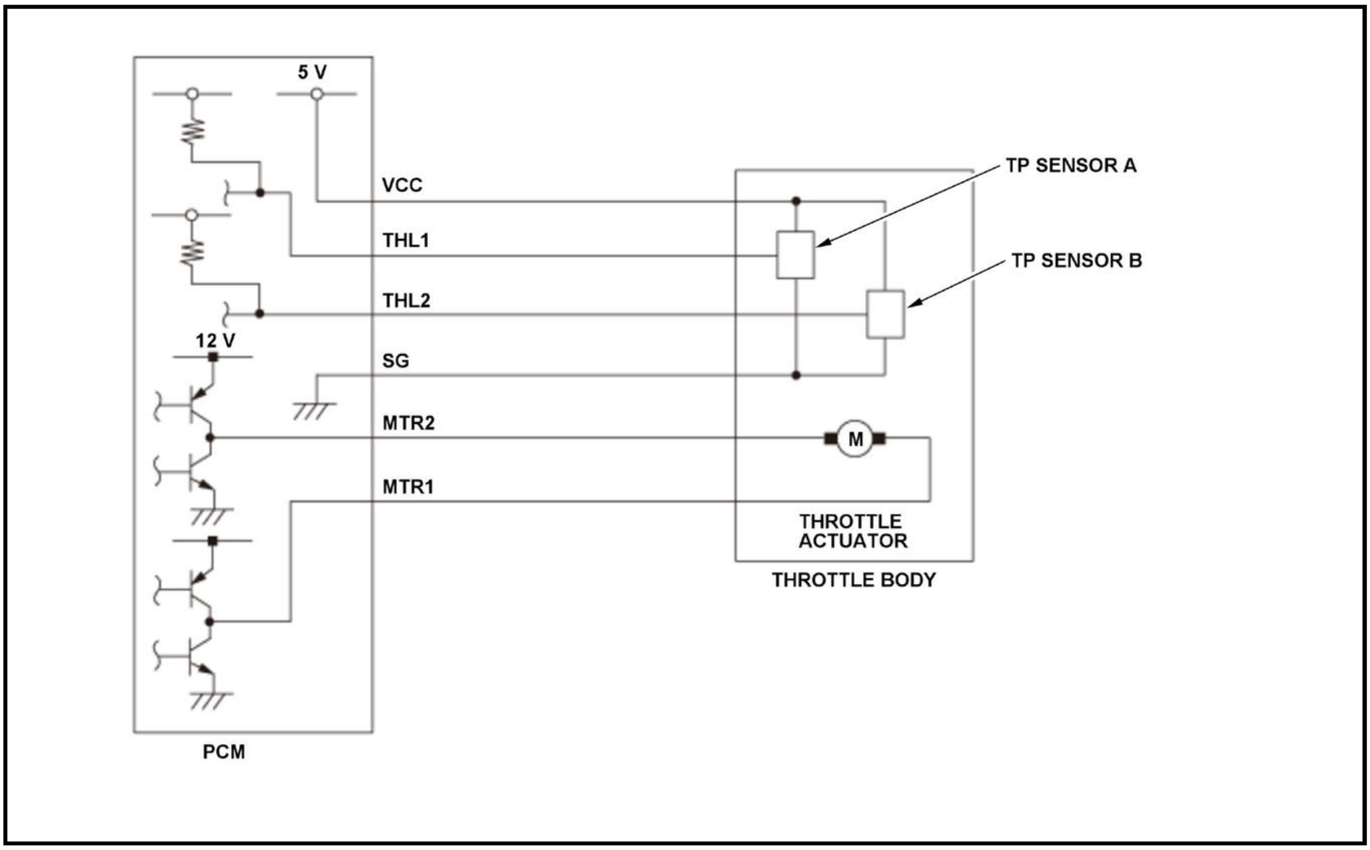
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0222, P0223

DTC P0222: Throttle Position (TP) Sensor B Circuit Low Voltage

DTC P0223: Throttle Position (TP) Sensor B Circuit High Voltage

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). TP sensor B is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position. The throttle valve position signal from TP sensor B is transmitted to the PCM for target position feedback control. If the signal from TP sensor B is a fixed value for a set time, the PCM detects a TP sensor B malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more

DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P0222

The TP sensor B output voltage [TP Sensor B] is 0.3 V or less for at least 200 milliseconds.

DTC: P0223

The TP sensor B output voltage [TP Sensor B] is 4.8 V or more for at least 200 milliseconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0222

- TP sensor B VCC line open
- TP sensor B THL2 line short to ground

DTC: P0223

- TP sensor B THL2 line open
- TP sensor B SG line open

Common

- TP sensor B failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

The cold start emission reduction process controls the air fuel ratio to lean when the engine is cold to lower emissions as the catalyst is not warmed up. If the commanded air fuel ratio is too lean or too rich compared to the target air fuel ratio, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	7 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	14 deg.F (-10 deg.C)	176 deg.F (80 deg.C)
High voltage battery capacity (SOC)	20 %	-
Throttle valve	Fully closed	
Accelerator pedal position	Released	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

The ratio of the commanded air fuel ratio to target air fuel ratio is 0.86 or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Leave the vehicle to cool the engine.

- Enter the maintenance mode, then start the engine, and let it idle for at least 7 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

Throttle valve	Fully closed	
Accelerator pedal position	Released	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

The ratio of the commanded air fuel ratio to target air fuel ratio is 1.14 or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Leave the vehicle to cool the engine.
- Enter the maintenance mode, then start the engine, and let it idle for at least 7 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0300, P0301, P0302, P0303, P0304

DTC P0300: Random Misfire Detected

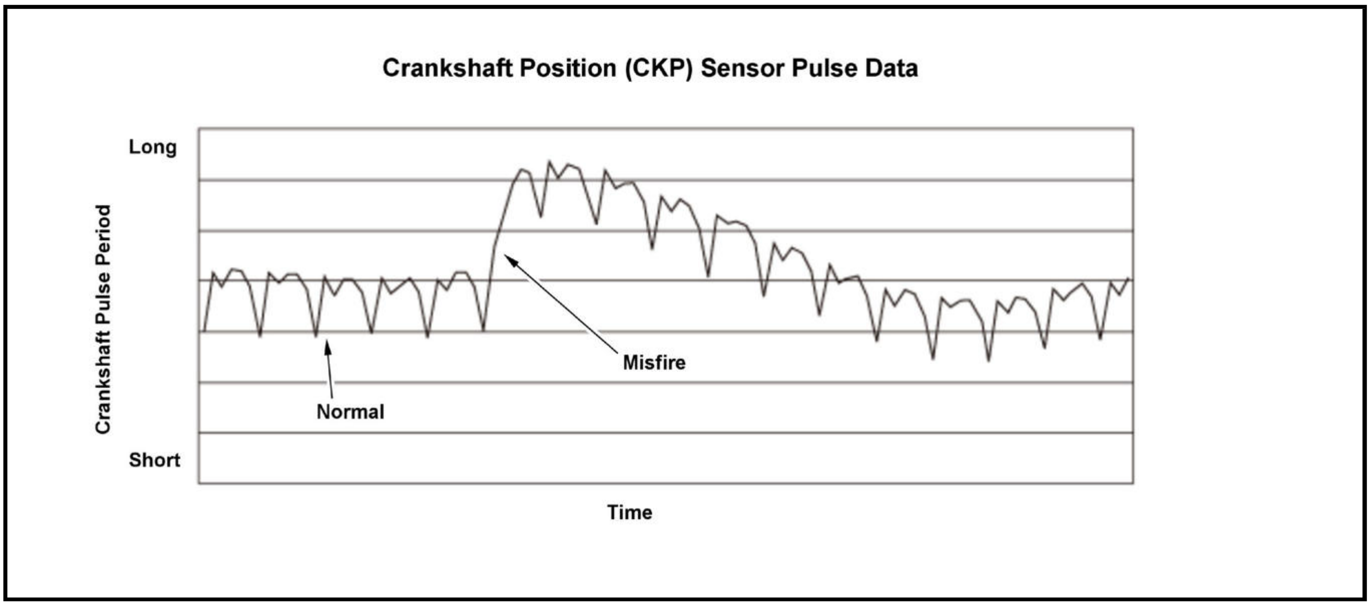
DTC P0301: No. 1 Cylinder Misfire Detected

DTC P0302: No. 2 Cylinder Misfire Detected

DTC P0303: No. 3 Cylinder Misfire Detected

DTC P0304: No. 4 Cylinder Misfire Detected

General Description



The crankshaft vibrates slightly when each cylinder fires. If a misfire occurs, the crankshaft rotation speed changes rapidly. The powertrain control module (PCM) monitors the crankshaft rotation speed based on the output pulses from the crankshaft position (CKP) sensor. By monitoring changes in the crankshaft rotation speed, the PCM counts the number of misfires and determines which cylinder is misfiring.

- P0300: If more than one DTC from P0301 through P0304 has been stored while misfires in multiple cylinders are detected, a malfunction is detected and a DTC is stored.
- P0301, P0302, P0303, P0304: If a misfire is detected on a specified cylinder, a DTC is stored.

There are two types of misfire detection:

- Type 1: When the number of misfires per 200 engine revolutions reaches the level that can damage the three way catalyst (TWC), a DTC is stored and the MIL blinks.
- Type 2: When the number of misfires per 1, 000 engine revolutions reaches the level that affects exhaust emissions but not severe enough to immediately damage the catalyst, a DTC is stored and the MIL comes on.

Monitor Execution, Sequence, Duration, DTC Type

Execution		Continuous
Sequence		None
Duration	Type 1	Per 200 revolutions
	Type 2	Per 1, 000 revolutions
DTC Type		Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after monitor finishing condition except immediate starting the engine	1.0 second	-
Engine coolant temperature [ECT Sensor 1]	None, unless the initial engine coolant temperature [ECT Sensor 1] is 14 deg.F (-10 deg.C) or less, in which case the monitor will not run until the engine coolant temperature [ECT Sensor 1] reaches 68 deg.F (20 deg.C)	
Engine speed [Engine Speed]	500 rpm	6, 500 rpm

Condition		Minimum	Maximum
MAP value [MAP Sensor]*	1, 200rpm**	24.6 kPa (185.0 mmHg, 7.28 inHg)	-
	2, 750 rpm**	20.9 kPa (157.0 mmHg, 6.18 inHg)	-
	1, 200 rpm***	26.5 kPa (199.0 mmHg, 7.83 inHg)	-
	2, 500 rpm***	22.5 kPa (169.0 mmHg, 6.65 inHg)	-
Fuel feedback		Other than during fuel cut-off operation	
Other		Test-drive on a flat road to avoid misdetection	

*: Varies with driving conditions

**: Rocker arm oil control solenoid: OFF

***: Rocker arm oil control solenoid: ON

[ ]: HDS Parameter

Malfunction Threshold

The number of misfires versus engine revolutions is equal to or greater than the values in the table.

Misfire Type	The number of engine revolutions	The number of misfires
Misfire Type 1 (Severe)	Per 200 revolutions	17 - 89 times****
Misfire Type 2 (Light)	Per 1, 000 revolutions	60 times

****: Depending on engine speed and load.

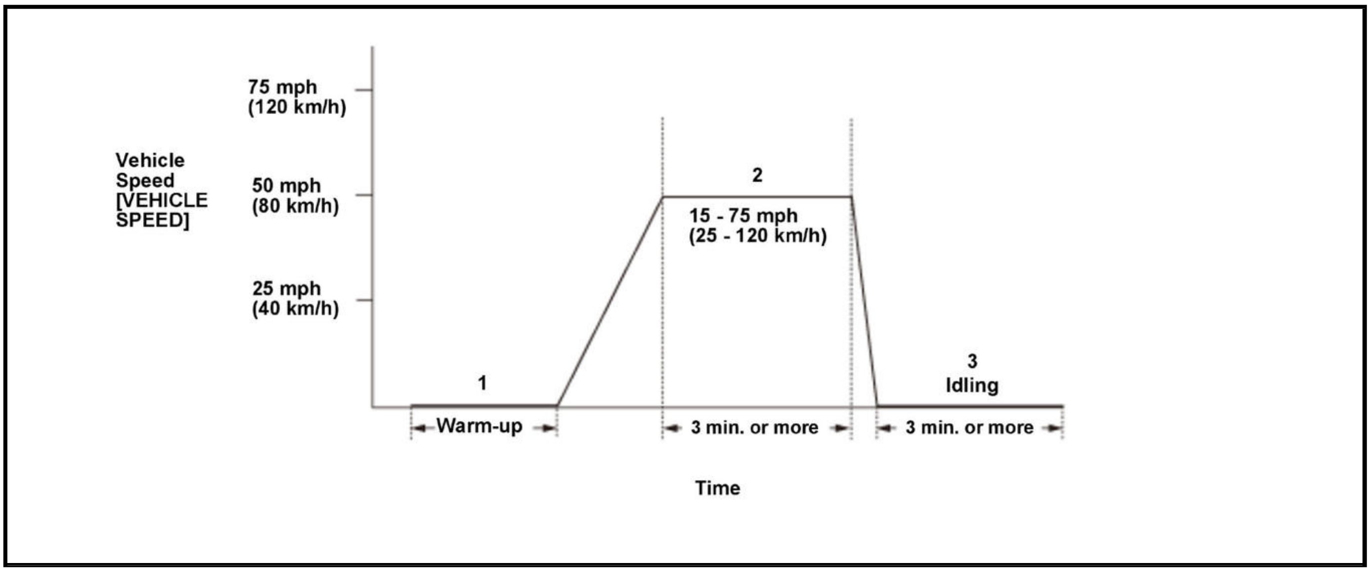
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Ignition system failure
- Fuel supply system failure
- Intake air system failure

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a speed between 15 - 75 mph (25 - 120 km/h) for at least 3 minutes.
- Stop the vehicle, and let the engine idle for at least 3 minutes.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2 or 3.
- When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

Misfire Type 1:

- If a type 1 misfire (catalyst damaging) occurs once, the MIL blinks once per second, a Pending DTC is stored, and the high rpm fuel injection stop system activates. The fuel injection stops, at high rpm only, on the cylinder that has the highest misfire counts. The MIL then continues to blink and the fuel injection stays off at high rpm, until the drive is completed.
- If a type 1 misfire occurs during a second drive cycle, the MIL and fuel injection behave the same and a Confirmed DTC is stored.
- After a type 1 misfire has been detected during two drive cycles, the MIL comes on and stays on beginning with the third drive cycle, unless the Pending DTC has been cleared by the PCM*****. Even if the MIL is on, it will start blinking if a type 1 misfire occurs.
- If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Misfire Type 2:

- If a type 2 misfire (emission-related but not severe enough to immediately damage the catalyst) occurs, a Pending DTC is stored, but the MIL does not come on or blink. If a type 2 misfire occurs during a second drive cycle, the MIL comes on and stays on unless the Pending DTC has been cleared by the PCM*****.

***** The Pending DTC is erased if either of these conditions is met:

- The vehicle is operated at least once under the same driving conditions as the first misfire detection, and no misfire is detected.
- 80 drive cycles, regardless of driving conditions, are completed with no misfire detected.

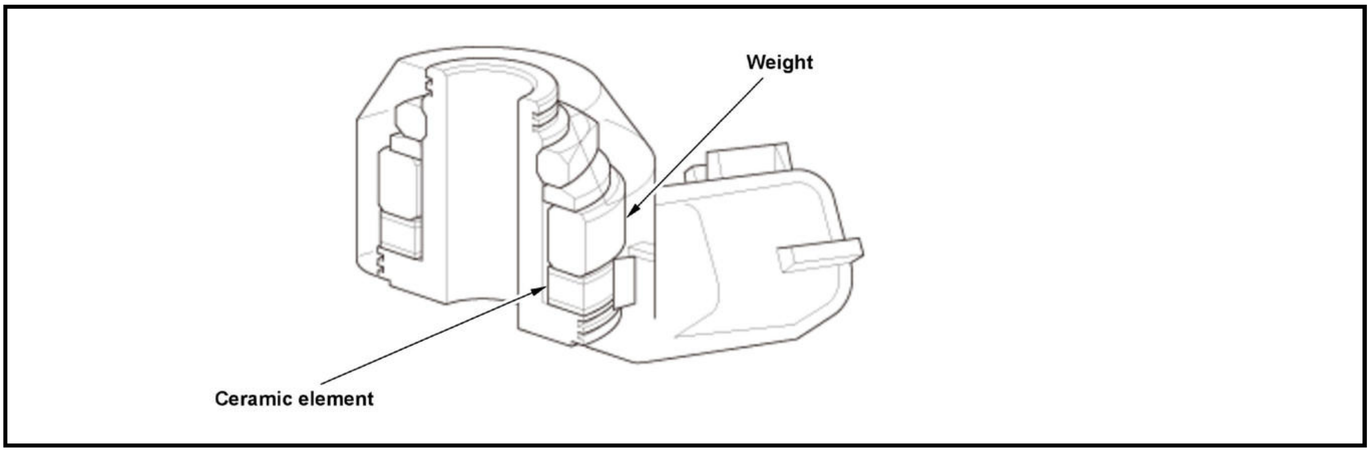
Conditions for clearing the DTC

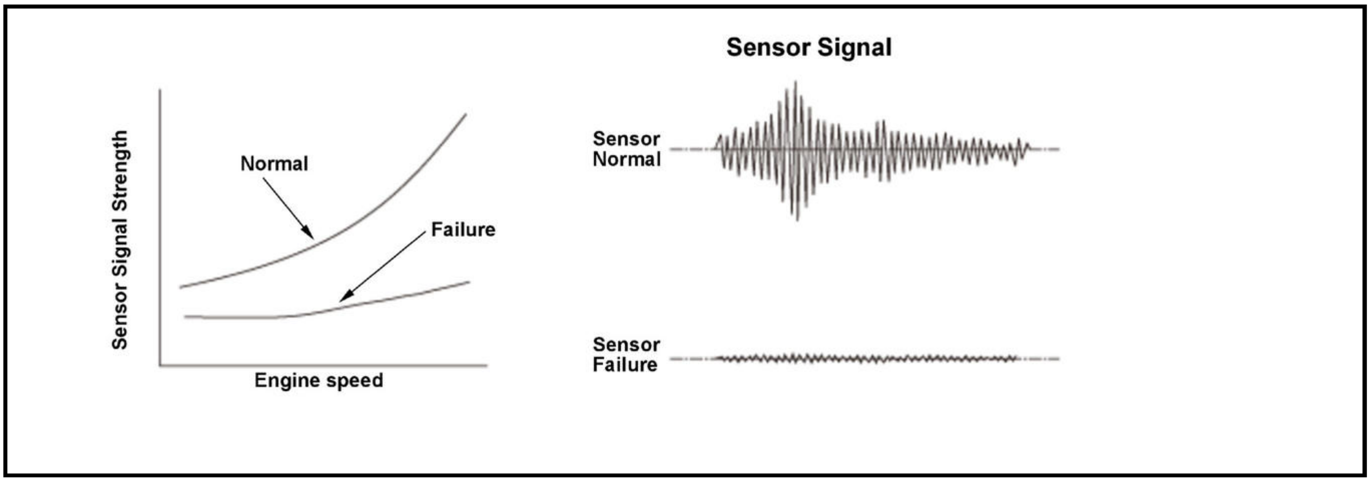
The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0326

DTC P0326: Knock Sensor Malfunction

General Description





A nonresonant type of knock sensor is used, and it is mounted on the cylinder block to detect engine knocking. Vibration from engine combustion causes the torus-shaped weight to compress the ceramic element in the nonresonant knock sensor, and converts it into electrical signals. The powertrain control module (PCM) controls the ignition timing according to the electrical signal level. If the signal level from the knock sensor drops for a set time because of a poor connection at the knock sensor, or a bad sensor, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	5.0 seconds	-
Engine speed [Engine Speed]	1, 800 rpm	-

[ ]: HDS Parameter

Malfunction Threshold

Either one of the conditions is met for at least 5.0 seconds.

- The knock sensor output signal strength is 90 or less at the engine speed [Engine Speed] of 1, 800 rpm.
- The knock sensor output signal strength is 160 or less at the engine speed [Engine Speed] of 2, 500 rpm.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Knock sensor miss installed
- Knock sensor failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at an engine speed [Engine Speed] 1, 800 rpm or more for at least 5 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

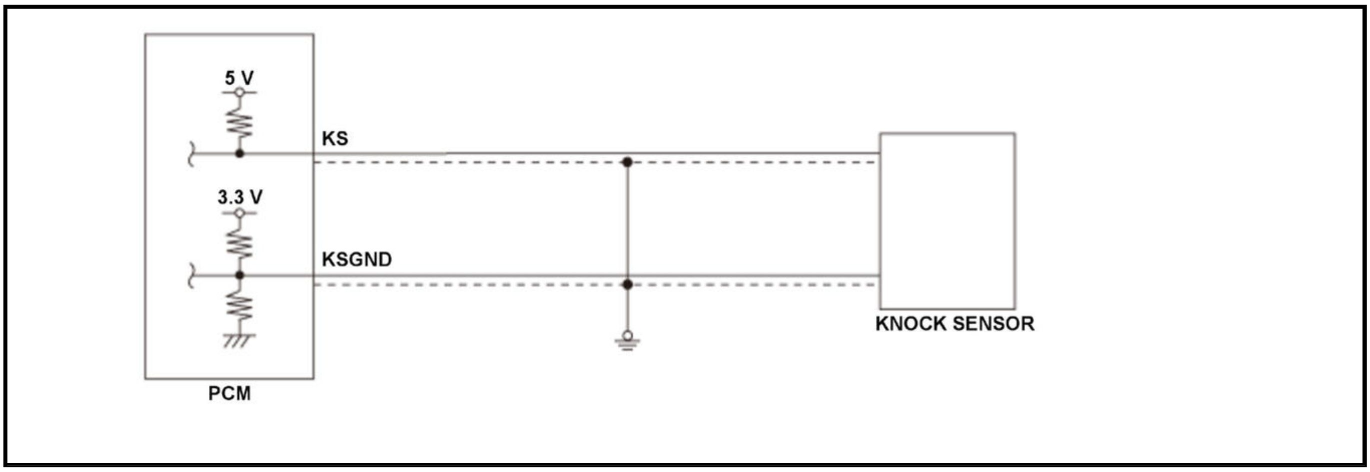
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0327, P0328

DTC P0327: Knock Sensor Circuit Low Voltage

DTC P0328: Knock Sensor Circuit High Voltage

General Description



The knock sensor is mounted on the engine block and detects engine knocking. The vibrations caused by the knocking are converted into electrical signals through the piezo ceramic element. The powertrain control module (PCM) controls the ignition timing based on the electrical signal. If the signal from the knock sensor is a specified voltage for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P0327

The knock sensor output voltage is 0.50 V or less for at least 2 seconds.

DTC: P0328

The knock sensor output voltage is 4.50 V or more for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0327

- Knock sensor KS line short to ground

DTC: P0328

- Knock sensor KS line open
- Knock sensor KSGND line open

Common

- Knock sensor failure

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

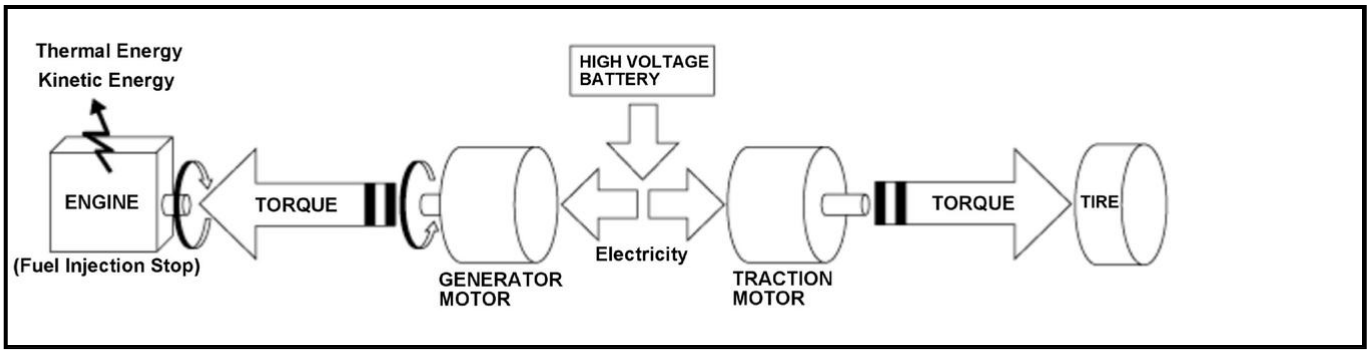
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

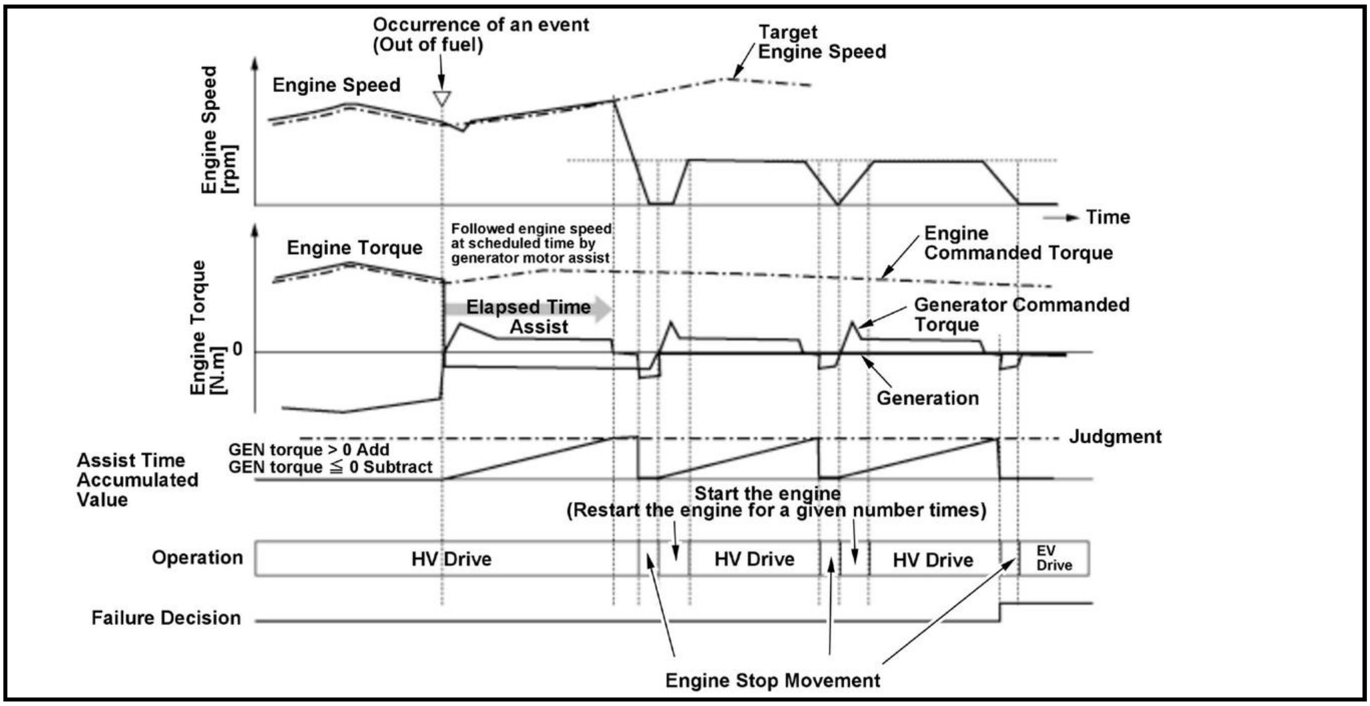
DTC P032F (2021)

DTC P032F: Engine Stall

General Description



Thermal Energy
Kinetic Energy
ENGINE
(Fuel Injection Stop)
TORQUE
HIGH VOLTAGE BATTERY
GENERATOR MOTOR
Electricity
TRACTION MOTOR
TORQUE
TIRE



If engine speed decreases or if the engine stalls after the engine speed was maintained by the generator for a given period of time, then it determined that the engine torque is not being generated. When engine torque is still not generated after trying to restart the engine for a given number of times, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	27 seconds or more (51 seconds or more)*
DTC Type	One drive cycle, MIL on

*: After disconnecting the 12 volt battery.

Enable Conditions

Condition	B
State of the vehicle	HV driving mode
	Engine clanking mode
Other	Other than a catalytic converter warm-up
	During fuel injection

Malfunction Threshold

When generator motor assists continues for 27 seconds (51 seconds)* or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Out of fuel
- Fuel system perfection stop
- Engine stall
- Ignition system relay failure

Confirmation Procedure

Operating Condition

Drive the vehicle for 27 seconds (51 seconds)* or more.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

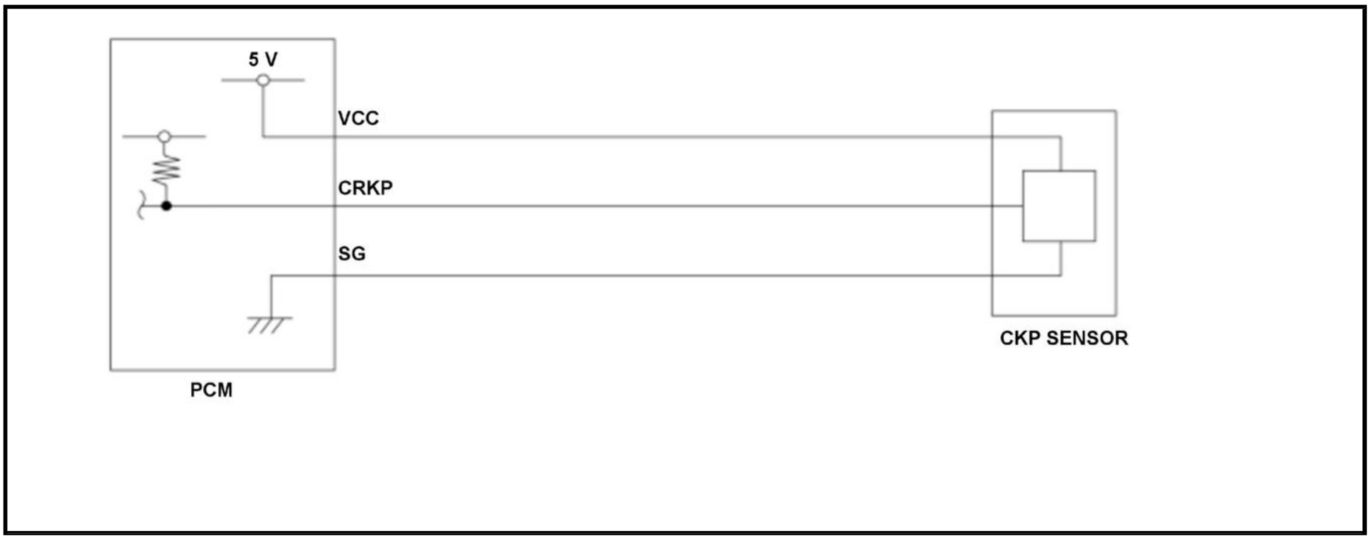
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0335

DTC P0335: Crankshaft Position (CKP) Sensor No Signal

General Description



The crankshaft position (CKP) sensor detects injection/ignition timing for each cylinder and engine speed. The CKP sensor consists of a rotor and a semiconductor that detects rotor position. When the engine starts, the rotor turns and the magnetic flux in the semiconductor device changes. The changes of magnetic flux are converted into pulsing signals to the powertrain control module (PCM). If no pulsing signals from the CKP sensor are detected, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more (when the engine speed is 750 rpm)
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

No input signals from the CKP sensor are detected while signals from the camshaft position (CMP) sensor are detected at least 75 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CKP sensor CRKP line open
- CKP sensor VCC line open
- CKP sensor SG line open
- CKP sensor CRKP line short to ground
- CKP sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

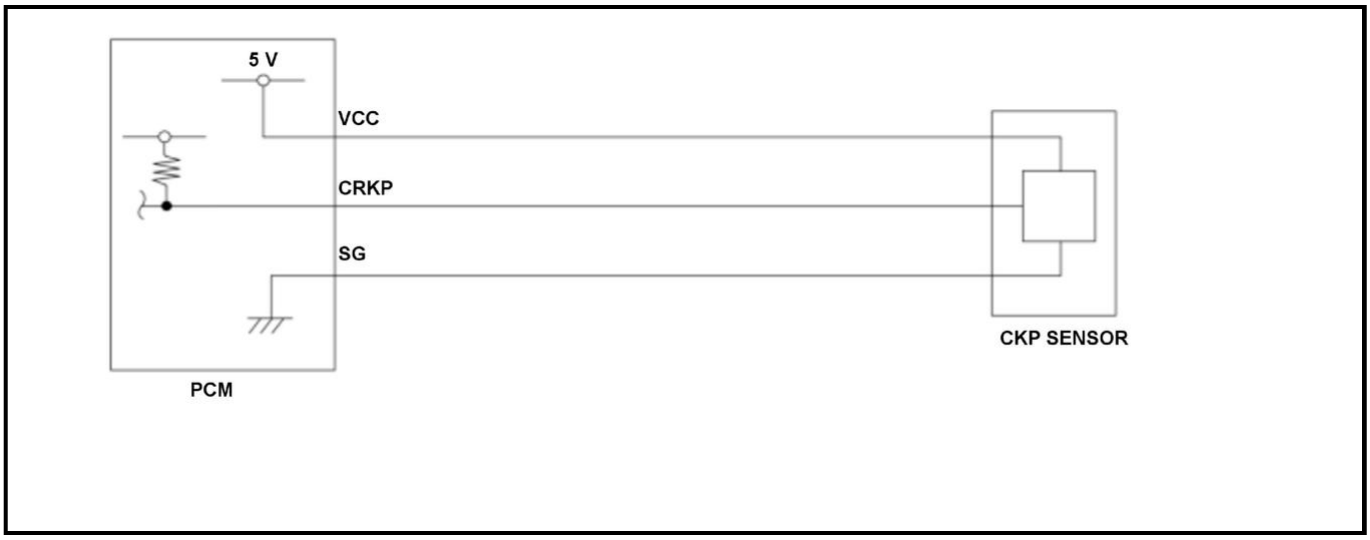
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0339

DTC P0339: Crankshaft Position (CKP) Sensor Circuit Intermittent Interruption

General Description



The crankshaft position (CKP) sensor detects injection/ignition timing for each cylinder and engine speed. The CKP sensor consists of a rotor and a semiconductor that detects rotor position. When the engine starts, the rotor turns and the magnetic flux in the semiconductor device changes. The changes of magnetic flux are converted into pulsing signals to the powertrain control module (PCM). If abnormal amount of pulsing signals from the CKP sensor are detected, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	400 rpm	-

[ ]: HDS Parameter

Malfunction Threshold

Other than 58 pulses are detected during intervals between reference pulses for each crank revolution. This condition has been detected at least 30 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CKP sensor CRKP line electrical noise overlapped
- CKP sensor rotor chipped
- CKP sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

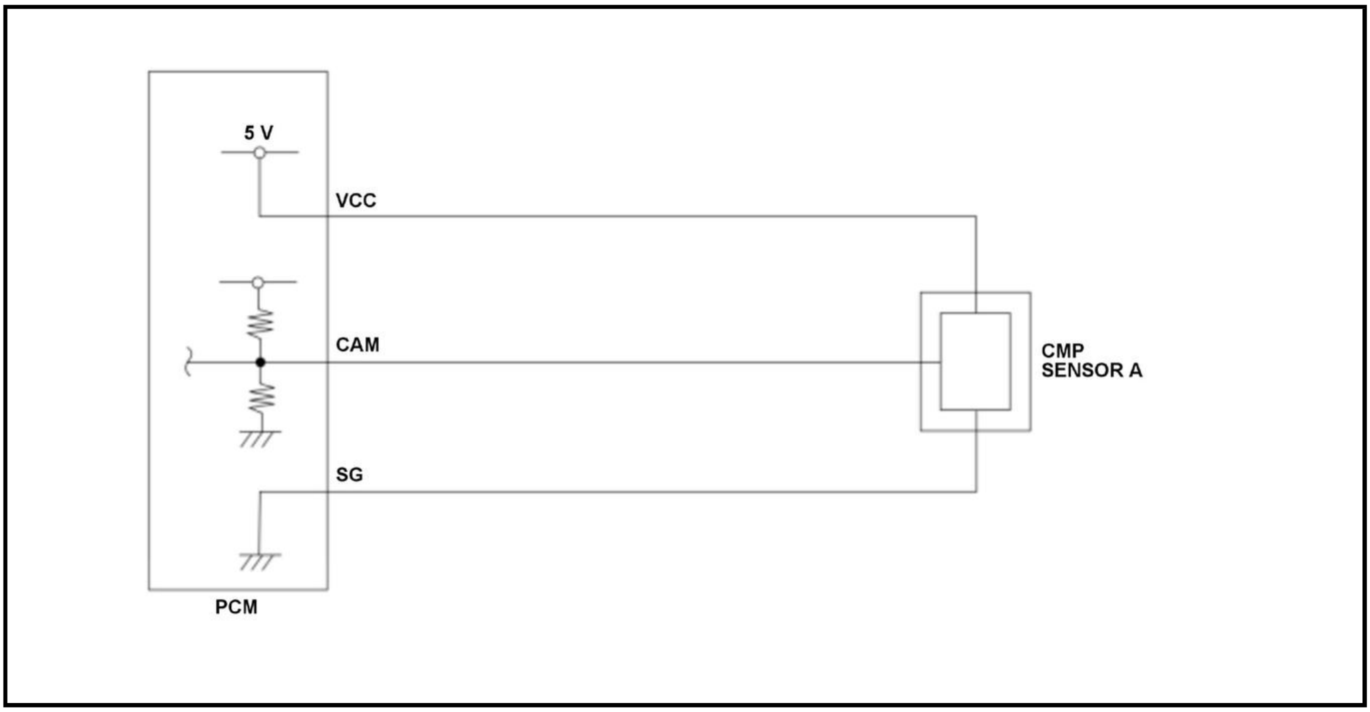
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0340

DTC P0340: Camshaft Position (CMP) Sensor A No Signal

General Description



Camshaft position (CMP) sensor A detects the intake camshaft timing and sends pulsing signals to the powertrain control module (PCM). The PCM determines the advance or the retard of the camshaft timing according to the signals from the crankshaft position (CKP) sensor and CMP sensor A. If no pulsing signals are detected from CMP sensor A, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

No input signals from CMP sensor A are detected at least 50 times in succession.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CMP sensor A CAM line open
- CMP sensor A VCC line open
- CMP sensor A SG line open
- CMP sensor A CAM line short to ground
- CMP sensor A failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

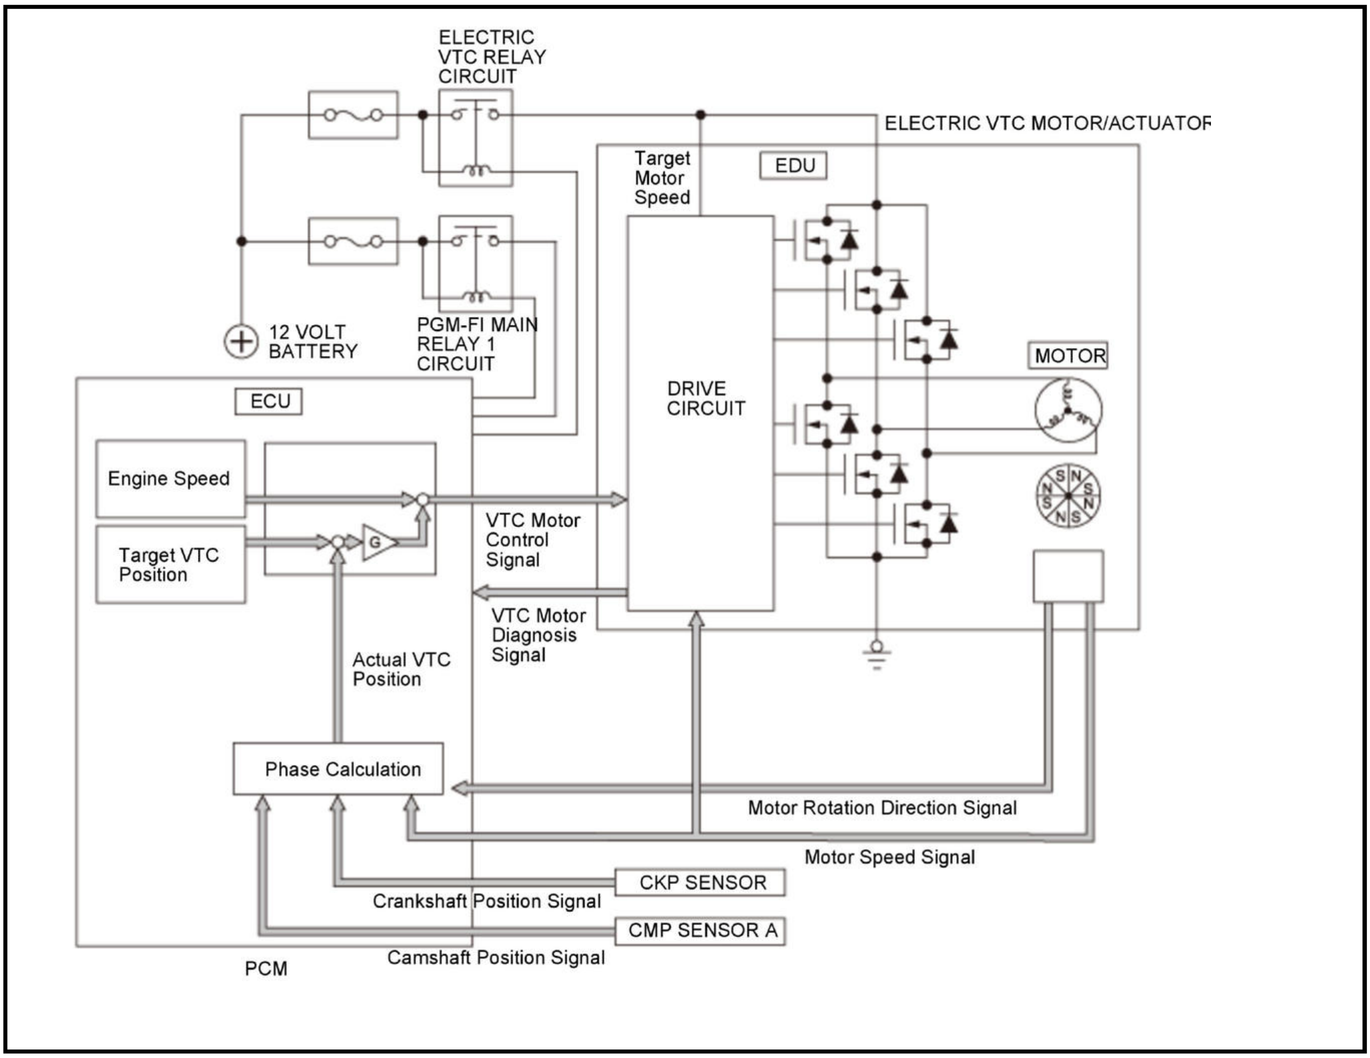
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0341

DTC P0341: Camshaft Position (CMP) Sensor A and Crankshaft Position (CKP) Sensor Incorrect Phase Detected

General Description



ELECTRIC VTC RELAY CIRCUIT
ELECTRIC VTC MOTOR/ACTUATOR

VTC Motor Control Signal
VTC Motor Diagnosis Signal
Actual VTC Position
Phase Calculation
Motor Rotation Direction Signal
Motor Speed Signal
CKP SENSOR
Crankshaft Position Signal
CMP SENSOR A
PCM
Camshaft Position Signal

The powertrain control module (PCM) detects intake camshaft phase from pulsing signal output from camshaft position (CMP) sensor A. The PCM determines the advance or the retard of the intake camshaft phase according to the signals from the crankshaft position (CKP) sensor and CMP sensor A. If the intake camshaft reference phase value deviates from a set range over a specified time period while the variable valve timing control (VTC) is not activated, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	500 milliseconds	-

[ ]: HDS Parameter

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	-
Other	VTC system not operating	

[ ]: HDS Parameter

Malfunction Threshold

The measured intake camshaft phase difference between CMP sensor A and CKP sensor is 10.0 deg. or more for at least 2.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CMP sensor A poor installation
- CMP sensor A stuck
- CMP sensor A range/performance problem
- Cam chain poor installation
- VTC actuator stuck
- VTC actuator response delay

Confirmation Procedure

Operating Condition

Enter the maintenance mode, then start the engine, and let it idle. When the diagnosis does not finish, allow the engine cool to an engine coolant temperature of ambient temperature, then restart the engine, and let it idle.

With the HDS

Select the VTC TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

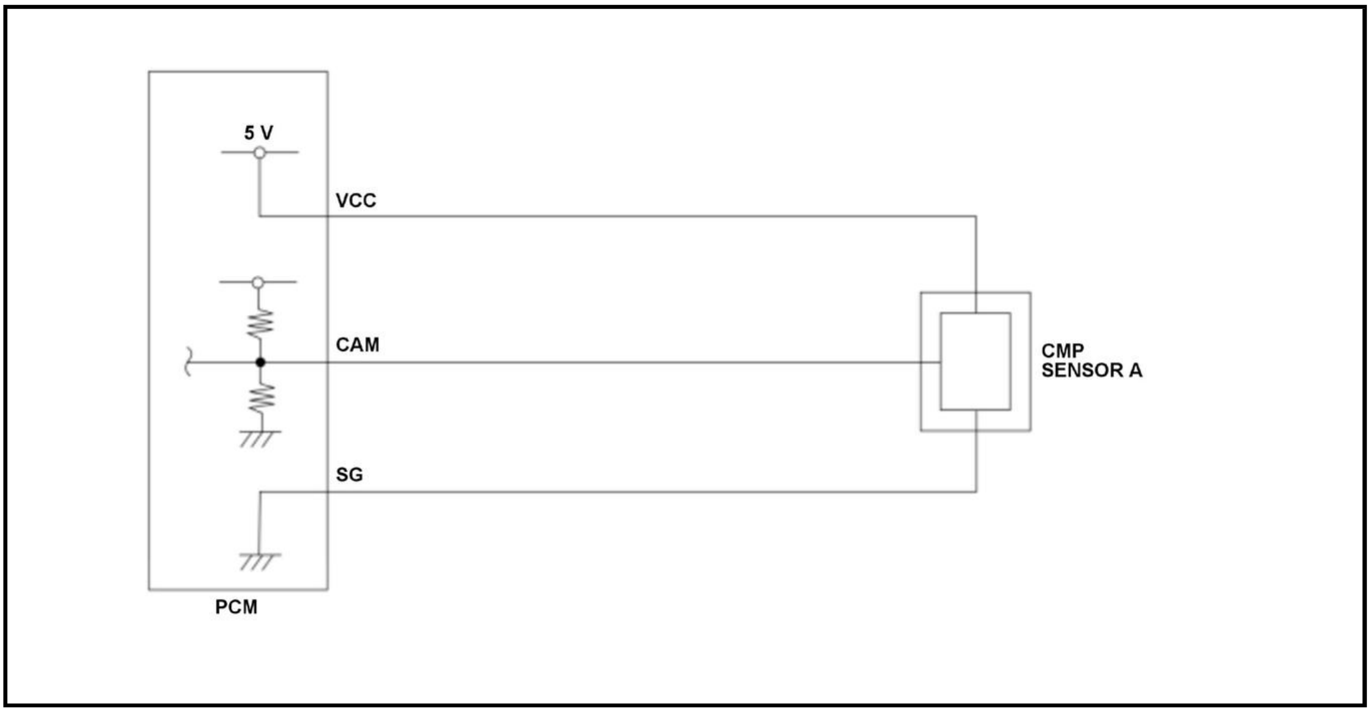
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0344

DTC P0344: Camshaft Position (CMP) Sensor A Circuit Intermittent Interruption

General Description



Camshaft position (CMP) sensor A detects the intake camshaft timing and sends pulsing signals to the powertrain control module (PCM). The PCM determines the advance or the retard of the camshaft timing according to the signals from the crankshaft position (CKP) sensor and CMP sensor A. If the number of pulsing signals from CMP sensor A during intervals between the CKP standard pulses is more or less than the proper number, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

More or less than two CMP sensor A pulses are detected during intervals between the CKP standard pulses. This condition occurs at least 60 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CMP sensor A CAM line electrical noise overlapped
- CMP sensor A rotor chipped
- CMP sensor A failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

- No. 1 ignition coil IGN01A line short to ground

DTC: P0352

- No. 2 ignition coil IGN02A line open
- No. 2 ignition coil IGN02A line short to ground

DTC: P0353

- No. 3 ignition coil IGN03A line open
- No. 3 ignition coil IGN03A line short to ground

DTC: P0354

- No. 4 ignition coil IGN04A line open
- No. 4 ignition coil IGN04A line short to ground

Common

- Ignition coil power supply line open
- Ignition coil ground line open
- Ignition coil internal circuit failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

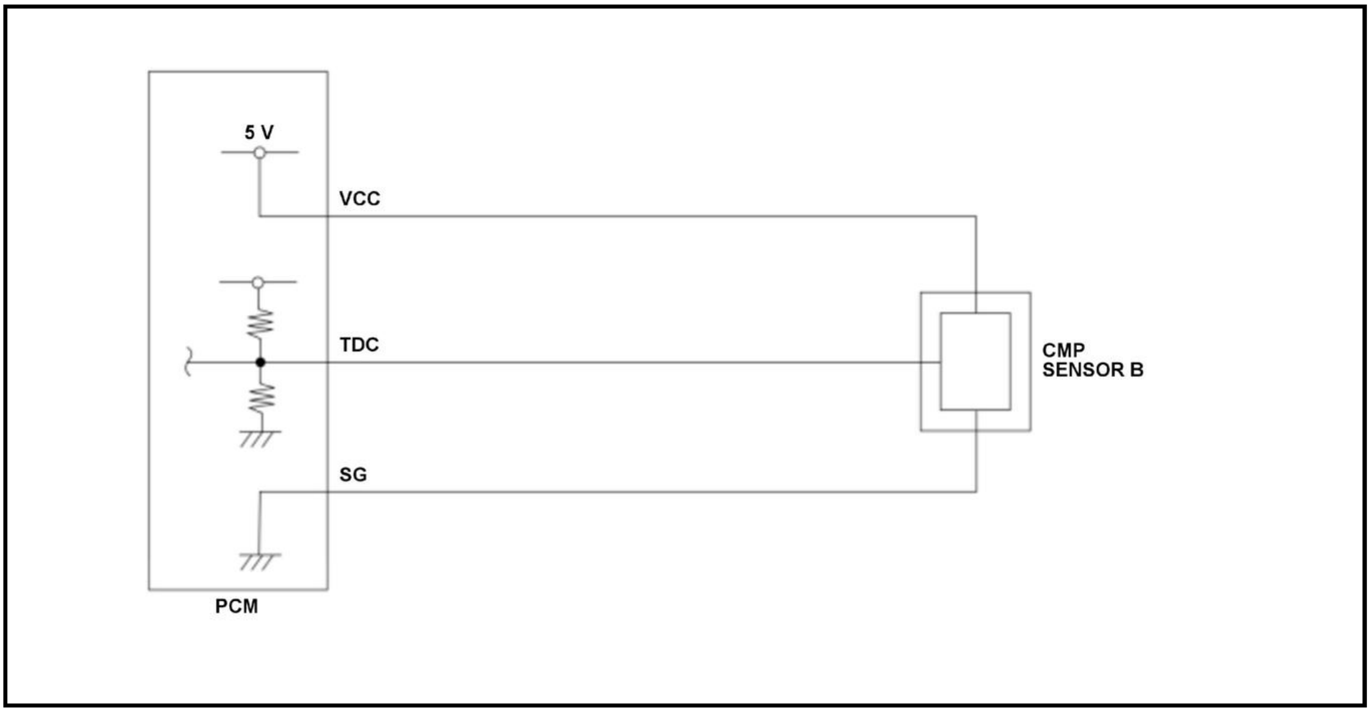
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear

command or by disconnecting the 12 volt battery.

DTC P0365

DTC P0365: Camshaft Position (CMP) Sensor B Circuit No Signal

General Description



Camshaft position (CMP) sensor B consists of a rotor and a semiconductor that detects rotor position. When the rotor turns after starting the engine, the changes of magnetic flux in the semiconductor are converted into pulsing signals to the powertrain control module (PCM). CMP sensor B detects the top dead center of each cylinder for fuel injection timing. If no CMP sensor B pulsing signals are detected, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more (when the engine speed is 750 rpm)
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

No input signals from CMP sensor B are detected while signals from the CKP sensor are detected at least 300 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CMP sensor B TDC line open

- CMP sensor B VCC line open
- CMP sensor B SG line open
- CMP sensor B TDC line short to ground
- CMP sensor B failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

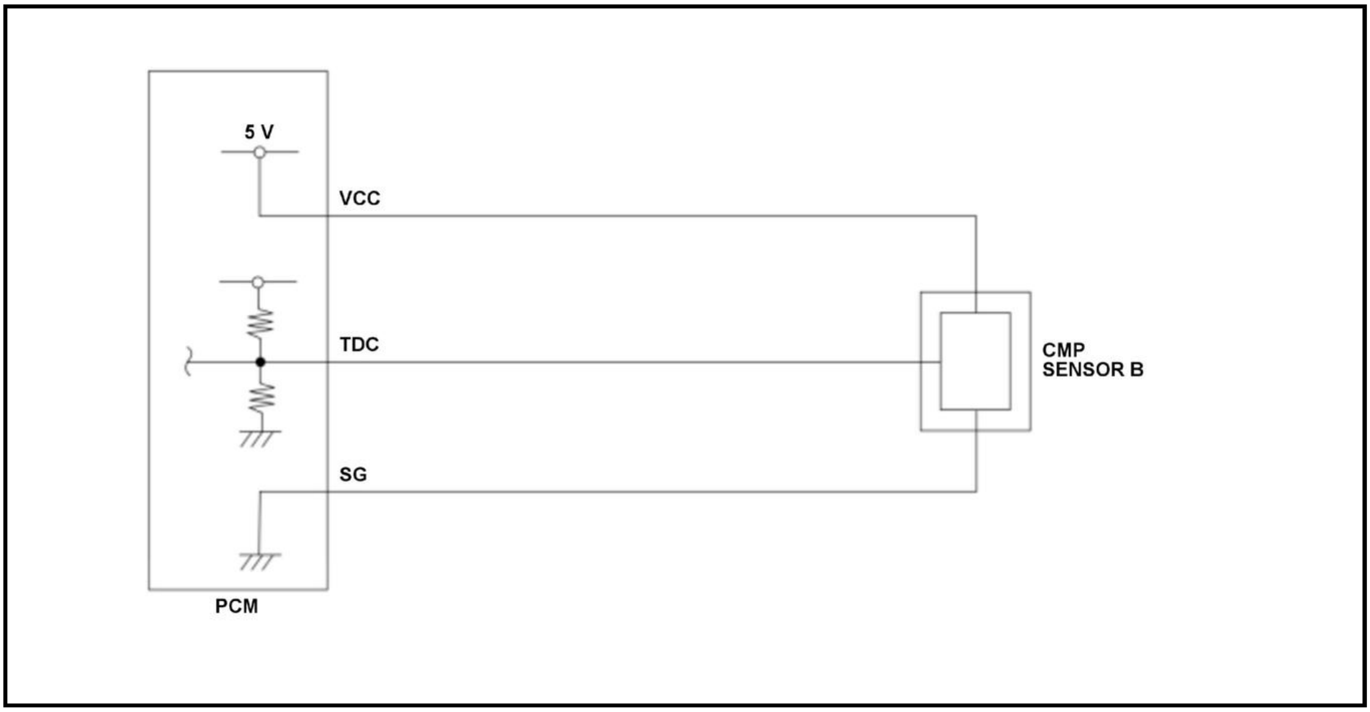
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0369

DTC P0369: Camshaft Position (CMP) Sensor B Circuit Intermittent Interruption

General Description



Camshaft position (CMP) sensor B consists of a rotor and a semiconductor that detects rotor position. When the rotor turns after starting the engine, the changes of magnetic flux in the semiconductor are converted into pulsing signals to the powertrain control module (PCM). CMP sensor B detects the top dead center of each cylinder for fuel injection timing. If CMP sensor B pulsing signals are detected an abnormal number of times due to noise, the PCM detects a malfunction and a stores DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	400 rpm	-

[ ]: HDS Parameter

Malfunction Threshold

Other than 6 CMP pulses are detected during two crankshaft revolutions. This condition has been detected at least 30 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CMP sensor B TDC line electrical noise overlapped
- CMP sensor B rotor chipped
- CMP sensor B failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

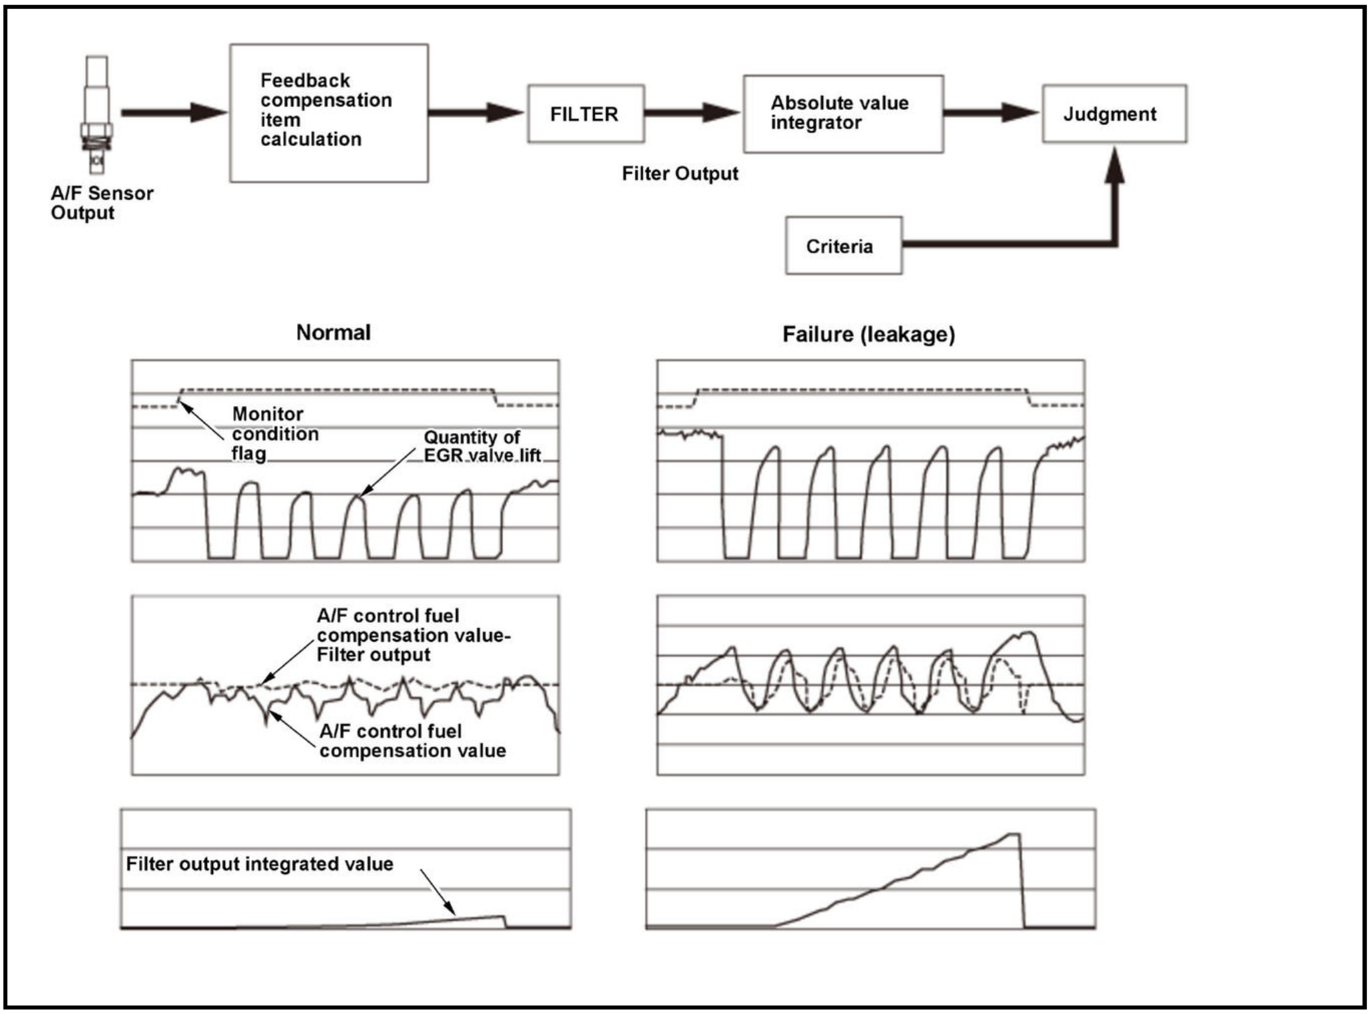
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0400

DTC P0400: Exhaust Gas Recirculation (EGR) System Leak Detected

General Description



Feedback compensation item calculation
FILTER
Absolute value integrator
Judgment
A/F Sensor Output
Filter Output
Criteria
Normal
Failure (leakage)
Monitor condition flag
Quantity of EGR valve lift
A/F control fuel compensation value-Filter output
A/F control fuel compensation value
Filter output integrated value

The exhaust gas recirculation (EGR) system failure conditions include a sticking lift sensor, restricted passages, and leakage from the external piping. At any specific EGR lift value there is a corresponding air/fuel ratio compensation value. If the air/fuel ratio compensation value is greater than the corresponding EGR lift value, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	P0404, P2413 are judged as OK
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1]	156 deg.F (69 deg.C)	-
Intake air temperature [IAT SENSOR (1)]	50 deg.F (10 deg.C)	-
Engine speed [ENGINE SPEED]	1, 750 rpm	3, 000 rpm
Vehicle speed [VEHICLE SPEED]	50 mph (80 km/h)	-
12 volt battery voltage [BATTERY]	10.5 V	-
Fuel feedback	Closed loop at stoichiometric	

Condition	Minimum	Maximum
Monitoring priority	P0133, P0420	
Other	Without excessive load change	

[ ]: HDS Parameter

Malfunction Threshold

The air/fuel ratio (A/F) sensor response parameter according to the opening and closing of the EGR is 32, 768 (LT80A) or less.

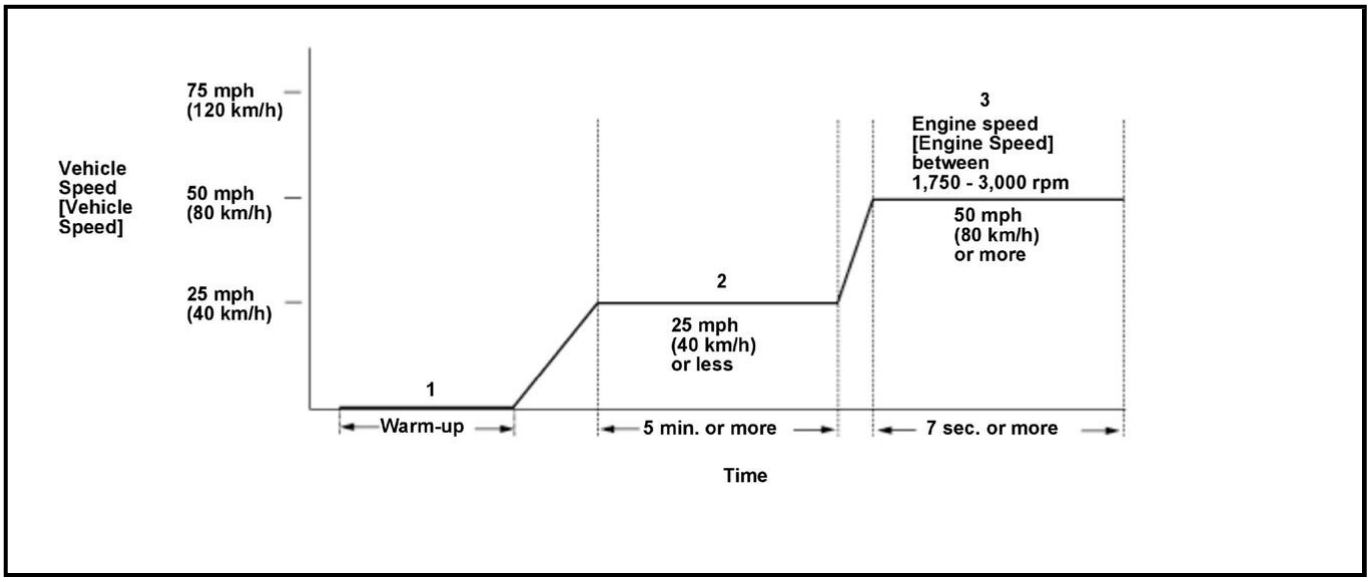
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EGR pipe misinstalled
- EGR valve failure

Confirmation Procedure

Operating Condition



- Start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed of 25 mph (40 km/h) or less, for at least 5 minutes.
- Drive immediately at a steady speed of 50 mph (80 km/h) or more and engine speed [ENGINE SPEED] between 1, 750 - 3, 000 rpm for at least 7 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the

freeze data are stored.

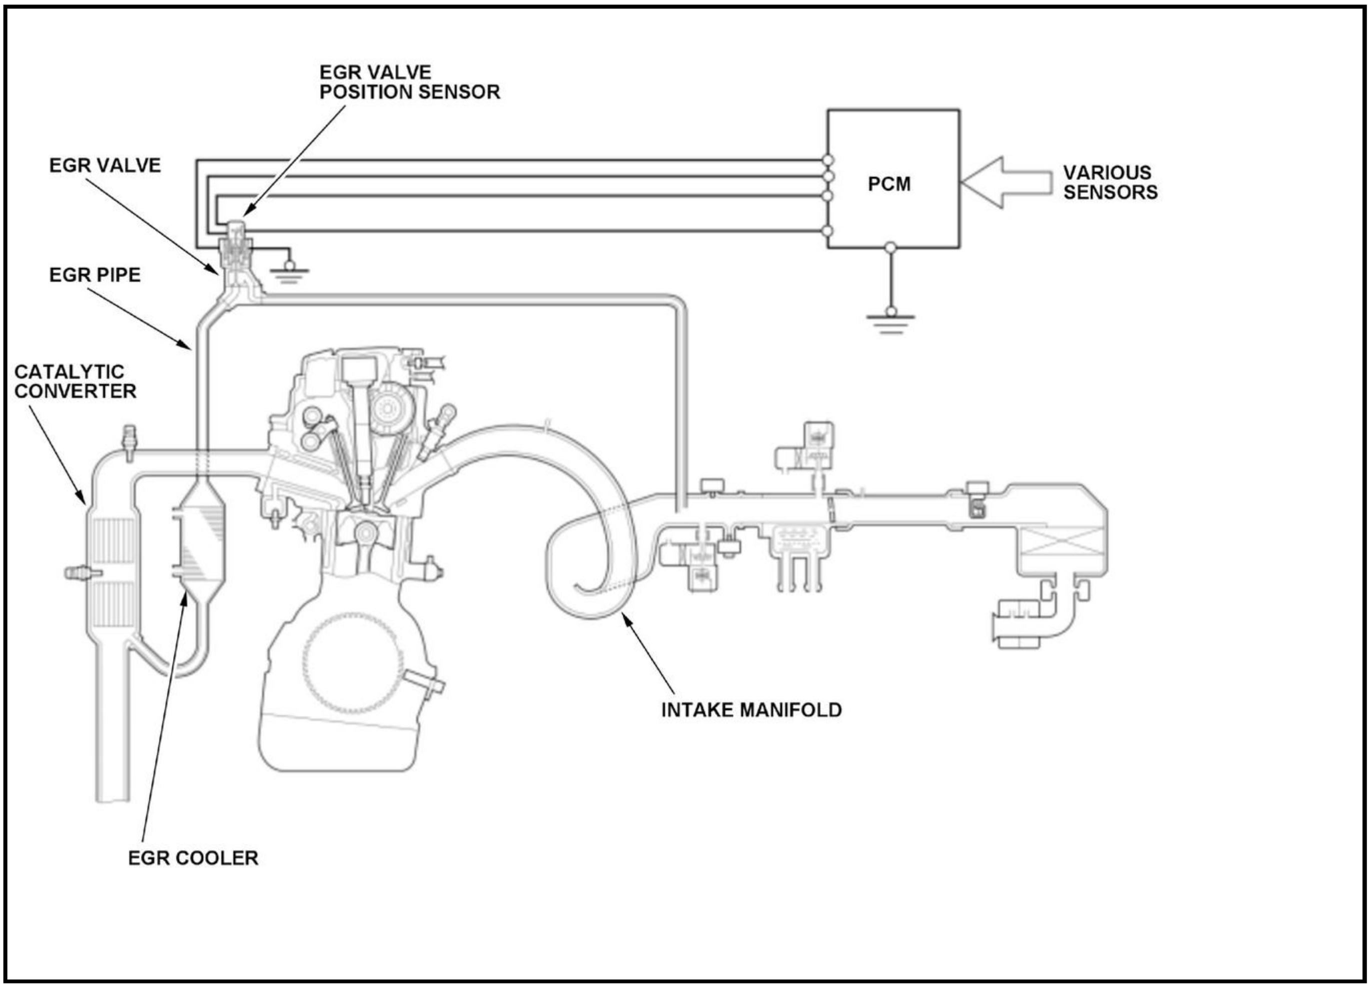
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

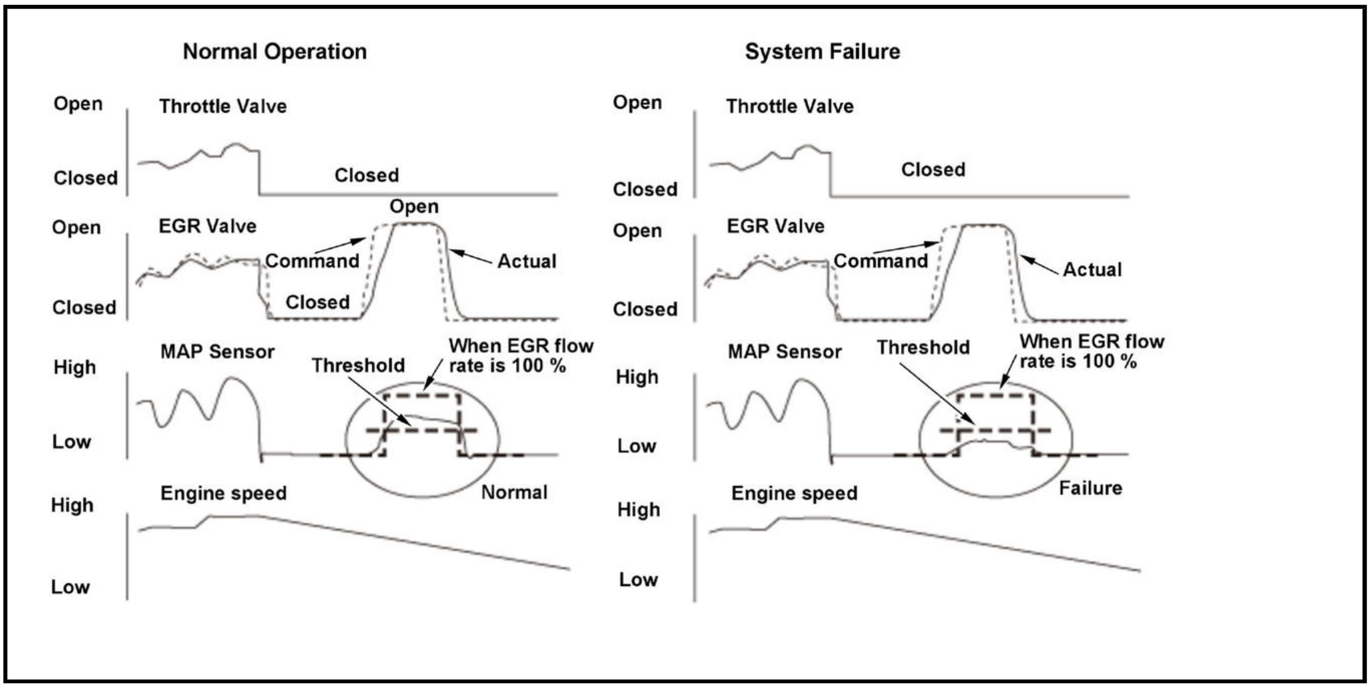
DTC P0401

DTC P0401: Exhaust Gas Recirculation (EGR) Insufficient Flow

General Description



EGR VALVE POSITION SENSOR
EGR VALVE
PCM
VARIOUS SENSORS
EGR PIPE
CATALYTIC CONVERTER
INTAKE MANIFOLD
EGR COOLER



The exhaust gas recirculation (EGR) valve, which is controlled by the powertrain control module (PCM), is opened and the exhaust gas flows through the EGR valve, the intake manifold, and the EGR passage. The exhaust gas is circulated into the air/fuel mixture to lower combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions. The EGR flow is inspected as follows. The EGR valve is closed during deceleration with the throttle valve fully closed. Then the PCM fully opens the EGR valve. After a set time, the PCM computes the ratio of the present EGR flow to the normal EGR flow by monitoring the fluctuation of the intake manifold pressure between when the EGR valve is fully opened and when it is fully closed. If the EGR flow rate is lower than normal, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	P0404, P2413 are judged as OK
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	156 deg.F (69 deg.C)	-
Engine speed [Engine Speed]	1, 200 rpm	2, 500 rpm
MAP value [MAP Sensor]	14.0 kPa (105.0 mmHg, 4.14 inHg)	-
Vehicle speed [Vehicle Speed]	23 mph (37 km/h)	-
12 volt battery voltage [Battery]	10.5 V	-
Throttle position	Fully closed	
Fuel feedback	During deceleration	

[ ]: HDS Parameter

Malfunction Threshold

The ratio of the current EGR flow to the normal EGR flow is 20.0 % or less for at least 5.0 seconds.

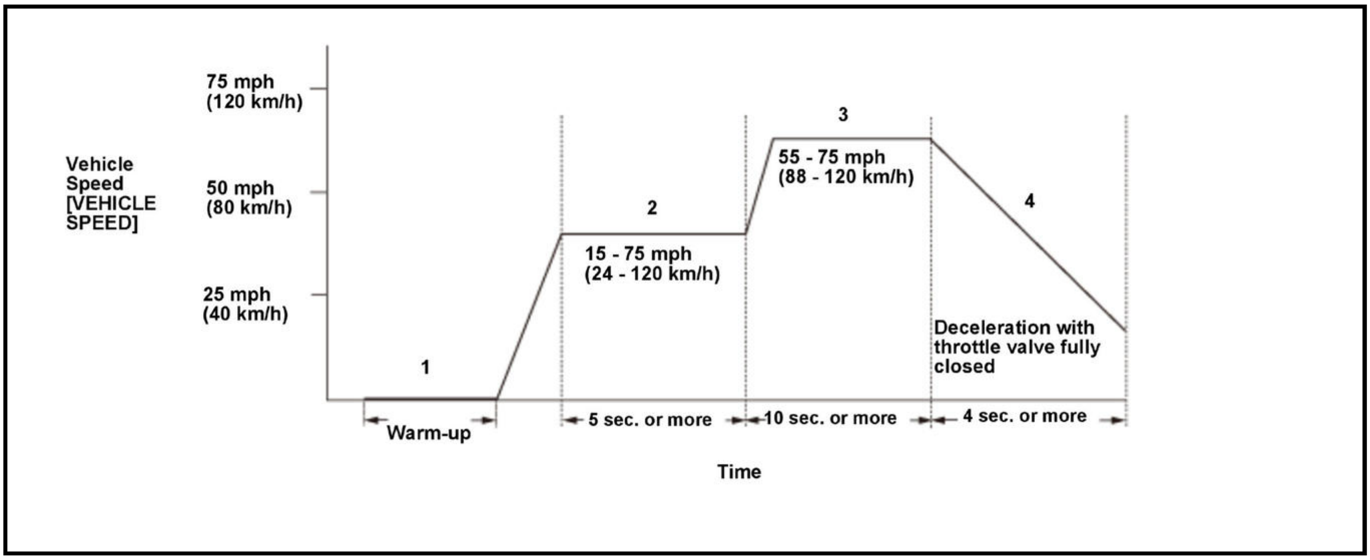
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EGR valve failure (valve or solenoid)
- EGR passage clogged

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
- Drive at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
- Decelerate with the throttle valve fully closed for at least 4 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

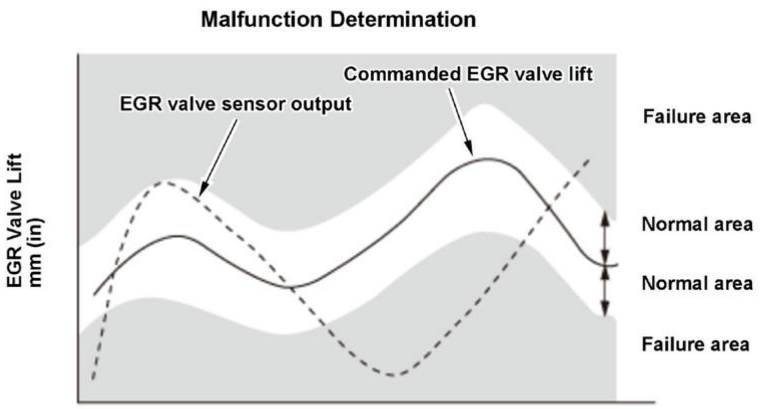
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0404

DTC P0404: Exhaust Gas Recirculation (EGR) Valve Circuit Range/Performance Problem

General Description



The exhaust gas recirculation (EGR) valve, which is controlled by the powertrain control module (PCM), is opened and the exhaust gas flows through the EGR valve, the intake manifold, and the EGR passage. The exhaust gas is circulated into the air/fuel mixture and the mixture is drawn into the combustion chamber to lower combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions. A sensor (lift sensor) is built into the EGR valve and detects the amount of valve lift. The command value for the target valve lift is stored in the PCM so that exhaust gas recirculation can be optimized according to driving conditions. Comparing this command value with the lift sensor output signal value, the PCM controls the EGR valve to make the amount of actual valve lift equal to the command value. If the difference between the value of commanded EGR valve lift and actual EGR valve lift is a specified value or more, an abnormality in the EGR valve or the lift sensor output is determined, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	-	4, 500 rpm
Commanded EGR valve lift	0.0119 in (0.30 mm)	-
12 volt battery voltage [Battery]	10.5 V	-

[ ]: HDS Parameter

Malfunction Threshold

The difference between the command value of the amount of EGR valve lift in the PCM and the actual amount of valve lift is 0.0402 in (1.02 mm) or more for at least 5.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EGR valve position sensor line open
- EGR valve position sensor line short
- EGR valve response delay
- EGR valve full open stuck

- EGR valve middle stuck
- EGR valve position sensor middle stuck
- EGR valve position sensor range/performance problem

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Select the EGR TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

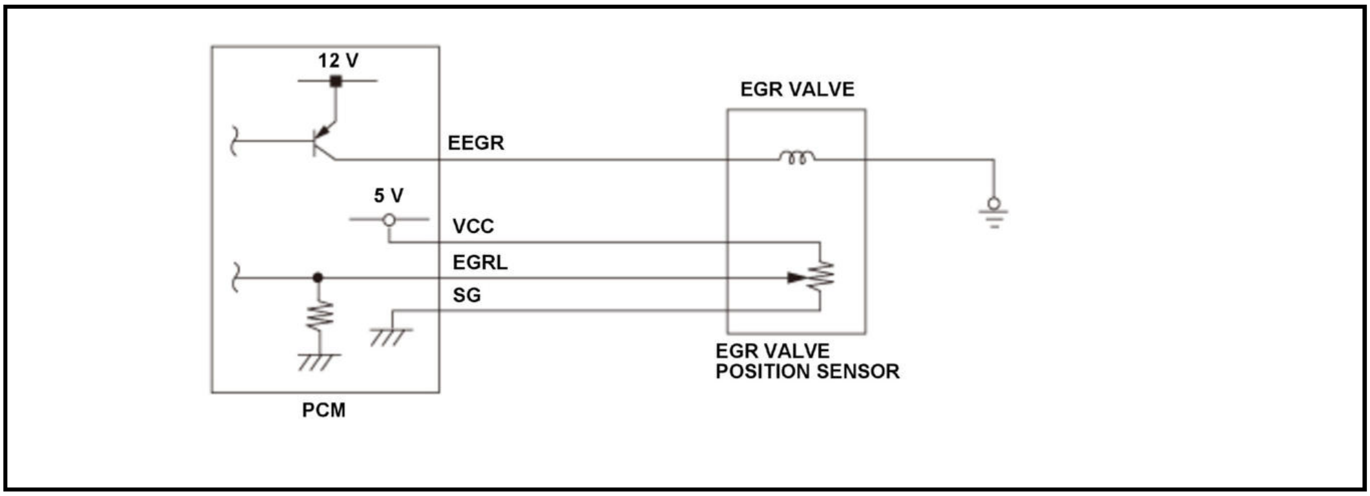
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0405

DTC P0405: Exhaust Gas Recirculation (EGR) Valve Circuit Range/Performance Problem

General Description



The powertrain control module (PCM) controls the exhaust gas recirculation (EGR) valve opening. The system includes the EGR actuator, the EGR valve, the EGR valve position sensor, and the PCM. The EGR valve position sensor is a semiconductor type, and it is attached to the EGR valve and shaft to determine EGR valve position. The EGR valve position signal from the EGR valve position sensor is transmitted to the PCM for target position feedback control. If the EGR valve position sensor output voltage is a specified value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

The EGR valve position sensor output voltage [EGR Valve Position Sensor (EGR Vls)] is 0.31 V or less for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EGR valve position sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

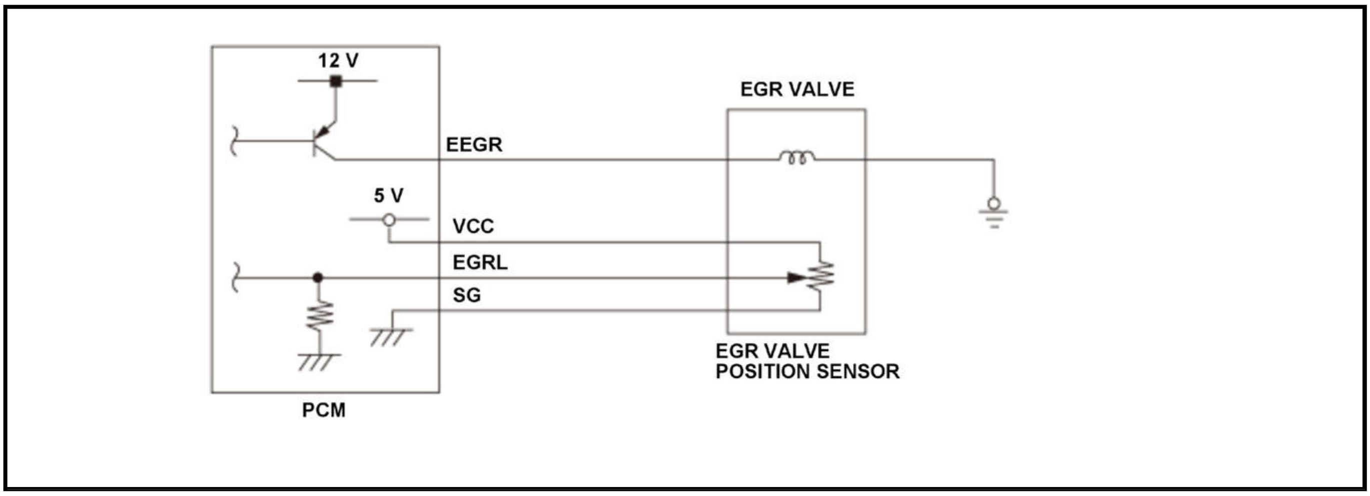
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0406

DTC P0406: Exhaust Gas Recirculation (EGR) Valve Position Sensor Circuit High Voltage

General Description



The powertrain control module (PCM) controls the exhaust gas recirculation (EGR) valve opening. The system includes the EGR actuator, the EGR valve, the EGR valve position sensor, and the PCM. The EGR valve position sensor is a semiconductor type, and it is attached to the EGR valve and shaft to determine EGR valve position. The EGR valve position signal from the EGR valve position sensor is transmitted to the PCM for target position feedback control. If the EGR valve position sensor output voltage is a specified value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

The EGR valve position sensor output voltage [EGR Valve Position Sensor (EGR Vls)] is 4.89 V or more for at least 2 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EGR valve position sensor EGRL line short to EGR valve position sensor VCC line
- EGR valve position sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

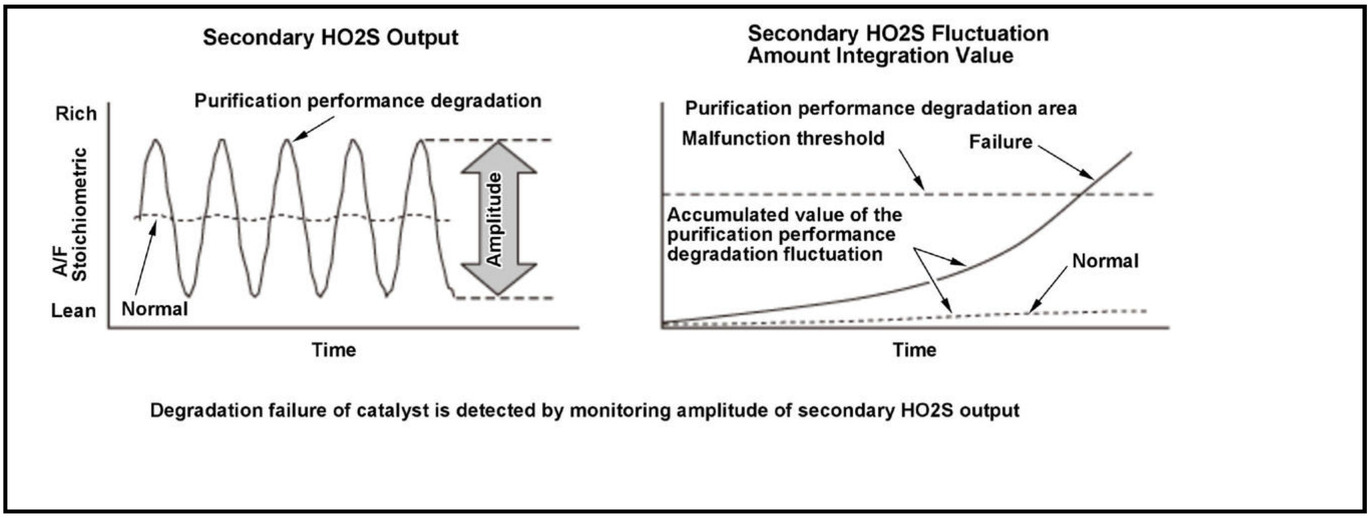
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0420

DTC P0420: Catalyst System Efficiency Below Threshold

General Description



Degradation failure of catalyst is detected by monitoring amplitude of secondary HO2S output

The three way catalytic converter (TWC) converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) in the exhaust gas to water vapor, carbon dioxide (CO 2), and dinitrogen (N 2). The powertrain control module (PCM) fluctuates the air/fuel ratio temporarily to detect the performance of the TWC and measures the degree of fluctuation in the secondary heated oxygen sensor (secondary HO2S (sensor 2)) output. If the accumulated value for a set time is too great, deterioration of the performance of the catalyst is detected, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	7.5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time that secondary HO2S activity is not monitored after starting the engine	15 seconds	-
Engine coolant temperature [ECT Sensor 1]	156 deg.F (69 deg.C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg.F (-25 deg.C)	-
Estimated TWC temperature	1, 112 deg.F (600 deg.C)	-
Vehicle speed [Vehicle Speed]	30 mph (48 km/h)	-
Fuel trim	0.69	1.47
Fuel feedback	Closed loop at stoichiometric	
Monitoring priority	P0133	

Condition	Minimum	Maximum
Other	Has record of deceleration at least once	
	Cruise load or more	

[ ]: HDS Parameter

Malfunction Threshold

The secondary HO2S (sensor 2) fluctuation integration value is 3.0 V or more for at least 7.5 seconds.

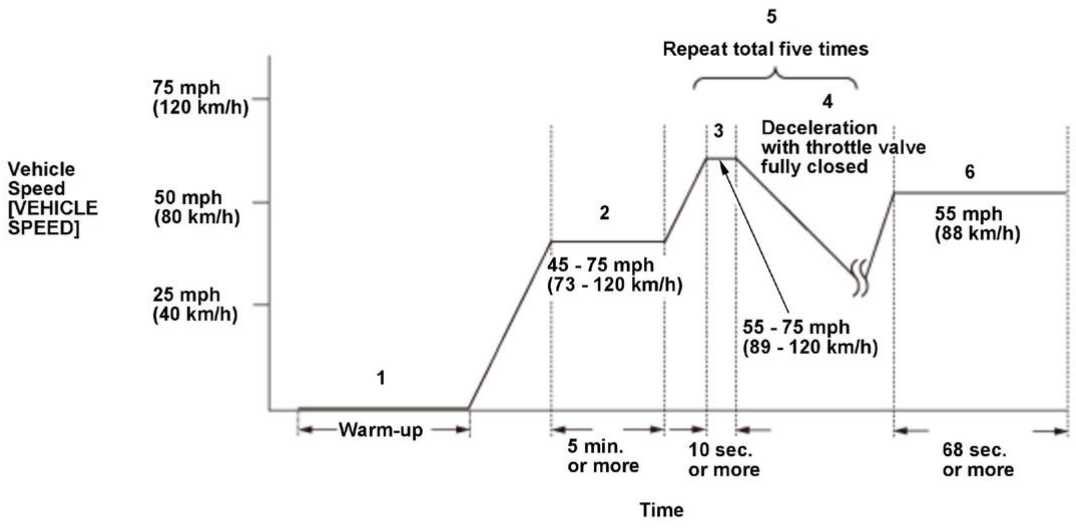
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TWC purification performance deterioration
- Secondary HO2S (sensor 2) line electrical noise overlapped
- Secondary HO2S (sensor 2) connector loose connection
- Exhaust system change (besides a genuine part)

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a speed between 45 - 75 mph (73 - 120 km/h) for at least 5 minutes, to warm up the TWC.
- Drive at a steady speed between 55 - 75 mph (89 - 120 km/h) for at least 10 seconds.
- Decelerate with the throttle valve fully closed.
- Repeat driving pattern steps 3 through 4, five times.
- Set a vehicle speed [Vehicle Speed] of 55 mph (88 km/h) on the cruise control or equivalent, and drive for at least 68 seconds.

- After disconnecting the 12 volt battery, extend Driving Pattern step 6 to 4 minutes or longer.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

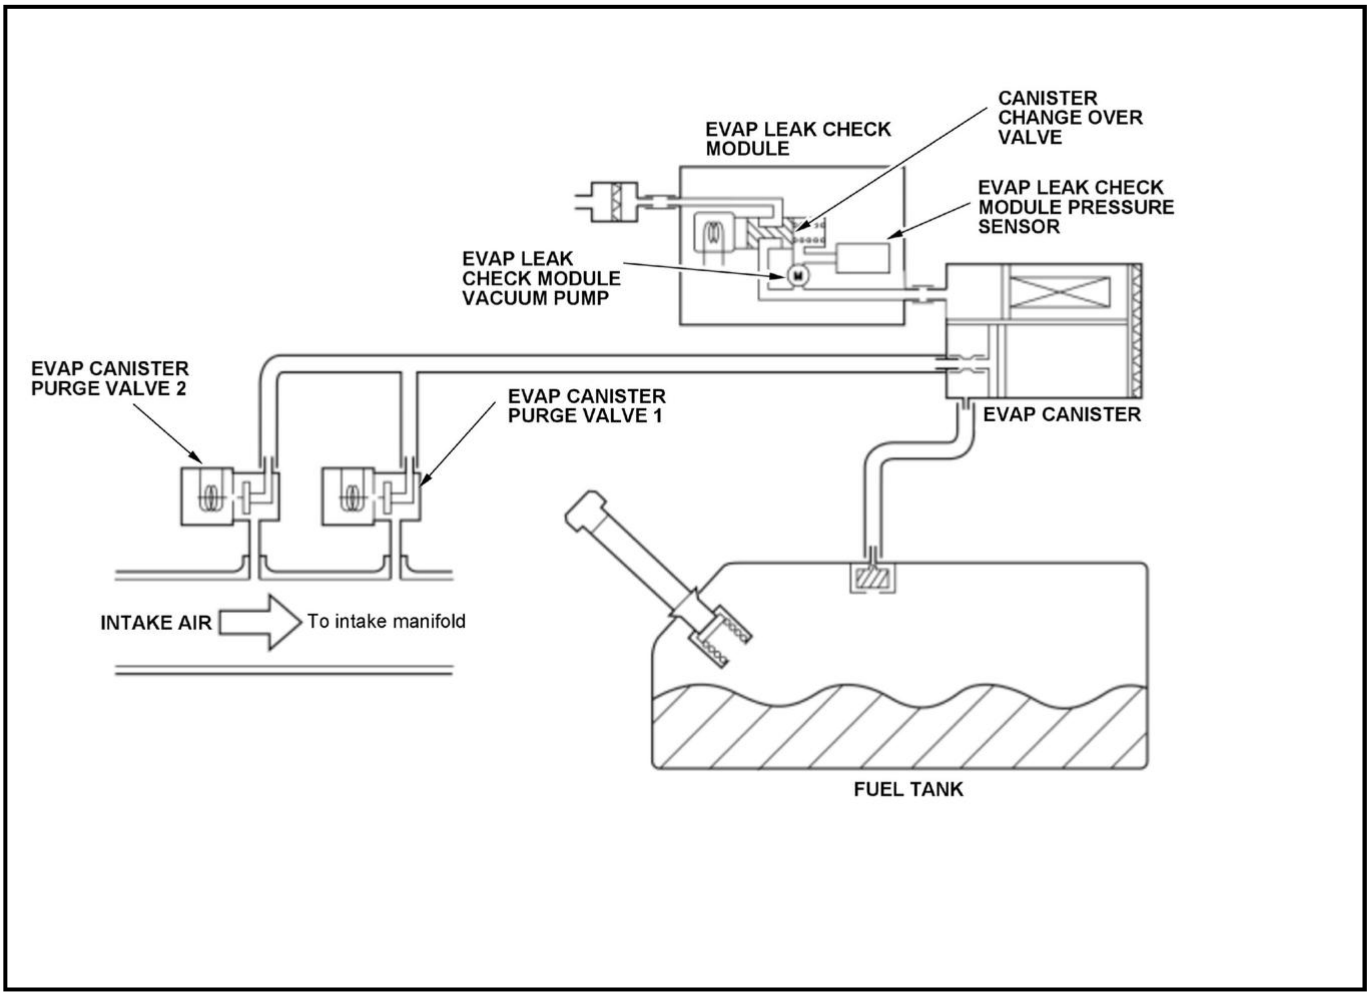
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

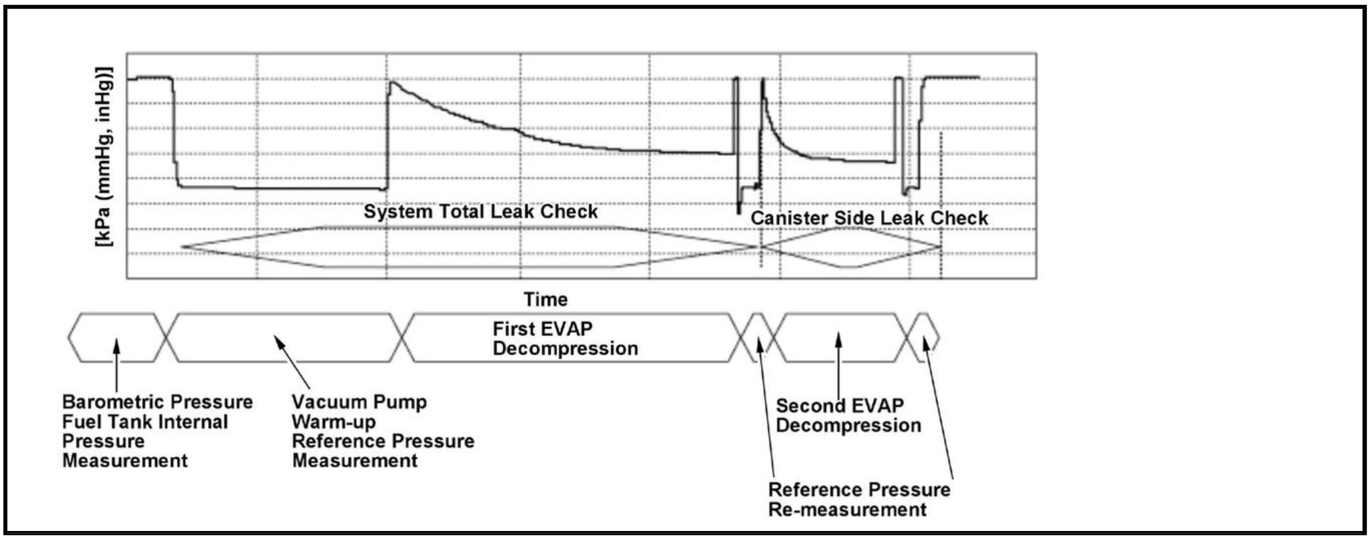
DTC P043E

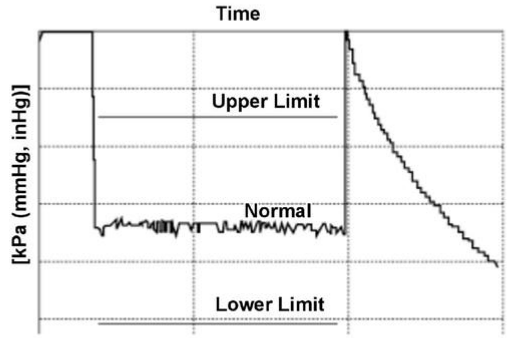
DTC P043E: Evaporative Emission (EVAP) Leak Check Module Standard Pressure Low

General Description



CANISTER CHANGE OVER VALVE
EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP LEAK CHECK MODULE VACUUM PUMP
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER PURGE VALVE 1
EVAP CANISTER
INTAKE AIR
To intake manifold
FUEL TANK





The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT Sensor 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere.

A malfunction is detected and a DTC is stored when changes in the pressure are equal to or less than the prescribed value after the prescribed time of starting the system pressure reduction.

EVAP leak check module operation flow

- Reference pressure measurement: Malfunction check in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction: Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement: Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the EVAP leak check module vacuum pump during detection.

Reference pressure is the pressure reduction by the reference orifice (#40 equivalent) in the EVAP leak check module used to check for leak by comparison with the system pressure reduction.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	At least 6 minutes 30 seconds but not more than 18 minutes 45 seconds
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the READY TO DRIVE mode	10 minutes	-
Elapsed time after the vehicle condition is turned to the OFF (LOCK) mode	5 hours	-
PCM wake up engine coolant temperature [ECT SENSOR 2]	40 deg.F (5 deg.C)	95 deg.F (35 deg.C)
Barometric pressure[BARO SENSOR]	76 kPa (569 mmHg, 22.5 inHg)	-
12 volt battery voltage [BATTERY]	10.5 V	-
Other	No refueling is required	

[ ]: HDS Parameter

Malfunction Threshold

The reference pressure is -5 kPa (-38.1 mmHg, -1.5 inHg) or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP leak check module vacuum pump failure
- Canister change over valve failure
- Reference orifice flow quantity is excessive
- Reference orifice flow quantity is too low

Confirmation Procedure

Operating Condition

- With the engine coolant temperature [ECT Sensor 2] within the specified range, turn the vehicle to the READY TO DRIVE mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes 45 seconds.

With the HDS

Do the EVAP TEST in the INSPECTION MENU with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored. Engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory.

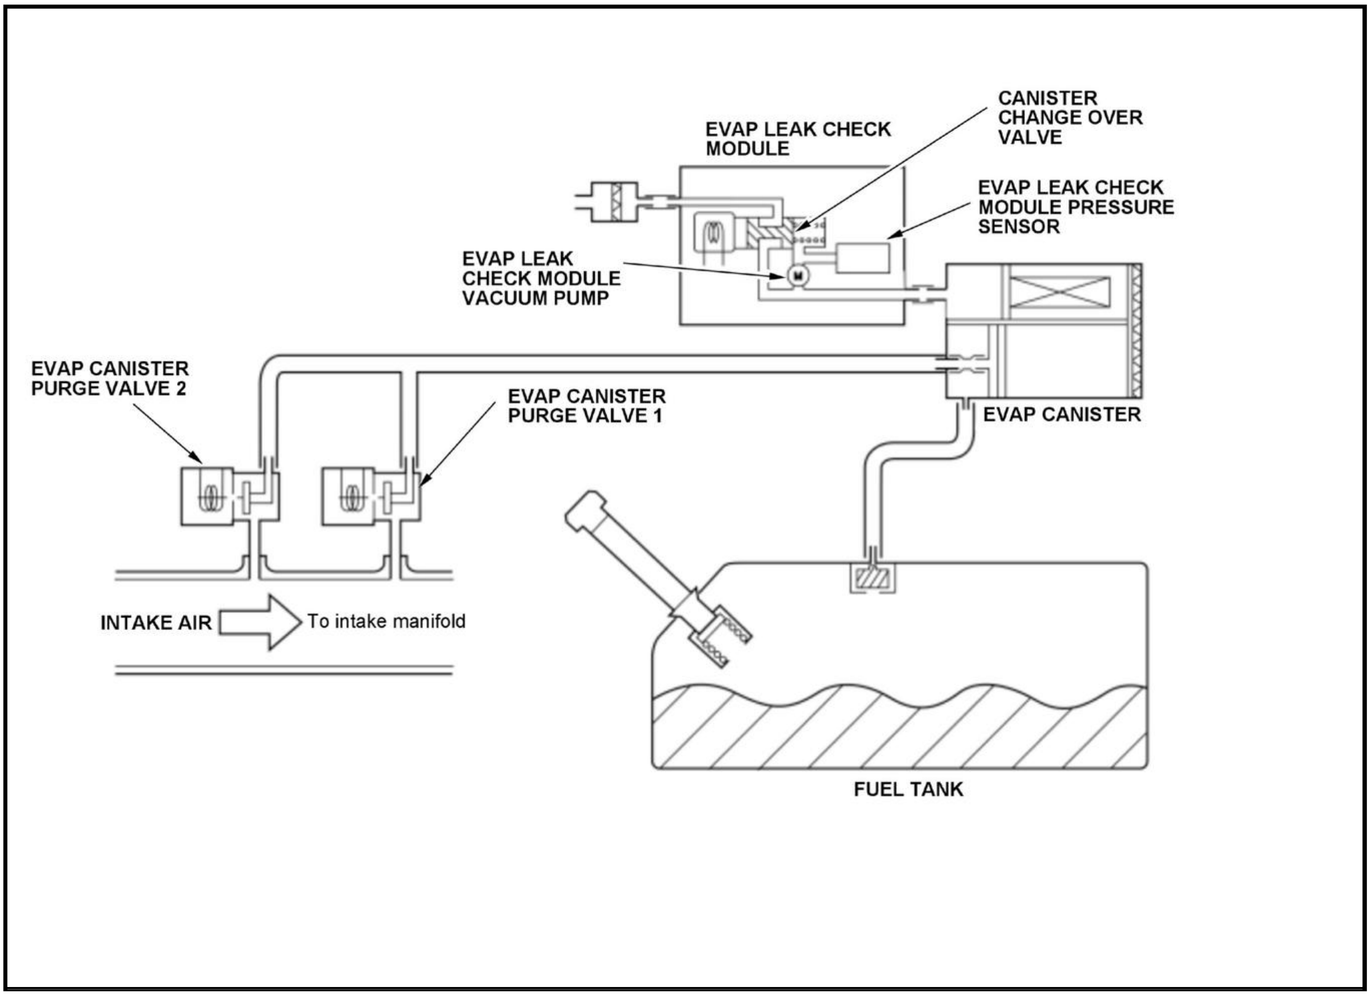
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

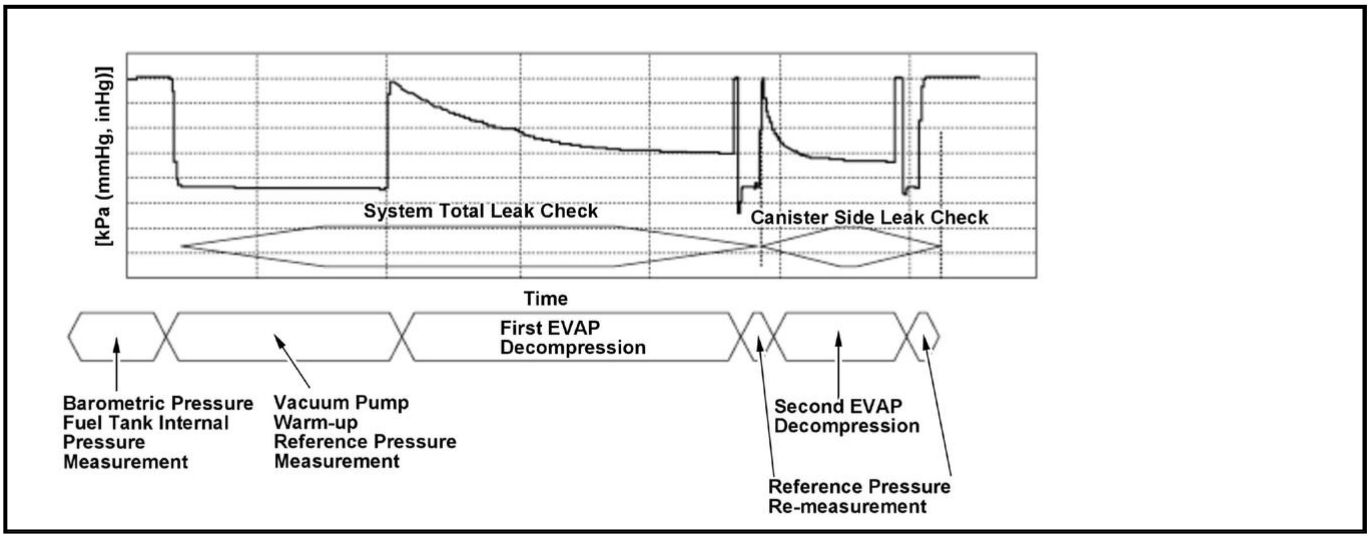
DTC P043F

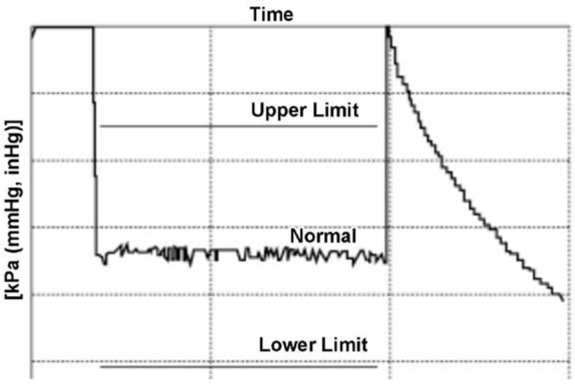
DTC P043F: Evaporative Emission (EVAP) Leak Check Module Standard Pressure High

General Description



CANISTER CHANGE OVER VALVE
EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP LEAK CHECK MODULE VACUUM PUMP
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER PURGE VALVE 1
EVAP CANISTER
INTAKE AIR
To intake manifold
FUEL TANK





The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT Sensor 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere.

A malfunction is detected and a DTC is stored when changes in the pressure are equal to or more than the prescribed value after the prescribed time of starting the system pressure reduction.

EVAP leak check module operation flow

- Reference pressure measurement: Malfunction detection in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction: Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement: Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the EVAP leak check module vacuum pump during detection.

Reference pressure is the pressure reduction caused by the reference orifice (#40 equivalent) in the EVAP leak check module used to check for leak by comparison with the system pressure reduction.

Malfunction Threshold

The reference pressure is -0.1 kPa (-7.5 mmHg, -0.3 inHg) or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP leak check module vacuum pump failure
- Canister change over valve failure
- Reference orifice flow quantity is excessive
- Reference orifice flow quantity is too low

Confirmation Procedure

Operating Condition

- With the engine coolant temperature [ECT Sensor 2] within the specified range, turn the vehicle to the READY TO DRIVE mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes 45 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored. Engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory.

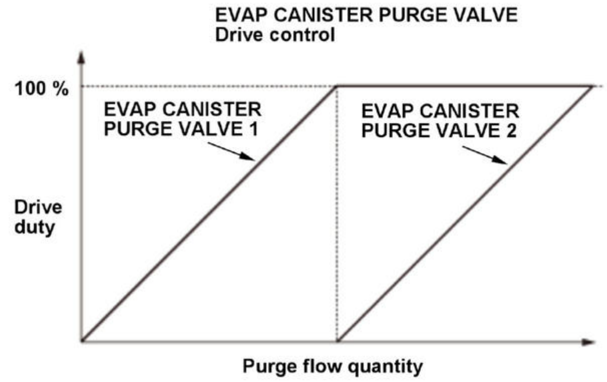
Conditions for clearing the DTC

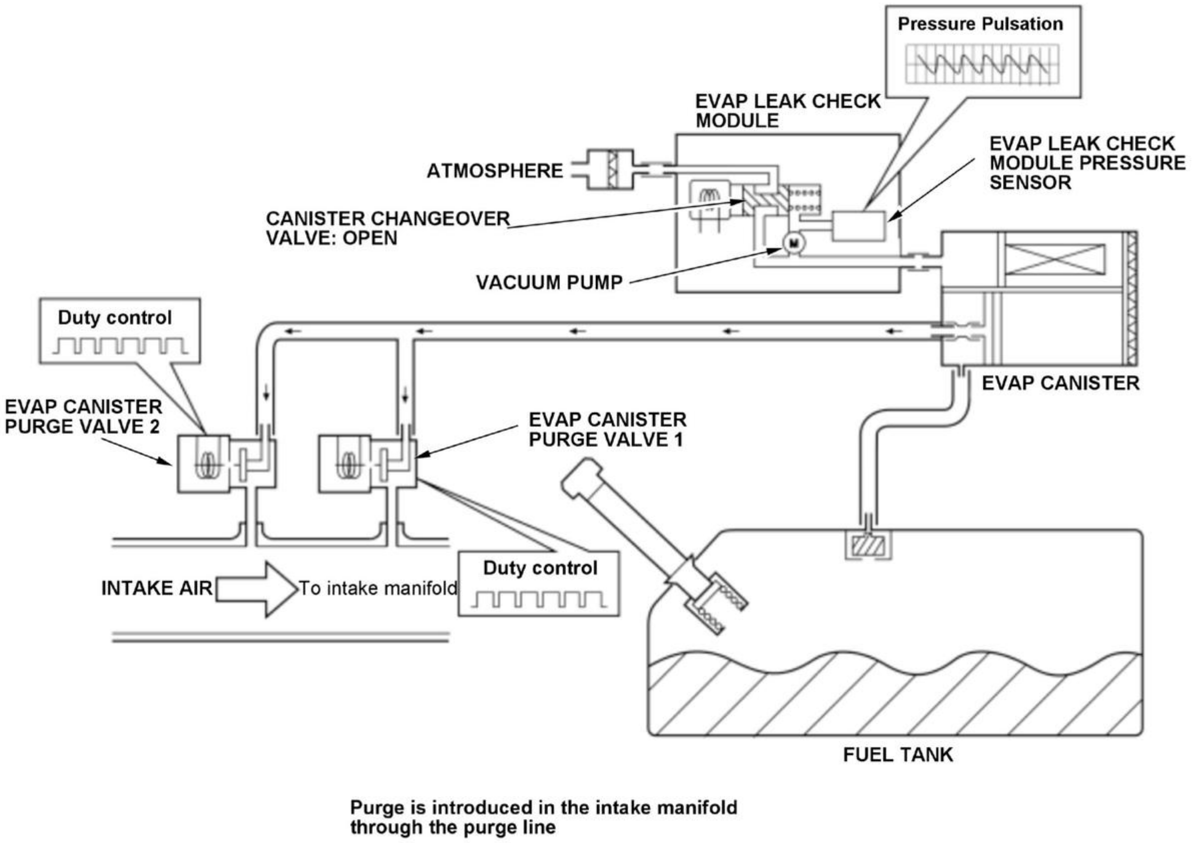
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P0441

DTC P0441: Evaporative Emission (EVAP) System Purge Flow Malfunction

General Description





Pressure Pulsation
EVAP LEAK CHECK MODULE
ATMOSPHERE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
CANISTER CHANGEOVER VALVE: OPEN
VACUUM PUMP
Duty control
EVAP CANISTER
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER PURGE VALVE 1
INTAKE AIR
To intake manifold
Duty control
FUEL TANK
Purge is introduced in the intake manifold through the purge line

The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine. The EVAP system is a system which has this EVAP canister purge valve equipped parallel and adjusts the amount of vapor by driving the EVAP canister purge valve 2 when the EVAP canister purge valve 1 is fully opened.

<STEP 1>

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the EVAP leak check module pressure sensor during purge flow (pulse method). If there are no pulsation with EVAP canister purge valve 1, it judges pulsation by switching to EVAP canister purge valve 2 drive in EVAP canister purge valve 1 drive area.

OK determination: If pulsation from EVAP canister purge valve 1 drive area and pulsation from EVAP canister purge valve 2 area (EVAP canister purge valve 1 is in fully opened driving condition) are both present. (P0441 OK/P145E OK)

- P04F1 Purge flow OK
- P04DF EVAP canister purge valve 1 stuck Open OK
- P04AE EVAP canister purge valve 2 stuck Open OK

NG determination: If pulsation from EVAP canister purge valve 1 drive area is not present but pulsation from EVAP canister purge valve 2 drive is present. (P0441 NG/P145E OK)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.
- In this case, classify the failed part according to <STEP 2>.

NG determination: If pulsation from EVAP canister purge valve 2 drive area is not present but pulsation from EVAP canister purge valve 1 drive is present. (P0441 OK/P145E NG)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.

NG determination: If pulsation from EVAP canister purge valve 1 and EVAP canister purge valve 2 drive area is not present. (P0441 NG/P145E NG)

- P04F1 Purge flow NG

<STEP 2>

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 1 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04DF EVAP canister purge valve 1 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 2 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04AE EVAP canister purge valve 2 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	9.3 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1] before EVAP purge control starts	104 deg.F (40 deg.C)	-
MAP value [MAP Sensor (Hi Res)]	-	-9.3 kPa (-0.3 inHg, -70 mmHg)
Vehicle speed [Vehicle Speed]	-	2 mph (3 km/h)
12 volt battery voltage [Battery]	10.5 V	-
Fuel trim	0.69	1.47
EVAP canister purge valve 1 duty	25 %	90 %
EVAP canister purge valve 2 duty	-	0 %
Fuel feedback	Closed loop at stoichiometric	

[ ]: HDS Parameter

Malfunction Threshold

The pulses detected by the EVAP leak check module pressure sensor are 10 % or less for at least 9.3 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve 1 middle stuck
- EVAP canister purge valve 1 open stuck
- EVAP leak check module pressure sensor stuck
- EVAP system line clogged
- EVAP system line miss installed
- EVAP canister purge valve 1 failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine running for at least 30 seconds.
- Stop the engine and leave the vehicle for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

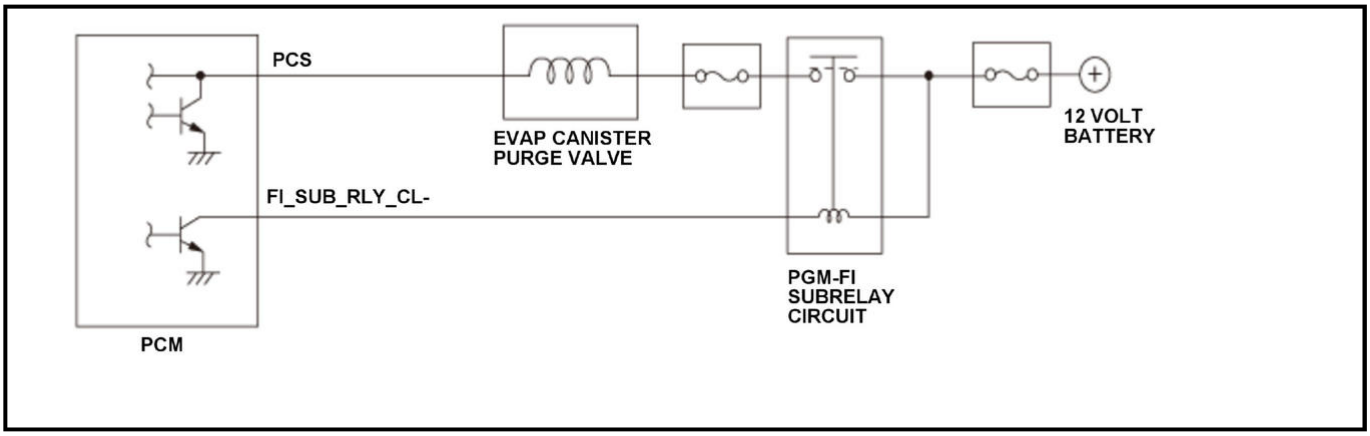
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0443

DTC P0443: Evaporative Emission (EVAP) Canister Purge Valve Circuit Malfunction

General Description



The evaporative emission (EVAP) canister purge valve is attached to the vacuum port between the intake manifold and the EVAP canister. When the engine coolant temperature is a specified value or less, or the output of the EVAP canister purge valve is not fully opened, the powertrain control module (PCM) turns off the EVAP canister purge valve. The PCM adjusts the amount of fuel vapor sent to the engine by controlling the EVAP canister purge valve and the EVAP canister purge valve duty cycle. When the return signal does not change according to the EVAP canister purge valve output for a set time, the PCM detects a malfunction and stores a DTC.

Condition	Minimum	Maximum
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

One of these symptom occurs:

- Symptom 1

  The return signal does not change according to the EVAP canister purge valve output for at least 1.5 seconds.

- Symptom 2

  When the return signal is fully opened and continues for at least 2.0 seconds while the EVAP canister purge valve output is 0 % (totally closed).

- Symptom 3

  When the return signal is fully closed and continues for at least 2.0 seconds while the EVAP canister purge valve output is 100 % (totally opened).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve PCS line open
- EVAP canister purge valve PCS line short to ground
- EVAP canister purge valve power supply line open
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

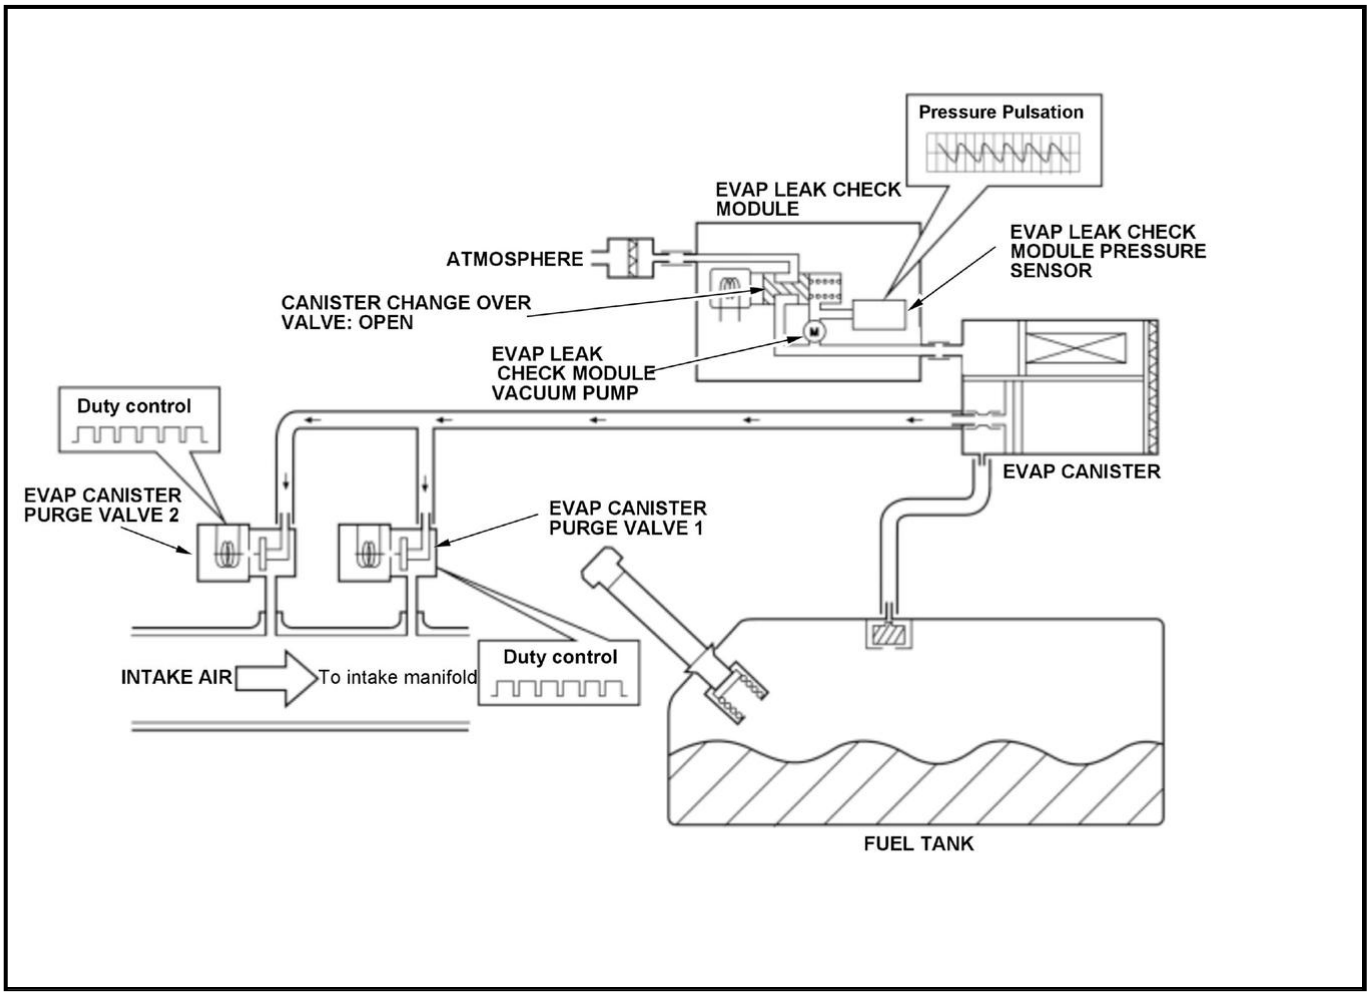
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

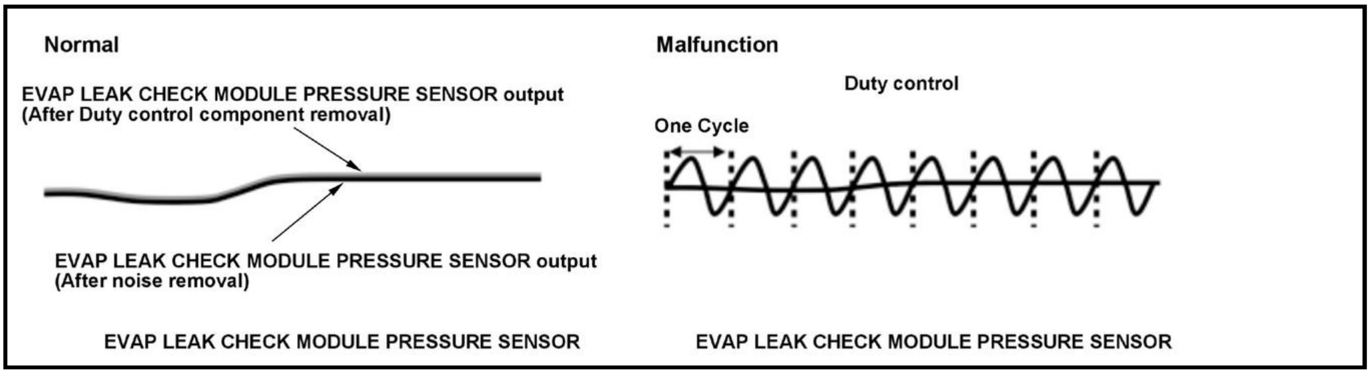
DTC P0451

DTC P0451: Evaporative Emission (EVAP) Leak Check Module Pressure Sensor Range/Performance

General Description



Pressure Pulsation
EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
ATMOSPHERE
CANISTER CHANGE OVER VALVE: OPEN
EVAP LEAK CHECK MODULE VACUUM PUMP
M
Duty control
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER
EVAP CANISTER PURGE VALVE 1
INTAKE AIR
To intake manifold
Duty control
FUEL TANK



The powertrain control module (PCM) monitors the evaporative emission (EVAP) leak check module pressure sensor output voltage. The EVAP leak check module pressure sensor output voltage rises as the fuel tank pressure increases. Conversely, the EVAP leak check module pressure sensor output voltage drops as the fuel tank pressure decreases. Rapid changes in the EVAP leak check module pressure sensor output voltage due to electrical noise or an intermittent open during the EVAP leak detection may cause incorrect leak detection, so abnormal output is monitored. If the EVAP leak check module pressure sensor output voltage change occurs for specified ratio within a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Duration	31 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	10 seconds	-
Engine coolant temperature [ECT Sensor 1]	104 deg.F (40 deg.C)	-

Fuel feedback	During deceleration	
Other	Purge-cut operation	

[ ]: HDS Parameter

Malfunction Threshold

The FTP sensor output voltage fluctuation occurs for more than 94 % within the set time at least 31 seconds.

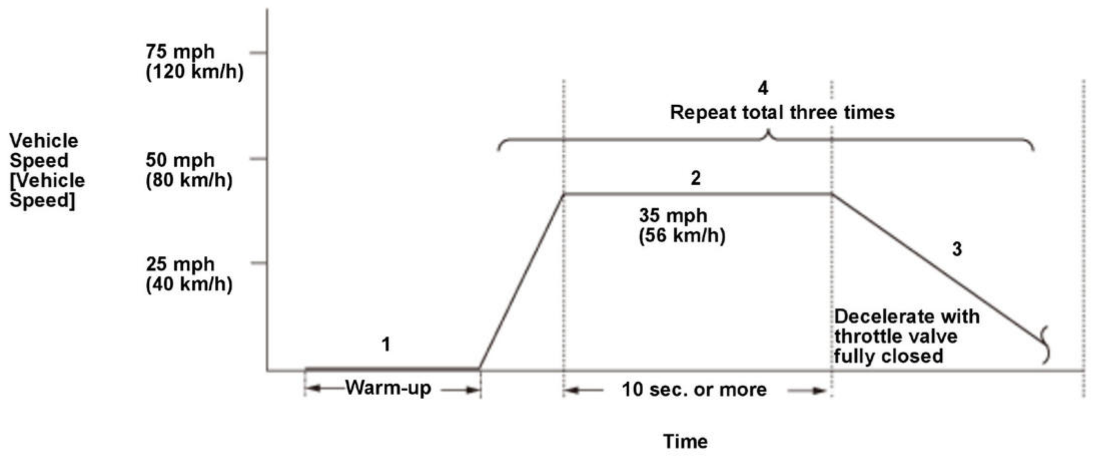
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP leak check module pressure sensor ELCMPA line layer open
- EVAP leak check module pressure sensor VCC line layer open
- EVAP leak check module pressure sensor SG line layer open
- EVAP leak check module pressure sensor electrical noise over lapped
- EVAP leak check module pressure sensor internal circuit failure

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine, and let it idle until the radiator fan comes on.

- Drive the vehicle at a steady speed 56 km/h (35 mph) for at least 10 seconds.
- Decelerate with the throttle valve fully closed.
- Repeat Driving Pattern steps 2 through 3, three times.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

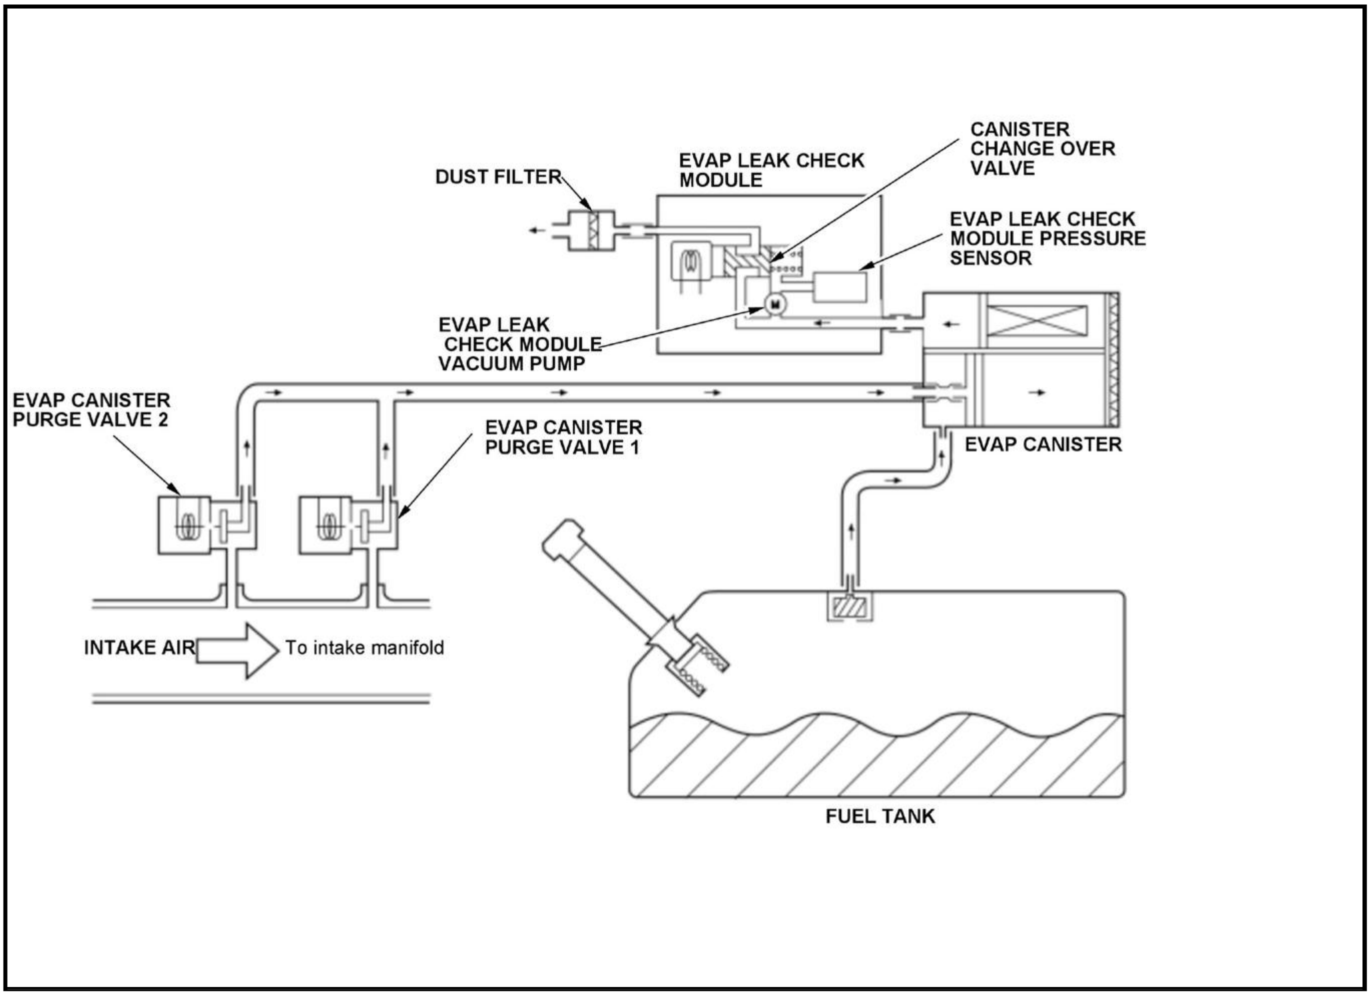
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P0456

DTC P0456: Evaporative Emission (EVAP) System Very Small Leak Detected

General Description



CANISTER CHANGE OVER VALVE
EVAP LEAK CHECK MODULE
DUST FILTER
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP LEAK CHECK MODULE VACUUM PUMP
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER PURGE VALVE 1
EVAP CANISTER
INTAKE AIR
To intake manifold
FUEL TANK

The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT Sensor 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere.

EVAP leak check module operation flow

- Reference pressure measurement: Malfunction check in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction: Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement: Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the EVAP leak check module vacuum pump during detection.

Reference pressure is the pressure reduction by the reference orifice (#40 equivalent) in the EVAP leak check module used to check for leak by comparison with the system pressure reduction.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None

Duration	18 minutes 45 seconds or less
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the OFF (LOCK) mode	5 hours	-
PCM wake up radiator coolant temperature [ECT Sensor 2]	40.0 deg.F (4.4 deg.C)	95 deg.F (35 deg.C)
Barometric pressure [Baro Sensor]	76 kPa (569 mmHg, 22.5 inHg)	-
12 volt battery voltage [Battery]	10.5 V	-
Other	No refueling is required	

[ ]: HDS Parameter

Malfunction Threshold

When the fuel tank internal pressure is not near the barometric pressure.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP system leak (EVAP canister purge valve from fuel tank)

Confirmation Procedure

Operating Condition

- With the radiator coolant temperature [ECT Sensor 2] within the specified range, turn the vehicle to the READY TO DRIVE mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes 45 seconds.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

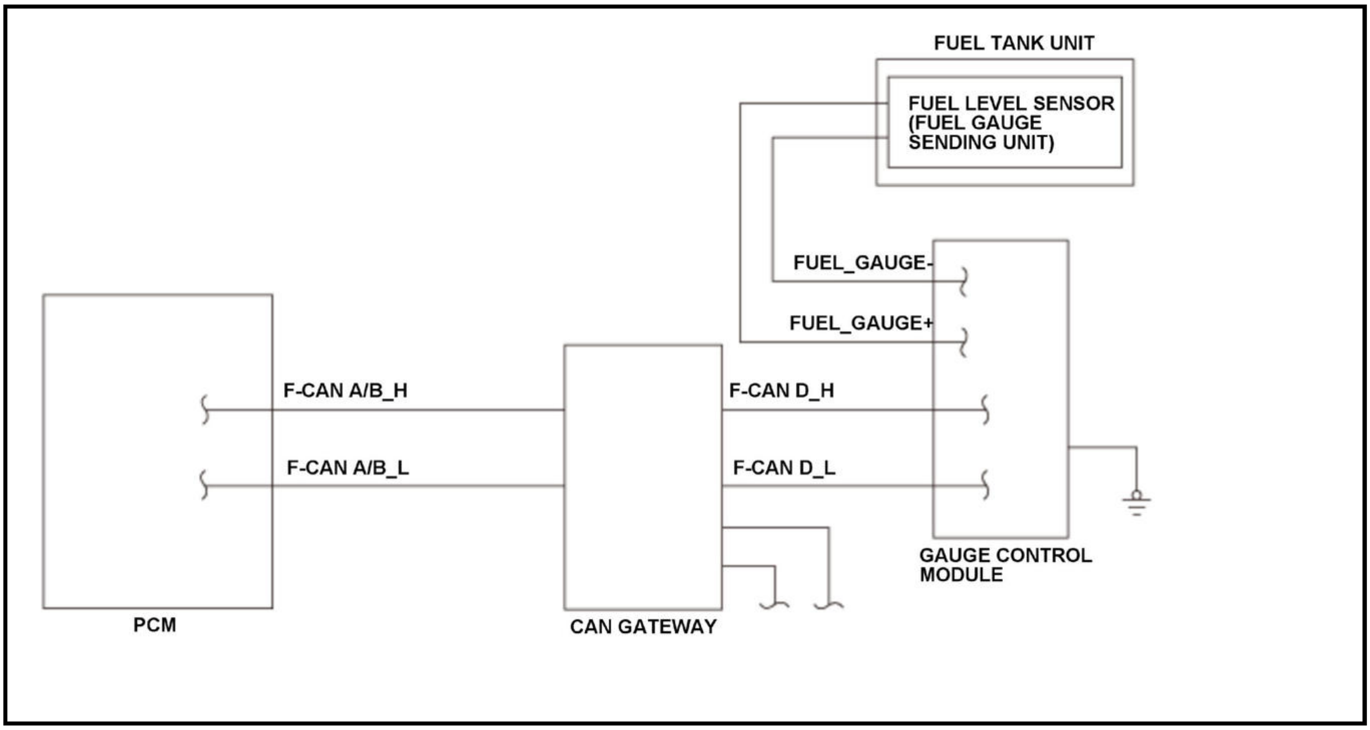
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P0460

DTC P0460: Fuel Level Sensor (Fuel Gauge Sending Unit) Out of Range

General Description



The fuel level sensor (fuel gauge sending unit) is incorporated into the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float to electrical signals as an output that corresponds fuel level variations in the fuel tank. The fuel level, which is indicated by the gauge control module, is sent to the powertrain control module (PCM) via the controller area network (CAN). If the received voltage information from the gauge control module is out of specified range for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The voltage information of the circuit between the fuel level sensor (fuel gauge sending unit) and the gauge control module which the PCM received from the gauge control module is out of specified range for at least 6.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel level sensor (fuel gauge sending unit) failure
- Gauge control module internal circuit failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

The fuel level sensor is incorporated with the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float into electrical signals that correspond to the fuel level, and it indicates the amount of fuel in the fuel tank. If the powertrain control module (PCM) receives no change in the fuel level sensor output after driving for a specified number of miles, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Mileage	125 miles (200 km)	-
Other	Test-drive on a flat road to avoid misdetection	
	No refueling is required	

Malfunction Threshold

The change in the fuel level sensor output [Fuel Level] is 3.5 % or less.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel gauge sending unit failure

Confirmation Procedure

Operating Condition

Drive for 125 miles (200 km) or more under Enable Conditions (see "Other") without refueling (accepts the vehicle to the OFF (LOCK) mode during the test drive).

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected in a certain drive cycle and a malfunction is detected in the same drive cycle, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

Failure
Fuel level sensor output change
Fuel level converted from fuel consumption

The fuel level sensor in the fuel tank measures the fuel level of the fuel tank. The powertrain control module (PCM) checks the change in the fuel level sensor output and then compares it to the calculated fuel level value. If the absolute difference between the fuel level sensor output change and the fuel consumption is a specified value for a specified duration when a certain fuel amount is consumed, the PCM detects a malfunction and stores a DTC.

Repeatedly filling the tank with less than the specified amount may lead to a mismatch in the actual fuel amount versus the calculated amount.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	0.1 second or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	520 milliseconds	-
Total driving distance	31.1 miles (50.0 km)	-
Fuel consumption after refueling	17.7 L (4.7 US gal)	-

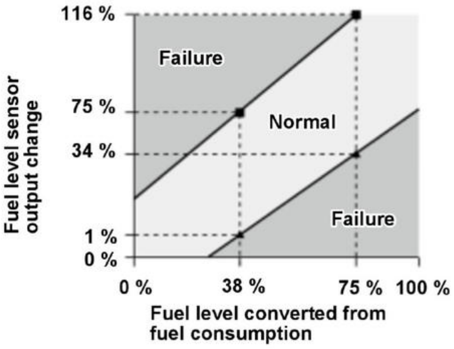
Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.5 V	-
Other	Test-drive on a flat road to avoid misdetection	

[ ]: HDS Parameter

Malfunction Threshold

Any of the condition occurs:

- The fuel level sensor output change is 75 % or more when the fuel level converted from the fuel consumption is 38 %.
- The fuel level sensor output change is 116 % or more when the fuel level converted from the fuel consumption is 75 %.
- The fuel level sensor output change is 1 % or less when the fuel level converted from the fuel consumption is 38 %.
- The fuel level sensor output change is 34 % or less when the fuel level converted from the fuel consumption is 75 %.



Possible Cause

NOTE:

- -

  The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- -

  Refueling the tank with less than the specified amount of 5 L (1.3 US gal) four times, may lead to a mismatch in the actual fuel amount versus the calculated amount. To prevent this, make sure that the customer fills the tank with the minimum specified amount during refueling. Refer to the How to Refuel section of the owner's manual for details.

- Fuel level sensor failure

Confirmation Procedure

Operating Condition

Drive the vehicle at least 31.1 miles (50.0 km) without refueling.

- The vehicle can be turned to the OFF (LOCK) mode during the test-drive.
- Test-drive on a flat road to avoid misdetection.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

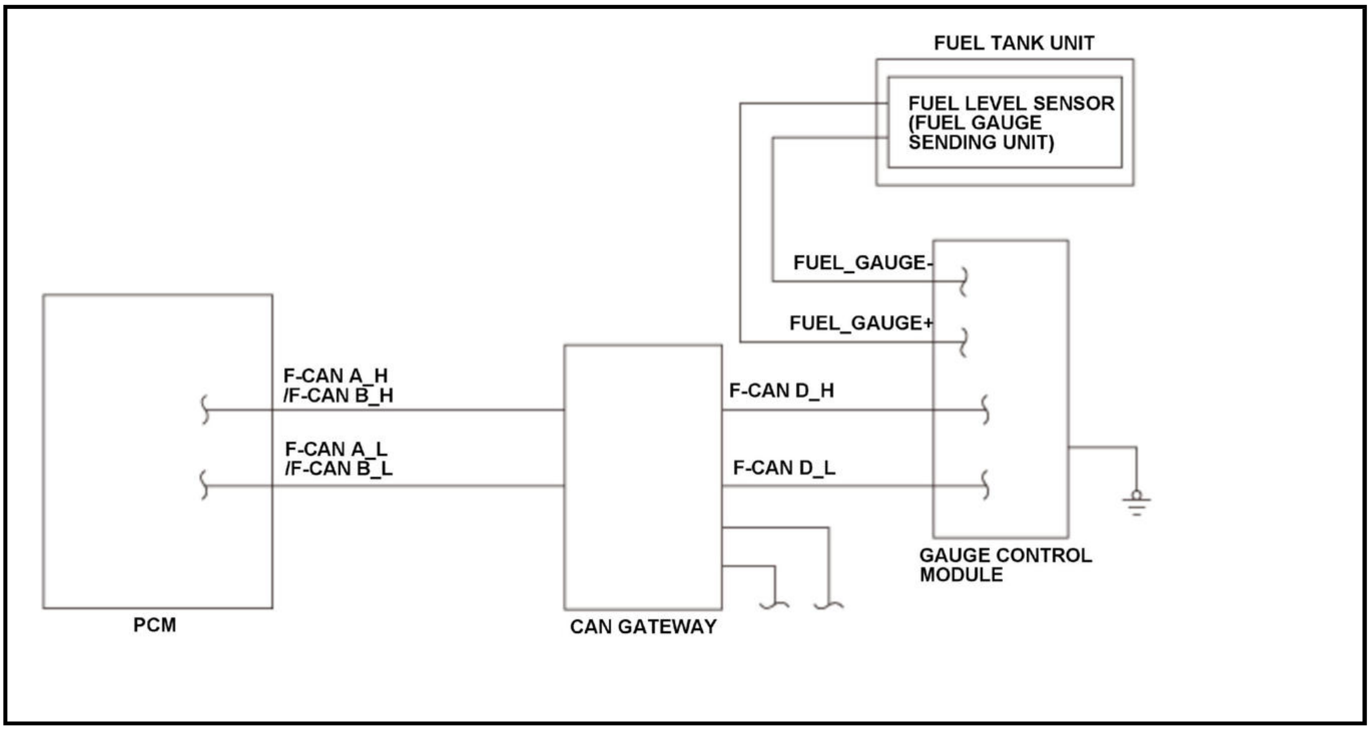
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P0462, P0463

DTC P0462: Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage

DTC P0463: Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage

General Description



The fuel level sensor (fuel gauge sending unit) is incorporated into the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float to electrical signals as an output that corresponds fuel level variations in the fuel tank. The fuel level, which is indicated by the gauge control module, is sent to the powertrain control module (PCM) via the controller area network (CAN). If the received voltage information from the gauge control module is high or low for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.0 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

DTC: P0462

The voltage information of the circuit between the fuel level sensor (fuel gauge sending unit) and the gauge control module which the PCM received from the gauge control module is low for at least 5 seconds.

DTC: P0463

The voltage information of the circuit between the fuel level sensor (fuel gauge sending unit) and the gauge control module which the PCM received from the gauge control module is high for at least 5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0462

- Fuel level sensor (fuel gauge sending unit) FUEL_GAUGE+ line short to ground

DTC: P0463

- Fuel level sensor (fuel gauge sending unit) FUEL_GAUGE+ line open
- Fuel level sensor (fuel gauge sending unit) FUEL_GAUGE- line open

Common

- Fuel level sensor (fuel gauge sending unit) failure
- Gauge control module internal circuit failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

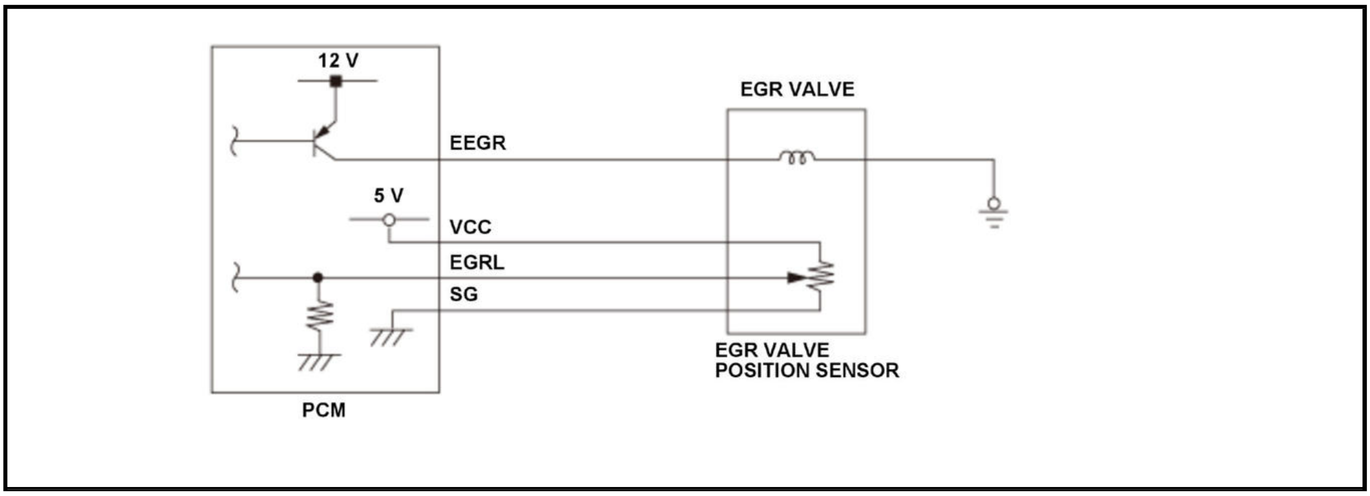
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P046C

DTC P046C: Exhaust Gas Recirculation (EGR) Valve Position Sensor Out of Range

General Description



The powertrain control module (PCM) controls the exhaust gas recirculation (EGR) valve opening. The system includes the EGR actuator, the EGR valve, the EGR valve position sensor and the PCM. The EGR valve position sensor is a semiconductor type, and it is attached to the EGR valve and shaft to determine EGR valve position. The EGR valve position signal from the EGR valve position sensor is transmitted to the PCM for target position feedback control. If the EGR valve position sensor output voltage is a specified value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

The EGR valve position sensor output voltage [EGR valve position sensor (EGR VLS)] is 4.41 V or more for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EGR valve position sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

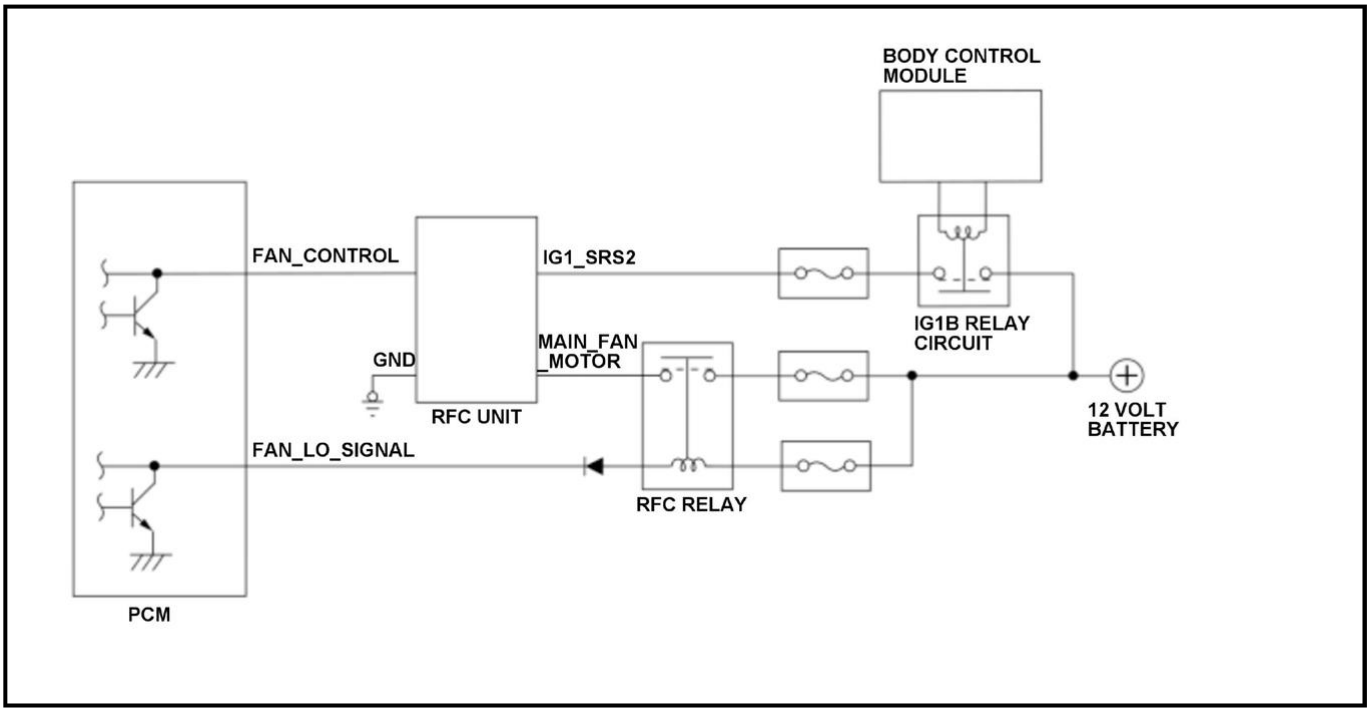
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0480

DTC P0480: Radiator Fan Control (RFC) System Malfunction

General Description



The radiator fan control (RFC) unit cools the radiator and the A/C condenser by controlling the cooling fan motor. The powertrain control module (PCM) communicates with the RFC unit using the pulse-width modulation (PWM) signal. The PCM sends drive command to the RFC unit via the FAN_CONTROL line using the PWM signal according to the condition of the vehicle. When a malfunction in the system is detected by self-diagnosis, the RFC unit makes FAN_CONTROL line signal output to GND. When the PCM cannot receive the PWM signal via the FAN_CONTROL line for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	12 seconds or more
DTC Type	Two drive cycles, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the PCM is activated	2 seconds	-
12 volt battery voltage [Battery]	10 V	18 V
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

The PCM cannot receive PWM signal from the RFC unit via the FAN_CONTROL line for at least 12 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- RFC unit MAIN_FAN_MOTOR line open
- RFC unit GND line open
- RFC unit FAN_CONTROL line open
- RFC unit FAN_CONTROL line short
- RFC relay stuck off
- RFC unit failure
- PCM failure

Confirmation Procedure

Operating Condition

None.

With the HDS

Select the RADIATOR FAN in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

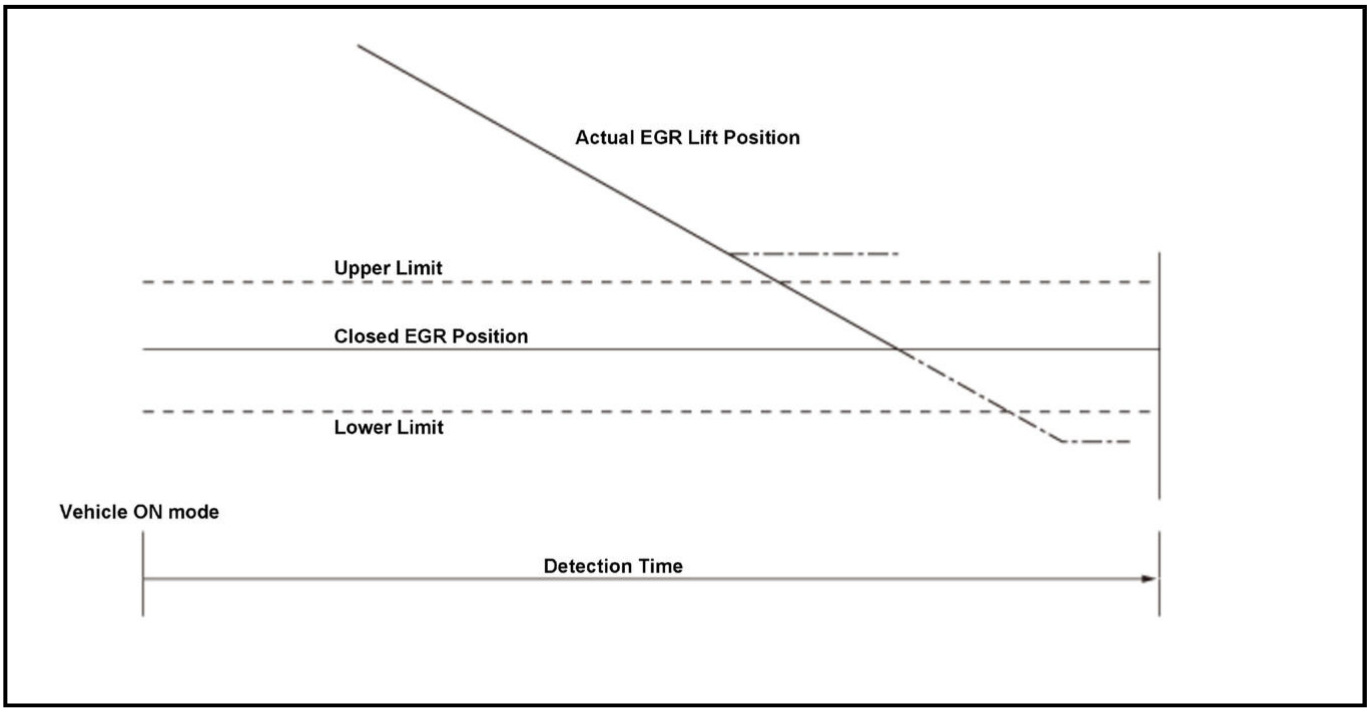
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P049D

DTC P049D: Exhaust Gas Recirculation (EGR) Control Position Exceeded Learning Limit

General Description



The powertrain control module (PCM) controls the exhaust gas recirculation (EGR) valve opening. The system includes the EGR actuator, the EGR valve, the EGR valve position sensor, and the PCM. The EGR valve position sensor is a semiconductor type, and it is attached to the EGR valve and shaft to determine EGR valve position. The EGR valve position signal from the EGR valve position sensor is transmitted to the PCM for target position feedback control. The PCM transmits a signal to the EGR actuator and moves the EGR valve to the fully closed position to register the EGR valve fully closed position when the vehicle is turned to the ON mode or during EGR operation is not in progress. If the registration of the EGR valve fully closed position does not complete within a predetermined time or the registered value is out of predetermined range, the PCM detects a malfunction in the EGR system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The registered value is 0.093 in (2.36 mm) or more, or -0.083 in (-2.11 mm) or less after the registration of the EGR valve fully closed position is completed.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EGR actuator EEGR line failure
- EGR actuator ground line failure
- EGR actuator failure
- EGR valve position sensor failure

- EGR valve failure
- PCM failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

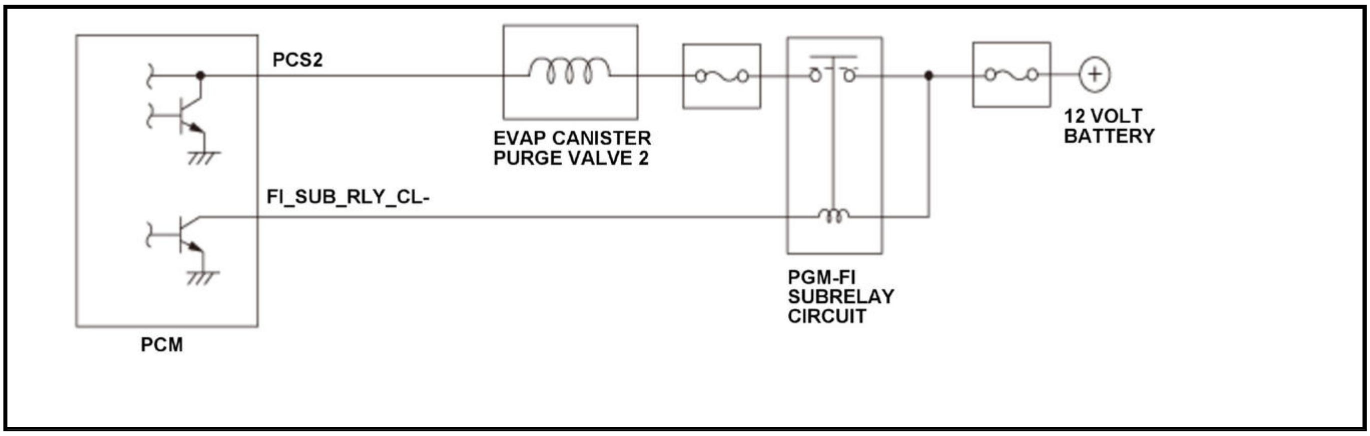
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P04AB

DTC P04AB: Evaporative Emission (EVAP) Canister Purge Valve Circuit Malfunction 2

General Description



Evaporative emission (EVAP) canister purge valve 2 is attached to the vacuum port between the intake manifold and the EVAP canister. When the engine coolant temperature is a specified value or less, or the output of EVAP canister purge valve 2 is not fully opened, the powertrain control module (PCM) turns off EVAP canister purge valve 2. The PCM adjusts the amount of fuel vapor sent to the engine by controlling EVAP canister purge valve 2 and the EVAP canister purge valve 2 duty cycle. When the return signal does not change according to the EVAP canister purge valve 2 output for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

[ ]: HDS Parameter

Malfunction Threshold

One of these symptom occurs:

- Symptom 1

  The return signal does not change according to the EVAP canister purge valve 2 output for at least 1.5 seconds.

- Symptom 2

  When the return signal is fully opened and continues for at least 2.0 seconds while the EVAP canister purge valve 2 output is 0 % (totally closed).

- Symptom 3

  When the return signal is fully closed and continues for at least 2.0 seconds while the EVAP canister purge valve 2 output is 100 % (totally opened).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve 2 PCS2 line open
- EVAP canister purge valve 2 PCS2 line short to ground
- EVAP canister purge valve 2 power supply line open
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

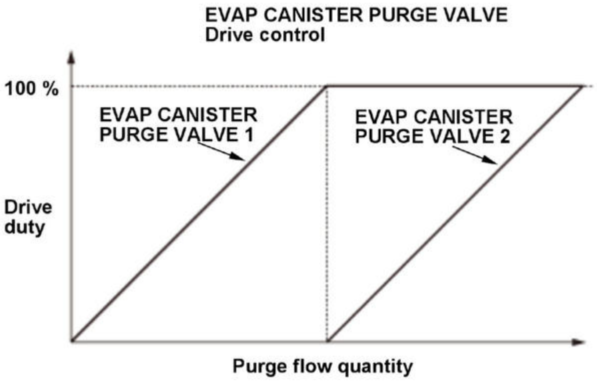
Conditions for clearing the DTC

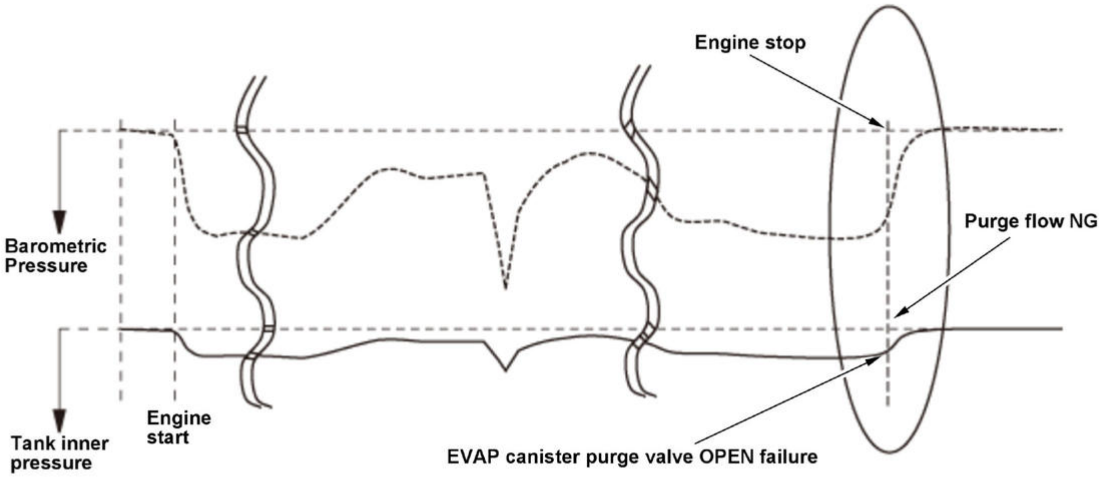
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P04AE

DTC P04AE: Evaporative Emission (EVAP) System High Purge Flow Detected 2

General Description





The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine. The EVAP system is a system which has this EVAP canister purge valve equipped parallel and adjusts the amount of vapor by driving the EVAP canister purge valve 2 when the EVAP canister purge valve 1 is fully opened.

<STEP 1>

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the EVAP leak check module pressure sensor during purge flow (pulse method). If there are no pulsation with EVAP canister purge valve 1, it judges pulsation by switching to EVAP canister purge valve 2 drive in EVAP canister purge valve 1 drive area.

OK determination: If pulsation from EVAP canister purge valve 1 drive area and pulsation from EVAP canister purge valve 2 area (EVAP canister purge valve 1 is in fully opened driving condition) are both present. (P0441 OK/P145E OK)

- P04F1 Purge flow OK
- P04DF EVAP canister purge valve 1 stuck Open OK
- P04AE EVAP canister purge valve 2 stuck Open OK

NG determination: If pulsation from EVAP canister purge valve 1 drive area is not present but pulsation from EVAP canister purge valve 2 drive is present. (P0441 NG/P145E OK)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.
- In this case, classify the failed part according to <STEP 2>.

NG determination: If pulsation from EVAP canister purge valve 2 drive area is not present but pulsation from EVAP canister purge valve 1 drive is present. (P0441 OK/P145E NG)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.

NG determination: If pulsation from EVAP canister purge valve 1 and EVAP canister purge valve 2 drive area is not present. (P0441 NG/P145E NG)

- P04F1 Purge flow NG

<STEP 2>

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 1 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04DF EVAP canister purge valve 1 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 2 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04AE EVAP canister purge valve 2 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	P145E is judged as NG
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Low load duration time	10 seconds	-
Wait for stability after the engine stopped	10 seconds	-

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1] before EVAP purge control starts	104 deg.F (40 deg.C)	-

[ ]: HDS parameter

Malfunction Threshold

The output from the EVAP leak check module pressure sensor is 0.2 kPa (0.07 inHg, 2 mmHg) or more for at least 10 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve 2 open stuck
- EVAP canister purge valve 2 middle stuck

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Let the engine running for at least 30 seconds.
- Stopp the engine and leave the vehicle for at least 10 seconds.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

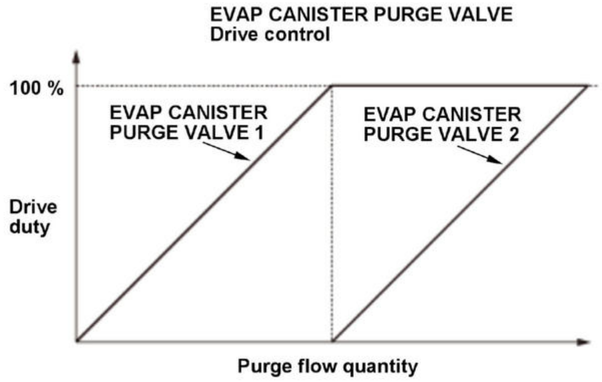
Conditions for clearing the DTC

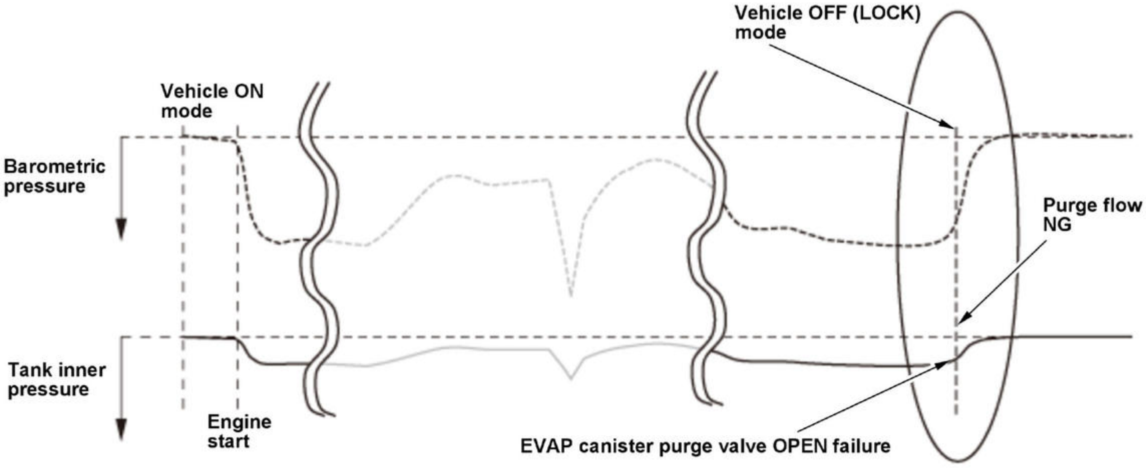
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P04DF

DTC P04DF: Evaporative Emission (EVAP) System High Purge Flow Detected

General Description





The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine. The EVAP system is a system which has this EVAP canister purge valve equipped parallel and adjusts the amount of vapor by driving the EVAP canister purge valve 2 when the EVAP canister purge valve 1 is fully opened.

<STEP 1>

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the EVAP leak check module pressure sensor during purge flow (pulse method). If there are no pulsation with EVAP canister purge valve 1, it judges pulsation by switching to EVAP canister purge valve 2 drive in EVAP canister purge valve 1 drive area.

OK determination: If pulsation from EVAP canister purge valve 1 drive area and pulsation from EVAP canister purge valve 2 area (EVAP canister purge valve 1 is in fully opened driving condition) are both present. (P0441 OK/P145E OK)

- P04F1 Purge flow OK
- P04DF EVAP canister purge valve 1 stuck OPEN OK

- P04AE EVAP canister purge valve 2 stuck OPEN OK

NG determination: If pulsation from EVAP canister purge valve 1 drive area is not present but pulsation from EVAP canister purge valve 2 drive is present. (P0441 NG/P145E OK)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.
- In this case, classify the failed part according to <STEP 2>

NG determination: If pulsation from EVAP canister purge valve 2 drive area is not present but pulsation from EVAP canister purge valve 1 drive is present. (P0441 OK/P145E NG)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.

NG determination: If pulsation from EVAP canister purge valve 1 and EVAP canister purge valve 2 drive area is not present. (P0441 NG/P145E NG)

- P04F1 Purge flow NG

<STEP 2>

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 1 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04DF EVAP canister purge valve 1 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 2 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04AE EVAP canister purge valve 2 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	P0441 is judged as NG
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Low load duration time	10 seconds	-
Wait for stability after the engine is stopped	10 seconds	-
Engine coolant temperature [ECT Sensor 1] before EVAP purge control starts	104 deg.F (40 deg.C)	-

[ ]: HDS Parameter

Malfunction Threshold

The output from the FTP sensor [FTP Sensor] is 0.27 kPa (2.00 mmHg, 0.079 inHg) or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve 1 open stuck
- EVAP canister purge valve 1 middle stuck

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Let the engine running for at least 30 seconds.
- Stop the engine and leave the vehicle for at least 10 seconds.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

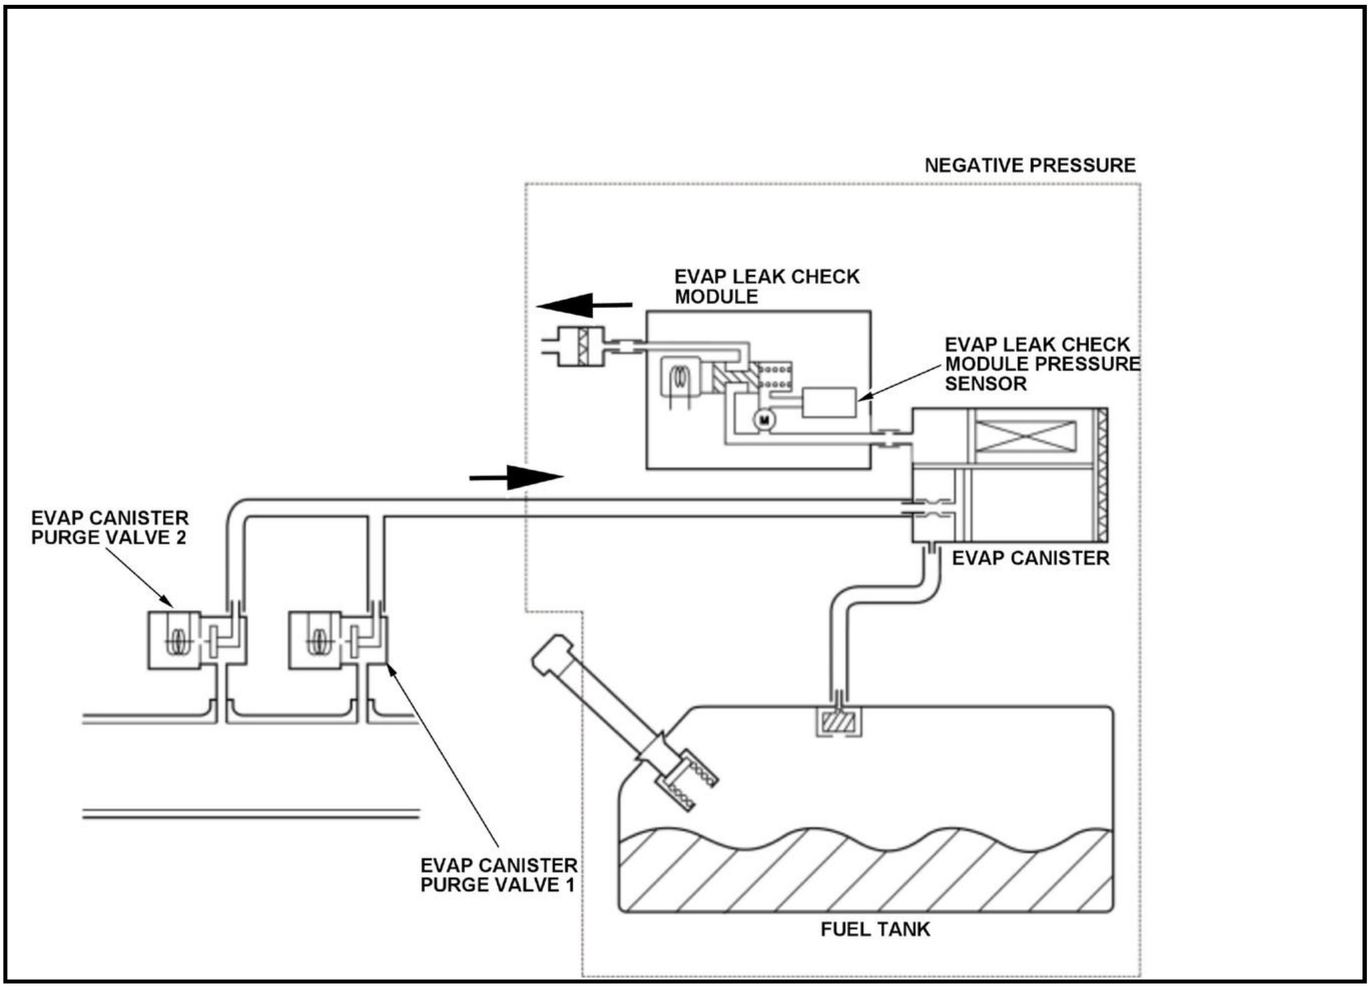
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

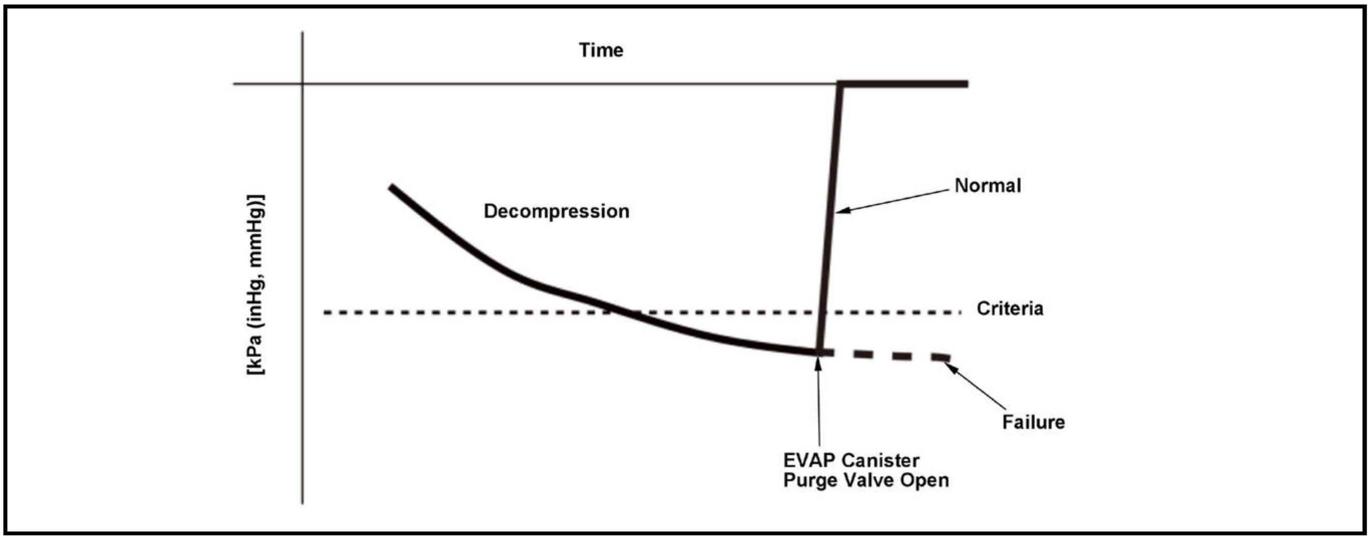
DTC P04E0

DTC P04E0: Evaporative Emission (EVAP) Canister Purge Valve Stuck Closed

General Description



NEGATIVE PRESSURE
EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER
EVAP CANISTER PURGE VALVE 1
FUEL TANK



Negative pressure is created in the evaporative emission (EVAP) system by reducing the pressure in the EVAP leak check module. When the EVAP canister purge valve is opened under that state, the air is sucked in through the intake manifold to cause the EVAP system pressure to be recovered to barometric pressure. The powertrain control module (PCM) detects a malfunction and stores a DTC when the prescribed change in the pressure toward positive pressure has not occurred after a given period of time of opening the EVAP canister purge valve.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	18 minutes 55 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	10 minutes	-
Elapsed time after the vehicle condition is turned to the OFF (LOCK) mode	5 hours	-
PCM wake up engine coolant temperature [ECT Sensor 2]	40 deg.F (5 deg.C)	95 deg.F (35 deg.C)
Barometric pressure[Baro Sensor]	76 kPa (22.5 inHg, 569 mmHg)	-
12 volt battery voltage [Battery]	10.5 V	-
Other	No refueling is required	

[ ]: HDS Parameter

Malfunction Threshold

When the change in the pressure is 0.3 kPa (0.11 inHg, 3 mmHg) or less toward positive pressure continuously for 18 minutes 55 seconds or more after opening the EVAP canister purge valve.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve close stuck

Confirmation Procedure

Operating Condition

- With the engine coolant temperature [ECT Sensor 2] within the specified range, turn the vehicle to the ON mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes 55 seconds.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select the EVAP Purge Flow Check Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

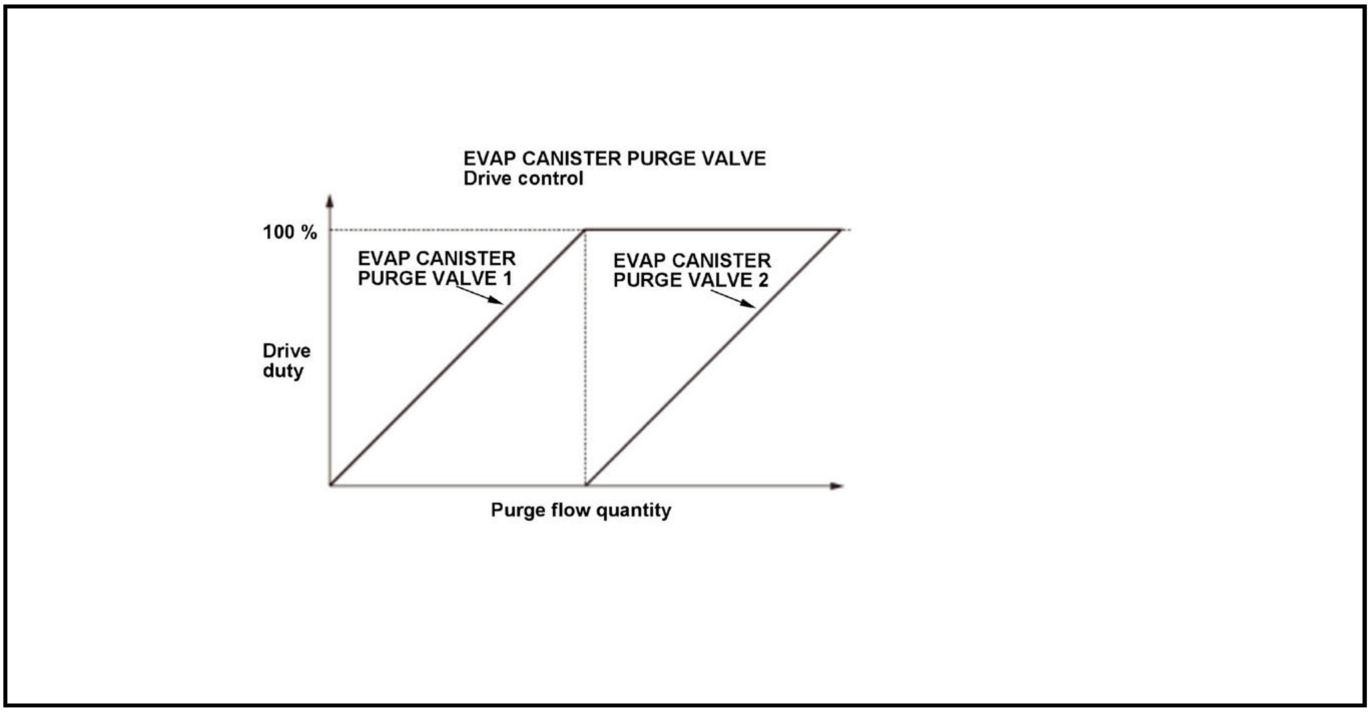
Conditions for clearing the DTC

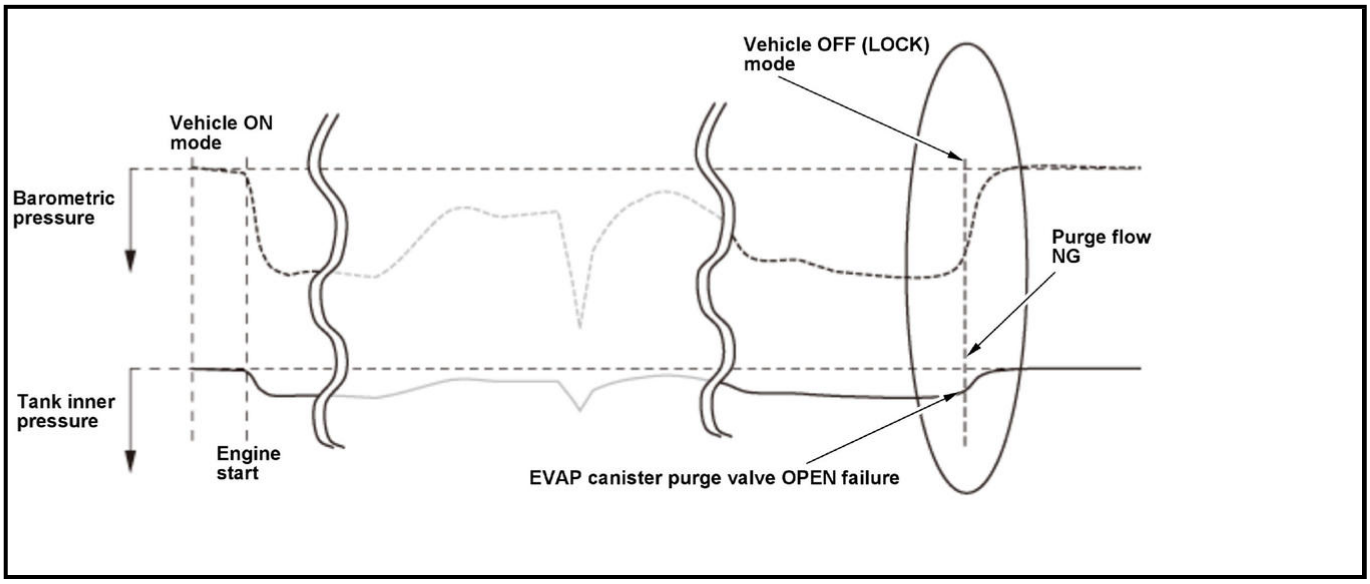
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P04F1

DTC P04F1: Evaporative Emission (EVAP) System Low Purge Flow Detected

General Description





The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine. The EVAP system is a system which has this EVAP canister purge valve equipped parallel and adjusts the amount of vapor by driving the EVAP canister purge valve 2 when the EVAP canister purge valve 1 is fully opened.

<STEP 1>

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the EVAP leak check module pressure sensor during purge flow (pulse method). If there are no pulsation with EVAP canister purge valve 1, it judges pulsation by switching to EVAP canister purge valve 2 drive in EVAP canister purge valve 1 drive area.

OK determination: If pulsation from EVAP canister purge valve 1 drive area and pulsation from EVAP canister purge valve 2 area (EVAP canister purge valve 1 is in fully opened driving condition) are both present. (P0441 OK/P145E OK)

- P04F1 Purge flow OK
- P04DF EVAP canister purge valve 1 stuck OPEN OK
- P04AE EVAP canister purge valve 2 stuck OPEN OK

NG determination: If pulsation from EVAP canister purge valve 1 drive area is not present but pulsation from EVAP canister purge valve 2 drive is present. (P0441 NG/P145E OK)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.
- In this case, classify the failed part according to <STEP 2>.

NG determination: If pulsation from EVAP canister purge valve 2 drive area is not present but pulsation from EVAP canister purge valve 1 drive is present. (P0441 OK/P145E NG)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.

NG determination: If pulsation from EVAP canister purge valve 1 and EVAP canister purge valve 2 drive area is not present. (P0441 NG/P145E NG)

- P04F1 Purge flow NG

<STEP 2>

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 1 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04DF EVAP canister purge valve 1 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 2 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04AE EVAP canister purge valve 2 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	P0441 is judged as NG
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Low load duration time	10 seconds	-
Wait for stability after the vehicle condition is turned to the OFF (LOCK) mode	10 seconds	-
Engine coolant temperature [ECT Sensor 1] before EVAP purge control starts	104 deg.F (40 deg.C)	-

[ ]: HDS Parameter

Malfunction Threshold

The output from the FTP sensor [FTP Sensor] is less than 0.27 kPa (2.00 mmHg, 0.079 inHg).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve 1 close stuck
- EVAP canister purge valve 2 close stuck
- EVAP canister purge valve 1 middle stuck
- EVAP canister purge valve 2 middle stuck
- EVAP leak check module pressure sensor stuck
- EVAP system line clogged
- EVAP system line misinstalled

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine running for at least 30 seconds.
- Stop the engine and leave the vehicle for at least 10 seconds.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

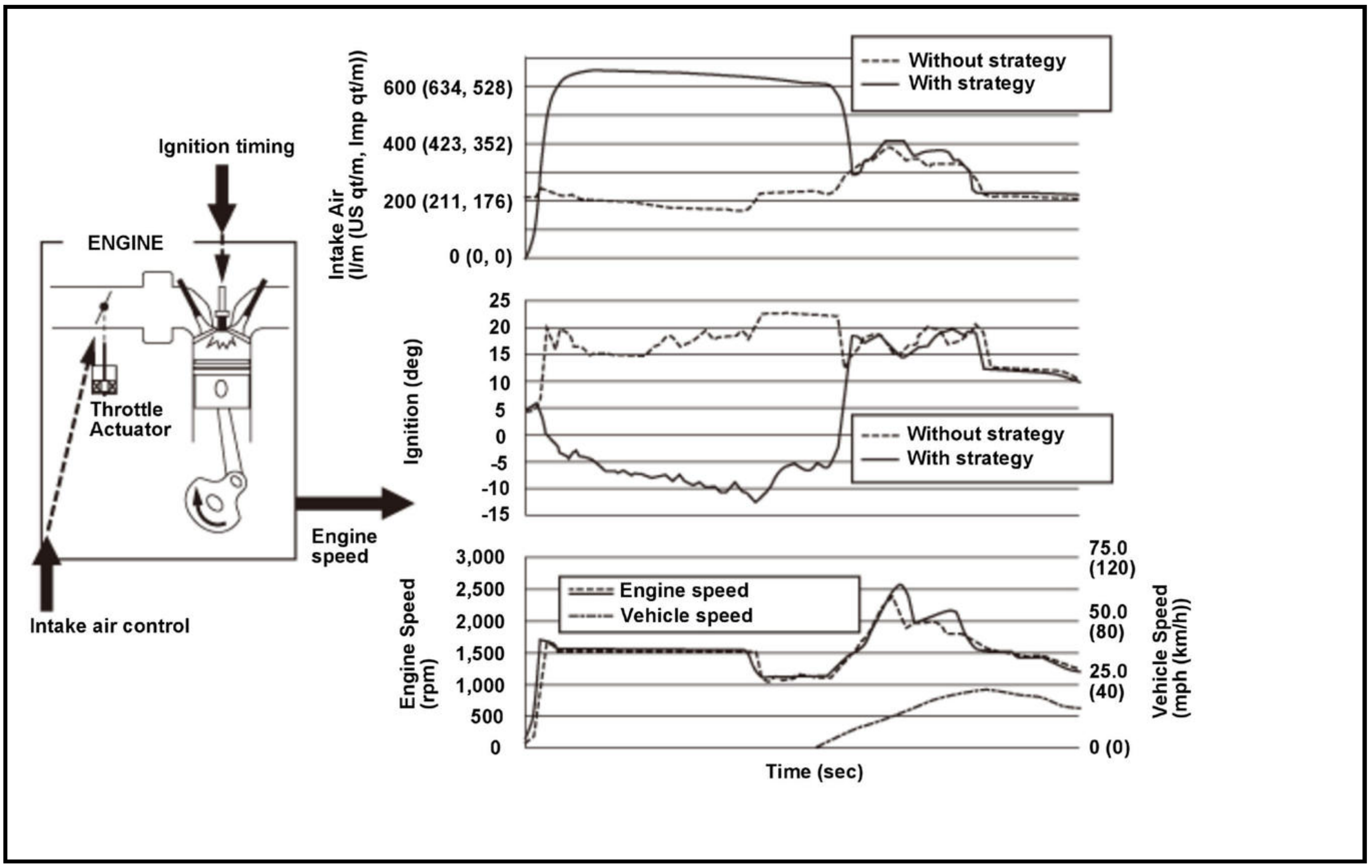
Conditions for clearing the DTC

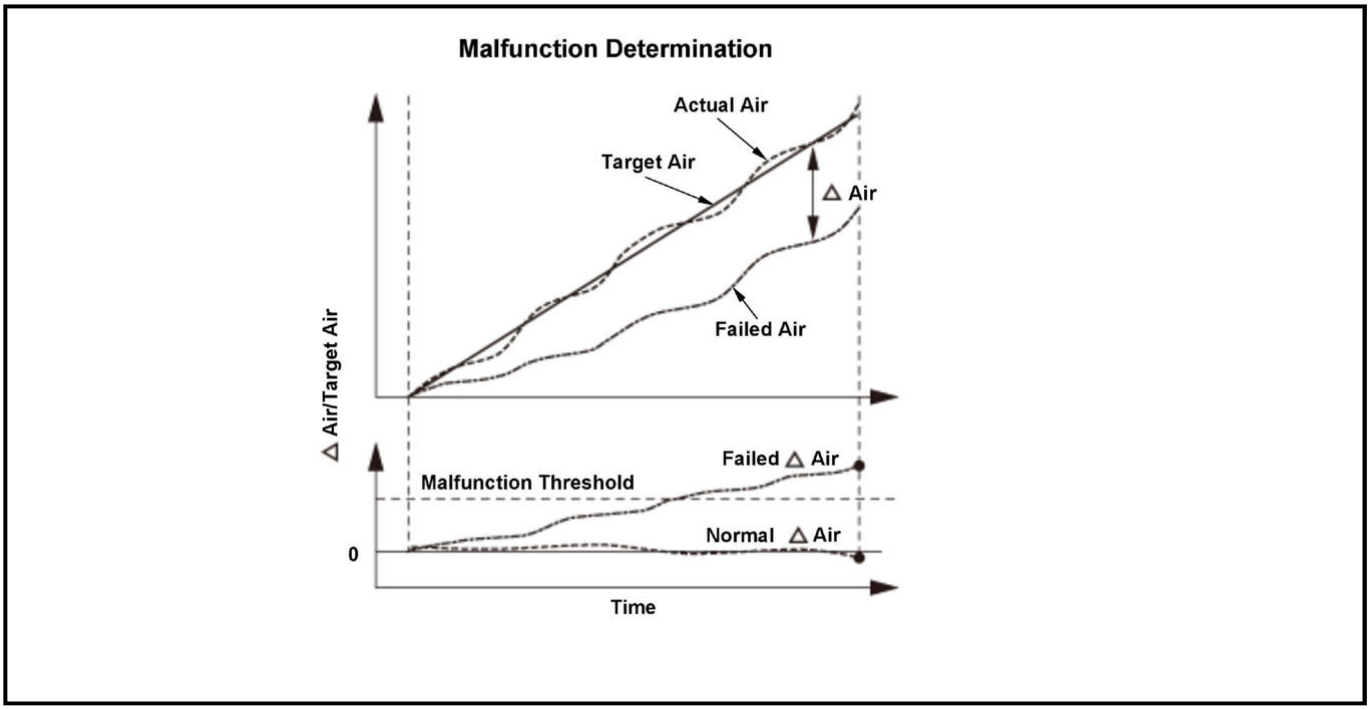
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P050A

DTC P050A: Cold Start Idle Air Control System Performance Problem

General Description





The quick warm-up system supplies additional air and retards the ignition timing when the engine is cold to activate the catalytic converter as quickly as possible. When the actual amount of air is less than the target amount, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Battery module capacity	20 %	-
Engine coolant temperature [ECT Sensor 1]	14 deg.F (-10 deg.C)	176 deg.F (80 deg.C)
Throttle position	Fully closed	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

The total airflow is decreased by a factor of 0.50 for at least 10 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Intake air duct breakage
- Intake air duct misinstalled
- Air cleaner breakage
- Air cleaner damage
- Air cleaner clogged
- Mass airflow (MAF) sensor failure
- Intake air system clogged
- Intake air temperature (IAT) sensor 1 failure

Confirmation Procedure

Operating Condition

- Allow the engine to cool to an ambient engine coolant temperature [ECT Sensor 1] of 122 deg.F (50 deg.C) or less.
- Enter the maintenance mode, then start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

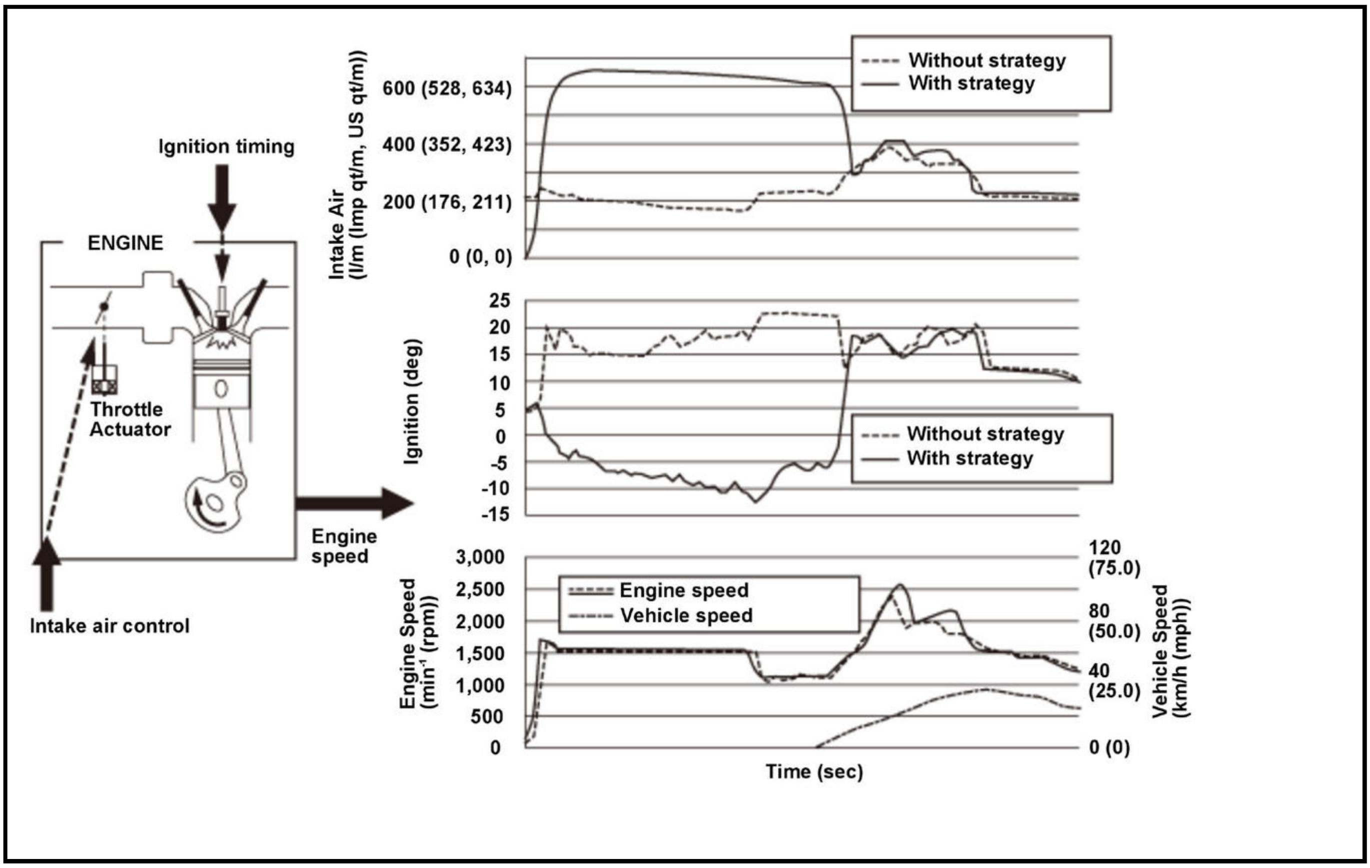
Conditions for clearing the DTC

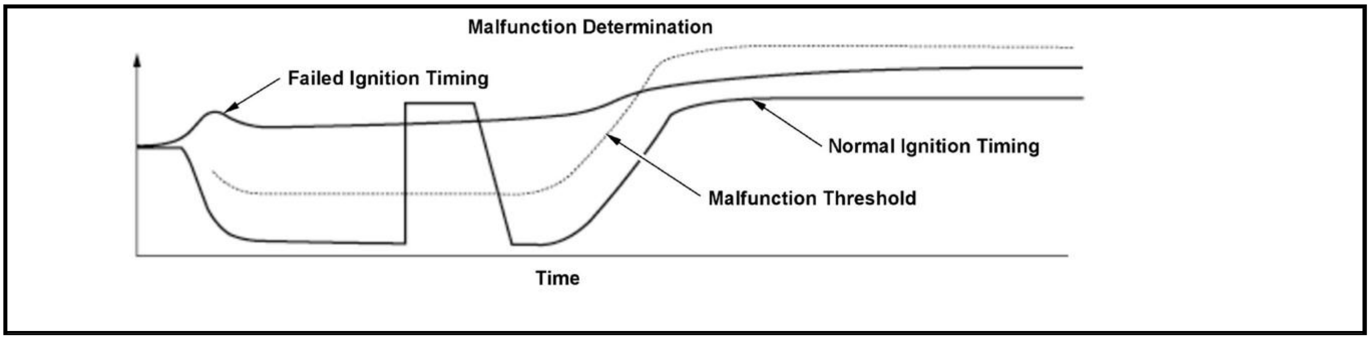
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P050B

DTC P050B: Cold Start Ignition Timing Control System Performance Problem

General Description





The quick warm-up system supplies additional air and retards the ignition timing when the engine is cold to activate the catalytic converter as quickly as possible. When the ignition timing is not retarded, and it continues for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	9.9 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	2.5 seconds	-
Engine coolant temperature [ECT SENSOR 1]	14 deg.F (-10 deg.C)	176 deg.F (80 deg.C)
Throttle position	Fully closed	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

The ignition timing deviation is 10 deg. or more for at least 9.9 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Intake air duct breakage
- Intake air duct misinstalled
- Air cleaner breakage
- Air cleaner damage
- Air cleaner clogged
- Mass airflow (MAF) sensor failure
- Engine coolant temperature (ECT) sensor 1 failure
- Ignition system failure

Confirmation Procedure

Operating Condition

- Leave the vehicle until the engine coolant temperature [ECT SENSOR 1] lowers to 122 deg.F (50 deg.C) or less.
- Enter the maintenance mode, then start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

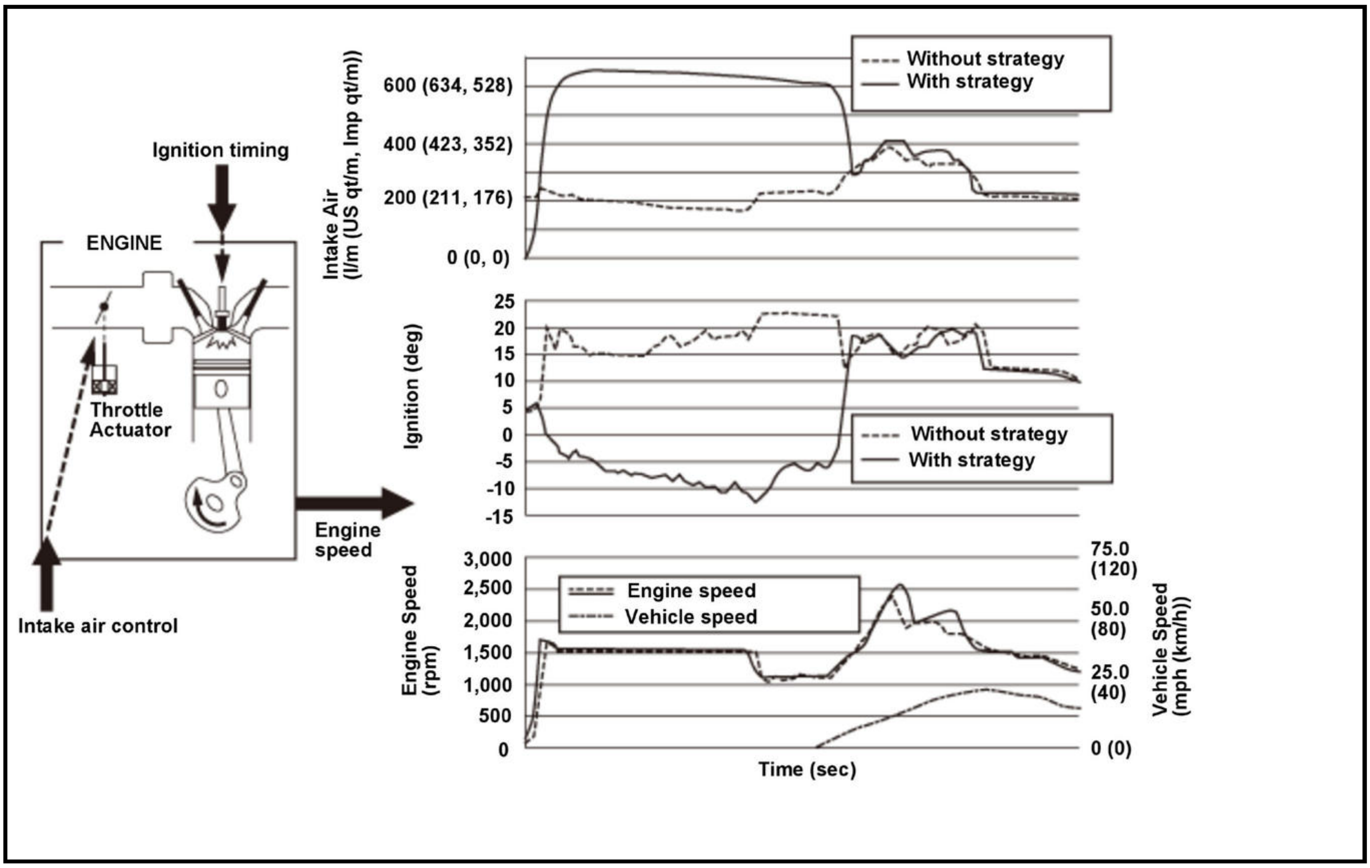
Conditions for clearing the DTC

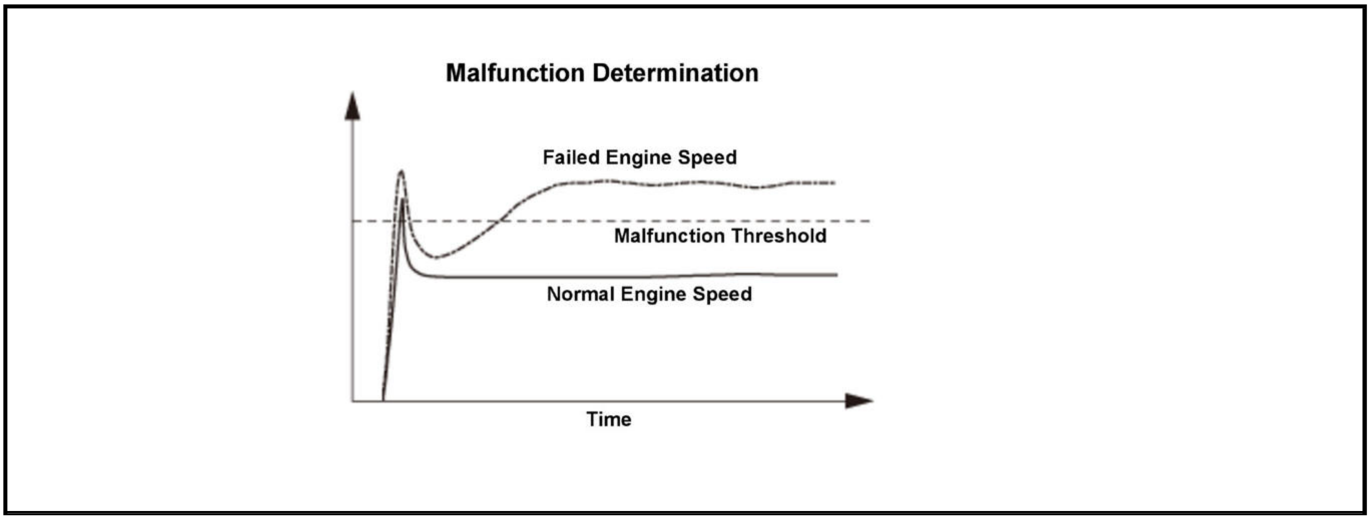
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P050D

DTC P050D: Cold Start Idle Speed Problem

General Description





The quick warm-up system supplies additional air and retards the ignition timing when the engine is cold to activate the catalytic converter as quickly as possible. When the actual engine speed is a specified fast idle value, and it continues for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None

Duration	3.5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	1.0 seconds	-
Battery module capacity	20 %	-
Engine coolant temperature [ECT Sensor 1]	14 deg.F (-10 deg.C)	176 deg.F (80 deg.C)
Throttle position	Fully closed	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

The engine speed [Engine Speed] is 2, 600 rpm or more for at least 3.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Intake air duct breakage
- Intake air duct misinstalled
- Air cleaner breakage
- Air cleaner damage
- Air cleaner clogged
- Mass airflow (MAF) sensor failure
- Generator motor failure

Confirmation Procedure

Operating Condition

- Allow the engine to cool to an ambient engine coolant temperature [ECT Sensor 1] of 122 deg.F (50 deg.C) or less.
- Enter the maintenance mode, then start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

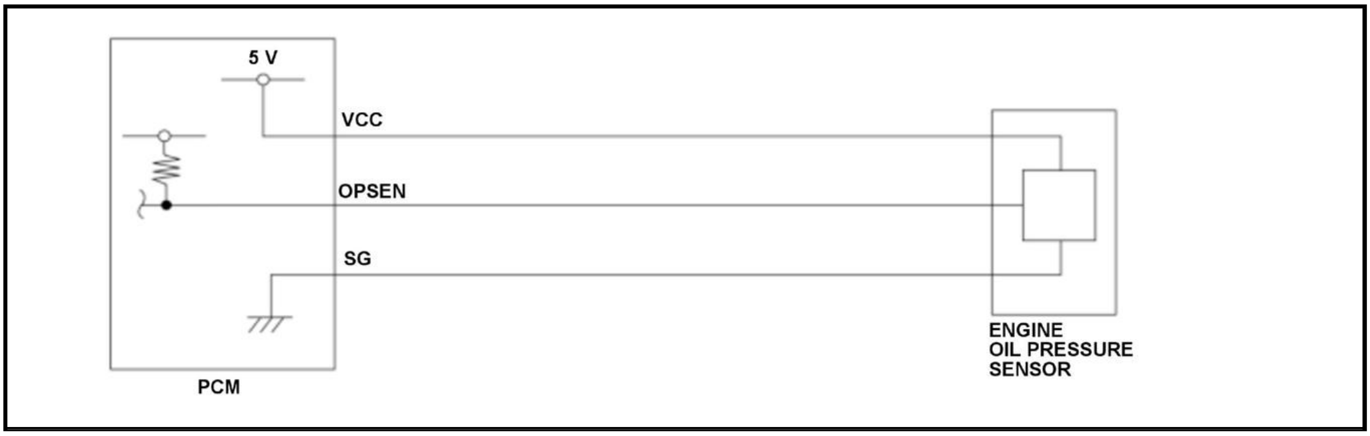
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P0522, P0523

DTC P0522: Engine Oil Pressure Sensor Circuit Low Voltage

DTC P0523: Engine Oil Pressure Sensor Circuit High Voltage

General Description



The engine oil pressure sensor detects engine oil pressure in the system. When the voltage from the engine oil pressure sensor is a set value for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL off

Enable Conditions

DTC: P0522

Condition	Minimum	Maximum
Barometric pressure[Baro Sensor]	70 kPa (520 mmHg, 20.5 inHg)	-

DTC: P0523

Condition	Minimum	Maximum
Engine coolant temperature[ECT Sensor 1]	104 deg.F (40 deg.C)	-
Engine speed[Engine Speed]	-	6, 000 rpm

[ ]: HDS Parameter

Malfunction Threshold

DTC: P0522

The engine oil pressure sensor output voltage [Rocker Arm Oil Pressure Sensor Voltage] is 0.18 V or less for at least 2.0 seconds.

DTC: P0523

The engine oil pressure sensor output voltage [Rocker Arm Oil Pressure Sensor Voltage] is 4.79 V or more for at least 2.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0522

- Engine oil pressure sensor VCC line open
- Engine oil pressure sensor OPSEN line short to ground

DTC: P0523

- Engine oil pressure sensor OPSEN line open
- Engine oil pressure sensor SG line open

Common

- Engine oil pressure sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

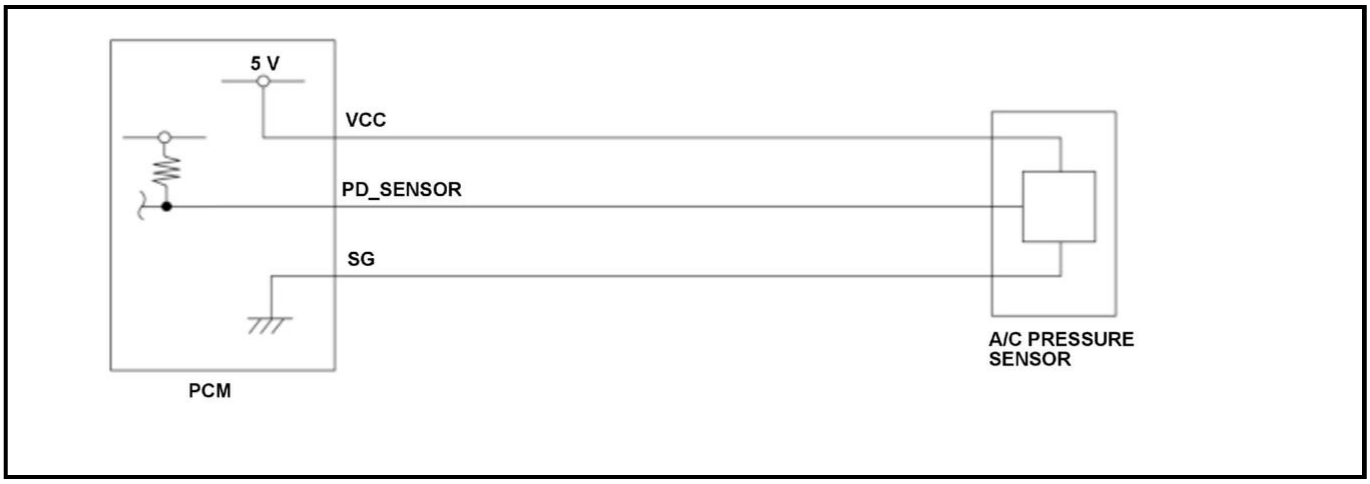
The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

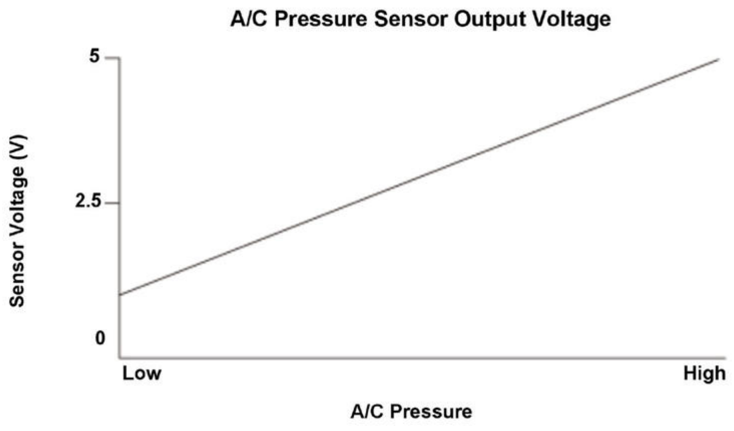
DTC P0532, P0533

DTC P0532: A/C Pressure Sensor Circuit Low Voltage

DTC P0533: A/C Pressure Sensor Circuit High Voltage

General Description





The A/C pressure sensor measures the change in the pressure of the air conditioning refrigerant. The signal from the A/C pressure sensor is low voltage at low pressure (when the air conditioning load is low) and high voltage at high pressure (when the air conditioning load is high). The powertrain control module (PCM) compares the expected voltage to the A/C pressure sensor output voltage. When the A/C pressure sensor output voltage is lower or higher than the expected voltage for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P0532

The A/C pressure sensor output voltage [A/C Pressure Sensor Voltage] is 0.24 V or less for at least 10 seconds.

DTC: P0533

The A/C pressure sensor output voltage [A/C Pressure Sensor Voltage] is 4.76 V or more for at least 10 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0532

- A/C pressure sensor VCC line open
- A/C pressure sensor PD_SENSOR line short to ground

DTC: P0533

- A/C pressure sensor PD_SENSOR line open
- A/C pressure sensor SG line open

Common

- A/C pressure sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

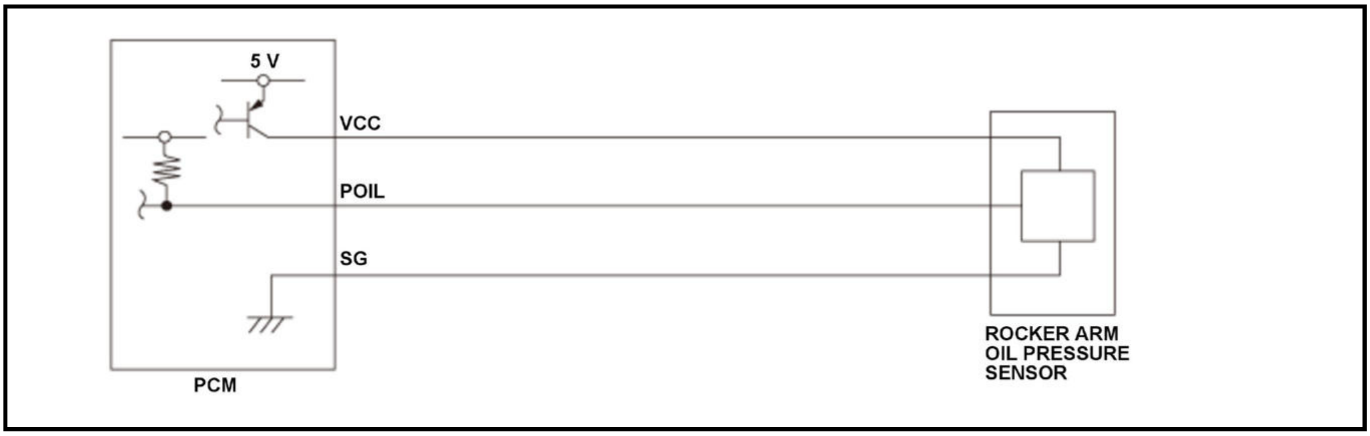
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P055B

DTC P055B: Rocker Arm Oil Pressure Sensor Out of Range

General Description



The rocker arm oil pressure sensor detects engine oil pressure in the VTEC system. When the voltage from the rocker arm oil pressure sensor is a set value for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The rocker arm oil pressure sensor output voltage [(Rocker Arm) Oil Pressure Sensor (B) Voltage] is 0.28 V or less for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Rocker arm oil pressure sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

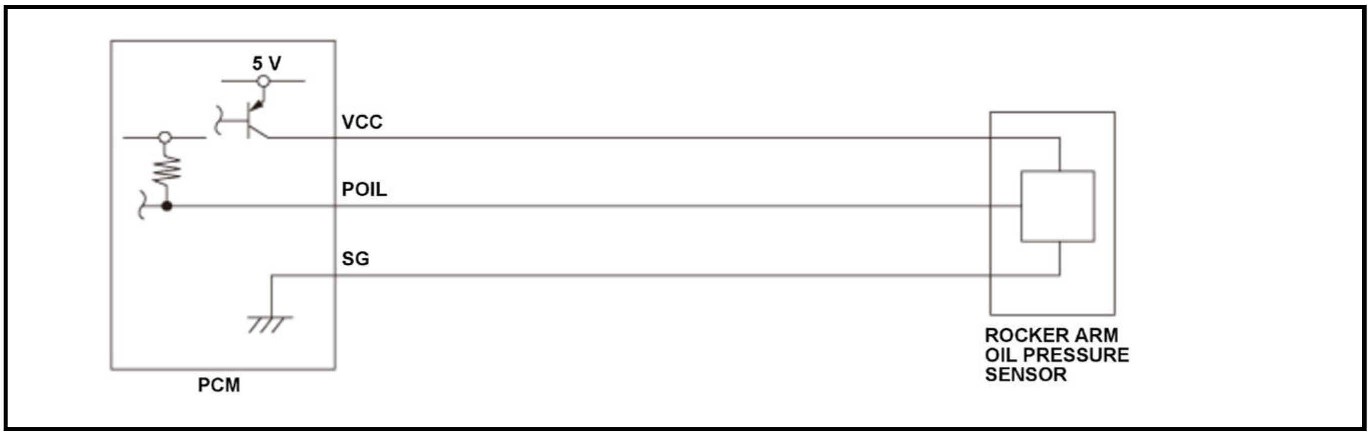
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P055C, P055D

DTC P055C: Rocker Arm Oil Pressure Sensor Circuit Low Voltage

DTC P055D: Rocker Arm Oil Pressure Sensor Circuit High Voltage

General Description



The rocker arm oil pressure sensor detects engine oil pressure in the VTEC system. When the voltage from the rocker arm oil pressure sensor is a set value for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more

DTC Type	One drive cycle, MIL on

Enable Conditions

DTC: P055C

Condition	B
Vehicle	ON mode

DTC: P055D

Condition	Minimum	Maximum

[ ]: HDS Parameter

Malfunction Threshold

DTC: P055C

The rocker arm oil pressure sensor output voltage [(Rocker Arm) Oil Pressure Sensor (B) Voltage] is 0.18 V or less for at least 2 seconds.

DTC: P055D

The rocker arm oil pressure sensor output voltage [(Rocker Arm) Oil Pressure Sensor (B) Voltage] is 4.79 V or more for at least 2.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P055C

- Rocker arm oil pressure sensor VCC line open
- Rocker arm oil pressure sensor POIL line short to ground

DTC: P055D

- Rocker arm oil pressure sensor POIL line open
- Rocker arm oil pressure sensor SG line open

Common

- Rocker arm oil pressure sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, the freeze data, and the on-board snapshot are stored in the PCM memory.

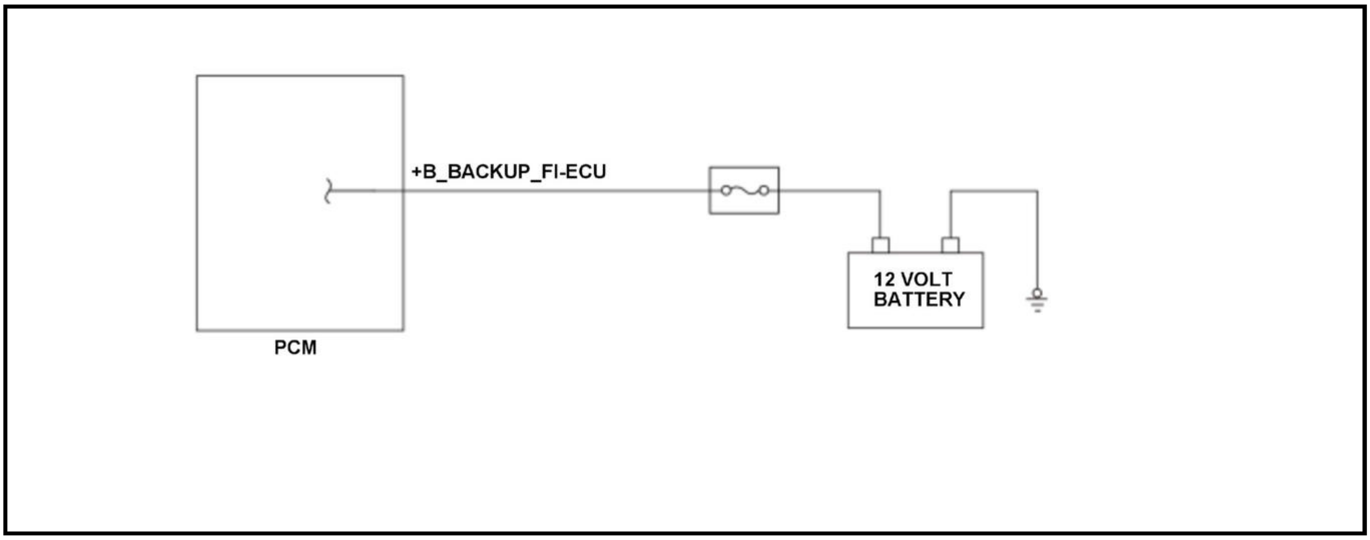
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0560

DTC P0560: Powertrain Control Module (PCM) Power Source Circuit Unexpected Voltage

General Description



The powertrain control module (PCM) constantly draws power from +B_BACKUP_FI-ECU to maintain the back-up ram. If the +B_BACKUP_FI-ECU terminal voltage is a set value for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The +B BACKUP FI-ECU terminal voltage is 6.0 V or less for at least 5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM +B_BACKUP_FI-ECU line failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

.When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

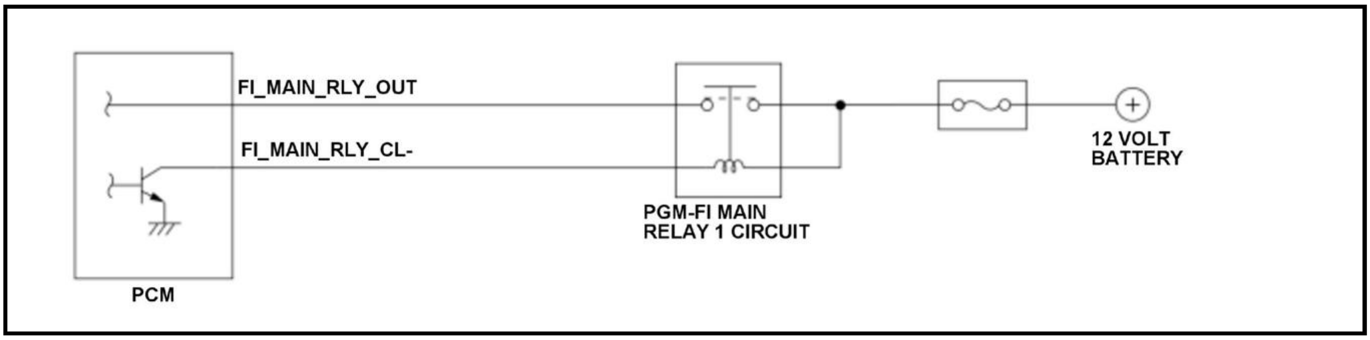
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0563

DTC P0563: Powertrain Control Module (PCM) Power Source Circuit Unexpected Voltage

General Description



If there is a short to ground in the harness between the powertrain control module (PCM) and PGM-FI main relay 1 circuit, PGM-FI main relay 1 circuit stays ON even if the vehicle is turned to the OFF (LOCK) mode, and the PCM remains active. However, the engine is not running because power for the gauges, the ignition, and the fuel pump is turned OFF by the power switch. When the PCM operates for a set time after the vehicle is turned to the OFF (LOCK) mode, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery] (FI_MAIN_RLY_OUT terminal of PCM)	10.0 V	-
Vehicle	OFF (LOCK) mode	

[ ]: HDS Parameter

Malfunction Threshold

The PCM operates for at least 5 seconds after the vehicle condition is turned to the OFF (LOCK) mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PGM-FI main relay 1 circuit FI_MAIN_RLY_CL- line short to ground

- PGM-FI main relay 1 circuit stuck on
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

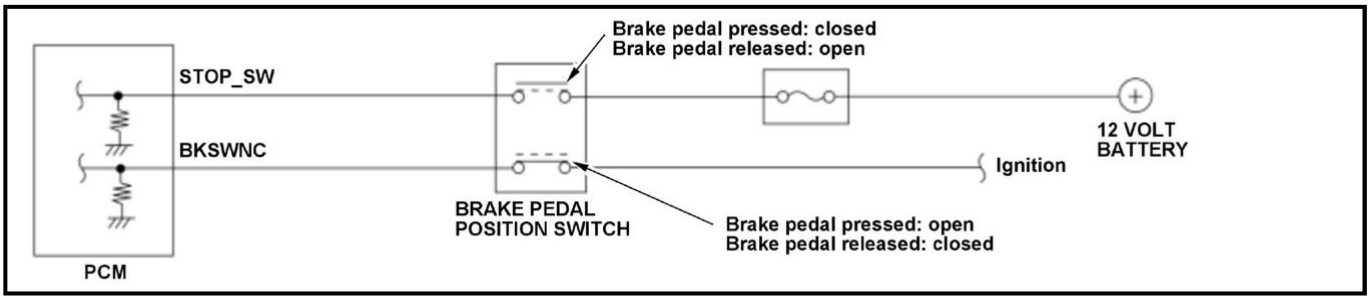
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0571

DTC P0571: Brake Pedal Position Switch Circuit Malfunction

General Description



Brake pedal pressed: closed
Brake pedal released: open
STOP_SW
BKSWNC
12 VOLT
BATTERY
Ignition
BRAKE PEDAL
POSITION SWITCH
Brake pedal pressed: open
Brake pedal released: closed
PCM

The powertrain control module (PCM) detects a brake pedal position switch malfunction by monitoring the signals from the brake pedal position switch. If the PCM continuously inputs an abnormal signal from brake pedal position switch for a specified time during a specified condition, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 minutes or more*, Depending on driving conditions**
DTC Type	Two drive cycles, MIL off

*: Symptom 1

**: Symptom 2

Enable Conditions

Condition	B
Vehicle	ON mode
Other*	Accelerator pedal pressed

Malfunction Threshold

Either of the symptom occurs:

- Symptom 1

The brake pedal position switch (STOP_SW line) is closed for at least 5 minutes when the vehicle speed [Vehicle Speed] is at 13 mph (20 km/h) or more.

- Symptom 2

  The brake pedal position switch (STOP_SW line) is open for three cycles when the vehicle is stopped (or decelerated to 1 mph (3 km/h) or less) from vehicle speed [Vehicle Speed] over 25 mph (40 km/h).

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Brake pedal position switch STOP_SW line open (includes a loose or disconnected connector)
- Brake pedal position switch STOP_SW line short to power
- Brake pedal position switch STOP_SW line short to ground
- Brake pedal position switch stuck
- Brake pedal position switch failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

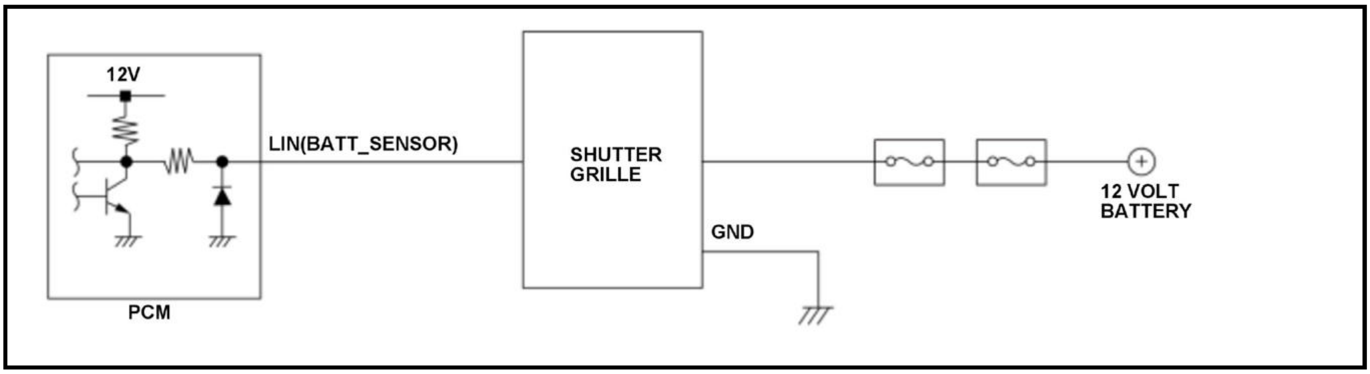
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P059F

DTC P059F: Shutter Grille Assembly (Upper) Malfunction

General Description



The shutter grille system open/closes the shutter depending on the driving conditions. The system improves fuel efficiency by reducing the wind drag. The shutter is controlled by the shutter grille which integrates the actuator. The powertrain control module (PCM) sends open/close requests which depends on the driving conditions to the shutter grille via the local interconnect network (LIN) line. If the actuator is detected as abnormal, the PCM confirms the abnormality and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

Either of the condition occurs for at least 2.5 seconds:

- The actuator does not reach the fully open position or the fully closed position by initial learning in the fully open position or fully closed position +12 % or more of the opening with respect to the position.
- The actuator does not reach the fully open or fully closed position by rotated 125 deg. or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Internal gear damage of actuator
- Shutter grille fins miss installed
- Torque transmission part of the shutter grille (link lever, link actuator) miss installed
- Actuator miss installed
- Shutter grille internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

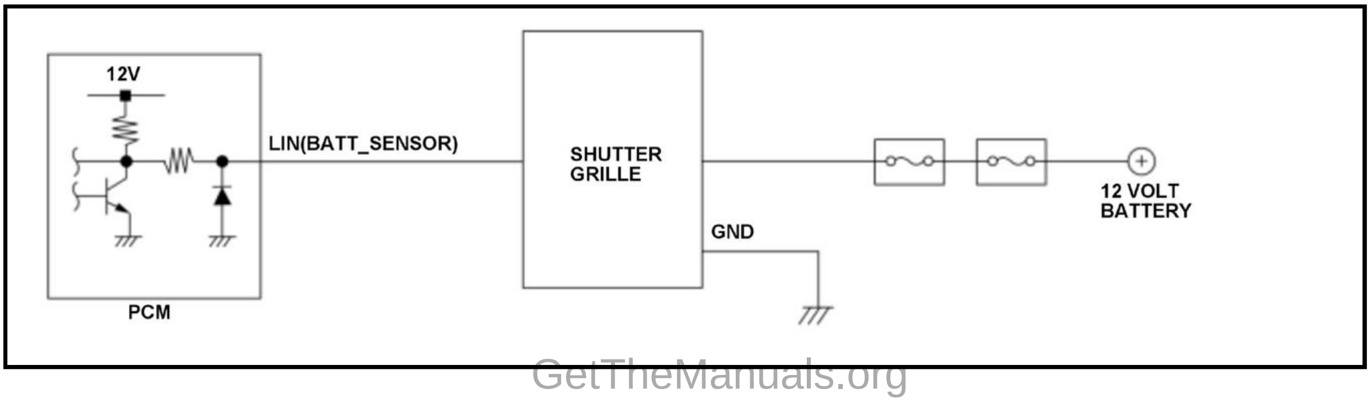
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P05A0

DTC P05A0: Shutter Grille Assembly (Upper) Malfunction

General Description



The shutter grille system opens/closes the shutter depending on the driving conditions. The system improves fuel efficiency by reducing the wind drag. The shutter is controlled by the shutter grille which includes the actuator with CPU. The powertrain control module (PCM) sends open/close requests which depends on the driving conditions to the shutter grille via the local interconnect network (LIN) line. If the shutter grille actuator detects a restriction and if the restriction condition continues even if the initial learning is retried for a specified time, the PCM confirms the abnormality and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	Initial learning retry three times, and 2.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

Both of the conditions occur:

- The shutter grille actuator detects a restriction and if the restriction condition continues for at least 2.5 seconds after the initial learning is retried for three times.
- The engine coolant temperature (ECT) sensor 1 output temperature [ECT SENSOR 1] is 221 deg.F (105 deg.C) or more and the ECT sensor 2 output temperature [ECT SENSOR 2] is 209 deg.F (98 deg.C) or more.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shutter grille stuck
- Temporary restriction of the shutter grille by foreign matter or freezing
- Shutter grille internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

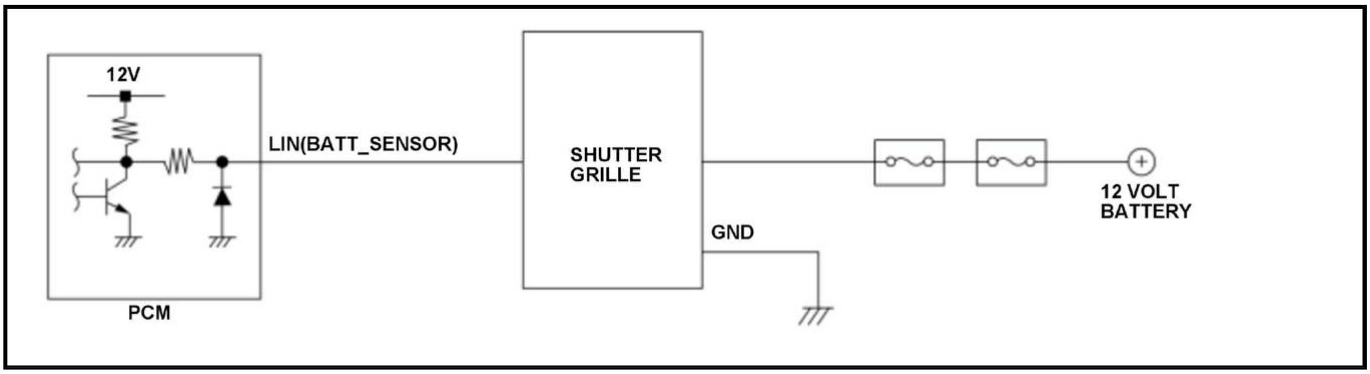
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P05A3

DTC P05A3: Shutter Grille Actuator (Upper) Malfunction

General Description



The shutter grille system open/closes the shutter depending on the driving conditions. The system improves fuel efficiency by reducing the wind drag. The shutter is controlled by the shutter grille which integrates the actuator. The powertrain control module (PCM) sends open/close requests which depends on the driving conditions to the shutter grille via the local interconnect network (LIN) line. The PCM also receives failure information from the shutter grille via the LIN line and discriminates a failure by the received signal value. If the PCM receives a specified signal from the shutter grille, the PCM detects as a shutter grille line open/short failure and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

Either of the condition occurs:

- The shutter grille actuator states a short to ground or read/write errors in the EEPROM of the motor for at least 2.5 seconds.
- The shutter grille actuator states a transmit/receive error in LIN communication for at least 2.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shutter grille internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

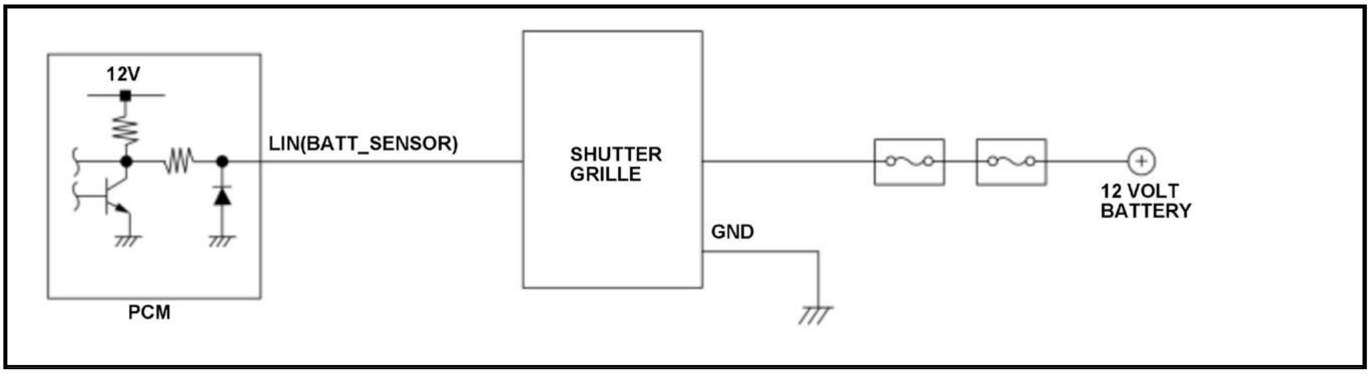
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P05A8

DTC P05A8: Shutter Grille Actuator (Upper) Malfunction

General Description



The shutter grille system open/closes the shutter depending on the driving conditions. The system improves fuel efficiency by reducing the wind drag. The shutter is controlled by the shutter grille which integrates the actuator. The powertrain control module (PCM) sends open/close requests which depends on the driving conditions to the shutter grille via the local interconnect network (LIN) line. If the actuator voltage is detected as abnormal, the PCM confirms the abnormality and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

The shutter grille actuator voltage is 17.5 V or more, or 7.5 V or less for at least 2.5 seconds when the power supply voltage of the PCM is 10.5 V or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shutter grille power supply line open
- Shutter grille power supply line short to ground
- Shutter grille power supply line short to power
- Shutter grille GND line open
- Shutter grille internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

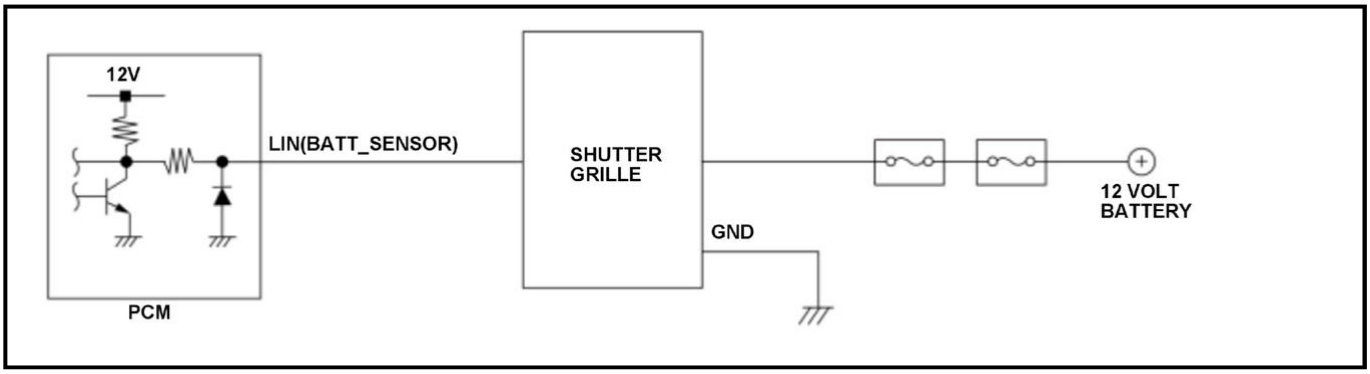
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P05C0

DTC P05C0: Shutter Grille Actuator (Upper) Temperature Malfunction

General Description



The shutter grille system open/closes the shutter depending on the driving conditions. The system improves fuel efficiency by reducing the wind drag. The shutter is controlled by the shutter grille which integrates the actuator. The powertrain control module (PCM) sends open/close requests which depends on the driving conditions to the shutter grille via the local interconnect network (LIN) line. If the temperature is detected as abnormal, the PCM confirms the abnormality and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
State of the engine	Running

Malfunction Threshold

The internal temperature of the shutter grille actuator is 302 deg.F (150 deg.C) or more for at least 2.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shutter grille internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

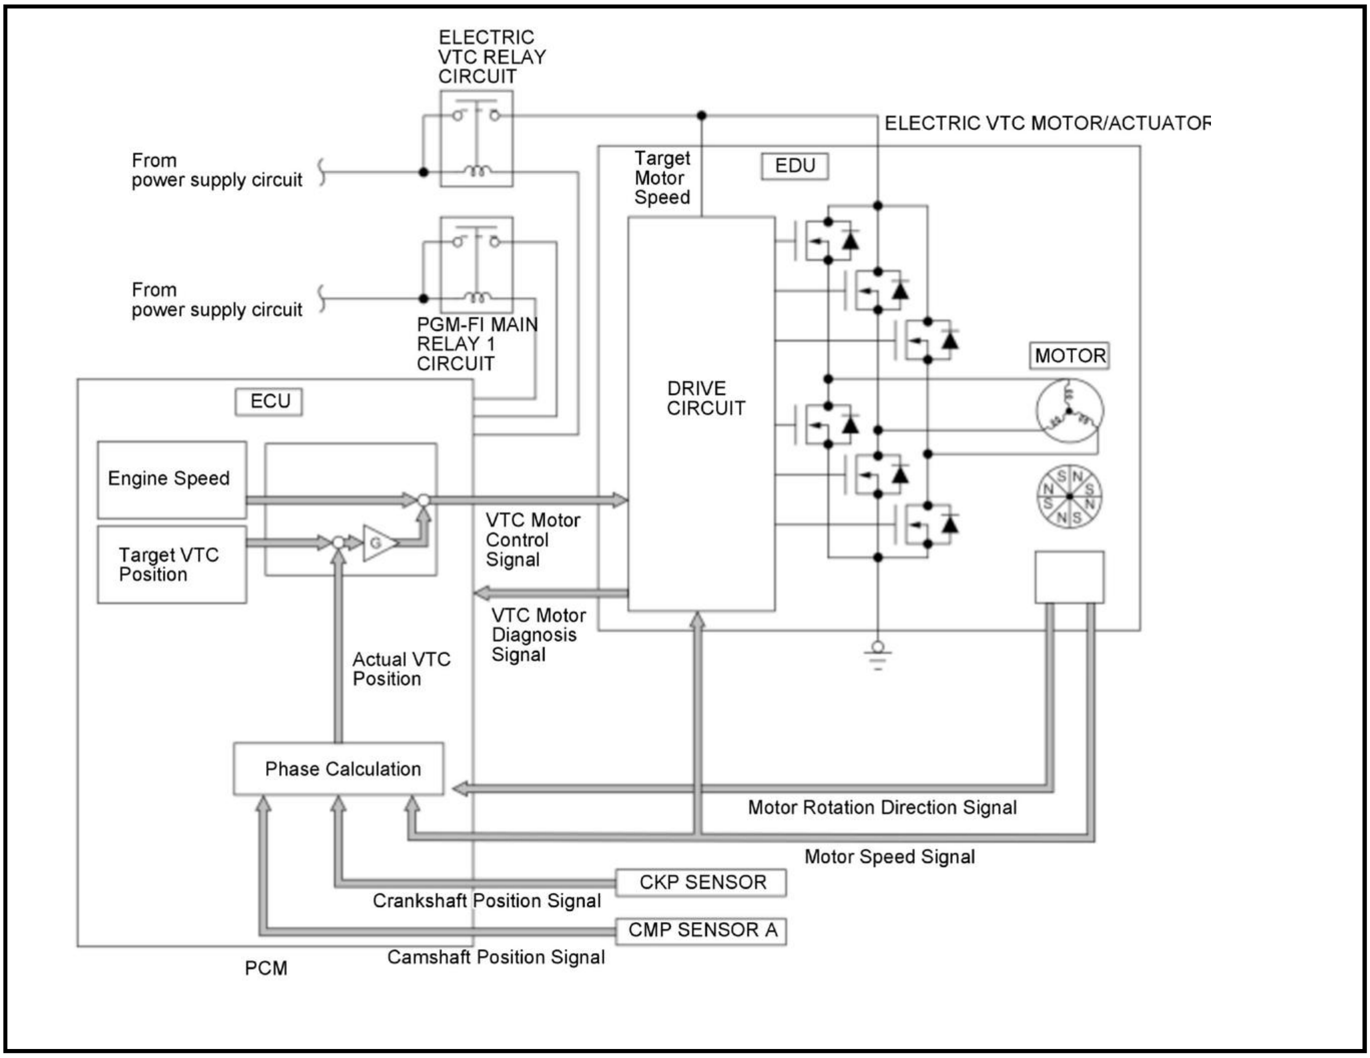
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P05CC (2021)

DTC P05CC: Cold Start VTC System Malfunction

General Description



ELECTRIC VTC RELAY CIRCUIT
From power supply circuit
From power supply circuit
PGM-FI MAIN RELAY 1 CIRCUIT
ELECTRIC VTC MOTOR/ACTUATOR
Target Motor Speed
EDU
DRIVE CIRCUIT
MOTOR
ECU
Engine Speed
Target VTC Position
G
VTC Motor Control Signal
VTC Motor Diagnosis Signal
Actual VTC Position
Phase Calculation
Motor Rotation Direction Signal
Motor Speed Signal
CKP SENSOR
Crankshaft Position Signal
CMP SENSOR A
Camshaft Position Signal
PCM

The cold start emission reduction process controls the air fuel ratio to lean when the engine is cold to lower emissions as the catalyst is not warmed up. If the difference between the phase control command and the actual timing of the camshaft using the camshaft position (CMP) is excessive for a certain period of time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	15 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
VTC operating voltage	6V	-
Engine coolant temperature [ECT Sensor 1]	14 deg.F (-10 deg.C)	176 deg.F (80 deg.C)
Engine speed [Engine Speed]	500 rpm	-

[ ]: HDS Parameter

Condition	Minimum	Maximum
12 volt battery voltage	10.5 V	-
High voltage battery capacity (SOC)	20 %	-
Quick warm-up system	Operation	
Accelerator pedal position	Released	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

The phase difference between the phase control command and the actual phase of the intake camshaft is 15.0 deg. or more for at least 15 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VTC actuator stuck
- VTC actuator response delay
- Electric VTC motor lock
- Electric VTC motor failure
- Electric VTC failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady speed between 25 - 75 mph (40 - 120 km/h) for at least 15 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

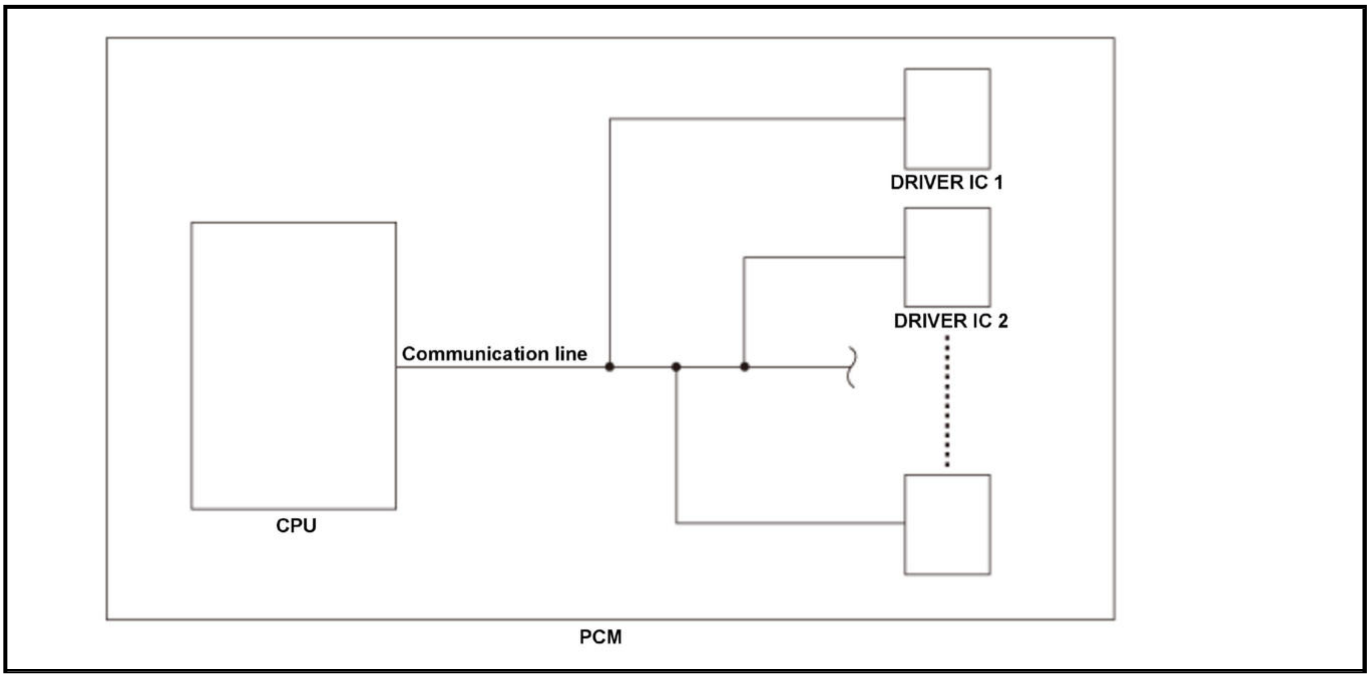
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0600

DTC P0600: Powertrain Control Module (PCM) Serial Communication Failure

General Description



The driver IC which has diagnostic function and the CPU are built into the powertrain control module (PCM). If the CPU cannot receive diagnostic information from the driver IC for a specified duration due to occurrence of communication abnormality between the driver IC and the CPU, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.0 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

One of the conditions is met for at least 5 seconds:

- The CPU does not receive signal from the driver IC via the communication lines.
- The signal sent from the driver IC is abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

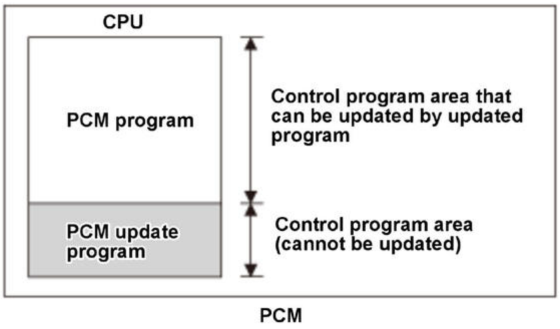
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0602 (PGM-FI SYSTEM)

DTC P0602: Powertrain Control Module (PCM) Programming Error

General Description



CPU
PCM program
PCM update program
Control program area that can be updated by updated program
Control program area (cannot be updated)
PCM

The powertrain control module (PCM) is equipped with an update program to update its control program. The programs in the CPU of the PCM are classified as a PCM program (update-capable program) and a program for the update function (non-updatable program). The program update only updates the PCM program. When the PCM power is turned off during an update, the power for the update function is lost, and the update process stops. When the program update is stopped before it is completed, the PCM stores a DTC that indicates the update is not finished.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or less
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The PCM program update stops 1 second before it is finished.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM program unwritten

Diagnosis Details

Conditions for setting the DTC

When the PCM program is not written in the PCM, the MIL comes on and a Pending DTC and a Confirmed DTC are stored in the PCM memory.

Conditions for clearing the DTC

The MIL, the Pending DTC, and the Confirmed DTC are cleared when the PCM program update is completed.

DTC P0606, P1A48, P1A49, P1A4A

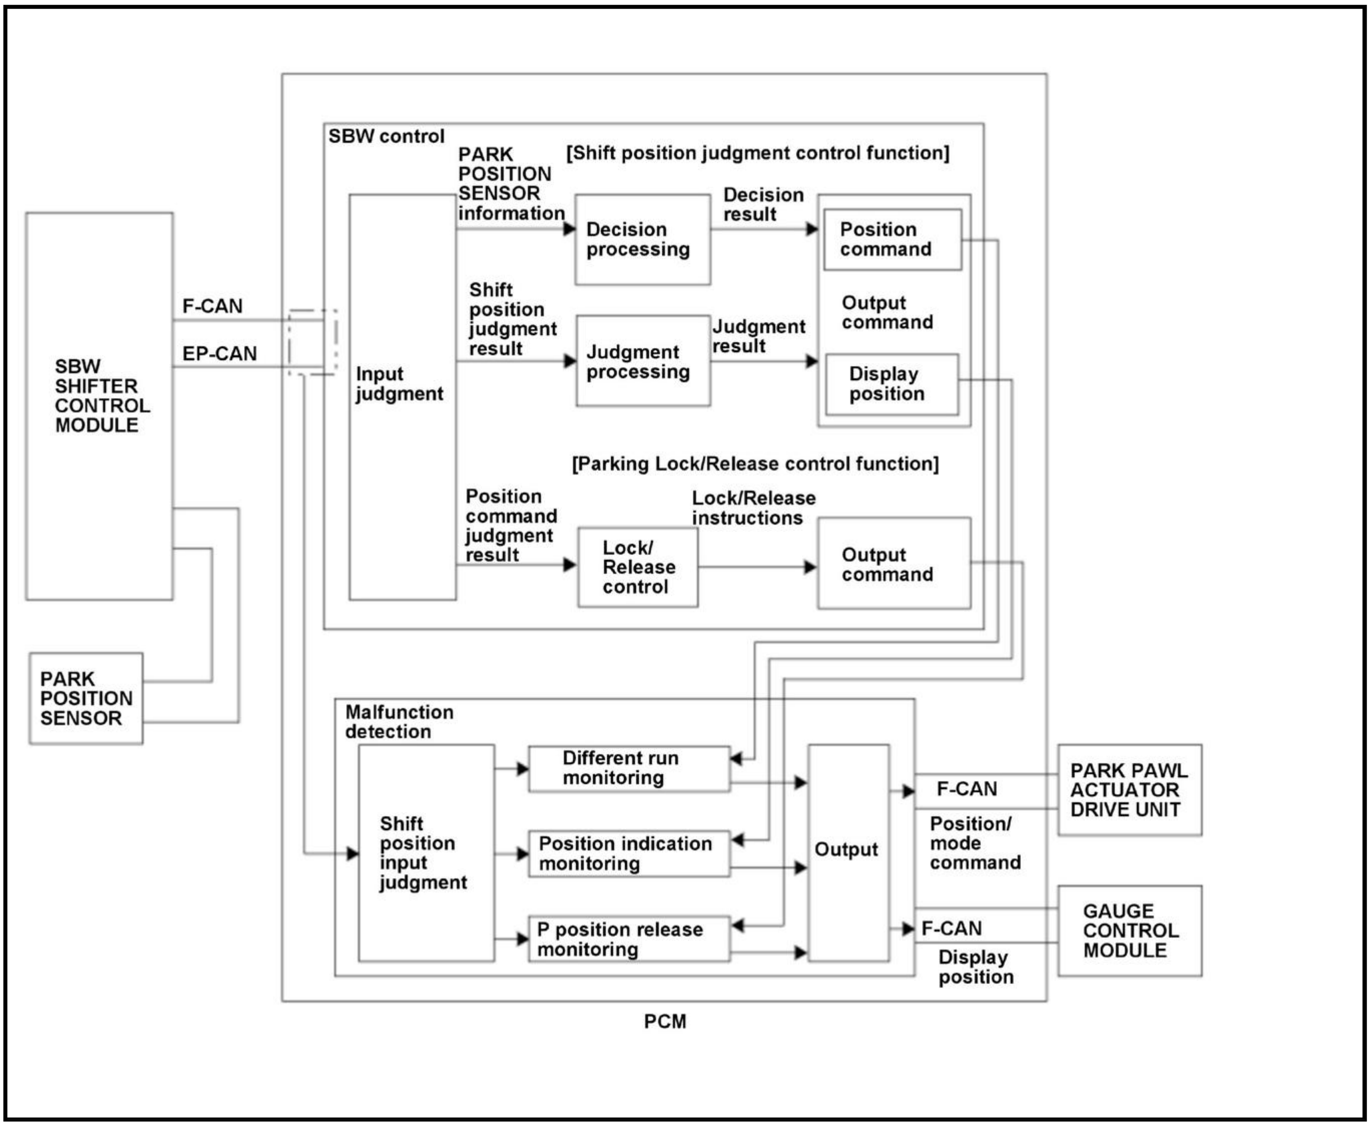
DTC P0606: Powertrain Control Module (PCM) Processor Malfunction

DTC P1A48: Powertrain Control Module (PCM) Internal Malfunction (SBW Different Run)

DTC P1A49: Powertrain Control Module (PCM) Internal Malfunction (SBW Parking Position)

DTC P1A4A: Powertrain Control Module (PCM) Internal Malfunction (SBW Display Position)

General Description



SBW control
PARK POSITION SENSOR information
[Shift position judgment control function]
Decision result
Decision processing
Position command
Shift position judgment result
Output command
Judgment processing
Judgment result
Display position
Input judgment
F-CAN

Malfunction detection
Different run monitoring
Shift position input judgment
Position indication monitoring
P position release monitoring
Output
F-CAN
Position/ mode command
PARK PAWL ACTUATOR DRIVE UNIT
F-CAN
Display position
GAUGE CONTROL MODULE
PCM

An abnormal condition is detected based on the correlation between the input signal of the shift by wire (SBW) shifter control module (in) and the position indication/display (out). The SBW control, which is the target of this detection, shifts the shift position/mode only when there is an input from the SBW shifter control module.

If the shift position/mode changes with no signal from the SBW shifter control module, the powertrain control module (PCM) detects a malfunction and stores a DTC.

B	Representative code	False command of shift position/mode	False command of parking release	False command of displaying position/mode
DTC	P0606*	P1A48	P1A49	P1A4A

*: DTC P0606 is stored when DTC P1A48, P1A49, and/or P1A4A are stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

Sequence	None
Duration	-
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P1A48

One of the conditions is occurred for a specified time:

- The shift position/mode command changed from D to R with no signal input from the SBW shifter control module.
- The shift position/mode command changed from R to D with no signal input from the SBW shifter control module.
- The shift position/mode command changed from R to D while D to R is input from the SBW shifter control module.

DTC: P1A49

The shift position/mode command changed to parking release even when R, N, or D is not input from the SBW shifter control module.

DTC: P1A4A

One of the conditions is occurred for a specified time:

- The shift position/mode display request changed from D to R with no signal input from the SBW shifter control module.
- The shift position/mode display request changed from R to D while D to R is input from the SBW shifter control module.
- The shift position/mode display request changed to P while park position sensor signal is not P.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC and the freeze data are stored in the PCM memory.

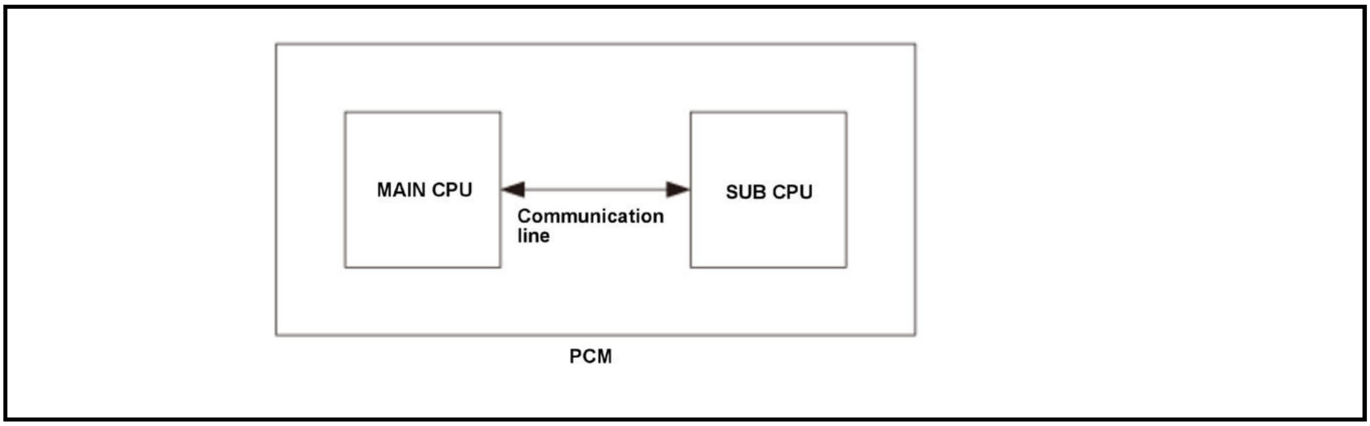
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P060A

DTC P060A: Powertrain Control Module (PCM) Internal Control Module Malfunction

General Description



When a malfunction occurs in the communication line between the main CPU and the sub CPU in the powertrain control module (PCM), no monitor signals from the sub CPU for a set time, or abnormal signals are detected for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

One of these symptoms occurs for at least 2.0 seconds:

- No sub CPU monitor signals are detected.
- Sub CPU monitor signals are abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P061B, P1A51, P1A52, P1A53 (PGM-FI SYSTEM)

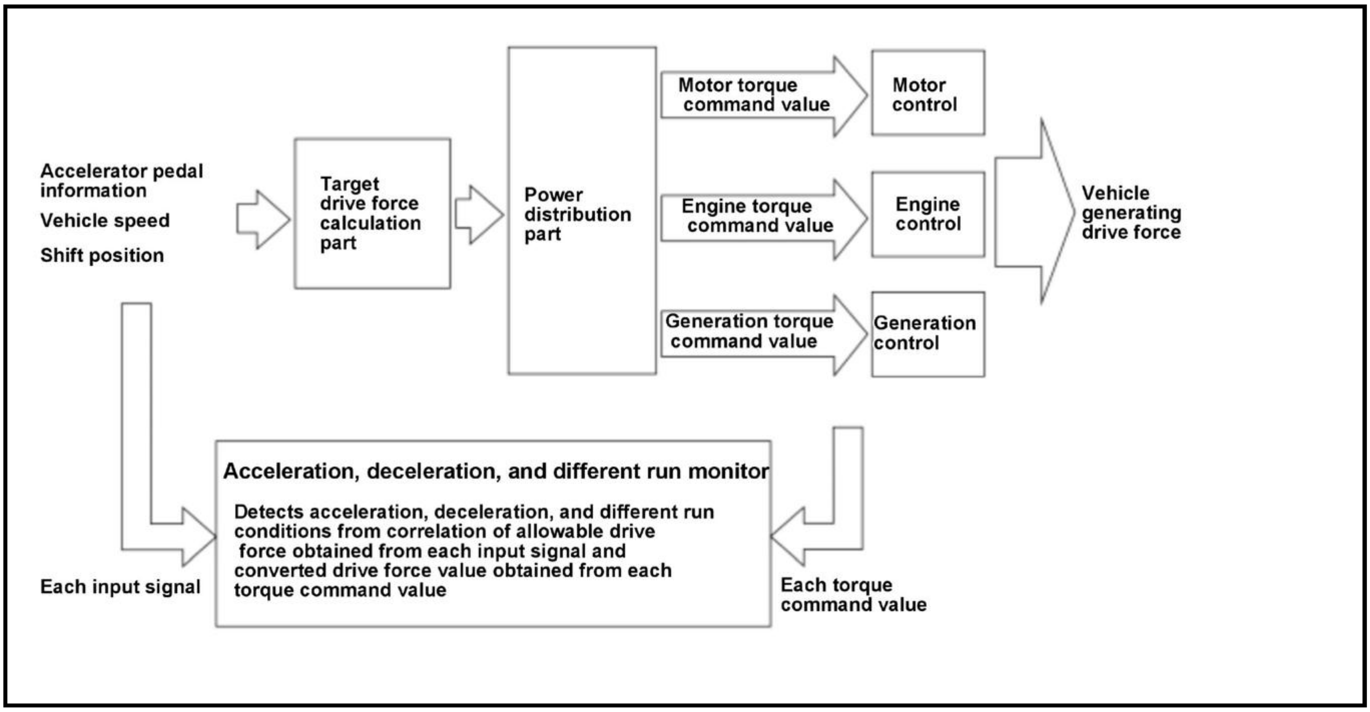
DTC P061B: Powertrain Control Module (PCM) Internal Malfunction (Torque Calculation)

DTC P1A51: Powertrain Control Module (PCM) Internal Malfunction (Torque Calculation Acceleration)

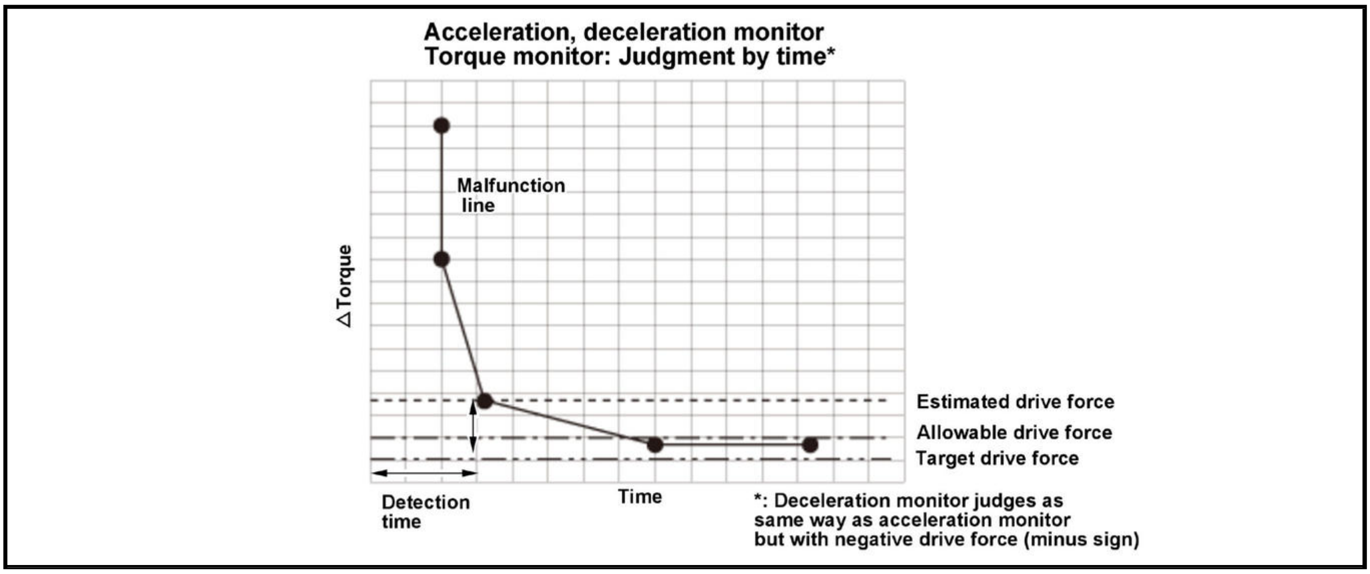
DTC P1A52: Powertrain Control Module (PCM) Internal Malfunction (Torque Calculation Deceleration)

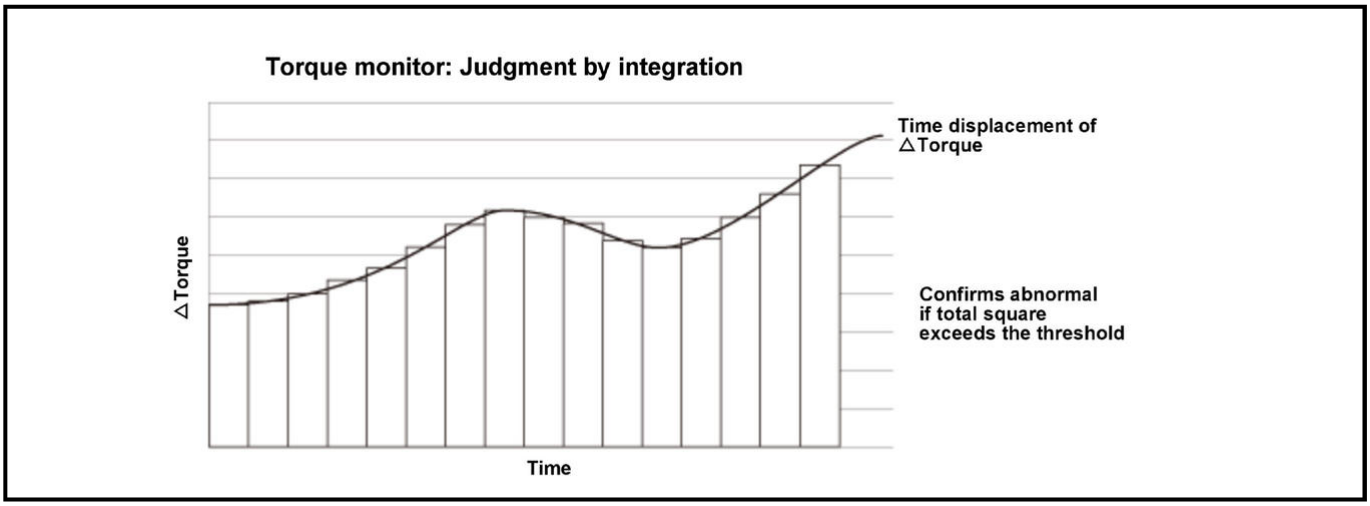
DTC P1A53: Powertrain Control Module (PCM) Internal Malfunction (Torque Calculation Different Run)

General Description



Accelerator pedal information
Vehicle speed
Shift position
Target drive force calculation part
Power distribution part
Motor torque command value
Motor control
Engine torque command value
Engine control
Generation torque command value
Generation control
Vehicle generating drive force
Acceleration, deceleration, and different run monitor
Detects acceleration, deceleration, and different run conditions from correlation of allowable drive force obtained from each input signal and converted drive force value obtained from each torque command value
Each input signal
Each torque command value





The powertrain control module (PCM) calculates the target drive force from the accelerator pedal inputs, external demands, and auxiliary load information, and calculates the allowable drive force until the acceleration state leads to a hazardous event for the target drive force. Abnormal accelerations are detected by the relations of the target drive force, the allowable drive force, and the converted drive force value of each torque command value.

- Acceleration monitor

  There are two methods to detect abnormal accelerations; time judgment method and integration judgment method. If both of the methods are judged abnormal, the PCM detects a malfunction and stores a DTC.

-
  - -

    Time judgment method:

    Malfunction is established if the estimated drive force is higher than the target drive force for a specified time. The allowable time changes depending on the difference width between the estimated drive force and the allowable drive force.

-
  - -

    Integration judgment method:

    Malfunction is established if the integration value of drive force difference exceeds a threshold.

- Deceleration monitor

  Deceleration monitor judges as same way as the acceleration monitor but with the negative drive force (minus sign).

- Different run monitor

  Malfunction is established if the vehicle drives opposite drive force to the driver's demand, or unintended vehicle start occurs at N position/mode for a specified time.

B	Torque monitor(Representative DTC)	Torque monitor(Acceleration)	Torque monitor(Deceleration)	Torque monitor(Different Run)
DTC	P061B*	P1A51	P1A52	P1A53

*: DTC P061B is stored when DTC P1A51, P1A52, and/or P1A53 are stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P1A51, P1A52

Both conditions are met:

- The estimated drive force is higher than the target drive force for a specified time. The allowable time changes depending on the difference width between the estimated drive force and the allowable drive force.
- The integration value of drive force difference exceeds a threshold.

DTC: P1A53

The vehicle drives opposite drive force to the driver's demand or unintended vehicle start occurs at N position/mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC and the freeze data are stored in the PCM memory.

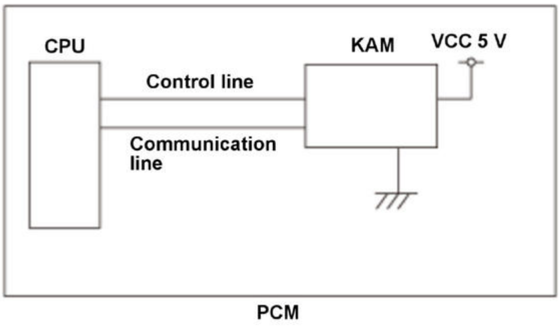
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P062F (PGM-FI SYSTEM)

DTC P062F: Powertrain Control Module (PCM) Internal Control Module Keep Alive Memory (KAM) Error

General Description



The powertrain control module (PCM) is equipped with a keep alive memory (KAM). The data (control learn data, etc.) for powertrain control and information (vehicle identification number (VIN), etc.) related to the vehicle control is stored in the KAM, so that it can be maintained even when power is not supplied to the PCM, such as when the 12 volt battery is disconnected. When powered up, the CPU retrieves the stored information from the KAM, as well as writes data to the KAM (control related data is written when the vehicle is turned to the ON mode, and vehicle information when commanded from the HDS). When the data retrieval or data writing process is not finished normally, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

A malfunction is detected whenever the keep alive data retrieval and writing process is not completed normally.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

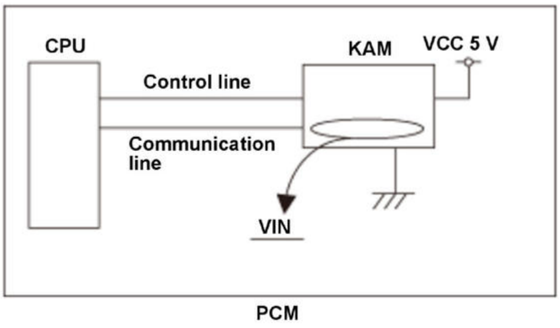
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0630

DTC P0630: VIN Not Programmed or Mismatch

General Description



The powertrain control module (PCM) stores a vehicle identification number (VIN) in the keep alive memory (KAM) and outputs the VIN according to commands from the HDS. The VIN for each vehicle is registered to the PCM using the HDS. The registered VIN is read by the CPU from the KAM after the vehicle condition is turned to the ON mode or after the Clear command is executed. If the VIN is not registered in the KAM when the vehicle condition is turned to the ON mode or when the Clear command is executed, the PCM detects a VIN unregistered condition and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or less
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The VIN is not registered in the KAM in the PCM.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- VIN not registered in the PCM KAM

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

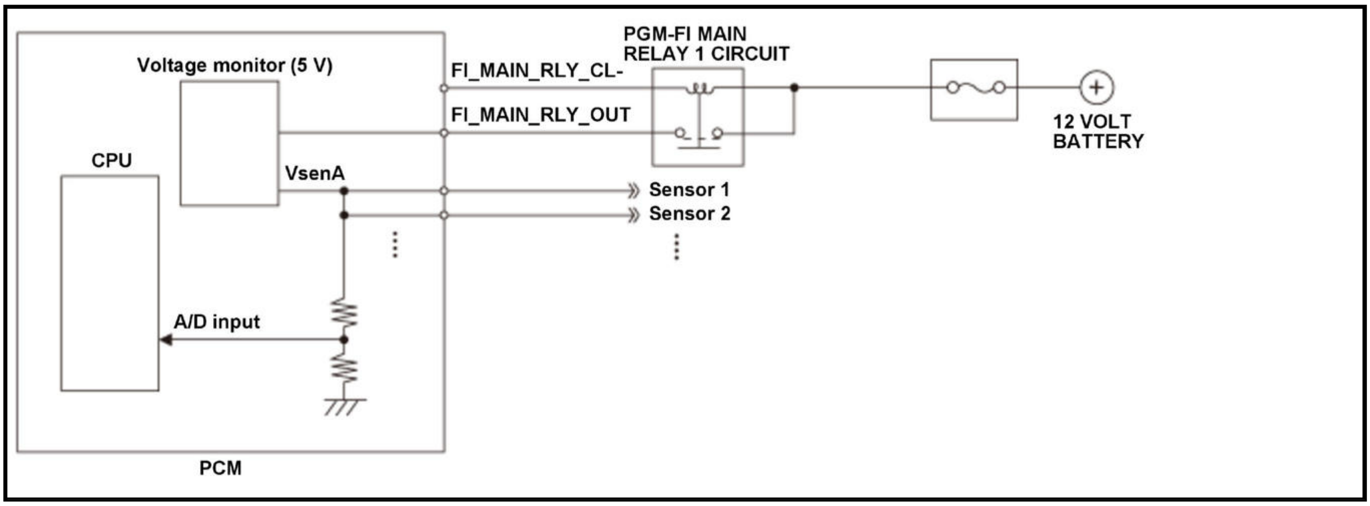
Conditions for clearing the DTC

When the VIN registration is completed, the MIL is cleared.

DTC P0641

DTC P0641: Sensor Reference Voltage A Malfunction

General Description



PGM-FI MAIN
RELAY 1 CIRCUIT
Voltage monitor (5 V)
FI_MAIN_RLY_CL-
FI_MAIN_RLY_OUT
12 VOLT
BATTERY
CPU
VsenA
Sensor 1
Sensor 2
A/D input
PCM

The powertrain control module (PCM) is equipped with a voltage monitor (5 V power source) to supply a stable 5 V to each sensor as reference voltage. The correct voltage for the sensors are loaded in the CPU of the PCM (A/D input) and when the sensor power voltage is a set value (high or low) for a certain time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The sensor power voltage is 6.00 V or more, or 3.99 V or less, for at least 2.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Manifold absolute pressure (MAP) sensor VCC line short to power
- Crankshaft position (CKP) sensor VCC line short to power
- Throttle body VCC line short to power
- Accelerator pedal position (APP) sensor VCC line short to power
- MAP sensor VCC line short to ground
- CKP sensor VCC line short to ground
- Throttle body VCC line short to ground
- APP sensor VCC line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

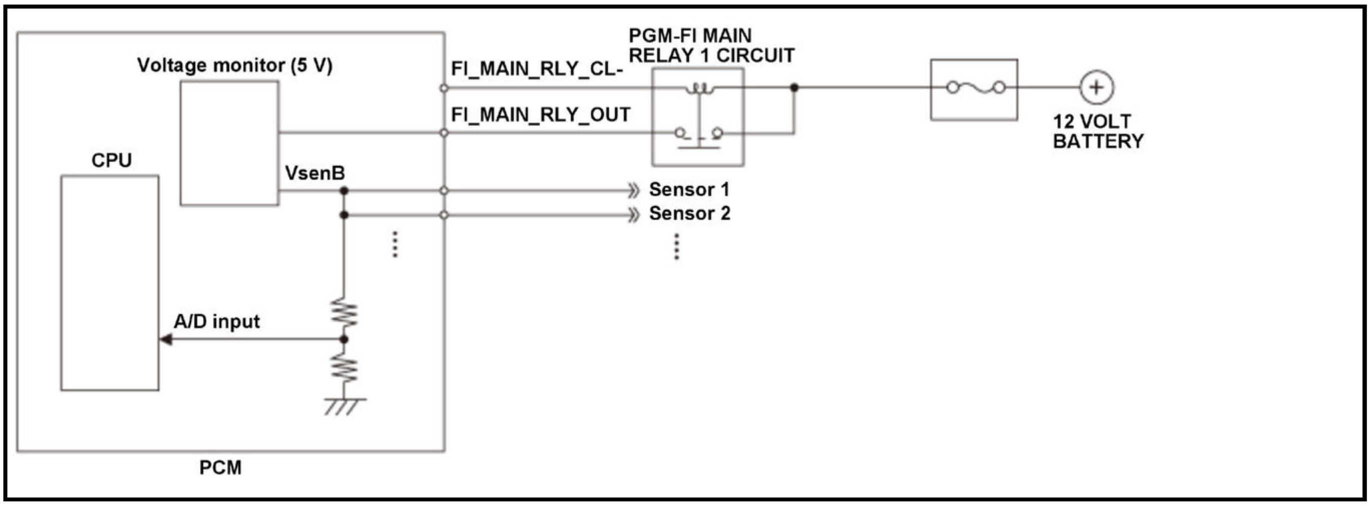
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0651

DTC P0651: Sensor Reference Voltage B Malfunction

General Description



The powertrain control module (PCM) is equipped with a voltage monitor (5 V power source) to supply a stable 5 V to each sensor as reference voltage. The correct voltage for the sensors are loaded in the CPU of the PCM (A/D input) and when the sensor power voltage is a set value (high or low) for a certain time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The sensor power voltage is 6.00 V or more, or 3.99 V or less, for at least 2.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/C pressure sensor VCC line short to power
- Accelerator pedal position (APP) sensor VCC line short to power
- Camshaft position (CMP) sensor A VCC line short to power
- CMP sensor B VCC line short to power
- Exhaust gas recirculation (EGR) valve VCC line short to power
- Rocker arm oil pressure sensor VCC line short to power
- Transmission fluid pressure sensor VCC line short to power
- Engine oil pressure sensor VCC line short to power
- Evaporative emission (EVAP) leak check module VCC line short to power
- A/C pressure sensor VCC line short to ground
- APP sensor VCC line short to ground
- CMP sensor A VCC line short to ground
- CMP sensor B VCC line short to ground
- EGR valve VCC line short to ground
- Rocker arm oil pressure sensor VCC line short to ground
- Transmission fluid pressure sensor VCC line short to ground
- Engine oil pressure sensor VCC line short to ground
- EVAP leak check module VCC line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

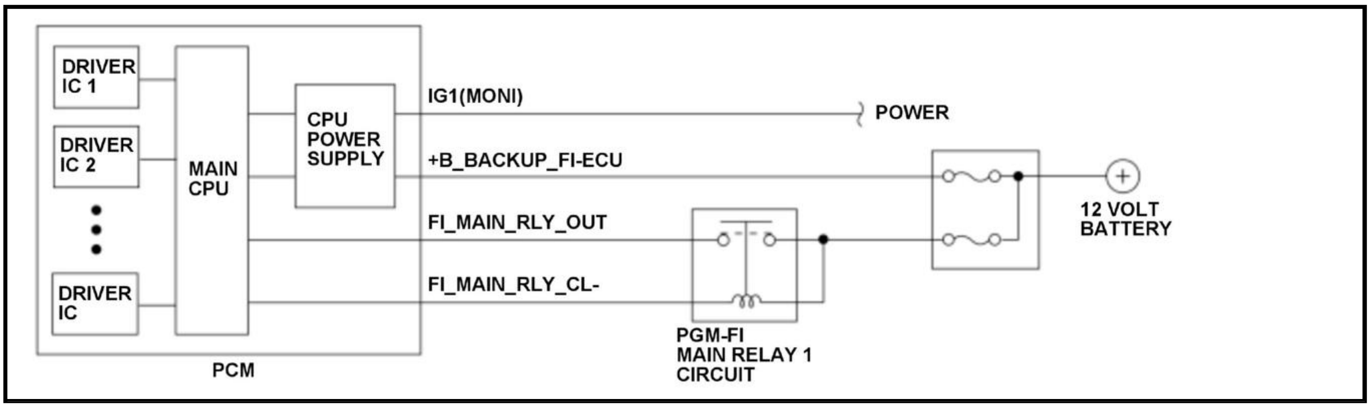
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0657

DTC P0657: Powertrain Control Module (PCM) Power Supply Circuit Malfunction

General Description



DRIVER IC 1
DRIVER IC 2
DRIVER IC
MAIN CPU
CPU POWER SUPPLY
PCM
IG1(MONI)
POWER
+B_BACKUP_FI-ECU
FI_MAIN_RLY_OUT
FI_MAIN_RLY_CL-
PGM-FI MAIN RELAY 1 CIRCUIT
12 VOLT BATTERY

Main CPU and driver ICs are built into the powertrain control module (PCM). The main CPU receives drive commands and driver IC drives each corresponding devices. Power for the main CPU is provided from +B_BACKUP_FI-ECU line via CPU power supply, and power for the driver ICs are provided from FI_MAIN_RLY_OUT line via PGM-FI main relay 1 circuit. If the FI_MAIN_RLY_OUT voltage is a specified voltage for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

FI_MAIN_RLY_OUT voltage is 6.0 V or less for at least 5.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PGM-FI main relay 1 circuit FI_MAIN_RLY_OUT line open (include fuse blown)
- PGM-FI main relay 1 circuit FI_MAIN_RLY_CL- line open (include fuse blown)
- PGM-FI main relay 1 circuit failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

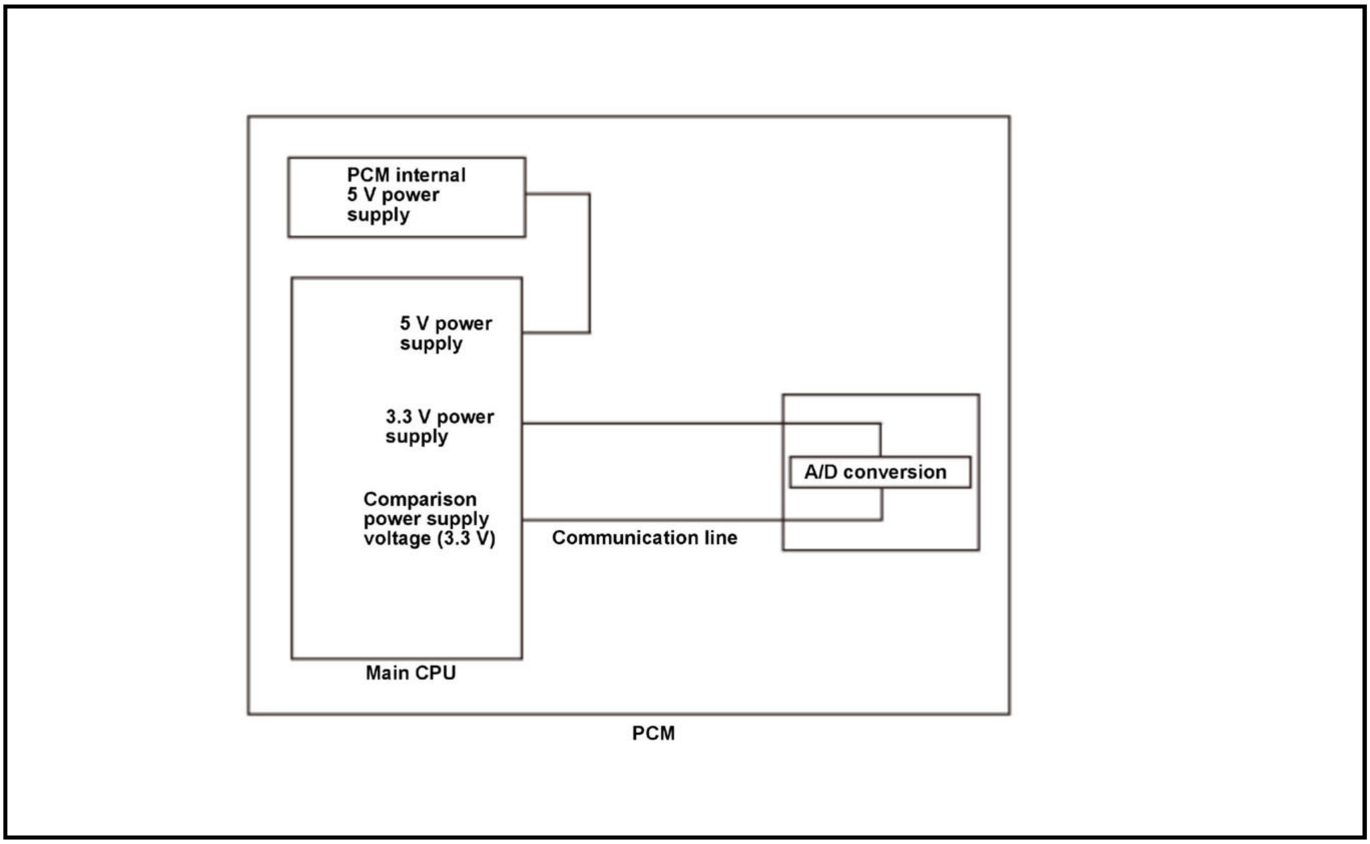
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

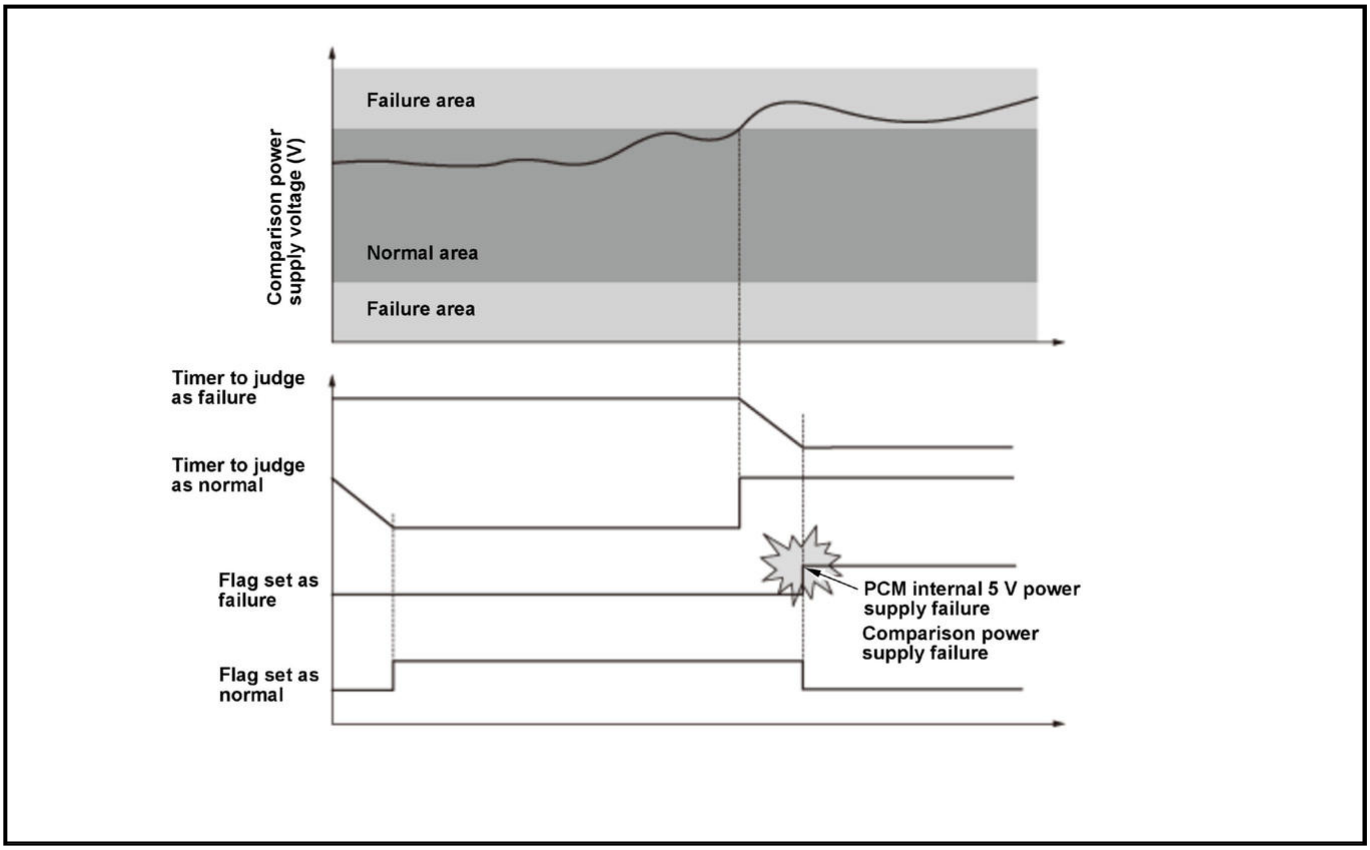
DTC P06A8

DTC P06A8: Internal VCC Power Malfunction

General Description



PCM internal 5 V power supply
5 V power supply
3.3 V power supply
Comparison power supply voltage (3.3 V)
A/D conversion
Communication line
Main CPU
PCM



The powertrain control module (PCM) monitors the internal 5 V power supply by comparing it to the A/D input power supply voltage (3.3 V). When the 5 V power supply is normal, the comparison power supply voltage (3.3 V) falls within a normal area. But if the 5 V power supply malfunctions, the comparison power supply voltage (3.3 V) exceeds the range of normal area. If the comparison power supply voltage is out of permissible range for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The PCM internal comparison power supply voltage is 3.10 V or less, 3.51 V or more for at least 2.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM (internal 5 V power supply circuit) failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

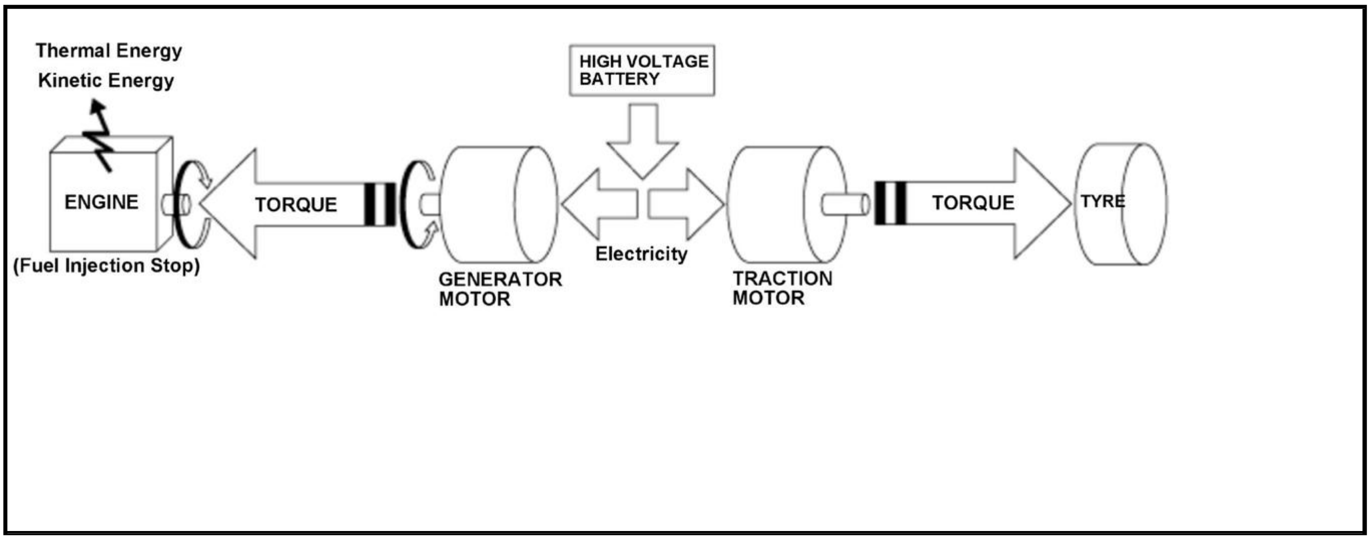
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

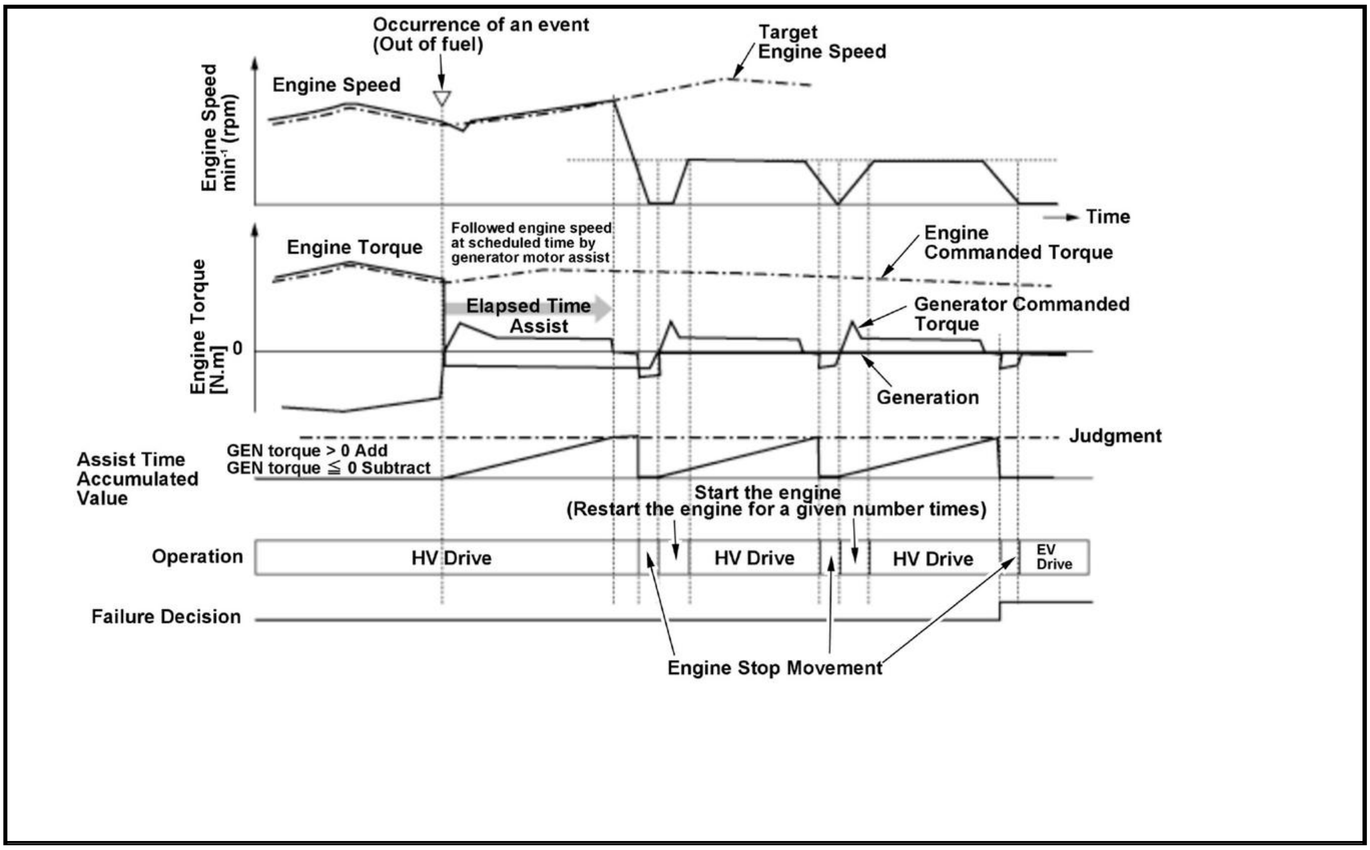
DTC P06AF (2020)

DTC P06AF: Engine Stall

General Description



Thermal Energy
Kinetic Energy
HIGH VOLTAGE BATTERY
ENGINE
TORQUE
TORQUE
TYRE
(Fuel Injection Stop)
Electricity
GENERATOR MOTOR
TRACTION MOTOR



If engine speed decreases or if the engine stalls after the engine speed was maintained by the generator for a given period of time, then it determined that the engine torque is not being generated. When engine torque is still not generated after trying to restart the engine for a given number of times, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

*: After disconnecting the 12 volt battery.

Duration	27 seconds or more (51 seconds or more)*
DTC Type	One drive cycle, MIL off

*: After disconnecting the 12 volt battery.

Enable Conditions

Condition	B
State of the vehicle	HV driving mode
	Engine clanking mode
Other	Other than a catalytic converter warm-up
	During fuel injection

Malfunction Threshold

When generator motor assists continues for 27 seconds (51 seconds)* or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Out of fuel
- Fuel system perfection stop
- Engine stall
- Ignition system relay failure

Confirmation Procedure

Operating Condition

Drive the vehicle for 27 seconds (51 seconds)* or more.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

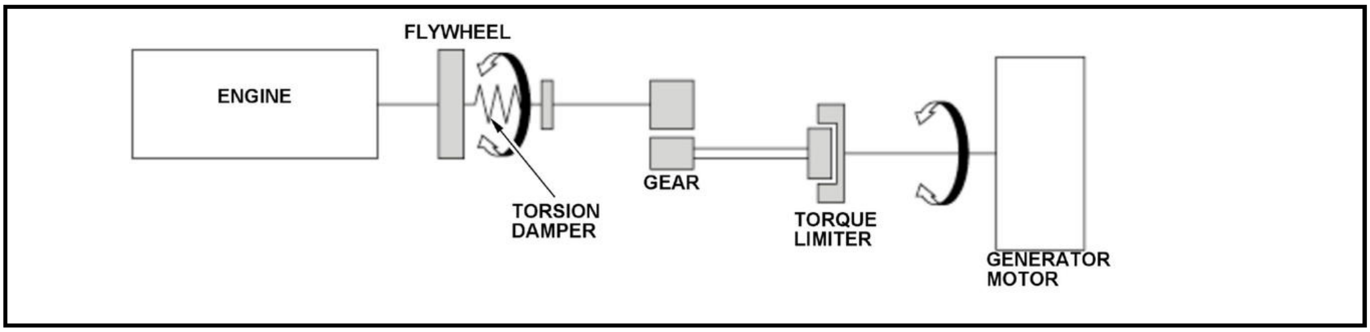
Conditions for clearing the DTC

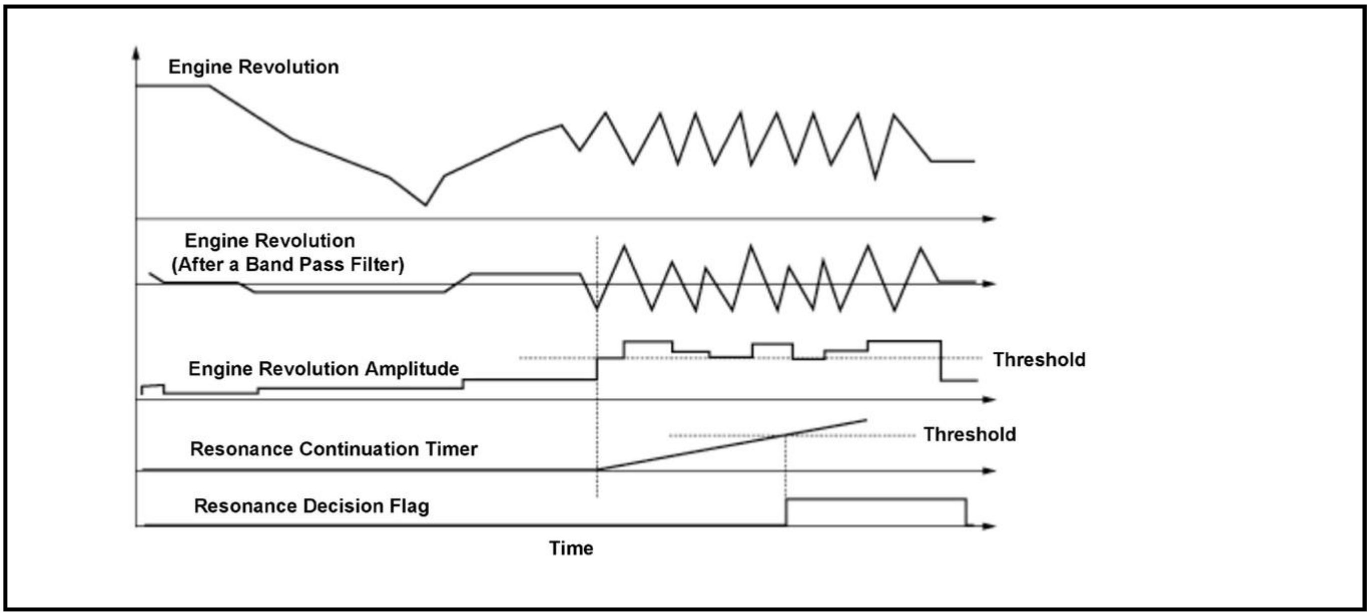
The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0700 (2021)

DTC P0700: Transmission Control System (MIL Request)

General Description





Engine resonance has the potential to cause severe engine damage. As a result, the flywheel is equipped with a high rate spring to help smooth out the transmission of power between the engine and the generator motor. However, there are still certain rpm levels where resonance can cause vibration. When resonance is detected by the powertrain control module (PCM), the rpm range is limited. There are also cases that resonance is caused by a misfire which can lead to an engine or generator motor failure.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	13.2 seconds or less
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Fuel feedback	Other than during fuel cut-off operation
State of the vehicle*	HV driving mode
	Engine driving mode
	HV driving mode -> Engine driving mode
	Engine driving mode -> HV driving mode

*: In any of described driving condition

Malfunction Threshold

When vibration due to engine resonance has increased.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Misfire (1 cylinder or 2 cylinder continuation misfires)

Confirmation Procedure

Operating Condition

Drive the vehicle for 13.2 seconds or more.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

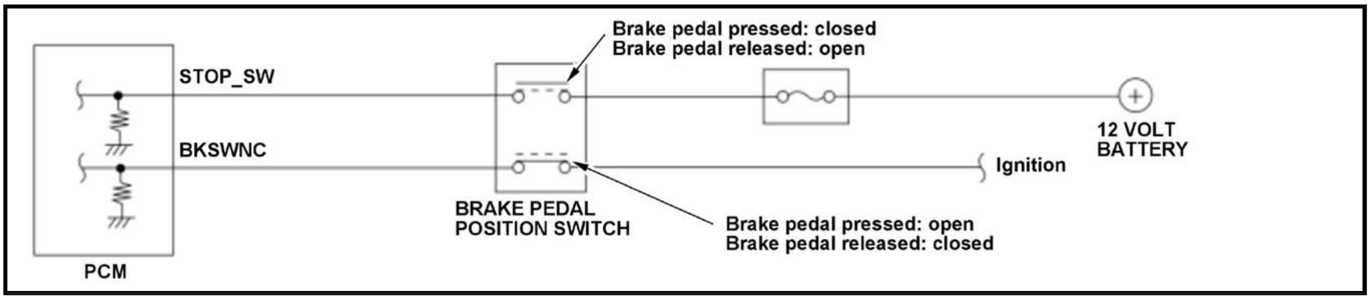
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0703

DTC P0703: Brake Pedal Position Switch (NC) Malfunction

General Description



Brake pedal pressed: closed
Brake pedal released: open
STOP_SW
BKSWNC
12 VOLT BATTERY
Ignition
BRAKE PEDAL POSITION SWITCH
Brake pedal pressed: open
Brake pedal released: closed
PCM

The powertrain control module (PCM) detects a brake pedal position switch malfunction by monitoring the signals from the brake pedal position switch. If the PCM continuously inputs an abnormal signal from brake pedal position switch for a specified time during a specified condition, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 minutes or more*, Depending on driving conditions**
DTC Type	Two drive cycles, MIL off

*: Symptom 1

**: Symptom 2

Enable Conditions

Condition	B
Vehicle	ON mode
Other*	Accelerator pedal pressed

Malfunction Threshold

Either of the symptom occurs:

- Symptom 1

  The brake pedal position switch (BKSWNC line) is open for at least 5 minutes when the vehicle speed [Vehicle Speed] is at 13 mph (20 km/h) or more.

- Symptom 2

  The brake pedal position switch (BKSWNC line) is closed for three cycles when the vehicle is stopped (or decelerated to 1 mph (3 km/h) or less) from vehicle speed [Vehicle Speed] over 25 mph (40 km/h).

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Brake pedal position switch BKSWNC line open (includes a loose or disconnected connector)
- Brake pedal position switch BKSWNC line short to power
- Brake pedal position switch BKSWNC line short to ground
- Brake pedal position switch stuck
- Brake pedal position switch failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on.

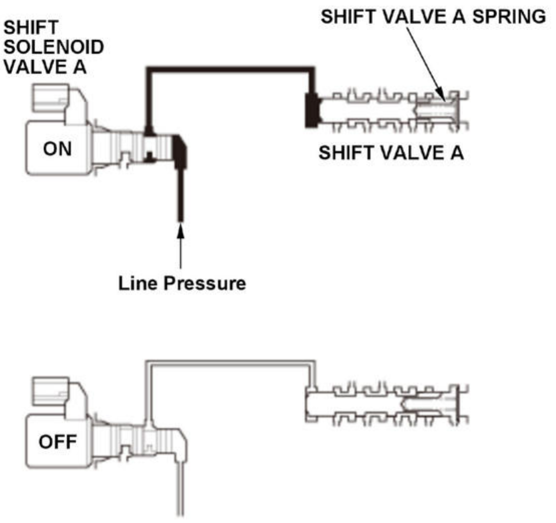
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0751

DTC P0751 : Shift Solenoid Valve A Stuck OFF

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

Shift solenoid valve A is installed on the flywheel housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to shift valve A. The signal from the PCM is output so that the line pressure is supplied to the clutch piston under the condition that overdrive clutch engagement is requested during running at 44 mph (70 km/h) or more. When the signal to shift solenoid valve A from the PCM is ON, and the line pressure is applied to shift valve A, it operates against the shift valve A spring. When the signal to shift solenoid valve A from the PCM is OFF, and the line pressure is discharged, shift valve A is inactive. The PCM monitors the transmission fluid pressure sensor and detects a shift solenoid valve A OFF failure and stores a DTC when the transmission fluid pressure sensor is specified pressure or less while engagement of the over drive clutch is requested.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.1 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Vehicle speed [Vehicle Speed]	44 mph (70 km/h)	-
12 volt battery voltage [Battery Voltage]	11 V	-
Over drive clutch	ON (engaged)	
State of the vehicle	Engine driving mode	

[ ]: HDS Parameter

Malfunction Threshold

The transmission fluid pressure sensor output is specified hydraulic pressure or less for at least 2.1 seconds while engagement of the over drive clutch is requested.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve A stuck off
- Valve body assembly (shift valve A stuck)

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed of 44 mph (70 km/h) or more for at least 10 seconds with engine drive mode.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

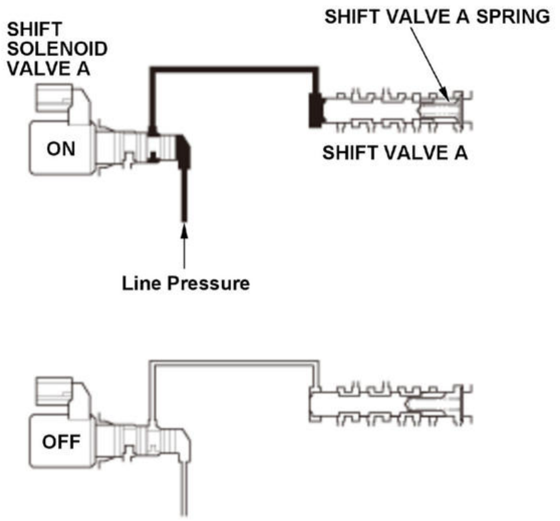
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0752

DTC P0752 : Shift Solenoid Valve A Stuck ON

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

Shift solenoid valve A is installed on the flywheel housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to shift valve A. The signal from the PCM is output so that the line pressure is supplied to the clutch piston under the condition that overdrive clutch engagement is requested during running at 44 mph (70 km/h) or more. When the signal to shift solenoid valve A from the PCM is on, and the line pressure is applied to shift valve A, it operates against the shift valve A spring. When the signal to shift solenoid valve A from the PCM is off, and the line pressure is discharged, shift valve A is inactive. The PCM monitors the transmission fluid pressure sensor and detects a shift solenoid valve A stuck ON failure and stores a DTC when the transmission fluid pressure sensor is specified pressure or more though the shift solenoid valve A is outputting OFF signal in the over drive clutch engagement process in response to a request for engagement of the over drive clutch.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.6 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Vehicle speed [Vehicle Speed]	44 mph (70 km/h)	-
12 volt battery voltage [Battery Voltage]	11 V	-
Over drive clutch	ON (engaged)	
State of the vehicle	Engine driving mode	

[ ]: HDS Parameter

Malfunction Threshold

The transmission fluid pressure sensor output is specified hydraulic pressure or more for at least 1.6 seconds despite the shift solenoid valve A OFF signal during the process of the over drive clutch engagement in response to the request.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve A stuck on
- Valve body assembly (shift valve A stuck)

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed of 44 mph (70 km/h) or more for at least 10 seconds with engine drive mode.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

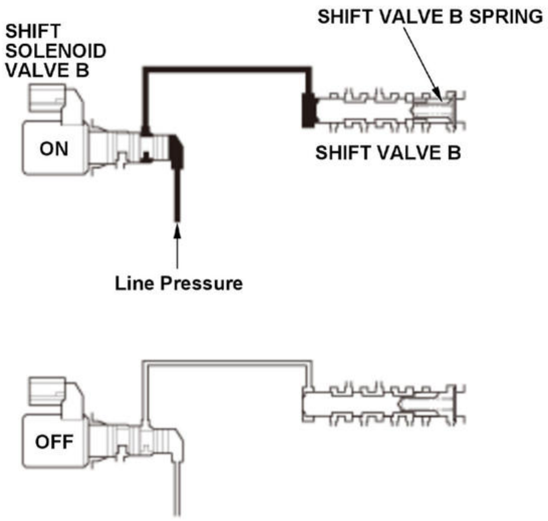
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0756

DTC P0756 : Shift Solenoid Valve B Stuck OFF

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

Shift solenoid valve B is installed on the flywheel housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to shift valve B. The signal from the PCM is output so that the line pressure is supplied to the clutch piston under the condition that overdrive clutch engagement is requested during running at 44 mph (70 km/h) or more. When the signal to shift solenoid valve B from the PCM is ON, and the line pressure is applied to shift valve B, it operates against the shift valve B spring. When the signal to shift solenoid valve B from the PCM is off, and the line pressure is discharged, shift valve B is inactive. The PCM monitors the transmission fluid pressure sensor and detects a shift solenoid valve B OFF failure and stores a DTC when the transmission fluid pressure sensor is specified pressure or less while engagement of the over drive clutch is requested.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.1 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Vehicle speed [Vehicle Speed]	44 mph (70 km/h)	-
12 volt battery voltage [Battery Voltage]	11 V	-
Over drive clutch	ON (engaged)	
State of the vehicle	Engine driving mode	

[ ]: HDS Parameter

Malfunction Threshold

The transmission fluid pressure sensor output is specified hydraulic pressure or less for at least 2.1 seconds while engagement of the over drive clutch is requested.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve B stuck off
- Valve body assembly (shift valve B stuck)

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed of 44 mph (70 km/h) or more for at least 10 seconds with engine drive mode.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

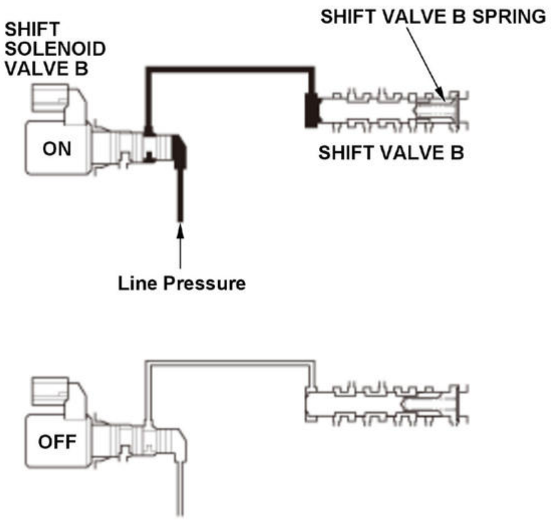
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0757

DTC P0757 : Shift Solenoid Valve B Stuck ON

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

Shift solenoid valve B is installed on the flywheel housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to shift valve B. The signal from the PCM is output so that the line pressure is supplied to the clutch piston under the condition that overdrive clutch engagement is requested during running at 44 mph (70 km/h) or more. When the signal to shift solenoid valve B from the PCM is ON, and the line pressure is applied to shift valve B, it operates against the shift valve B spring. When the signal to shift solenoid valve B from the PCM is off, and the line pressure is discharged, shift valve B is inactive. The PCM monitors the transmission fluid pressure sensor and detects a shift solenoid valve B stuck ON failure and stores a DTC when the transmission fluid pressure sensor is specified pressure or more though the shift solenoid valve B is outputting OFF signal while the engine is running.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.6 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	11 V	-
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

The transmission fluid pressure sensor output is specified hydraulic pressure or more for at least 1.6 seconds despite the shift solenoid valve B OFF signal while the engine is running.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve B stuck on
- Valve body assembly (shift valve B stuck)

Confirmation Procedure

Operating Condition

Enter the maintenance mode, then start the engine, and wait for at least 1.6 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

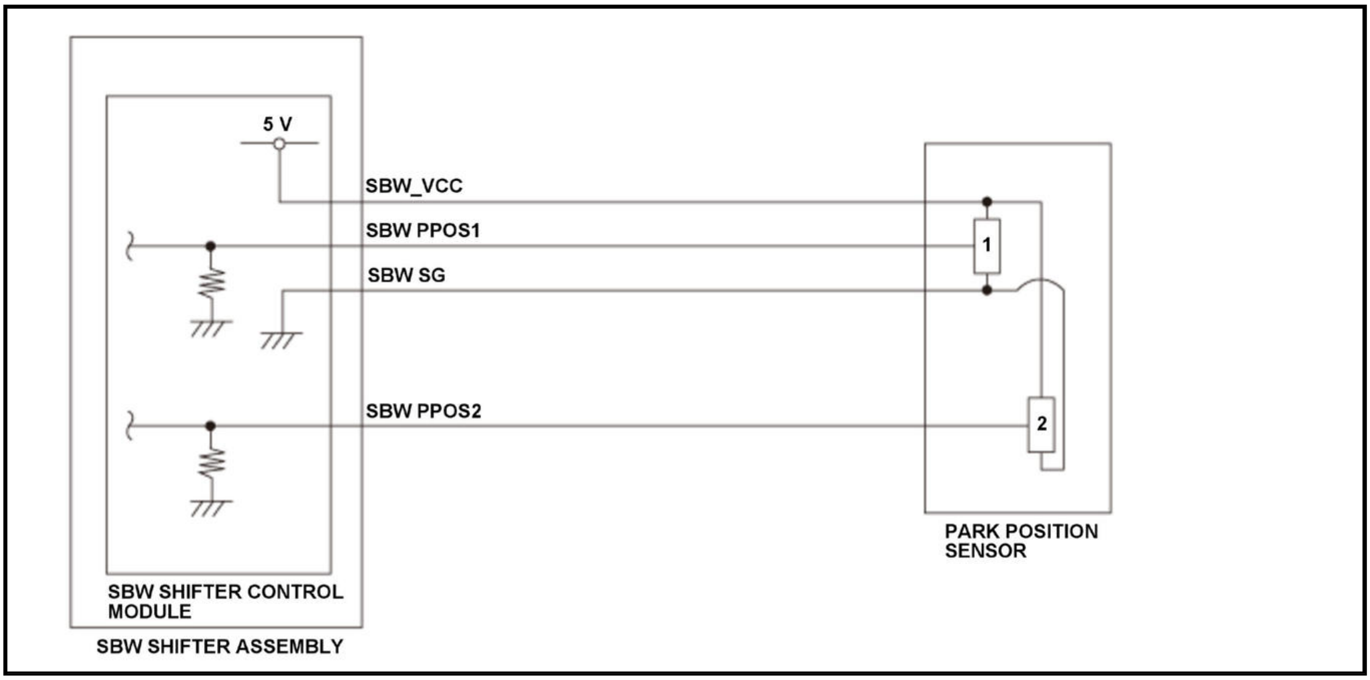
The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P07B3, P07B4

DTC P07B3 : Transmission Park Position Sensor/Switch A Circuit Low

DTC P07B4 : Transmission Park Position Sensor/Switch A Circuit High

General Description



The SBW shifter control module in the SBW shifter assembly judges the parking position by the output voltage from the park position sensor. The SBW shifter control module monitors the park position sensor 1 output voltage, and when the output voltage is a specified value for a specified duration, the powertrain control module (PCM) receives a malfunction from the SBW shifter control module and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P07B3

Park position sensor 1 output voltage [Parking Sensor 1 voltage] is 0.111 V or less for at least 2 seconds.

DTC: P07B4

Park position sensor 1 output voltage [Parking Sensor 1 voltage] is 4.855 V or more for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P07B3

- Park position sensor SBW PPOS1 line open (includes a loose or disconnected connector)
- Park position sensor SBW_VCC line open (includes a loose or disconnected connector)
- Park position sensor SBW SG line open (includes a loose or disconnected connector)
- Park position sensor SBW PPOS1 line short to ground
- Park position sensor SBW_VCC line short to ground

DTC: P07B4

- Park position sensor SBW PPOS1 line short to power

Common

- Park position sensor failure
- SBW shifter assembly (SBW shifter control module) internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

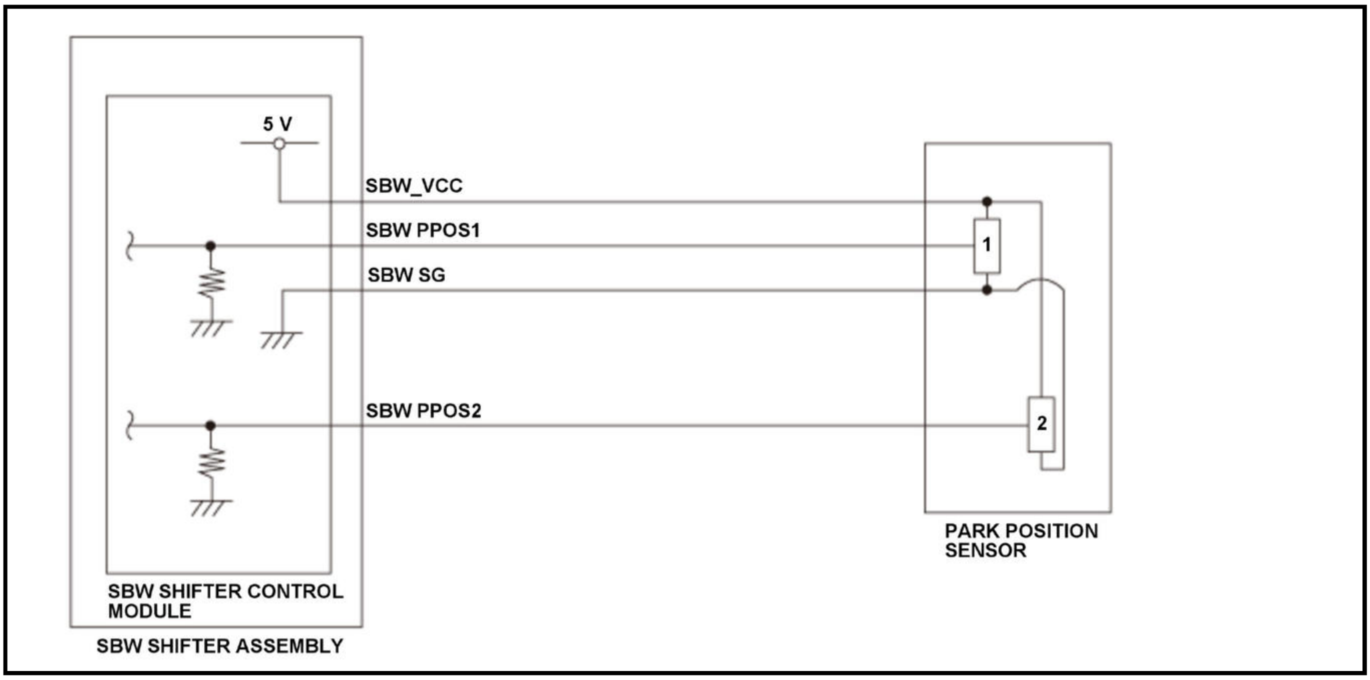
The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P07B9, P07BA

DTC P07B9 : Transmission Park Position Sensor/Switch B Circuit Low

DTC P07BA : Transmission Park Position Sensor/Switch B Circuit High

General Description



The SBW shifter control module in the SBW shifter assembly judges the parking position by the output voltage from the park position sensor. The SBW shifter control module monitors the park position sensor 2 output voltage, and when the output voltage is a specified value for a specified duration, the powertrain control module (PCM) receives a malfunction from the SBW shifter control module and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P07B9

Park position sensor 2 output voltage [Parking Sensor 2 voltage] is 0.111 V or less for at least 2 seconds.

DTC: P07BA

Park position sensor 2 output voltage [Parking Sensor 2 voltage] is 4.855 V or more for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P07B9

- Park position sensor SBW PPOS2 line open (includes a loose or disconnected connector)
- Park position sensor SBW_VCC line open (includes a loose or disconnected connector)
- Park position sensor SBW SG line open (includes a loose or disconnected connector)
- Park position sensor SBW PPOS2 line short to ground
- Park position sensor SBW_VCC line short to ground

DTC: P07BA

- Park position sensor SBW PPOS2 line short to power

Common

- Park position sensor failure
- SBW shifter assembly (SBW shifter control module) internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

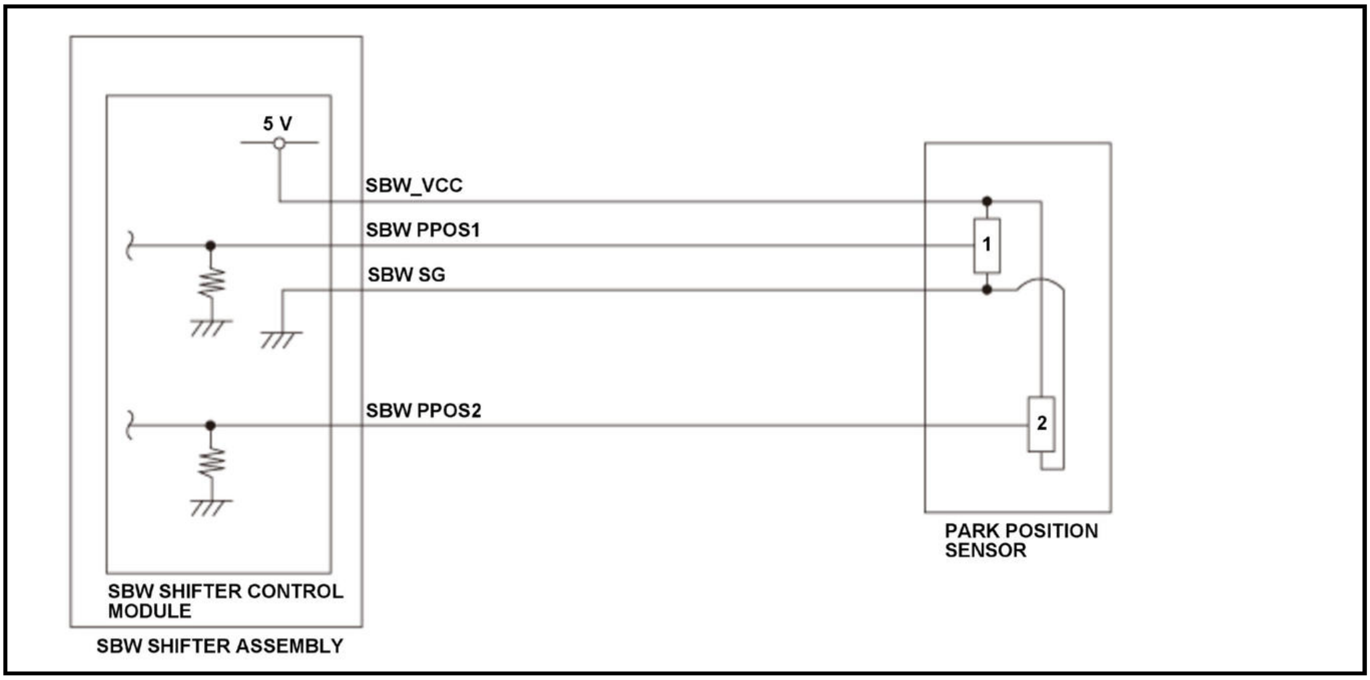
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P07BE

DTC P07BE : Transmission Park Position Sensor/Switch A/B Incorrect Voltage Correlation

General Description



The SBW shifter control module in the SBW shifter assembly detects the parking position by the output voltage from the park position sensor. The SBW shifter control module monitors the total value of the park position sensor 1 output voltage and the park position sensor 2 output voltage. When the total voltage is out of a specified range for a specified duration, the powertrain control module (PCM) receives malfunction information from the SBW shifter control module and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The total value of the park position sensor 1 output voltage and the park position sensor 2 output voltage is 3.4 V or more, or 2.6 V or less for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Park position sensor SBW PPOS1 line short to park position sensor SBW PPOS2 line
- Park position sensor failure
- SBW shifter assembly (SBW shifter control module) internal failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the ON mode, and wait for at least 2 seconds.
- While pressing the brake pedal, shift the transmission to N position/mode.
- Shift the transmission to P position/mode.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

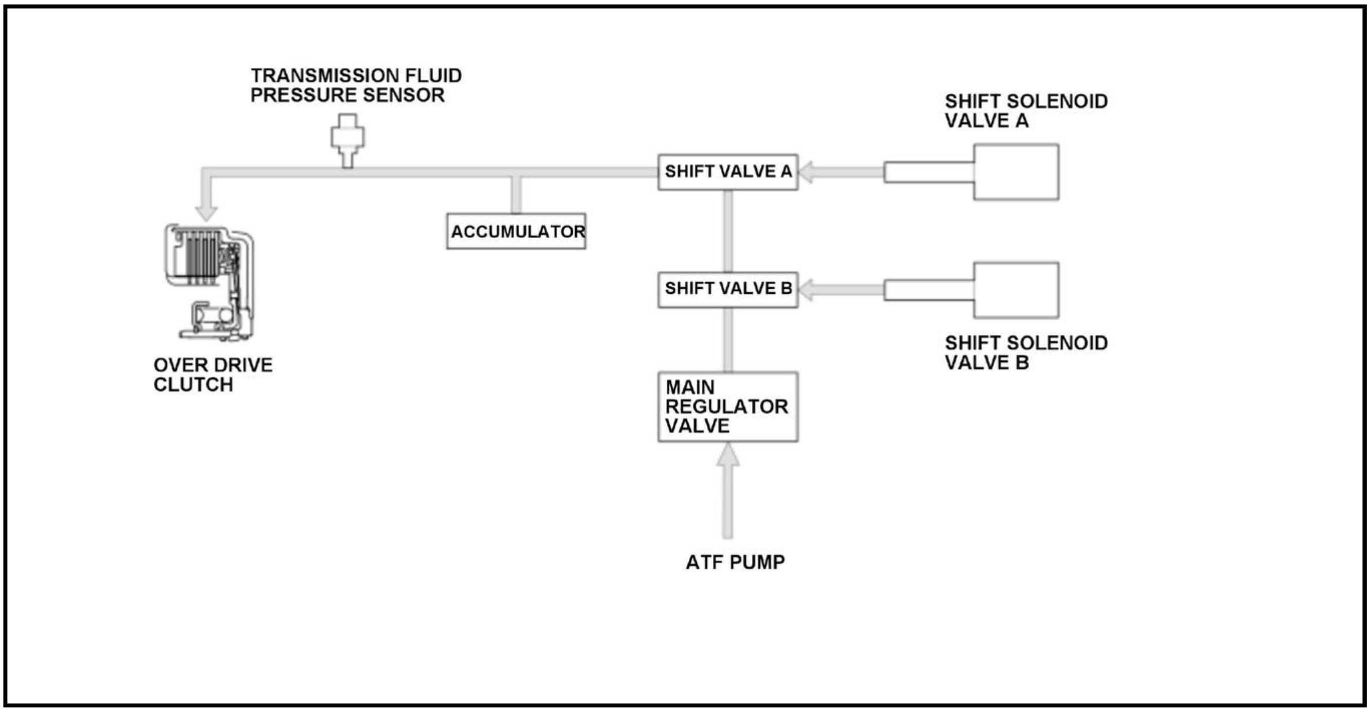
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0811

DTC P0811 : Excessive Clutch A Slippage

General Description



When running at 44 mph (70 km/h) or more, the line pressure is supplied to the clutch piston in response to a request for engagement of the over drive clutch from the powertrain control module (PCM) to cause the clutch to be engaged and the input shaft and the over drive gear rotate together to transmit the driving force. The hydraulic pressure to the clutch is supplied from the ATF pump -> regulator valve -> shift valve -> clutch piston. (Failure in the clutch piston in the supply paths above is detected by failure detection of each shift solenoid valve.) The PCM calculates the difference between the input revolution speed (Engine speed) to the over drive clutch and the output revolution speed (Traction motor speed) and detects a malfunction of the hydraulic pressure supply system or the clutch and stores a DTC when the difference in the revolution speed is more than the prescribed value when engagement of the over drive clutch is requested.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	0.5 seconds or more
DTC Type	Two drive cycles, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Vehicle speed [Vehicle Speed]	44 mph (70 km/h)	-
12 volt battery voltage [Battery Voltage]	11 V	-
Over drive clutch	ON (engaged)	
State of the vehicle	Engine driving mode	

[ ]: HDS Parameter

Malfunction Threshold

The difference between the input rotation speed (engine speed) and the output rotation speed (traction motor speed) is more than 100 rpm for at least 0.5 seconds when engagement of the over drive clutch is requested.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Over drive clutch failure
- Transmission (e-CVT) (over drive clutch hydraulic circuit) failure
- Valve body assembly (ATF pump, main regulator valve) failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed of 44 mph (70 km/h) or more for at least 10 seconds with engine drive mode.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the

12 volt battery.

DTC P0840 (2020)

DTC P0840 : Transmission Fluid Pressure Sensor Malfunction

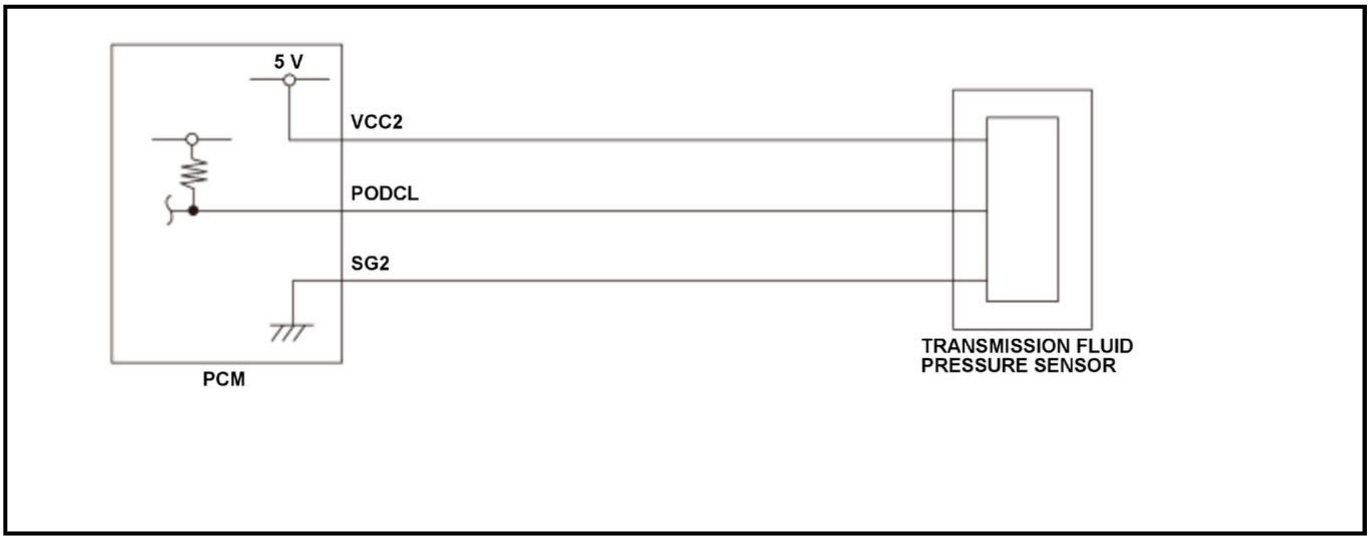
General Description

DTC P0840 is stored when the DTC that is related to transmission fluid pressure sensor performance abnormality is detected. The powertrain control module (PCM) stores the DTC at the time when DTC P173A or P173B is detected.

DTC P0840 (2021)

DTC P0840: Transmission Fluid Pressure Sensor Malfunction

General Description



The transmission fluid pressure sensor is installed in the hydraulic pressure circuit to the over drive clutch. When hydraulic pressure is supplied to the over drive clutch, the transmission fluid pressure sensor output is above the main regulator valve output pressure. When hydraulic pressure is not supplied to the over drive clutch, the transmission fluid pressure sensor output is low. The signal from the transmission fluid pressure sensor is sent to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the over drive clutch to the hydraulic circuit. If the transmission fluid pressure sensor output voltage is a specified value for a set time, the PCM detects a transmission fluid pressure sensor failure and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY VOLTAGE]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

The transmission fluid pressure sensor output voltage [Oil Pressure Sensor 1 Voltage] is 0.34 V or less for at least 6.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission fluid pressure sensor failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 6.0 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, the shift position indicator blinks and a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0841 (2021)

DTC P0841: Transmission Fluid Pressure Sensor Performance

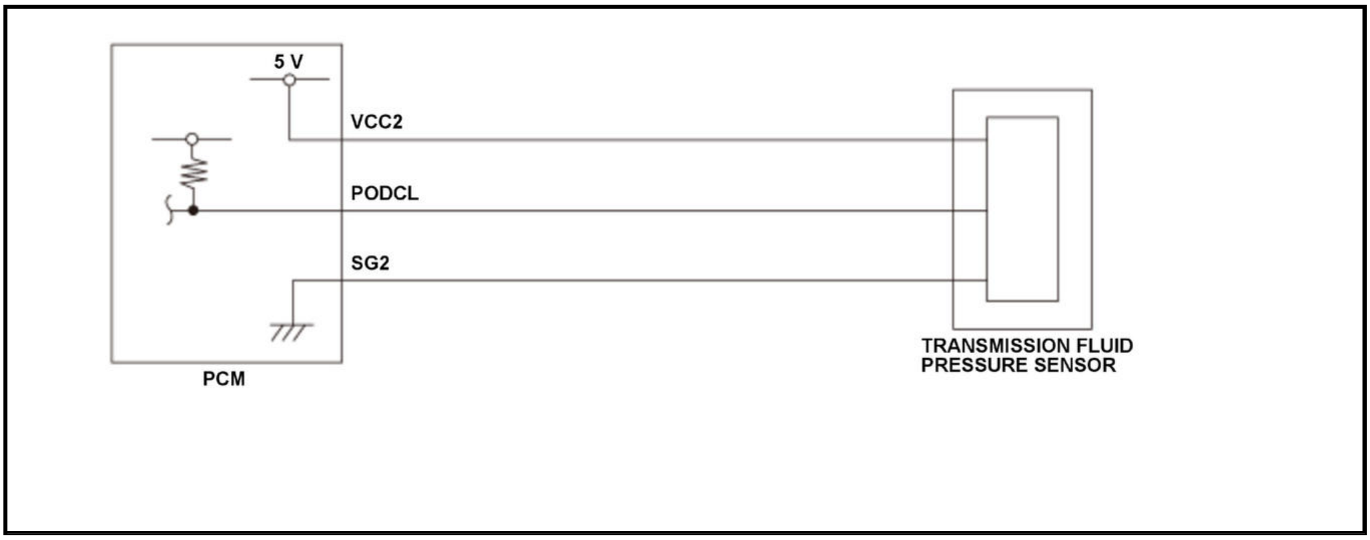
General Description

DTC P0841 is stored when the DTC that is related to abnormality of the transmission fluid pressure sensor is detected. The powertrain control module (PCM) stores the DTC at the time when DTC P173A or P173B is detected.

DTC P0842 (2021)

DTC P0842: Transmission Fluid Pressure Sensor Circuit Low Input

General Description



The transmission fluid pressure sensor is installed in the hydraulic pressure circuit to the over drive clutch. When hydraulic pressure is supplied to the over drive clutch, the transmission fluid pressure sensor output is above the main regulator valve output pressure. When hydraulic pressure is not supplied to the over drive clutch, the transmission fluid pressure sensor output is low. The signal from the transmission fluid pressure sensor is sent to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the over drive clutch to hydraulic circuit. If the transmission fluid pressure sensor output voltage is a specified value for a set time, the PCM detects a transmission fluid pressure sensor failure and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY VOLTAGE]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

When the transmission fluid pressure sensor output voltage [Oil Pressure Sensor 1 Voltage] is 0.25 V or less for 5.0 seconds or more while to vehicle is turned to the ON mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission fluid pressure sensor PODCL line short to ground
- Transmission fluid pressure sensor VCC2 line open
- PCM internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 5.0 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, the shift position indicator blinks and a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

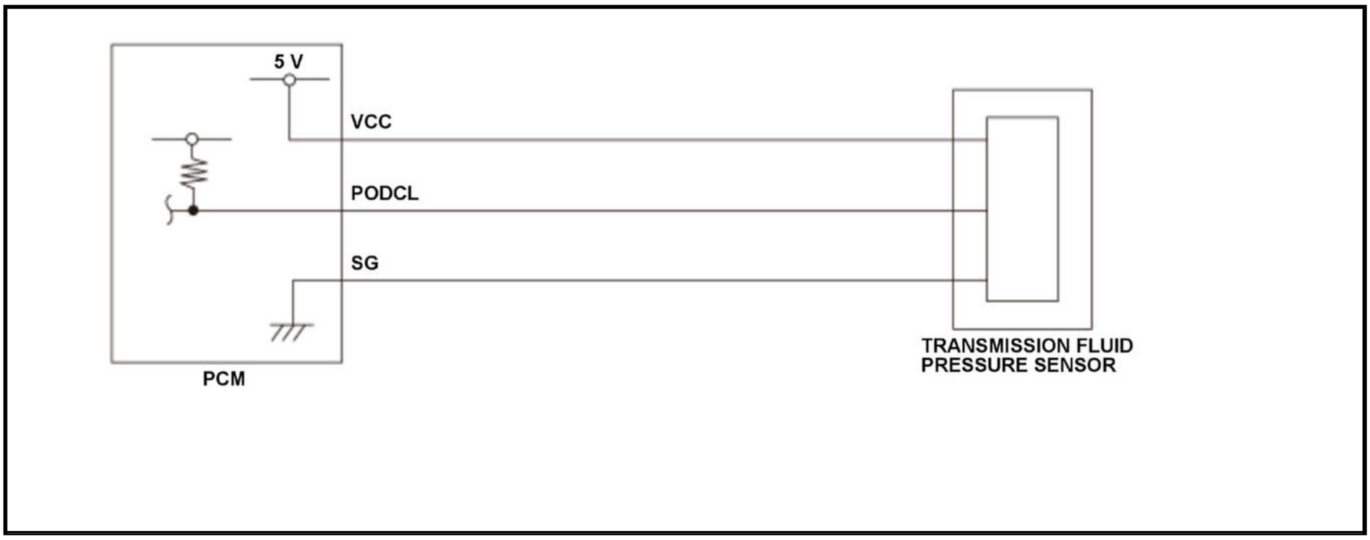
The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0842, P0843 (2020)

DTC P0842 : Transmission Fluid Pressure Switch A (2nd Clutch) Circuit Low/Transmission Fluid Pressure Sensor Circuit Low Input

DTC P0843 : Transmission Fluid Pressure Switch A (2nd Clutch) Circuit High/Transmission Fluid Pressure Sensor Circuit High Input

General Description



Transmission fluid pressure sensor is installed in the hydraulic pressure circuit to the over drive clutch. When hydraulic pressure is supplied to the over drive clutch, the transmission fluid pressure sensor output is above the main regulator valve output pressure. When hydraulic pressure is not supplied to the over drive clutch, the transmission fluid pressure sensor output is low pressure. The signal from transmission fluid pressure sensor is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the over drive clutch to hydraulic circuit. If transmission fluid pressure sensor output voltage is a specified value for a set time, the PCM detects a transmission fluid pressure sensor failure and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

DTC: P0842

When the transmission fluid pressure sensor output voltage [Transmission Fluid Pressure Sensor] is 0.25 V or less for at least 5.0 seconds.

DTC: P0843

When the transmission fluid pressure sensor output voltage [Transmission Fluid Pressure Sensor] is 4.65 V or more for at least 5.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P0842

- Transmission fluid pressure sensor VCC line open (includes a loose or disconnected connector)
- Transmission fluid pressure sensor PODCL line short to ground

DTC: P0843

- Transmission fluid pressure sensor PODCL line open (includes a loose or disconnected connector)
- Transmission fluid pressure sensor SG line open (includes a loose or disconnected connector)

Common

- Transmission fluid pressure sensor failure
- PCM internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 5.0 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the

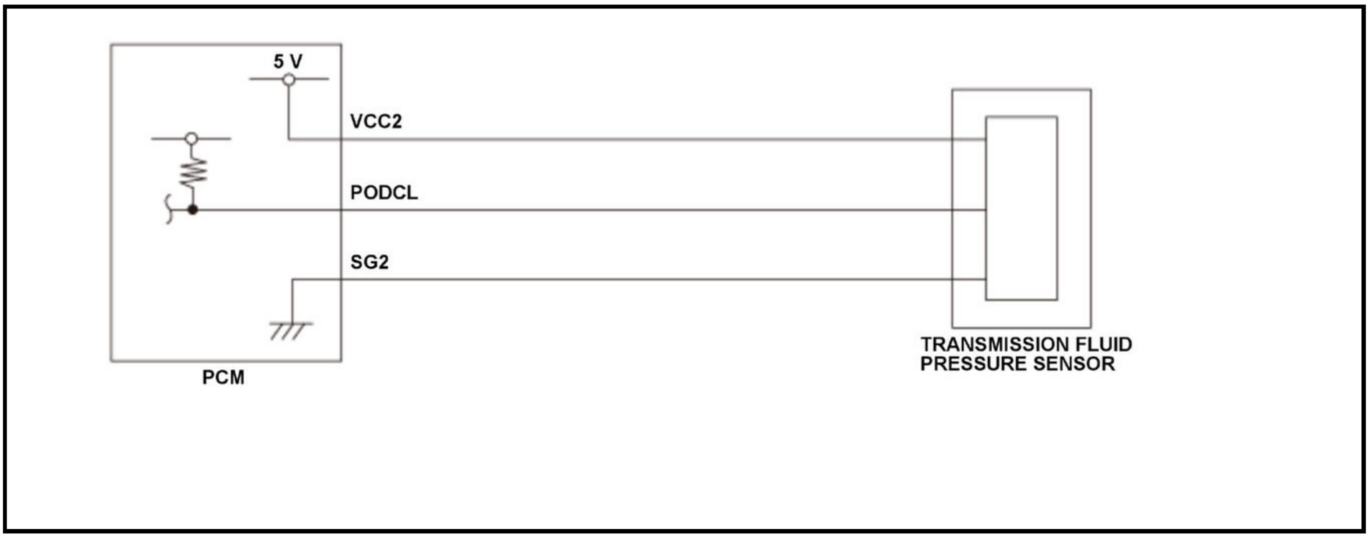
12 volt battery.

ADVANCED DIAGNOSTICS

DTC P0843 (2021)

DTC P0843: Transmission Fluid Pressure Sensor Circuit High Input

General Description



The transmission fluid pressure sensor is installed in the hydraulic pressure circuit to the over drive clutch. When hydraulic pressure is supplied to the over drive clutch, the transmission fluid pressure sensor output is above the main regulator valve output pressure. When hydraulic pressure is not supplied to the over drive clutch, the transmission fluid pressure sensor output is low. The signal from the transmission fluid pressure sensor is sent to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the over drive clutch. If the transmission fluid pressure sensor signal voltage is a specified value for a set time, the PCM detects a transmission fluid pressure sensor failure and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.0 seconds or more
DTC Type	Two drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage[BATTERY VOLTAGE]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

When the transmission fluid pressure sensor output voltage [Oil Pressure Sensor 1 Voltage] is 4.65 V or more for 5.0 seconds or more while vehicle is turned to the ON mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission fluid pressure sensor PODCL line open
- Transmission fluid pressure sensor SG2 line open
- PCM internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 5.0 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, the shift position indicator blinks and a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

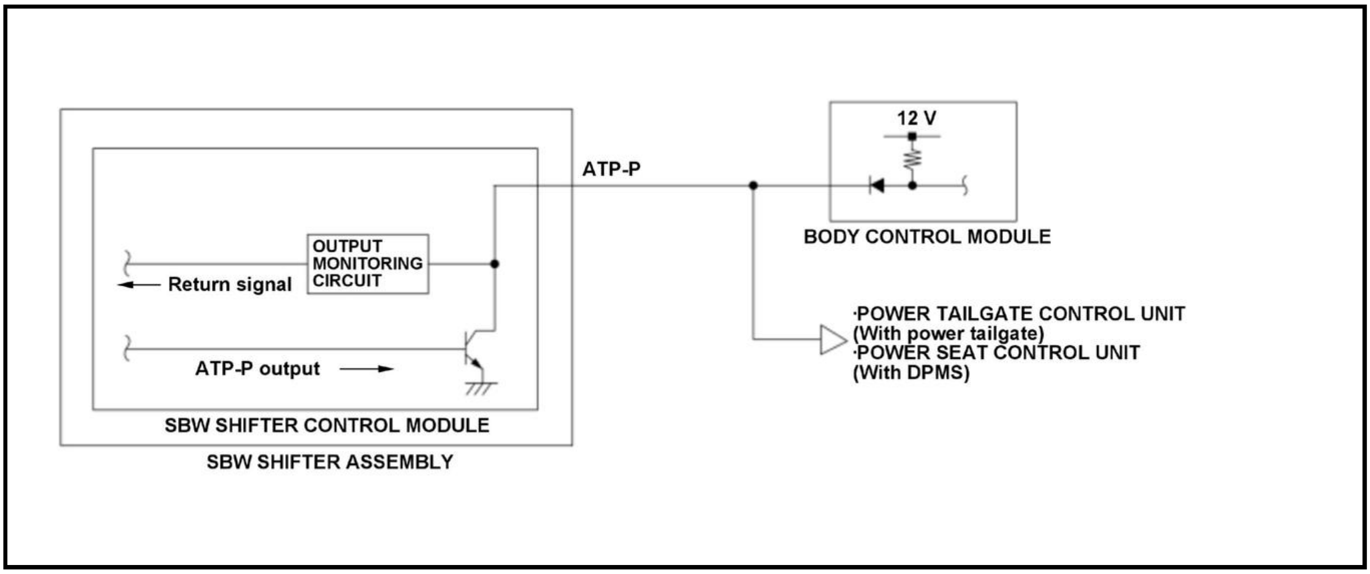
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

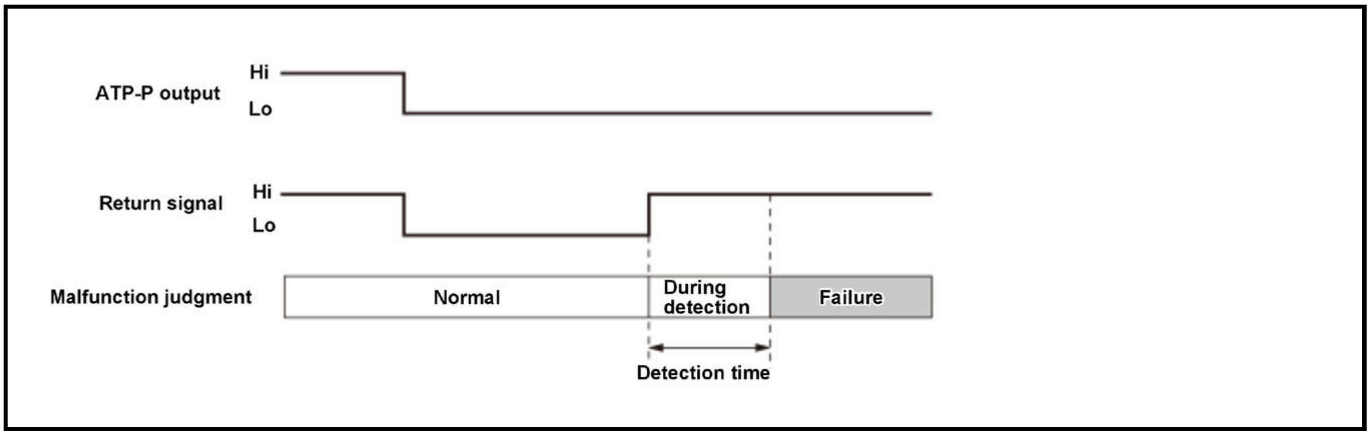
DTC P084F

DTC P084F : Park/Neutral Switch Output Circuit

General Description



ATP-P
12 V
BODY CONTROL MODULE
OUTPUT MONITORING CIRCUIT
Return signal
ATP-P output
SBW SHIFTER CONTROL MODULE
SBW SHIFTER ASSEMBLY
·POWER TAILGATE CONTROL UNIT (With power tailgate)
·POWER SEAT CONTROL UNIT (With DPMS)



The SBW shifter control module in the SBW shifter assembly judges the parking position by the output voltage from the park position sensor. The SBW shifter control module switches the ATP-P output to Hi/Lo according to the parking condition of the transmission. The SBW shifter control module monitors the return signal of the ATP-P output, and when the return signal and ATP-P output does not match for a specified duration, the powertrain control module (PCM) receives malfunction from the SBW shifter control module, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The return signal and the ATP-P output do not match for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- SBW shifter control module ATP-P line short to ground
- SBW shifter control module ATP-P line short to power
- SBW shifter assembly internal failure
- Body control module internal failure
- Power tailgate control unit internal failure (With power tailgate)
- Power seat control unit internal failure (With DPMS)

Confirmation Procedure

Operating Condition

- Turn the vehicle to the READY TO DRIVE mode.
- Shift the transmission to P position/mode, and wait for at least 10 seconds.
- While pressing the brake pedal, shift the transmission to N position/mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

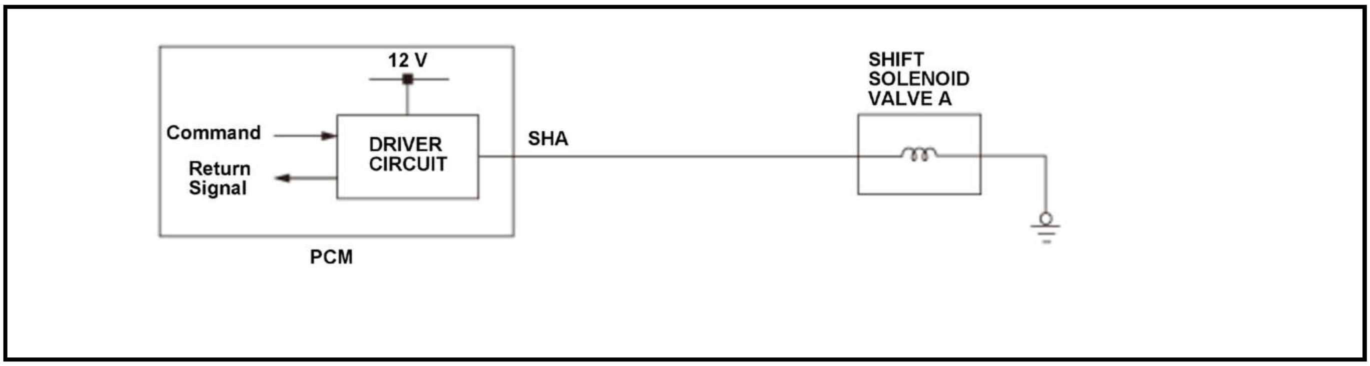
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0973

DTC P0973 : Shift Solenoid Valve A Control Circuit Low (Short)

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

When shift solenoid valves A and B are turned ON, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of the shift solenoid valves. The powertrain control module (PCM) commands the driver circuit to turn ON the shift solenoid valve. The circuit detects malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn ON the shift solenoid valve, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

The return signal does not match the command to turn ON shift solenoid valve A for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve A SHA line short to ground
- Shift solenoid valve A internal circuit short
- PCM internal failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed of 44 mph (70 km/h) or more for at least 10 seconds with engine drive mode.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

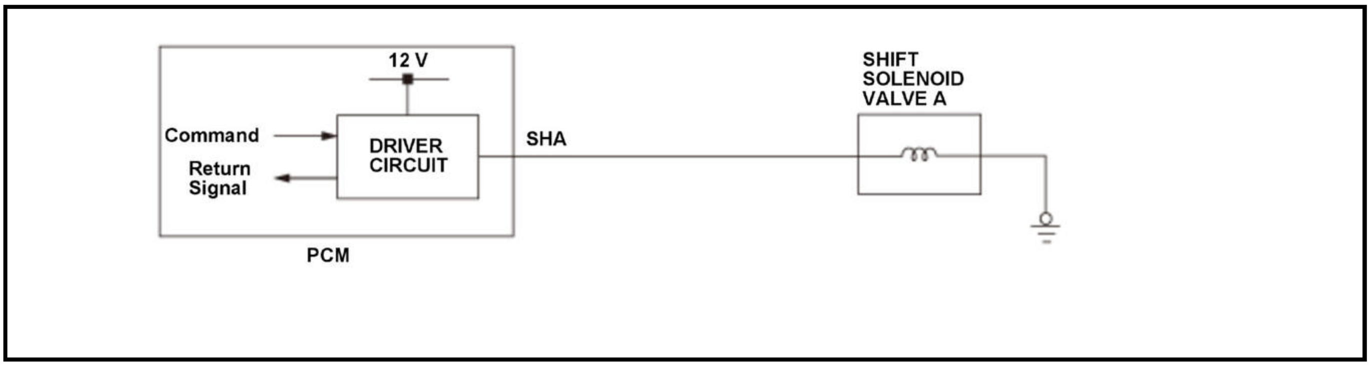
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0974

DTC P0974 : Shift Solenoid Valve A Control Circuit High (Open)

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

When shift solenoid valves A and B are turned ON, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of the shift solenoid valves. The powertrain control module (PCM) commands the driver circuit to turn ON the shift solenoid valve. The circuit detects malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn OFF the shift solenoid valve, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

The return signal does not match the command to turn OFF shift solenoid valve A for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve A SHA line open (includes a loose or disconnected connector)
- Shift solenoid valve A internal circuit open
- PCM internal failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the READY TO DRIVE mode.

- Shift the transmission to P position/mode, and wait for at least 1 second.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

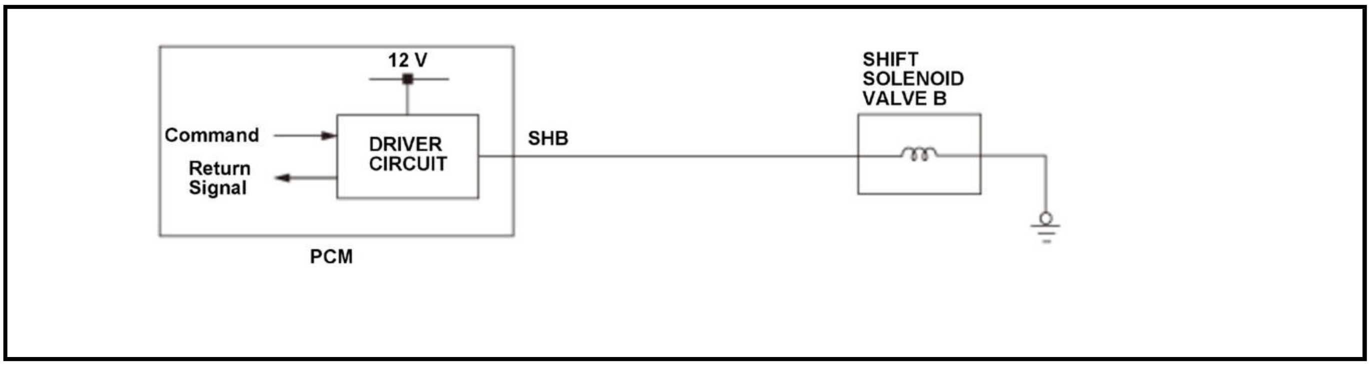
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0976

DTC P0976 : Shift Solenoid Valve B Control Circuit Low (Short)

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

When shift solenoid valves A and B are turned ON, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of the shift solenoid valves. The powertrain control module (PCM) commands the driver circuit to turn ON the shift solenoid valve. The circuit detects malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn ON the shift solenoid valve, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

The return signal does not match the command to turn ON shift solenoid valve B for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve B SHB line short to ground
- Shift solenoid valve B internal circuit short
- PCM internal failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Drive the vehicle at a steady speed of 44 mph (70 km/h) or more for at least 10 seconds with engine drive mode.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

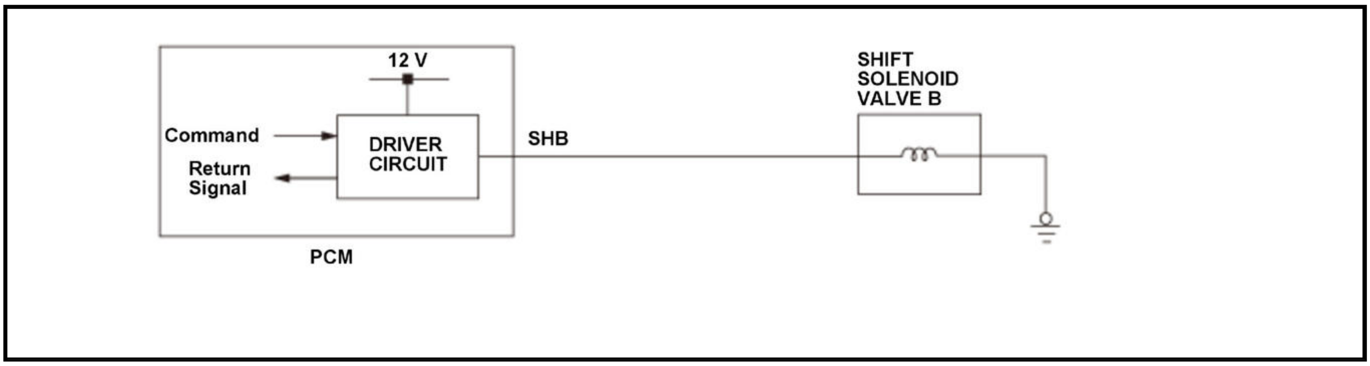
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0977

DTC P0977 : Shift Solenoid Valve B Control Circuit High (Open)

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

When shift solenoid valves A and B are turned ON, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of the shift solenoid valves. The powertrain control module (PCM) commands the driver circuit to turn ON the shift solenoid valve. The circuit detects malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. When the return signal does not match the PCM command to turn OFF the shift solenoid valve, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

The return signal does not match the command to turn OFF shift solenoid valve B for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve B SHB line open (includes a loose or disconnected connector)
- Shift solenoid valve B internal circuit open
- PCM internal failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the READY TO DRIVE mode.

- Shift the transmission to P position/mode, and wait for at least 1 second.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

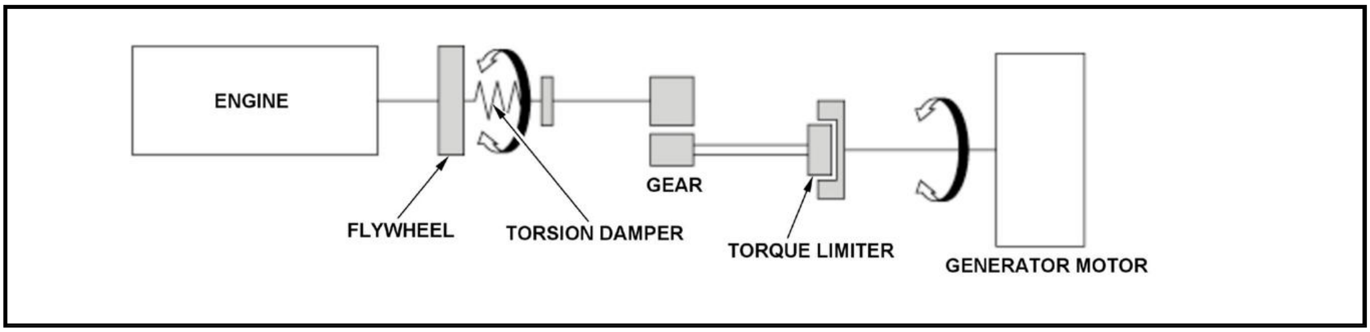
Conditions for clearing the DTC

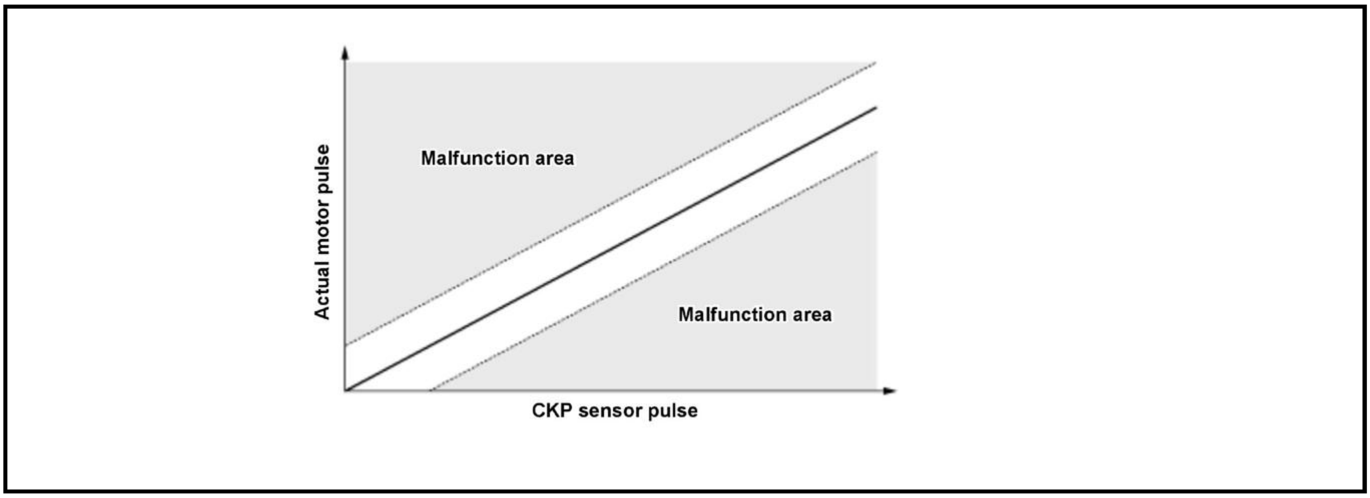
The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P0C2F

DTC P0C2F: GEN-ENG Angular Speed Correlation Malfunction

General Description





The powertrain control module (PCM) detects a malfunction and stores a DTC if the pulse value of the generator motor differs from the crank pulse value by either a set value or less, or a set vale or more.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	4.8 seconds or more, but not more than 24 seconds
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	2, 500 rpm

[ ]: HDS Parameter

Malfunction Threshold

When the generator motor pulse count is different from the crank pulse count by 127 or less or by 154 or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM NGENPLS line open
- PCM NGENPLS line short to failure
- PCM NGENPLS line electrical noise overlapped
- CKP sensor CRKP line failure
- CKP sensor CRKP line electrical noise overlapped

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine.
- Drive the vehicle at engine speed [Engine Speed] between 500 - 2, 500 rpm for at least 24 seconds.

- When freeze data is stored, hold the engine speed under those conditions.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

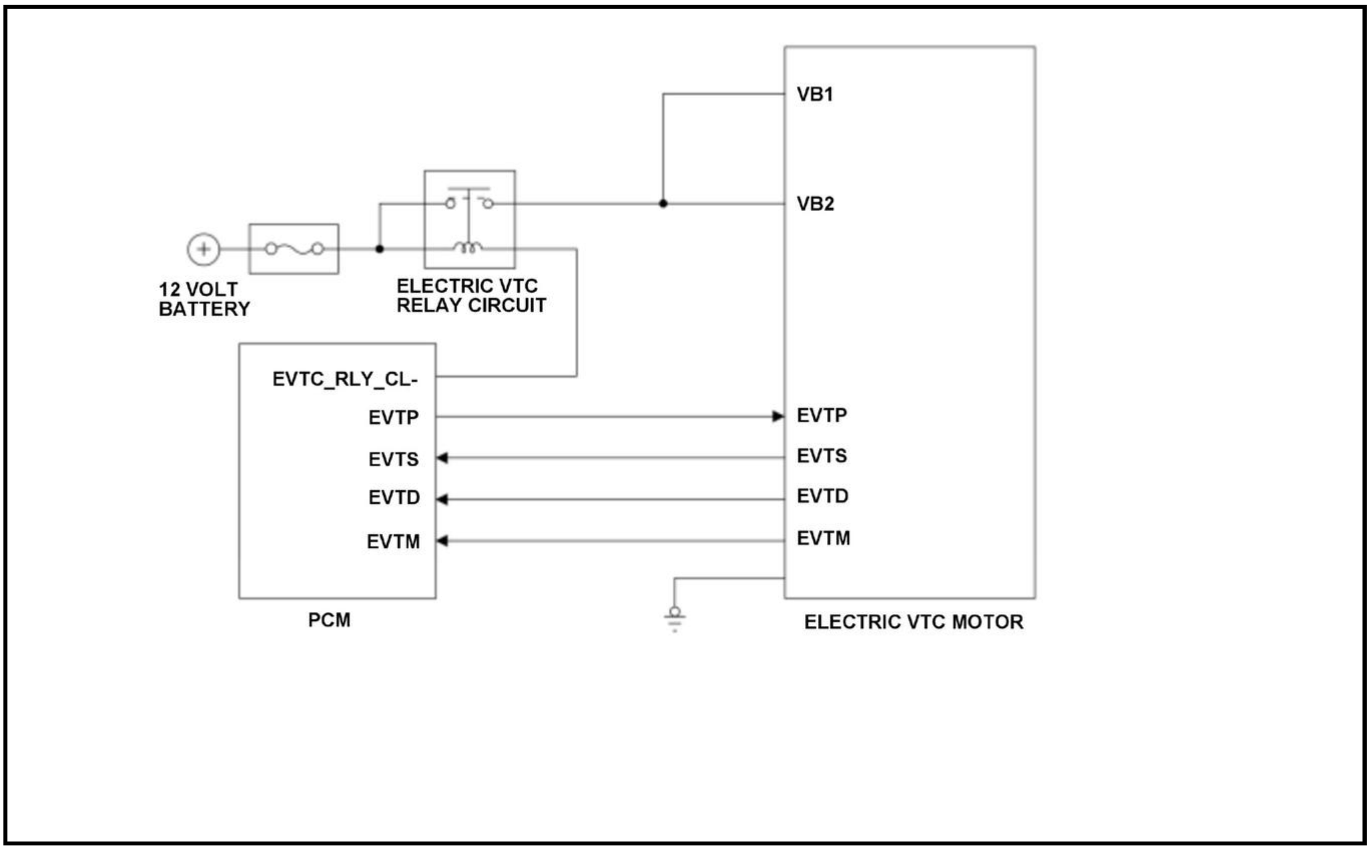
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P100A

DTC P100A: Electric VTC Motor Circuit Malfunction

General Description



VB1
VB2
12 VOLT BATTERY
ELECTRIC VTC RELAY CIRCUIT
EVTC_RLY_CL-
EVTP
EVTS
EVTD
EVTM
PCM
EVTP
EVTS
EVTD
EVTM
ELECTRIC VTC MOTOR

The EVTM line of the powertrain control module (PCM) is installed to receive a diagnostic signal from the electric VTC motor. When the electric VTC relay circuit is on under normal conditions, the EVTM line output from the electric VTC motor is 80 % (+/-5 %) duty. The PCM detects a malfunction and stores a DTC when the EVTM line output is anything other than 80 % (+/-5 %) duty continuously for the prescribed time or when though the electric VTC relay circuit is turned on.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.5 V	-

[ ]: HDS Parameter

Malfunction Threshold

When the EVTM output pulse number is incorrect and the 80 % (+/-5 %) duty continuously for 5 seconds or more when the PCM has turned on the electric VTC relay circuit.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric VTC motor EVTP line open
- Electric VTC motor EVTM line open

- Electric VTC motor ground line open
- Electric VTC relay circuit EVTC_RLY_CL- line open
- Electric VTC motor EVTP line short
- Electric VTC motor EVTM line short
- Electric VTC motor ground line short
- Electric VTC relay circuit EVTC_RLY_CL- line short to power
- Electric VTC motor VB1 line short to ground
- Electric VTC motor VB2 line short to ground
- Electric VTC relay circuit stuck off

Confirmation Procedure

Operating Condition

None.

With the HDS

Select the VTC TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P100B

When the EVTM output is other than 40 % (+/-5 %) duty or 60 % (+/-5 %) duty continuously for 5 seconds or more though the PCM has turned on the electric VTC relay circuit.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric VTC motor internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

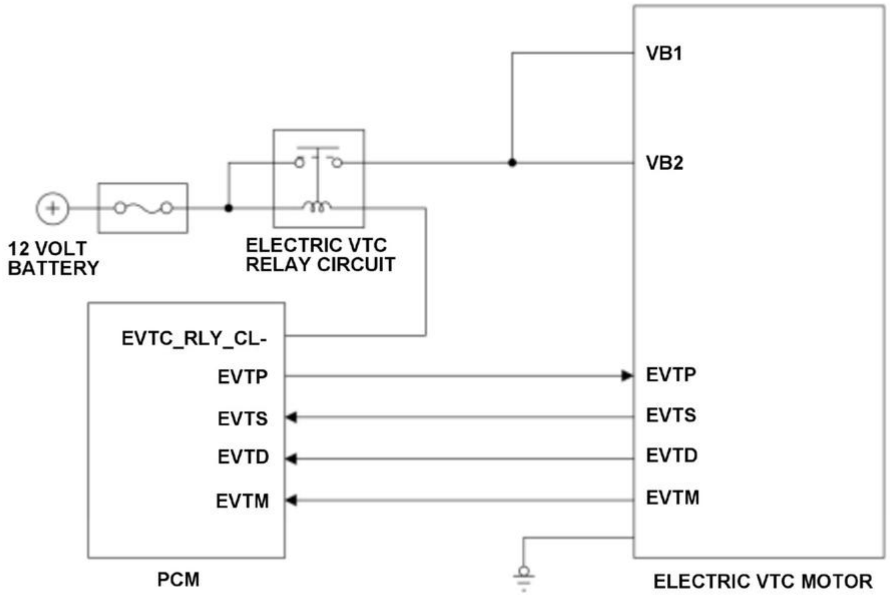
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P100C

DTC P100C: Electric VTC Motor Speed Signal Circuit Malfunction

General Description



The EVTS line and the EVTM line of the powertrain control module (PCM) receive the electric VTC motor revolution speed and the electric VTC motor revolution direction data and output pulses accordingly. The EVTM outputs the same pulse as the EVTS when the electric VTC motor revolution direction is normal and outputs reverse pulse of the EVTS when reversing. The PCM detects a malfunction and stores a DTC when the EVTS pulse number and the EVTD pulse number sent from the electric VTC motor are different continuously for the prescribed time.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.5 V	-

[ ]: HDS Parameter

Malfunction Threshold

When the EVTS line pulse number and the EVTD line pulse number are different continuously for 5 seconds or more when the PCM has turned on the electric VTC relay circuit.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric VTC motor EVTS line open
- Electric VTC motor EVTD line open
- Electric VTC motor EVTS line short
- Electric VTC motor EVTD line short
- Electric VTC motor EVTS line electrical noise overlapped
- Electric VTC motor EVTD line electrical noise overlapped

Confirmation Procedure

Operating Condition

None.

With the HDS

Select the VTC TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

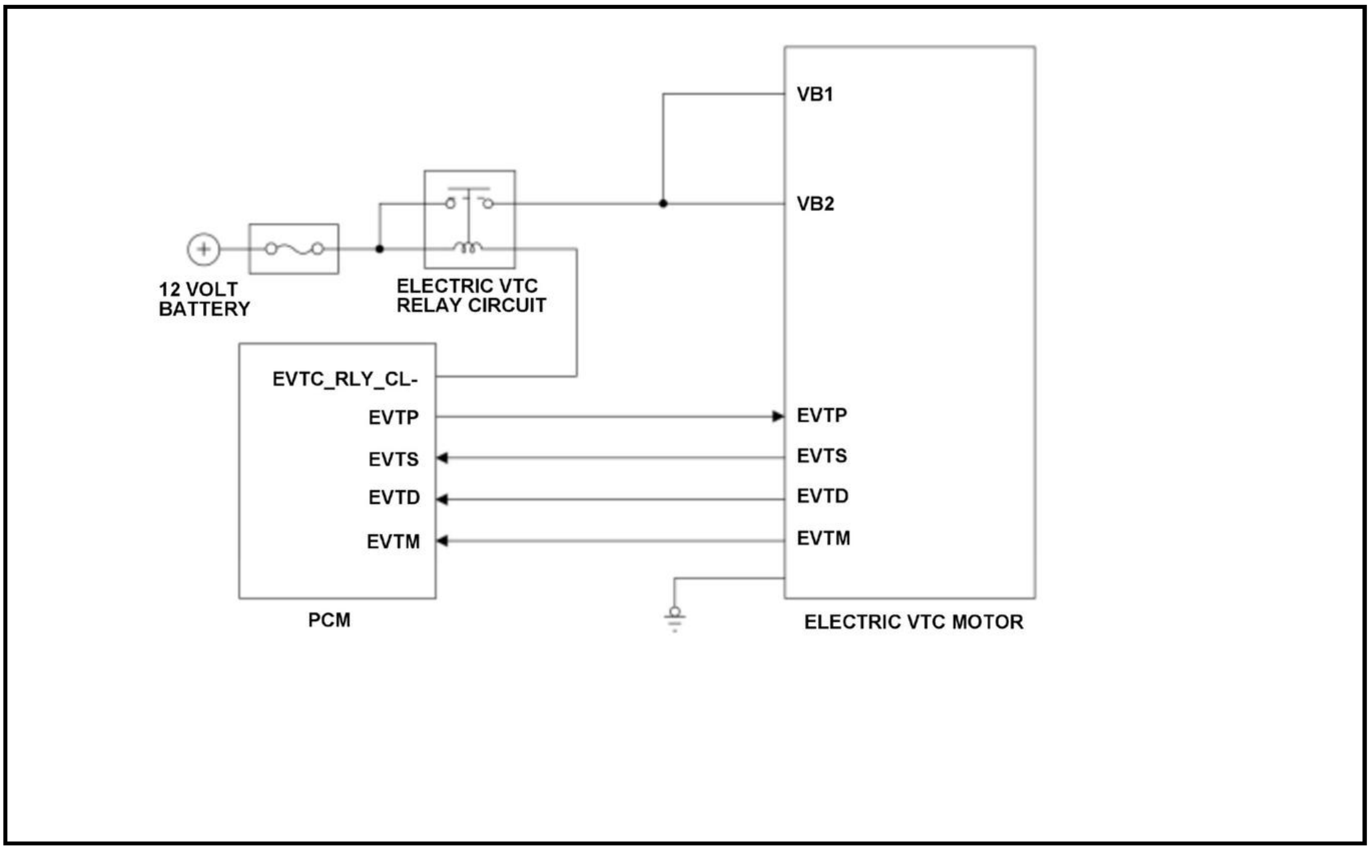
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P100D

DTC P100D: Electric VTC Motor Power Relay Circuit Stuck On

General Description



The EVTM line of the powertrain control module (PCM) is installed to receive diagnostic signal from the electric VTC motor. When the electric VTC relay circuit is off under normal conditions, the EVTM line output from the electric VTC motor is 100 % (+/-5 %) duty. When in the vehicle OFF (LOCK) mode, the PCM detects a malfunction and stores a DTC when the EVTM line output is anything other than 100 % (+/-5 %) duty continuously for the prescribed time though the electric VTC relay circuit is turned off.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.5 V	-

[ ]: HDS Parameter

Malfunction Threshold

When the EVTM output is other than 100 % (+/-5 %) duty continuously for 5 seconds or more though the PCM has turned off the electric VTC relay circuit in the vehicle OFF (LOCK) mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric VTC motor VB2 line short to power
- Electric VTC motor EVTM line short to ground

- Electric VTC relay circuit EVTC_RLY_CL- line short to ground
- Electric VTC relay circuit stuck on

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

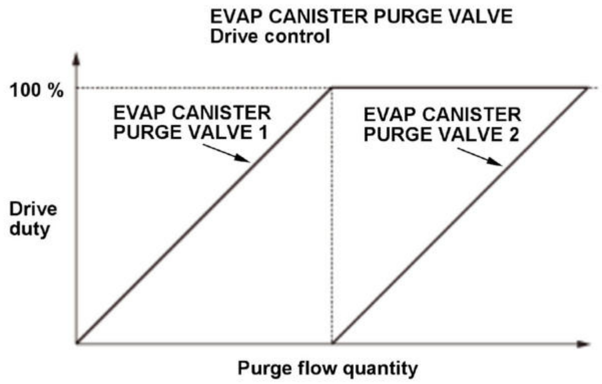
Conditions for clearing the DTC

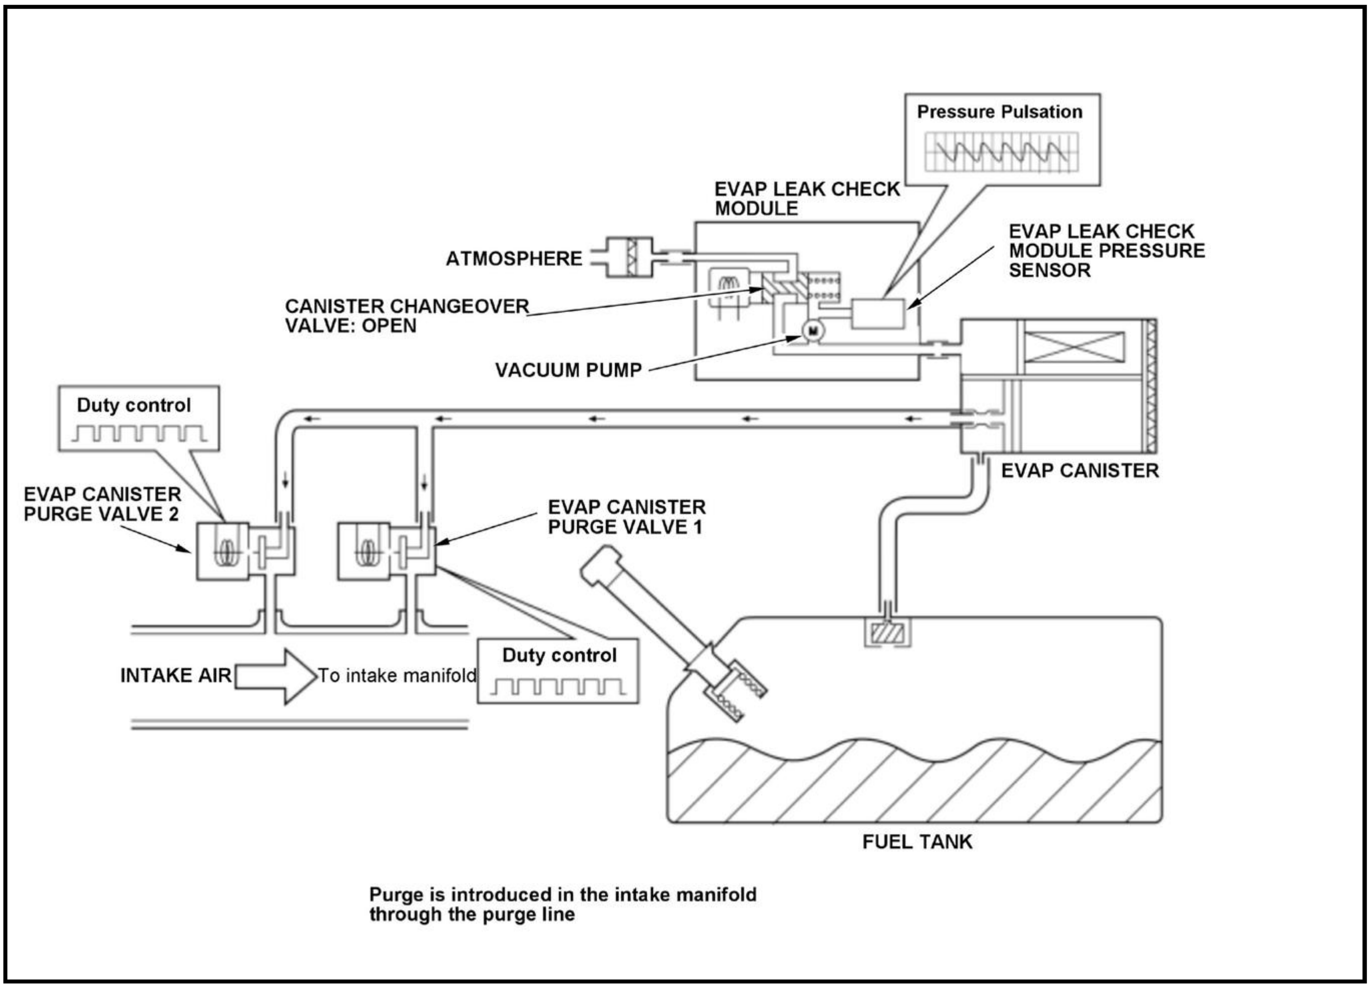
The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P145E

DTC P145E: Evaporative Emission (EVAP) System Purge Flow Malfunction 2

General Description





Pressure Pulsation
EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
ATMOSPHERE
CANISTER CHANGEOVER VALVE: OPEN
VACUUM PUMP
M
Duty control
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER PURGE VALVE 1
EVAP CANISTER
INTAKE AIR
To intake manifold
Duty control
FUEL TANK
Purge is introduced in the intake manifold through the purge line

The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine. The EVAP system is a system which has this EVAP canister purge valve equipped parallel and adjusts the amount of vapor by driving the EVAP canister purge valve 2 when the EVAP canister purge valve 1 is fully opened.

<STEP 1>

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve duty cycle is transmitted to the EVAP leak check module pressure sensor during purge flow (pulse method). If there are no pulsation with EVAP canister purge valve 1, it judges pulsation by switching to EVAP canister purge valve 2 drive in EVAP canister purge valve 1 drive area.

OK determination: If pulsation from EVAP canister purge valve 1 drive area and pulsation from EVAP canister purge valve 2 area (EVAP canister purge valve 1 is in fully opened driving condition) are both present. (P0441 OK/P145E OK)

- P04F1 Purge flow OK
- P04DF EVAP canister purge valve 1 stuck Open OK
- P04AE EVAP canister purge valve 2 stuck Open OK

NG determination: If pulsation from EVAP canister purge valve 1 drive area is not present but pulsation from EVAP canister purge valve 2 drive is present. (P0441 NG/P145E OK)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.
- In this case, classify the failed part according to <STEP 2>.

NG determination: If pulsation from EVAP canister purge valve 2 drive area is not present but pulsation from EVAP canister purge valve 1 drive is present. (P0441 OK/P145E NG)

- Either purge flow P04F1 abnormality or P04DF EVAP canister purge valve 1 OPEN failure.

NG determination: If pulsation from EVAP canister purge valve 1 and EVAP canister purge valve 2 drive area is not present. (P0441 NG/P145E NG)

- P04F1 Purge flow NG

<STEP 2>

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 1 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04DF EVAP canister purge valve 1 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve 2 is stuck OPEN:

When the EVAP leak check module pressure sensor fluctuates from negative pressure to atmospheric pressure after the engine stopped: P04AE EVAP canister purge valve 2 stuck OPEN

When there is no fluctuation of the EVAP leak check module pressure sensor: P04F1 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	9.3 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1] before EVAP purge control starts	104 deg.F (40 deg.C)	-
MAP value [MAP Sensor (Hi Res)]	-	-9.3 kPa (-0.3 inHg, -70 mmHg)
Vehicle speed [Vehicle Speed]	-	2 mph (3 km/h)
12 volt battery voltage [Battery]	10.5 V	-
Fuel trim	0.69	1.47
EVAP canister purge valve 2 duty	15 %	90 %
Fuel feedback	Closed loop at stoichiometric	

[ ]: HDS Parameter

Malfunction Threshold

The pulses detected by the EVAP leak check module pressure sensor are 50 % or less for at least 9.3 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP canister purge valve 2 middle stuck
- EVAP canister purge valve 2 open stuck
- EVAP leak check module pressure sensor stuck
- EVAP system line clogged
- EVAP system line miss installed
- EVAP canister purge valve 2 failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine running for at least 30 seconds.
- Stop the engine and leave the vehicle for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

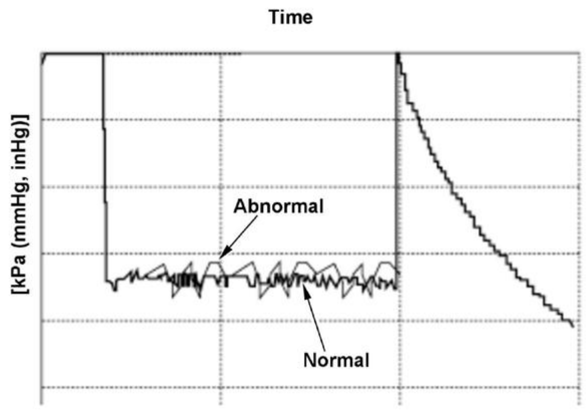
Pressure
Measurement
Vacuum Pump
Warm-up
Reference Pressure
Measurement
Second EVAP
Decompression
Reference Pressure
Re-measurement



The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT Sensor 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere.

A malfunction is detected and a DTC is stored when the max and min values of the pressure measurements within the prescribed time during reference pressure measurement is equal to or more than the prescribed value.

EVAP leak check module operation flow

- Reference pressure measurement: Malfunction detection in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction: Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement: Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the EVAP leak check module vacuum pump during detection.

Reference pressure is the pressure reduction caused by the reference orifice (#40 equivalent) in the EVAP leak check module used to check for leak by comparison with the system pressure reduction.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	At least 6 minutes 10 seconds but not more than 18 minutes 45 seconds
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the READY TO DRIVE mode	10 minutes	-
Elapsed time after the vehicle condition is turned to the OFF (LOCK) mode	5 hours	-
PCM wake up engine coolant temperature [ECT SENSOR 2]	40 deg.F (5 deg.C)	95 deg.F (35 deg.C)

Condition	Minimum	Maximum
Barometric pressure[BARO SENSOR]	76 kPa (569 mmHg, 22.5 inHg)	-

[ ]: HDS Parameter

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.5 V	-
Other	No refueling is required	

[ ]: HDS Parameter

Malfunction Threshold

When the max and min values of the pressure measurements within the prescribed time during reference pressure measurement is 0.3 kPa (2.5 mmHg, 0.1 inHg) or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP leak check module vacuum pump failure
- Canister change over valve failure
- Reference orifice flow quantity is excessive
- Reference orifice flow quantity is too few

Confirmation Procedure

Operating Condition

- With the engine coolant temperature [ECT Sensor 2] within the specified range, turn the vehicle to the READY TO DRIVE mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes 45 seconds.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and freeze data are stored.

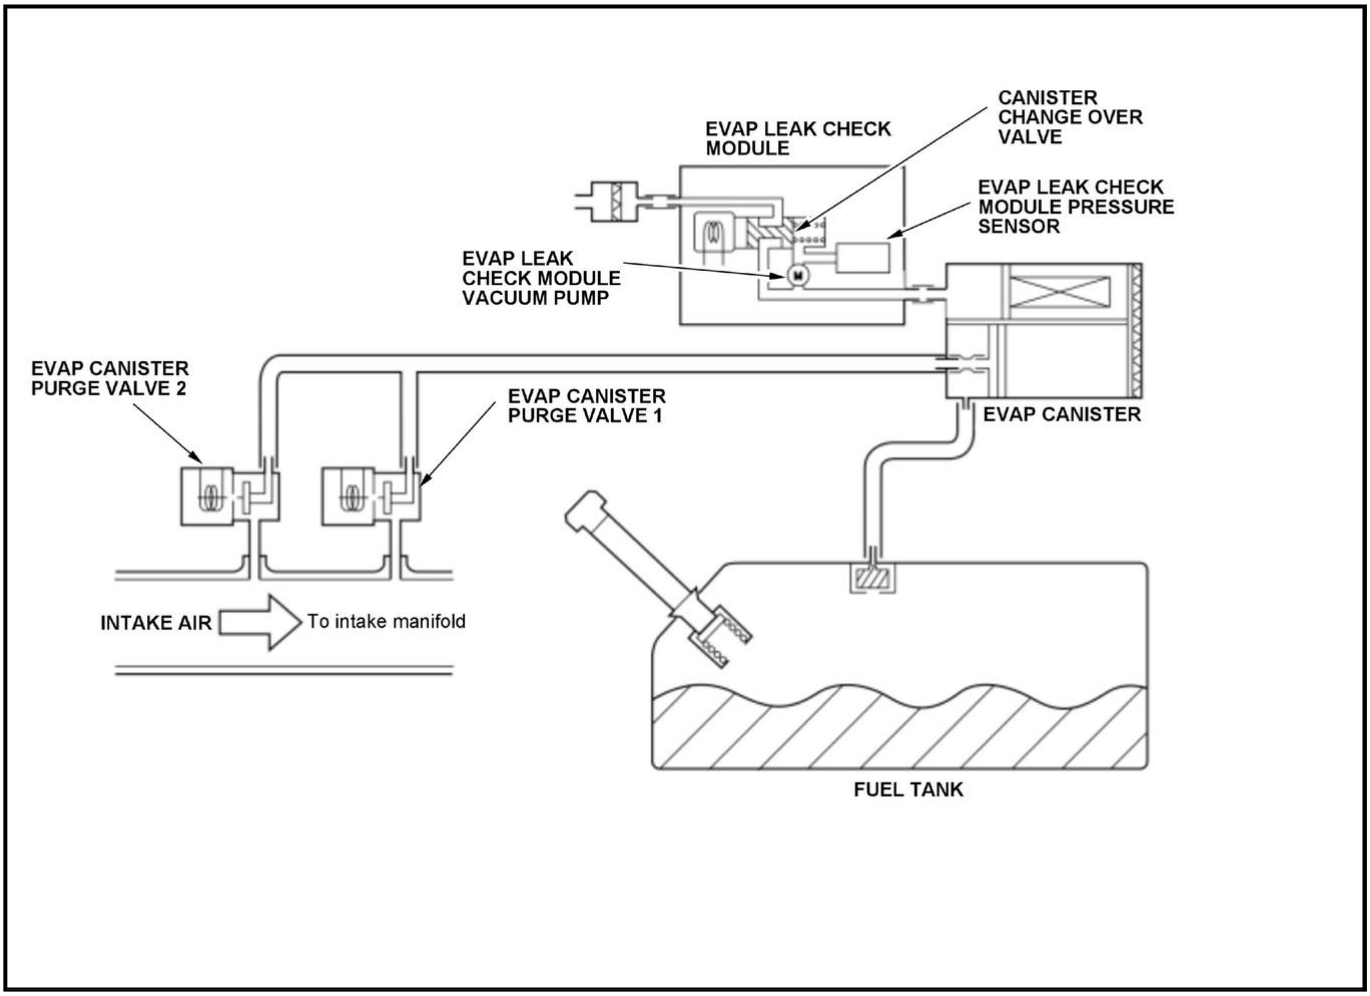
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

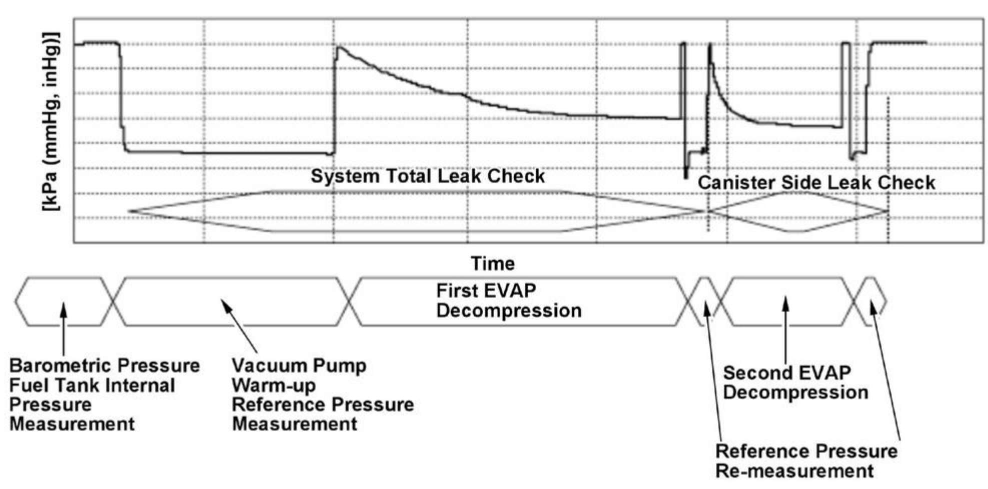
DTC P1461

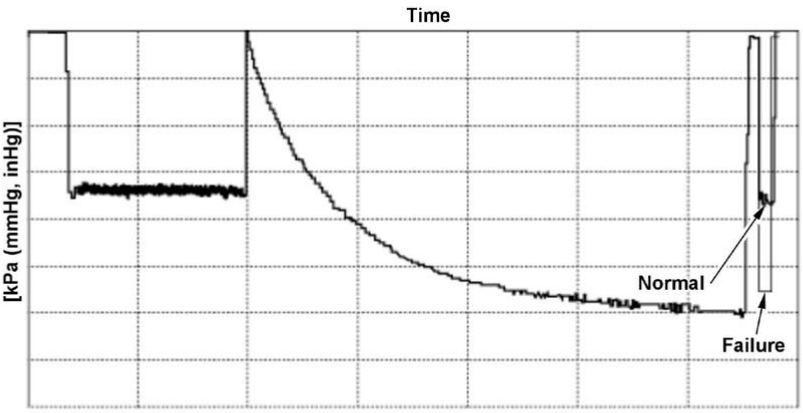
DTC P1461: Evaporative Emission (EVAP) Leak Check Module Pressure Sensor Shifts

General Description



EVAP LEAK CHECK MODULE
CANISTER CHANGE OVER VALVE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP LEAK CHECK MODULE VACUUM PUMP
M
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER PURGE VALVE 1
EVAP CANISTER
INTAKE AIR
To intake manifold
FUEL TANK





The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT Sensor 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere.

A malfunction is detected and a DTC is stored when the first reference pressure measurement and the second reference pressure measurement are equal to or more than prescribed values.

EVAP leak check module operation flow

- Reference pressure measurement: Malfunction detection in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction: Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement: Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the EVAP leak check module vacuum pump during detection.

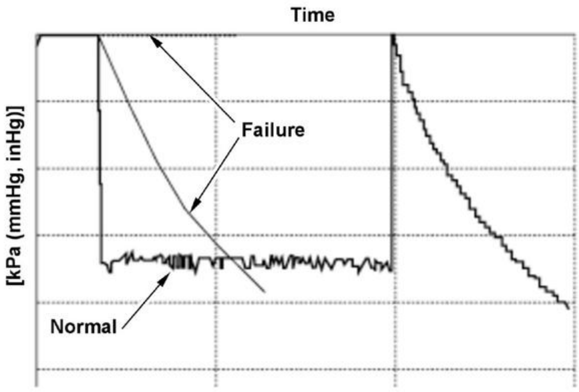
Time
First EVAP Decompression
Barometric Pressure Fuel Tank Internal Pressure Measurement
Vacuum Pump Warm-up Reference Pressure Measurement
Second EVAP Decompression
Reference Pressure Re-measurement



The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT Sensor 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere.

A malfunction is detected and a DTC is stored when the prescribed negative pressure is not created though pressure reduction when of the reference pressure measurement is started.

EVAP leak check module operation flow

- Reference pressure measurement: Malfunction detection in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction: Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement: Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the EVAP leak check module vacuum pump during detection.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	1 minute 14 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the READY TO DRIVE mode	10 minutes	-
Elapsed time after the vehicle condition is turned to the OFF (LOCK) mode	5 hours	-
PCM wake up engine coolant temperature [ECT SENSOR 1]	40 deg.F (5 deg.C)	95 deg.F (35 deg.C)
Barometric pressure[BARO SENSOR]	76 kPa (569 mmHg, 22.5 inHg)	-
12 volt battery voltage [BATTERY]	10.5 V	-

Condition	Minimum	Maximum
Other	No refueling is required	

[ ]: HDS Parameter

Malfunction Threshold

When negative pressure of 1 kPa (-7.5 mmHg, -0.3 inHg) or more is not created though pressure reduction when the reference pressure measurement is started.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP leak check module vacuum pump failure
- Canister change over valve failure
- Reference orifice flow quantity is excessive
- Reference orifice flow quantity is too few

Confirmation Procedure

Operating Condition

- With the engine coolant temperature [ECT Sensor 2] within the specified range, turn the vehicle to the READY TO DRIVE mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 1 minute 14 seconds.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

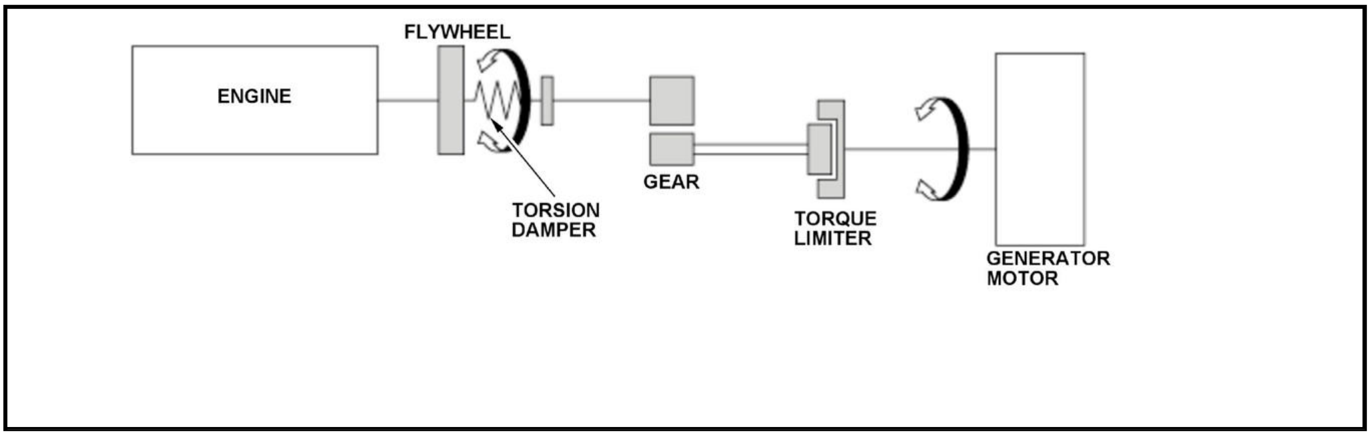
Conditions for clearing the DTC

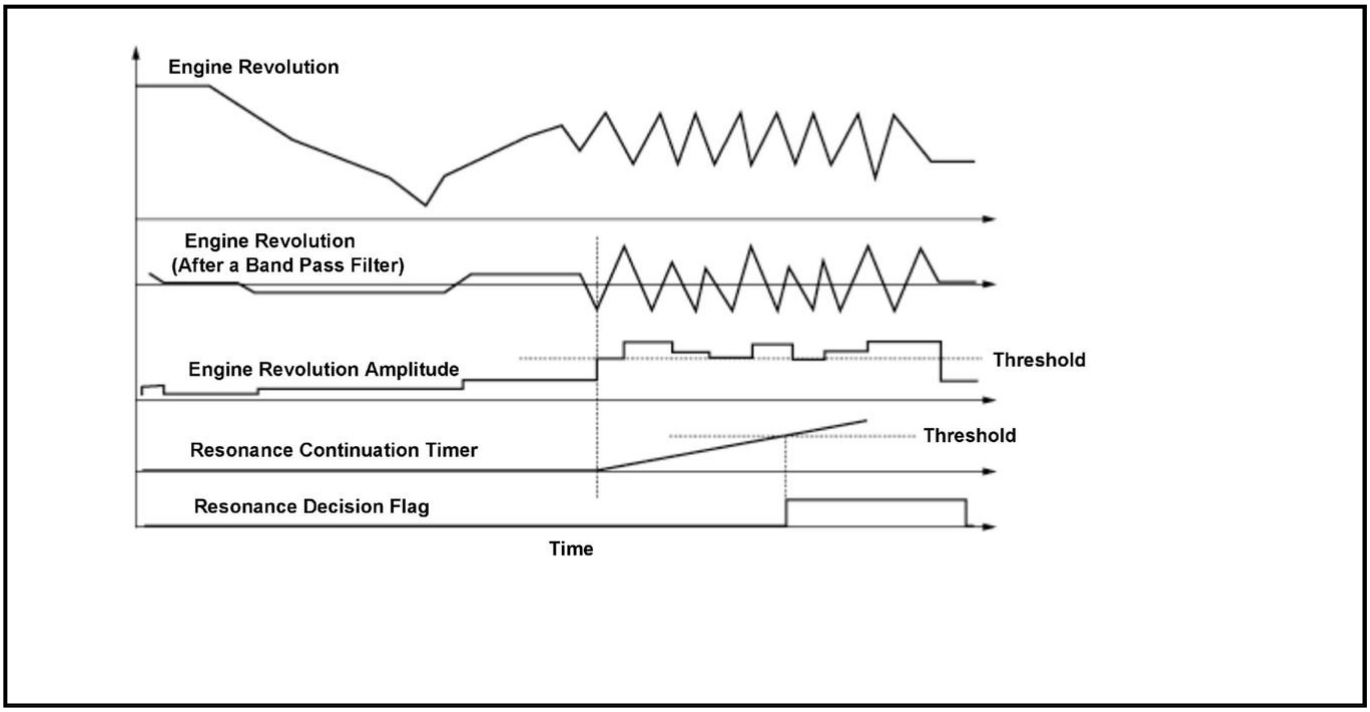
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P14A0 (2020)

DTC P14A0: Engine Abnormal Vibration

General Description





Engine resonance has the potential to cause severe engine damage. As a result, the flywheel is equipped with a high rate spring to help smooth out the transmission of power between the engine and the generator motor. But there are still certain rpm levels where resonance can cause vibration. When detected by the powertrain control module (PCM), the rpm range is limited. This is also the case if resonance is caused by misfire, engine failure or generator motor failure.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	13.2 seconds or less
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
Fuel feedback	Other than during fuel cut-off operation
State of the vehicle*	HV driving mode
	Engine driving mode
	HV driving mode -> Engine driving mode
	Engine driving mode -> HV driving mode

*: In any of described driving condition

Malfunction Threshold

When vibration due to engine resonance has increased.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Misfire (1 cylinder or 2 cylinder continuation misfires)

Confirmation Procedure

Operating Condition

Drive the vehicle for 13.2 seconds or more.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

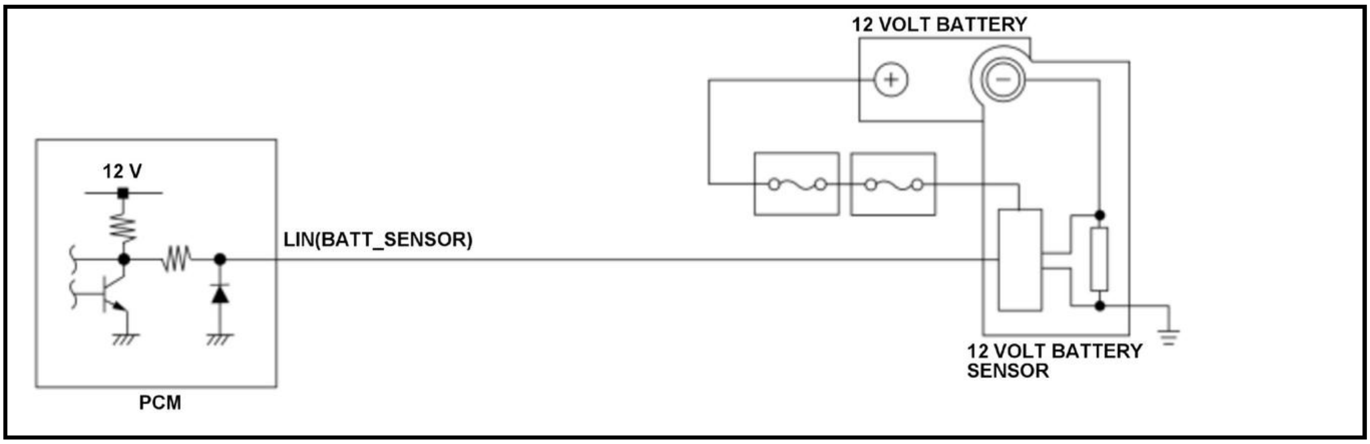
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P154A

DTC P154A: Battery Sensor Internal Failure

General Description



The 12 volt battery sensor is connected between the 12 volt battery and ground. It is also connected to the gauge control module by the local interconnect network (LIN) line and transmits/receives 12 volt battery sensor information to/from the powertrain control module (PCM) via the controller area network (CAN) line. The 12 volt battery sensor measures the 12 volt battery's current, voltage, and temperature. When the PCM requests this information to operate the engine electrical system efficiently, the 12 volt battery sensor runs a diagnostic program and sends the results to the PCM via the LIN and the CAN line. If the diagnostic results are outside the normal range, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

Either one of the conditions is met for at least 10 seconds:

- Internal current detection circuit open or A/D conversion circuit abnormal
- Internal voltage detection circuit open/short or A/D conversion circuit abnormal
- Internal temperature detection circuit open/short or A/D conversion circuit abnormal
- Calibration data abnormal

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- 12 volt battery sensor internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

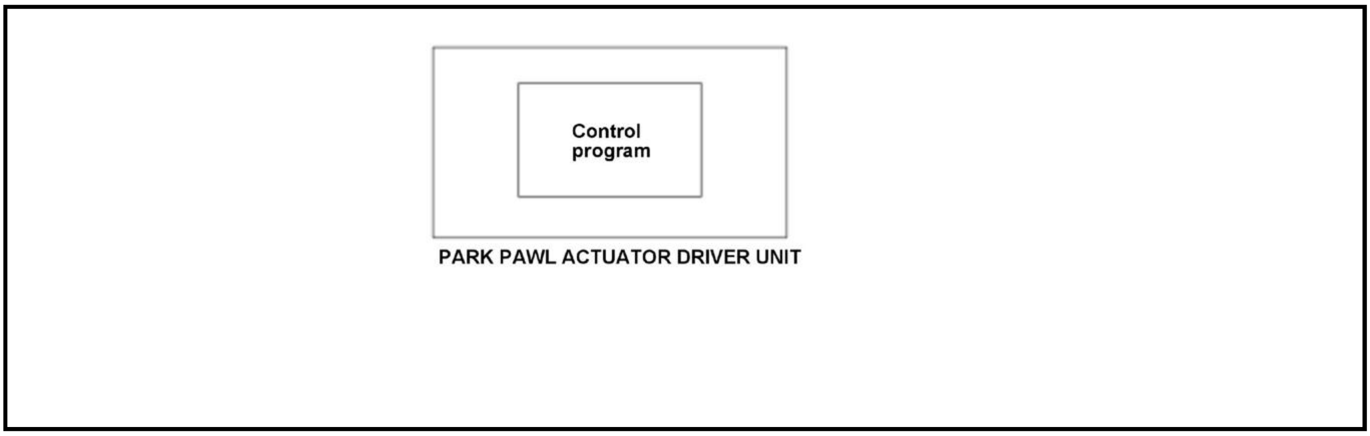
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P161B

DTC P161B : Park Pawl Control Module Programming Error

General Description



The park pawl actuator driver unit controls shifting/releasing of the park pawl actuator to/from the P position. A control program is stored in the park pawl actuator driver unit which confirms whether the control program is correctly written on start-up. If an abnormal condition of the control program is detected, the powertrain control module (PCM) receives malfunction from the park pawl actuator driver unit, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	-
Sequence	None
Duration	Depending on the driving conditions
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The abnormality or the unwritten condition is detected at the control program in the park pawl actuator driver unit.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Park pawl actuator driver unit internal failure
- PCM software data not updated

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 5 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

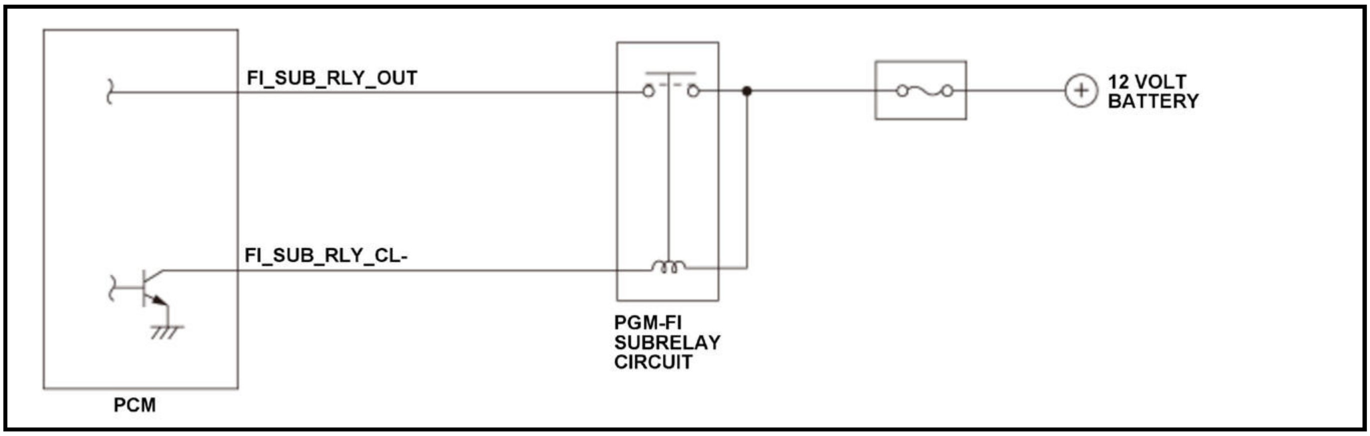
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P1658

DTC P1658: Electronic Throttle Control System (ETCS) Control Relay ON Malfunction

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensors A and B (installed in the throttle body). When the voltage is applied from the PGM-FI subrelay circuit to the FI_SUB_RLY_OUT terminal for a set time after the PGM-FI subrelay circuit is turned off, the PCM detects a malfunction in the PGM-FI subrelay circuit power switch and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	OFF (LOCK) mode

Malfunction Threshold

The communication signal is input from the PCM for at least 2.0 seconds after the PGM-FI subrelay circuit is turned off.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PGM-FI subrelay circuit FI_SUB_RLY_CL- line short to ground
- PGM-FI subrelay circuit failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

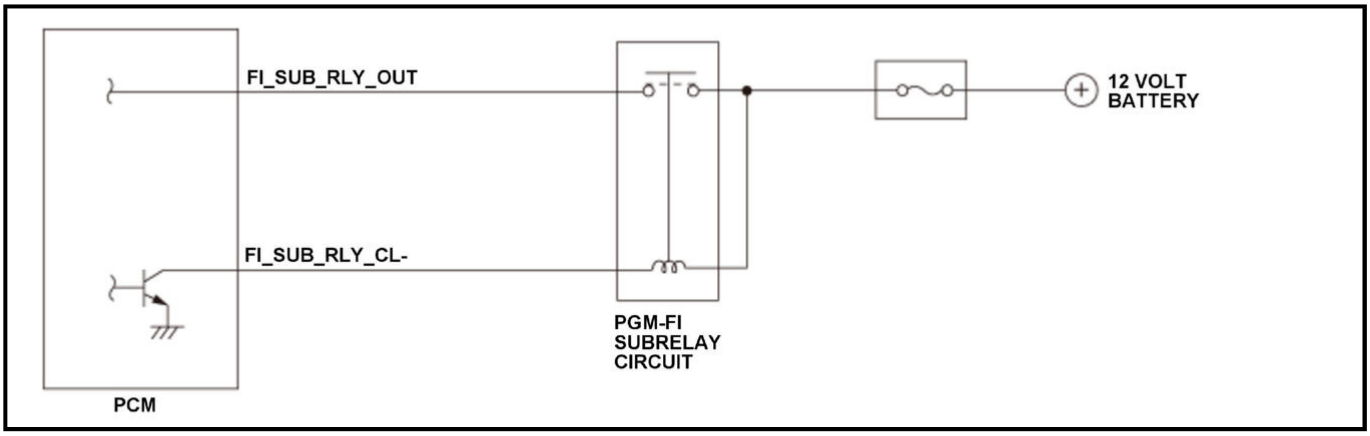
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P1659

DTC P1659: Electronic Throttle Control System (ETCS) Control Relay OFF Malfunction

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensors A and B (installed in the throttle body). When the voltage from the PGM-FI subrelay circuit is not input for a set time after the PGM-FI subrelay circuit is turned on when the vehicle is turned to the ON mode, the PCM detects a malfunction in the PGM-FI subrelay circuit power switch and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

The power supply voltage is not applied from the PGM-FI subrelay circuit for at least 200 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PGM-FI subrelay circuit FI_SUB_RLY_OUT line open (include fuse blown)
- PGM-FI subrelay circuit FI_SUB_RLY_CL- line open (include fuse blown)
- PGM-FI subrelay circuit failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

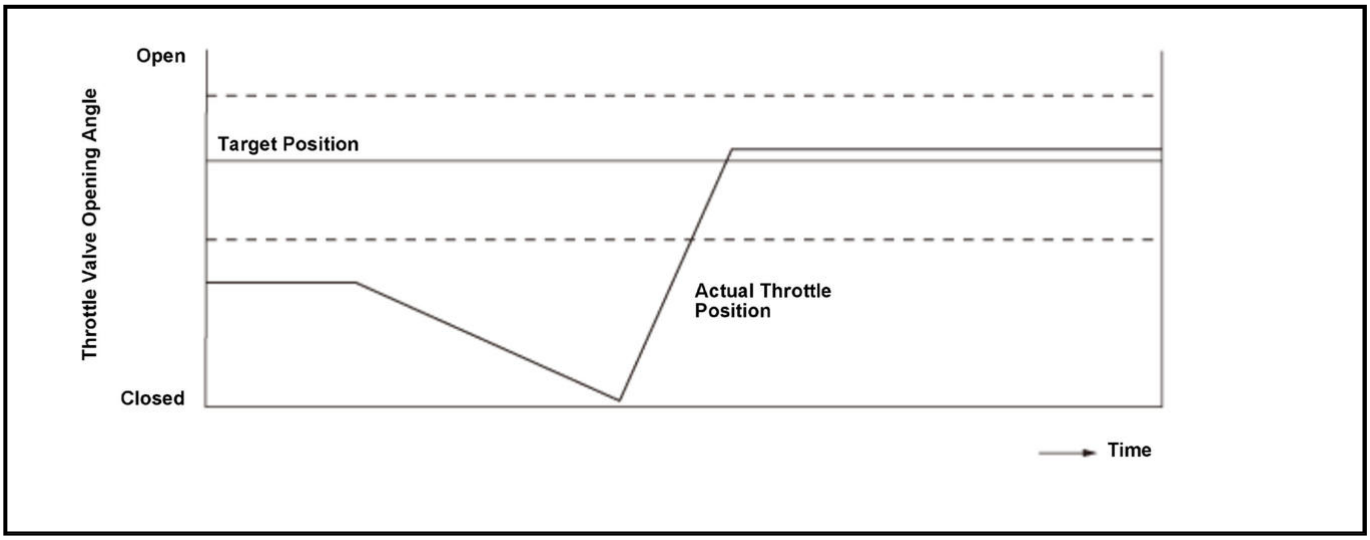
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P1683

DTC P1683: Throttle Valve Default Position Spring Performance Problem

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). The throttle valve default position spring is attached to the throttle valve gear. It opens the throttle valve to improve starting performance in cold conditions, or to retain minimum running performance in case of an electronic throttle control system failure. To confirm that the throttle valve is operating normally, and if the detecting condition meets, the throttle valve moves to a fully closed position and opens to the target position by the throttle valve default position spring. If the throttle valve does not move to the target position range, the PCM detects a throttle valve default position spring malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	158 deg.F (70 deg.C)	-
12 volt battery voltage [Battery]	7.0 V	-
Vehicle	OFF (LOCK) mode	

[ ]: HDS Parameter

Malfunction Threshold

The throttle valve position is +5 deg. or more from the fully closed position, or +3 deg. or less from the fully closed position, for at least 2.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle valve default position spring abnormal
- Throttle valve friction increase (poor action)

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.
- Turn the vehicle to the ON mode.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

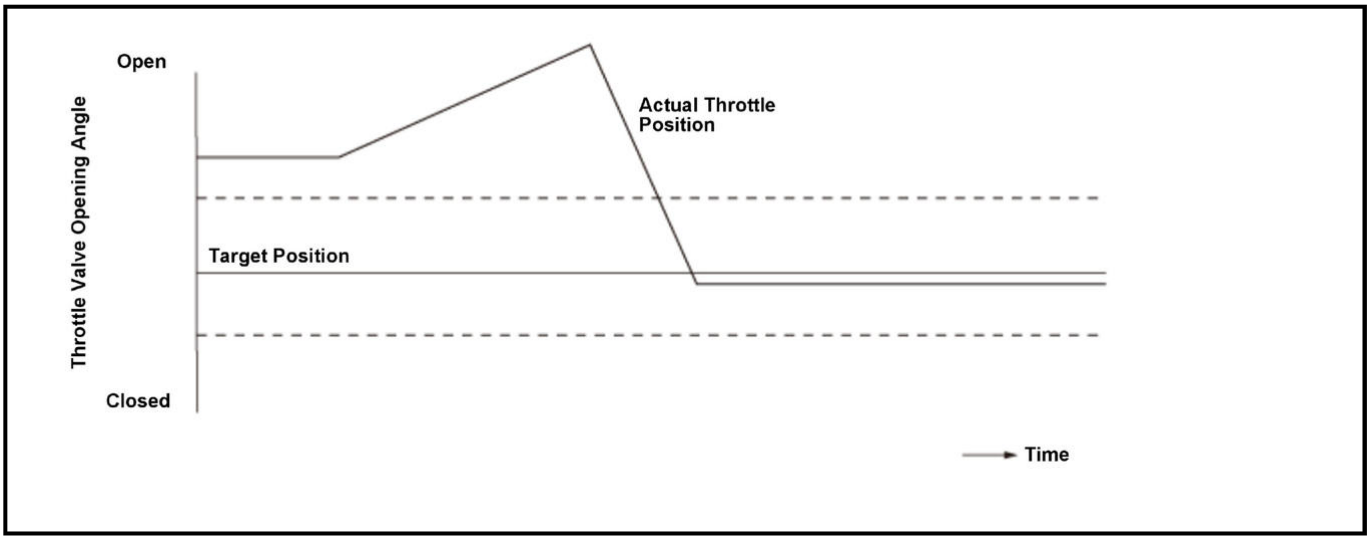
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P1684

DTC P1684: Throttle Valve Return Spring Performance Problem

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). The throttle valve return spring is attached to the throttle valve gear to return the throttle valve to the default position. To confirm that the throttle valve is operating normally, and if the detecting condition meets, the throttle valve moves to a specified position and closes to the target position by the throttle valve return spring. If the throttle valve does not move to the target position range, the PCM detects a throttle valve return spring malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	158 deg.F (70 deg.C)	-
12 volt battery voltage [Battery]	7.0 V	-
Vehicle	OFF (LOCK) mode	

[ ]: HDS Parameter

Malfunction Threshold

The throttle valve opening angle is 17 deg. or more, or 11 deg. or less, for at least 2.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle valve return spring failure
- Throttle valve friction increase (poor action)

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.
- Turn the vehicle to the ON mode.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

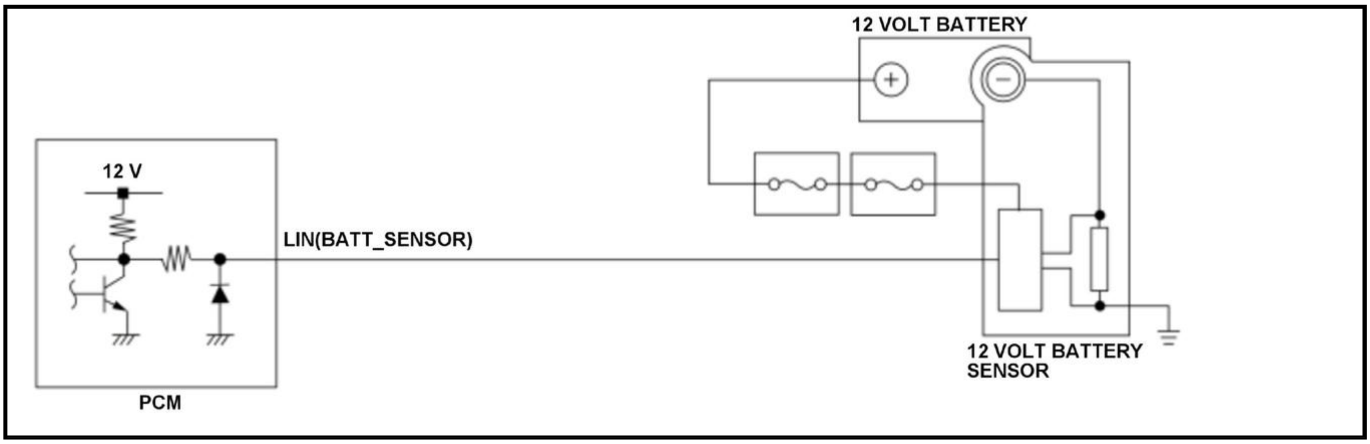
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P16E3

DTC P16E3: PGM-FI-Battery Sensor LIN Communication Error

General Description



The 12 volt battery sensor measures the 12 volt battery's current, voltage, and temperature. It is connected to the gauge control module by the local interconnect network (LIN) line, and transmits/receives 12 volt battery sensor information to/from the powertrain control module (PCM) via the CAN line. The LIN communication abnormality between the 12 volt battery sensor and the gauge control module is detected by the gauge control module and sent to the PCM via the CAN line. If the PCM receives abnormal communication, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met for at least 5 seconds:

- The PCM cannot receive any information via the LIN(BATT_SENSOR) line.
- The information sent from the 12 volt battery sensor is abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- 12 volt battery sensor LIN(BATT_SENSOR) line open
- 12 volt battery sensor LIN(BATT_SENSOR) line short
- 12 volt battery sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

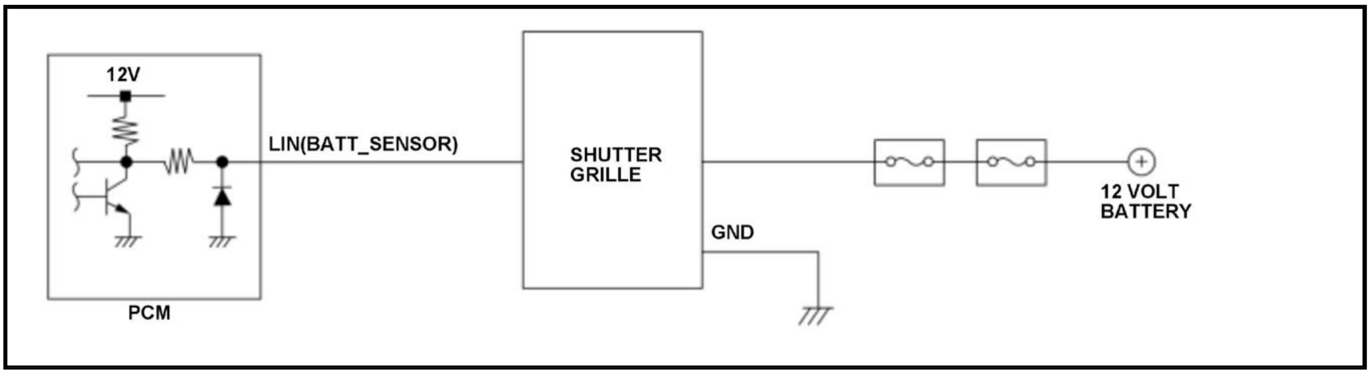
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P16E8

DTC P16E8: PGM-FI-Shutter Grille LIN Communication Error

General Description



The local interconnect network (LIN) line connects the shutter grille and the powertrain control module (PCM). The LIN uses a master/slave protocol to send and receive data to the different components on the line. The PCM is the master unit, which controls the engine electrical system. The shutter grille is the slave. The shutter grille receives data from the PCM and provides feedback to the PCM, which allows the PCM to operate the engine electrical system efficiently. When the PCM does not receive signals from the shutter grille within its specified amount of time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either one of the conditions is met for at least 5 seconds:

- The PCM cannot receive any information via the LIN line.
- The information sent from the shutter grille is abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, it is possible that there may be other causes.

- Shutter grille LIN(BATT_SENSOR) line open
- Shutter grille LIN(BATT_SENSOR) line short
- Shutter grille failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

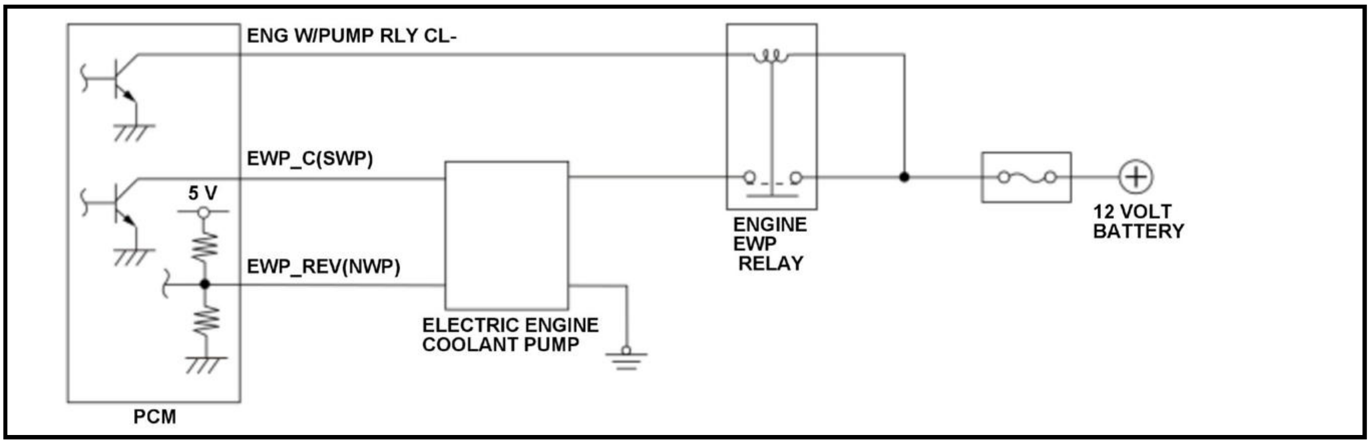
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P16EA

DTC P16EA: Electric Engine Coolant Pump Relay Stuck On

General Description



The electric engine coolant pump varies the pump revolution speed according to the powertrain control module (PCM) outputs signal. The PCM outputs signal (EWP_C(SWP)) to the electric engine coolant pump and feeds back the revolution speed (EWP_REV(NWP)) from the electric engine coolant pump to control the revolution speed. Since the flow rate of the pump is in proportion to the revolution speed, the flow rate increases as the revolution speed is raised. After the vehicle OFF (LOCK) mode, the PCM turns off the electric engine coolant pump relay. The PCM outputs electric engine coolant pump operation command signal when the electric engine coolant pump relay is off to check for electric engine coolant pump relay stuck on. The PCM detects a malfunction and stores a DTC when the revolution speed is equal to or more than the set value continuously for the prescribed time or more to the electric engine coolant pump operation command when the electric engine coolant pump relay is off.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	B
Vehicle	OFF (LOCK) mode

Malfunction Threshold

When the electric engine coolant pump revolution speed is 600 rpm or more continuously for 5 seconds or more while the engine EWP relay is off.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric engine coolant pump relay stuck on
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

PARK PAWL ACTUATOR DRIVER UNIT
PARK PAWL ACTUATOR

The park pawl actuator driver unit controls shifting/releasing of the park pawl actuator to/from the P position. The park pawl actuator driver unit monitors the voltage supplied to the park pawl actuator using three lines (P-ACT MTR U, P-ACT MTR V, and P-ACT MTR W). If the voltage supplied to the park pawl actuator continues to be a specified value or more for a specified length of time or more when turn ON command is not output to the park pawl actuator relay, the powertrain control module (PCM) receives malfunction from the park pawl actuator driver unit, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	-
Sequence	None
Duration	64 milliseconds or more
DTC Type	Two drive cycles, MIL off, shift position indicator off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	7.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The voltage supplied to the park pawl actuator continues to be 4.22 V or more for at least 64 milliseconds when turn ON command is not output to the park pawl actuator relay.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Park pawl actuator relay stuck ON
- Park pawl actuator driver unit P-ACT CL- line short to ground

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on and the shift position indicator does not blink.

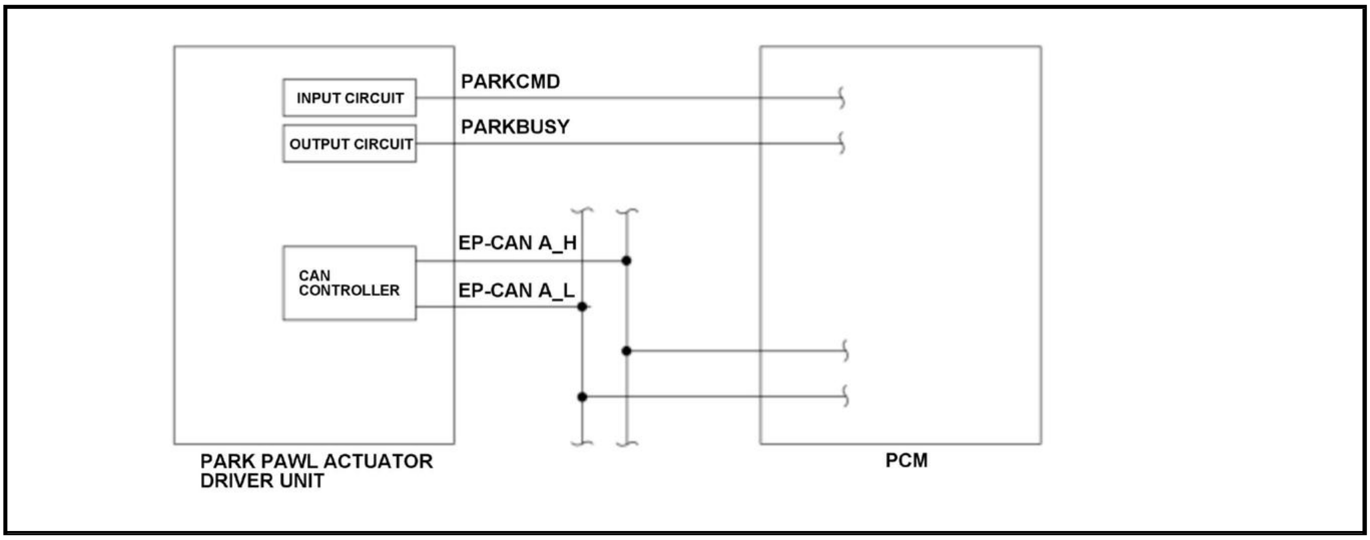
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P170F

DTC P170F : Park Pawl Unit Communication Circuit (PWM)

General Description



The park pawl actuator driver unit controls shifting/releasing of the park pawl actuator to/from the P position. The park pawl actuator driver unit usually uses two communication lines (EP-CAN A_H and EP-CAN A_L) to receive the shifting to/releasing from P position commands from powertrain control module (PCM) and to transmit/receive the feedback signals from the park pawl actuator driver unit to/from the PCM. If communication via EP-CAN is not available, it is also possible as an alternative method to transmit and receive via PWM communication using the communication line for shifting / releasing (PARKCMD) and the communication line for the feedback signals (PARKBUSY). The PCM and the park pawl actuator driver unit monitor the PWM communication together, and if transmitting and receiving are not available or if abnormal content continues to be received for a specified length of time or more, the PCM receives malfunction from the park pawl actuator driver unit, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	-
Sequence	None
Duration	1.5 seconds or more
DTC Type	Two drive cycles, MIL off, shift position indicator off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met for at least 1.5 seconds:

- The park pawl actuator driver unit cannot transmit/receive any signals via the PWM communication.
- The signal received by the park pawl actuator driver unit is abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Park pawl actuator driver unit PARKCMD line open (includes a loose or disconnected connector)
- Park pawl actuator driver unit PARKBUSY line open (includes a loose or disconnected connector)
- Park pawl actuator driver unit PARKCMD line short to ground

- Park pawl actuator driver unit PARKBUSY line short to ground
- Park pawl actuator driver unit PARKCMD line short to power
- Park pawl actuator driver unit PARKBUSY line short to power
- Park pawl actuator driver unit internal failure
- PCM internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on and the shift position indicator does not blink.

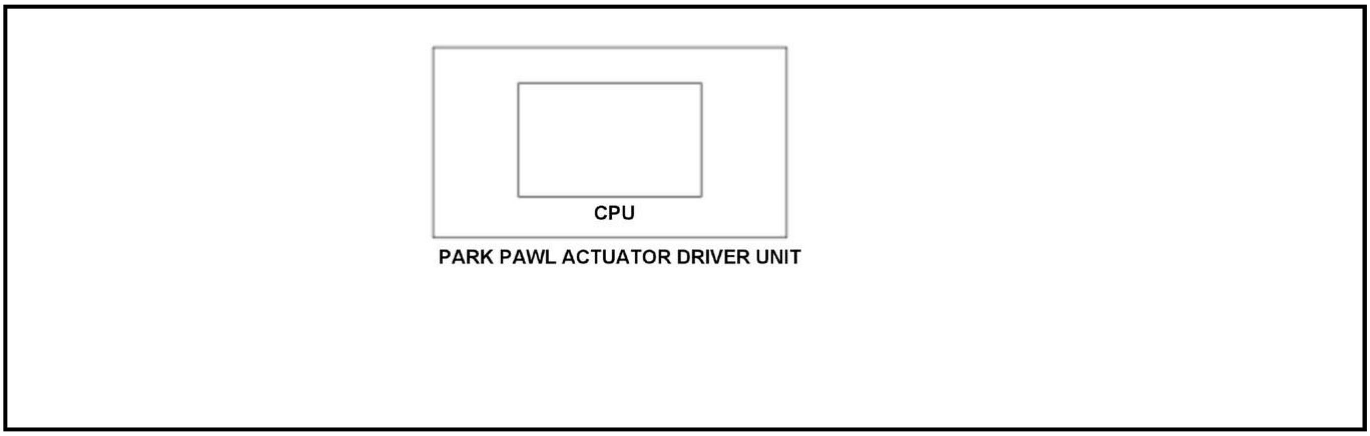
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P1711

DTC P1711 : Park Pawl Unit Malfunction

General Description



The park pawl actuator driver unit controls shifting/releasing of the park pawl actuator to/from the P position. The park pawl actuator driver unit monitors the malfunctions of the built-in CPU. If abnormal behavior of the CPU continues to be detected for a specified length of time or more, the powertrain control module (PCM) receives malfunction from the park pawl actuator driver unit, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	-
Sequence	None
Duration	96 milliseconds or more

DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

Abnormal behavior of the CPU built in the park pawl actuator driver unit continues to be detected for at least 96 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Park pawl actuator driver unit internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

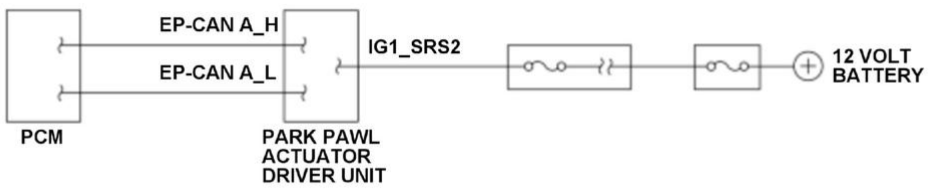
DTC P1721

DTC P1721 : Park Pawl Unit IG1 SW No Signal

General Description



The park pawl actuator driver unit controls the park pawl actuator for shifting to/releasing from the P position. The park pawl actuator driver unit monitors the information of the IG1 signal to shift to a control mode in which the park pawl actuator is operational, using the information of the IG1 signal. If the IG1 signal information recognized by the park pawl actuator driver unit continues to be OFF for a specified time or more while the IG1 signal information that is recognized by the powertrain control module (PCM) and transmitted via EP-CAN is ON, the PCM receives malfunction from the park pawl actuator driver unit, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	-
Sequence	None

Duration	1.2 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10 V	-
Other	No abnormal condition in the communication via EP-CAN	

[ ]: HDS Parameter

Malfunction Threshold

The IG1 signal information recognized by the park pawl actuator driver unit continues to be OFF for at least 1.2 seconds while the IG1 signal information recognized by the PCM is ON.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Park pawl actuator driver unit IG1_SRS2 line open (includes a loose or disconnected connector)

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

PARK PAWL ACTUATOR DRIVER UNIT
PARK PAWL ACTUATOR

The park pawl actuator driver unit controls shifting/releasing of the park pawl actuator to/from the P position. The park pawl actuator driver unit performs the initial learning when the vehicle is turned to the ON mode and controls to limit the current flowing into the park pawl actuator. If the current flowing into the park pawl actuator during the initial learning continues to be a specified value or more for a specified length of time or more, the powertrain control module (PCM) receives malfunction from the park pawl actuator driver unit, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	-
Sequence	None
Duration	32 milliseconds or more
DTC Type	Two drive cycles, MIL off, shift position indicator off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	7 V	-

[ ]: HDS Parameter

Malfunction Threshold

The total value of the current applied to the park pawl actuator (MAU/P-ACT_MTR_U, MAV/P-ACT_MTR_V, and MAW/P-ACT_MTR_W) is 15 A or more for at least 32 milliseconds when initial learning is performed.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Park pawl actuator driver unit internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on and the shift position indicator does not blink.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

PARK PAWL ACTUATOR

The park pawl actuator driver unit controls shifting/releasing of the park pawl actuator to/from the P position. The park pawl actuator driver unit performs the initial learning when the vehicle is turned to the ON mode. If the initial learning does not complete even when a specified length of time or more has passed after the vehicle is turned to the ON mode, the powertrain control module (PCM) receives malfunction from the park pawl actuator driver unit, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	-
Sequence	None
Duration	5.0 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10.5 V	-

[ ]: HDS Parameter

Malfunction Threshold

The initial learning continued for at least 5.0 seconds after the vehicle condition is turned to the ON mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Park pawl actuator internal failure
- Park mechanism failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

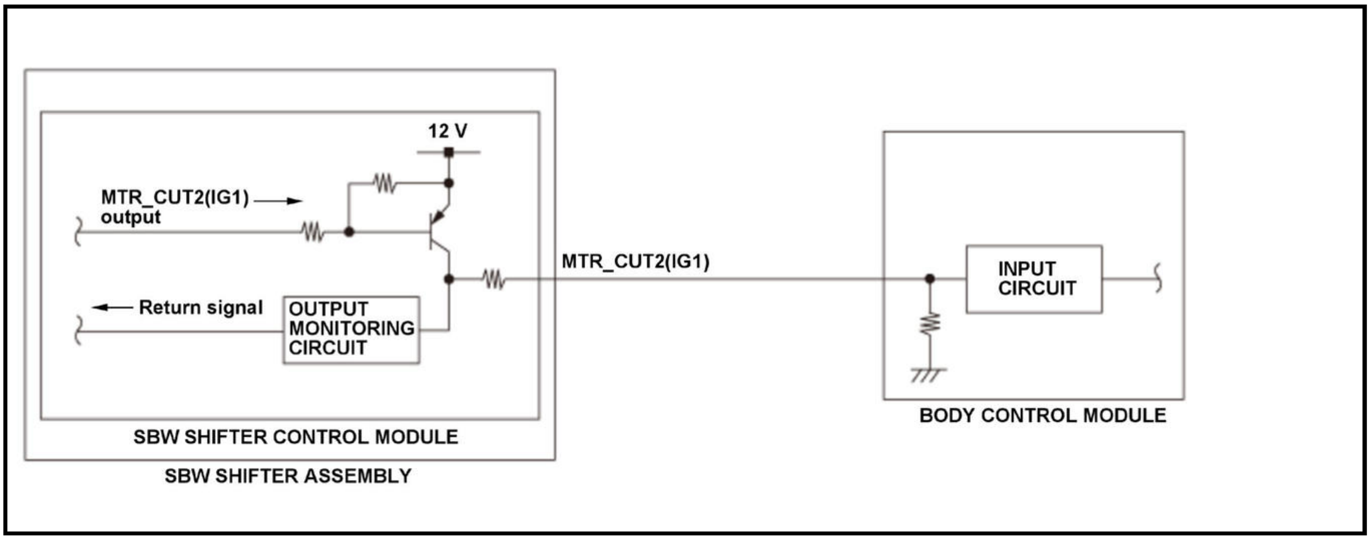
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

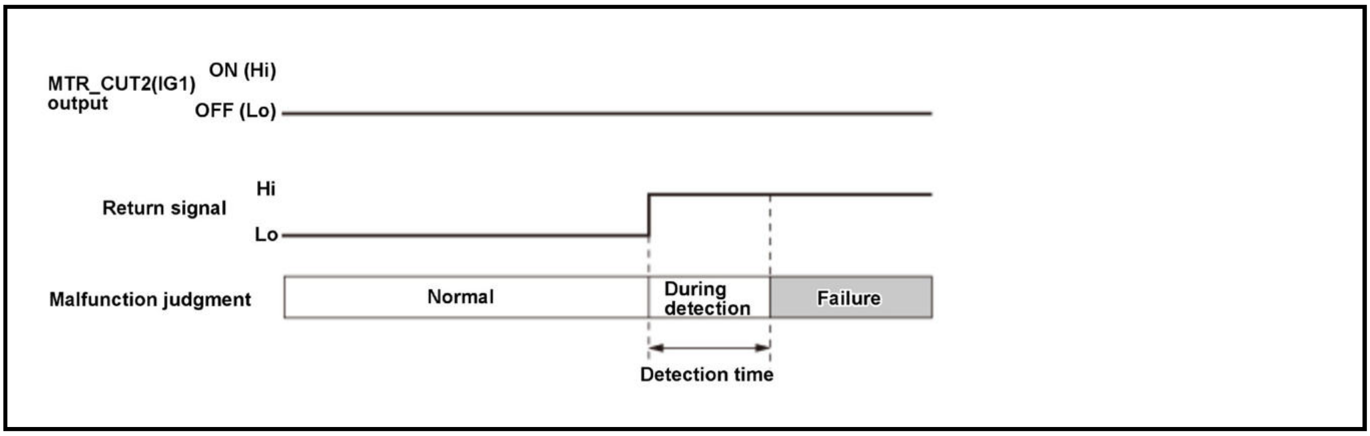
DTC P172A

DTC P172A : KEY-Release Wake-up Output Circuit Malfunction

General Description



12 V
MTR_CUT2(IG1) output
Return signal
OUTPUT MONITORING CIRCUIT
SBW SHIFTER CONTROL MODULE
SBW SHIFTER ASSEMBLY
MTR_CUT2(IG1)
INPUT CIRCUIT
BODY CONTROL MODULE



At the condition the vehicle is in OFF (LOCK) mode, the SBW shifter control module in the SBW shifter assembly turns the MTR_CUT2(IG1) output to ON (12 V) when the key release switch is pressed once. The SBW shifter control module monitors the return signal of the MTR_CUT2(IG1) output, and when the return signal and MTR_CUT2(IG1) output does match for a specified duration, the powertrain control module (PCM) receives malfunction from the SBW shifter control module and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The return signal is abnormal for at least 2 seconds when the MTR_CUT2(IG1) outputs OFF.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- SBW shifter control module MTR_CUT2(IG1) line short to power
- SBW shifter assembly (SBW shifter control module) internal failure
- Body control module internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on and the shift position indicator does not blink.

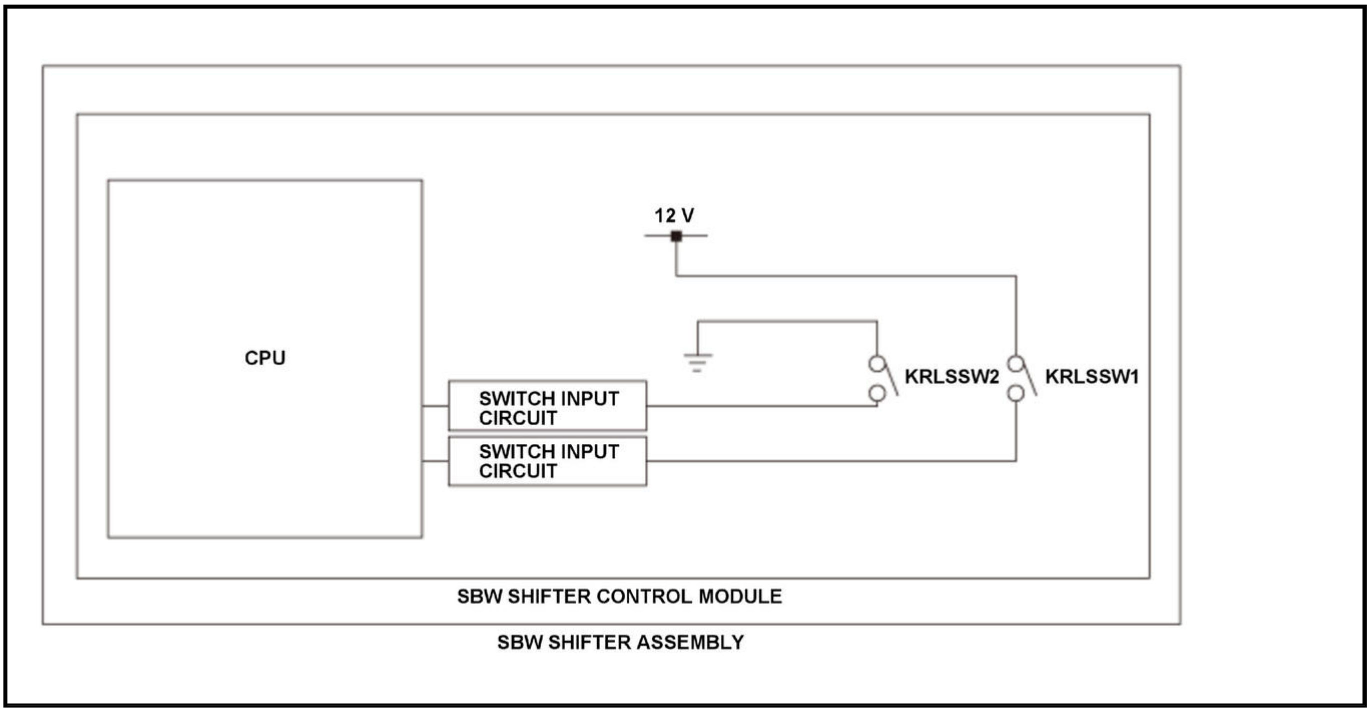
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P172B

DTC P172B : KEY-Release Switch Input Circuit Malfunction

General Description



The SBW shifter control module in the SBW shifter assembly has a key release switch. By operating the key release switch, it unlocks the parking position in the transmission. The key release switch is composed of KRLSSW1 and KRLSSW2, and when the input signal logic does match for a specified duration, the powertrain control module (PCM) receives malfunction from the SBW shifter control module and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 minute or more
DTC Type	One drive cycle, MIL off, shift position indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The input signal logic of KRLSSW1 and KRLSSW2 do not match (KRLSSW1 ON and KRLSSW2 OFF or KRLSSW1 OFF and KRLSSW2 ON) for at least 1 minute.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- SBW shifter assembly (SBW shifter control module) internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait at least 1 minute.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on and the shift position indicator does not blink.

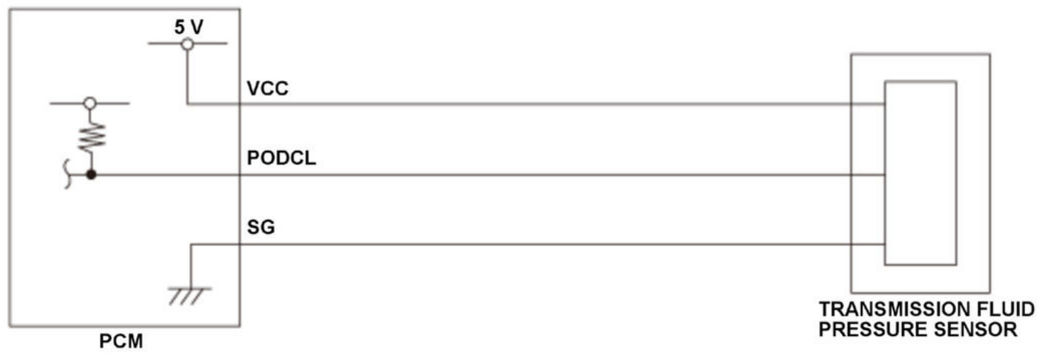
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P173A (2020)

DTC P173A : Transmission Fluid Pressure Sensor Performance High

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

Shift solenoid valve A is installed on the flywheel housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to shift valve A. The signal from the PCM is output so that the line pressure is supplied to the clutch piston under the condition that overdrive clutch engagement is requested during running at 44 mph (70 km/h) or more. When the signal to shift solenoid valve A from the PCM is ON, and the line pressure is applied to shift valve A, it operates against the shift valve A spring. When the signal to shift solenoid valve A from the PCM is OFF, and the line pressure is discharged, shift valve A is inactive. The PCM monitors the transmission fluid pressure sensor. If the transmission fluid pressure sensor pressure is a specified value or more when the engine is stopped or engagement of the over drive clutch is not requested, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3.0 seconds or more
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

The transmission fluid pressure sensor output value is 177 kPa (1327 mmHg, 52.3 inHg) or more for at least 3.0 seconds when the engine is stopped or the engagement of the over drive clutch is not requested.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission fluid pressure sensor failure
- PCM internal failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at speed of 44 mph (70 km/h) or less for at least 10 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

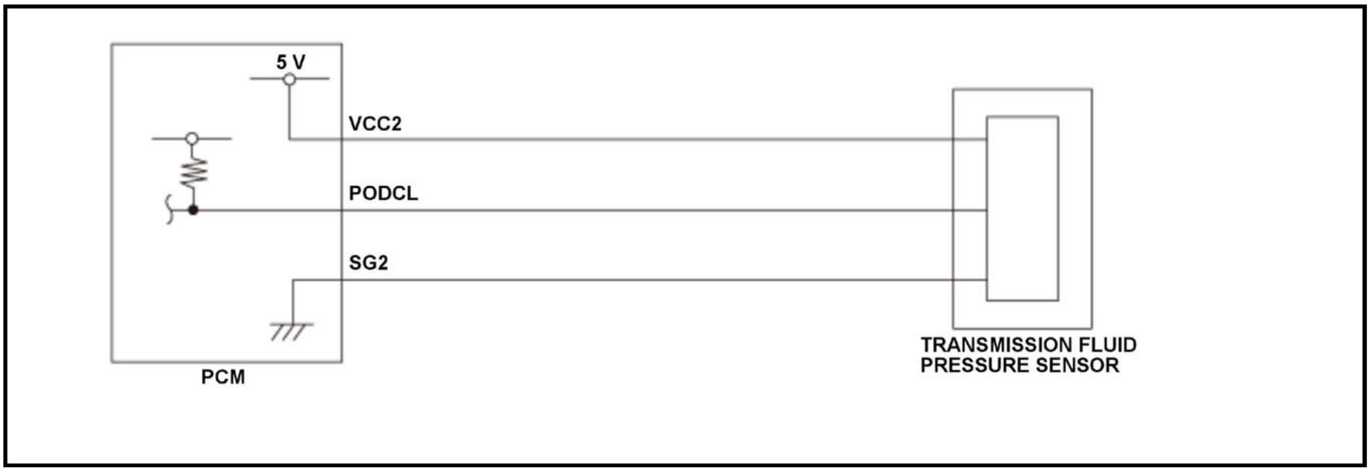
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P173A (2021)

DTC P173A: Transmission Fluid Pressure Sensor Performance High

General Description



Capacity of Over Drive Clutch		Shift Solenoid Valve A	
		ON (12 V)	OFF (0 V)
Shift Solenoid Valve B	ON (12 V)	ON	OFF
	OFF (0 V)	OFF	OFF

Shift solenoid valve A is installed on the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to shift valve A. The signal from the PCM is outputted so that the line pressure is supplied to the clutch piston under the condition that the overdrive clutch engagement is requested while driving at 44 mph (70 km/h) or more. When the signal to shift solenoid valve A from the PCM is ON, and the line pressure is applied to shift valve A, it operates against the shift valve A spring. When the signal to shift solenoid valve A from the PCM is OFF, and the line pressure is discharged, shift valve A is inactive. The PCM monitors the transmission fluid pressure sensor. If the transmission fluid pressure sensor pressure is at specified value or more when the engine is stopped or engagement of the over drive clutch is not requested, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3.0 seconds or more
DTC Type	One drive cycle, MIL on, shift position indicator blinks

Enable Conditions

Condition	B
12 volt battery voltage [BATTERY VOLTAGE]	11 V

[ ]: HDS Parameter

Malfunction Threshold

The transmission fluid pressure sensor value is 177 kPa (1327 mmHg, 52.3 inHg) or more for at least 3.0 seconds when the engine is stopped or engagement of the over drive clutch is not requested.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission fluid pressure sensor failure
- PCM internal failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at speed of a 44 mph (70 km/h) or less for at least 10 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

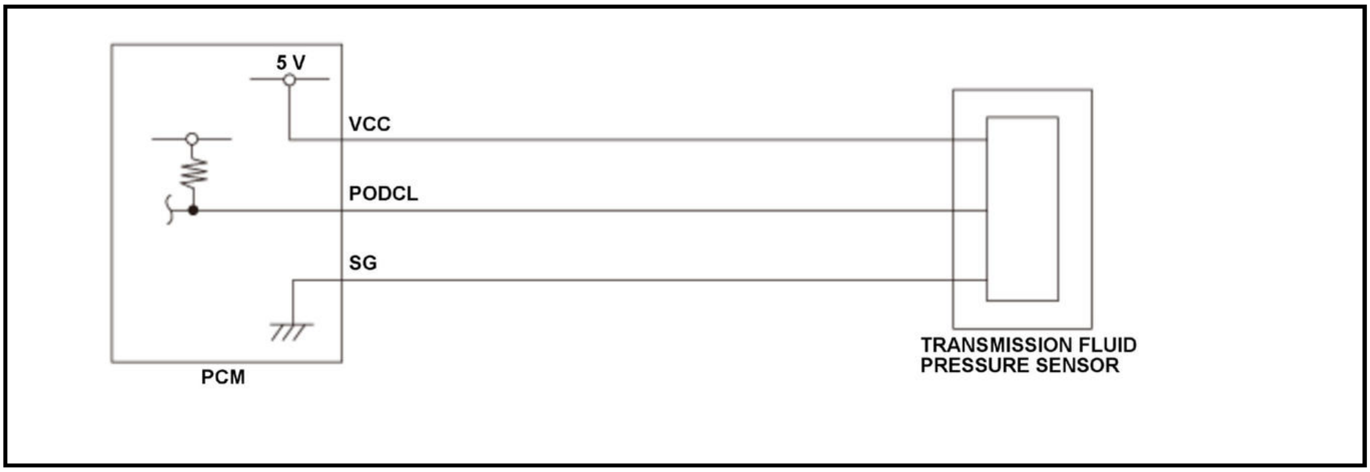
Conditions for clearing the DTC

The shift position indicator turns off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P173B (2020)

DTC P173B : Transmission Fluid Pressure Sensor Performance Low

General Description



Condition of over drive clutch		Shift solenoid valve A	
		ON (12 V)	OFF (0 V)
Shift solenoid valve B	ON (12 V)	ON (engaged)	OFF (disengaged)
	OFF (0 V)	OFF (disengaged)	OFF (disengaged)

Shift solenoid valve A is installed on the flywheel housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to shift valve A. The signal from the PCM is output so that the line pressure is supplied to the clutch piston under the condition that overdrive clutch engagement is requested during running at 44 mph (70 km/h) or more. When the signal to shift solenoid valve A from the

PCM is ON, and the line pressure is applied to shift valve A, it operates against the shift valve A spring. When the signal to shift solenoid valve A from the PCM is OFF, and the line pressure is discharged, shift valve A is inactive. The PCM monitors the transmission fluid pressure sensor. If the transmission fluid pressure sensor pressure is a specified value or less when engagement of the over drive clutch is requested, the PCM detects a malfunction and stores a DTC.

Normal range
Threshold
Secondary HO2S feedback correction factor (Short term fuel trim)
Normal range
Target secondary HO2S voltage
Judgment permission by intake air amount accumulation value
Intake air amount accumulated value

The powertrain control module (PCM) detects oxygen content in the exhaust gas by the air/fuel ratio (A/F) sensor (sensor 1), and it uses feedback control before the three way catalytic converter (TWC) to bring the air/fuel ratio close to the target air/fuel ratio. The target air/fuel ratio is adjusted by the secondary heated oxygen sensor (secondary HO2S (sensor 2)) output so that the air/fuel ratio in the TWC is optimized. When the A/F sensor (sensor 1) cannot measure air/fuel ratio in the exhaust gas normally, a gap occurs to the actual air/fuel ratio. As a result, the gap causes a deviation in target air/fuel ratio control (after TWC) which is determined by the secondary HO2S (sensor 2). If the deviation exceeds a limit, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle*
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on

*: The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction is detected.

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	155.9 deg.F (68.8 deg.C)	-

Condition	Minimum	Maximum
Intake air temperature [IAT Sensor (1)]	18.4 deg.F (-7.6 deg.C)	-
Engine speed [Engine Speed]	1, 100 rpm	4, 000 rpm
Intake air amount	9.0 g/second (0.318 oz/second)	-
Fuel feedback	Closed loop	

[ ]: HDS Parameter

Malfunction Threshold

Either of the conditions is met:

DTC: P2096

- Short term fuel trim is lower than -0.03.
- Long term fuel trim is lower than 0.001.

DTC: P2097

- Short term fuel trim is higher than -0.014.
- Long term fuel trim is higher than 0.042.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) malfunction/slow response
- A/F sensor (sensor 1) circuit range/performance
- Fuel system too lean
- Fuel system too rich
- Secondary HO2S (sensor 2) circuit signal stuck lean
- Secondary HO2S (sensor 2) circuit open
- Secondary HO2S (sensor 2) slow response
- Air/fuel ratio variation between cylinders
- Misfire
- Exhaust system failure (exhaust gas leak)

Confirmation Procedure

Operating Condition

- Enter the maintenace mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive at a steady speed between 15 - 75 mph (25 - 120 km/h) and engine speed [Engine Speed] 4, 000 rpm or less for at least 45 seconds.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

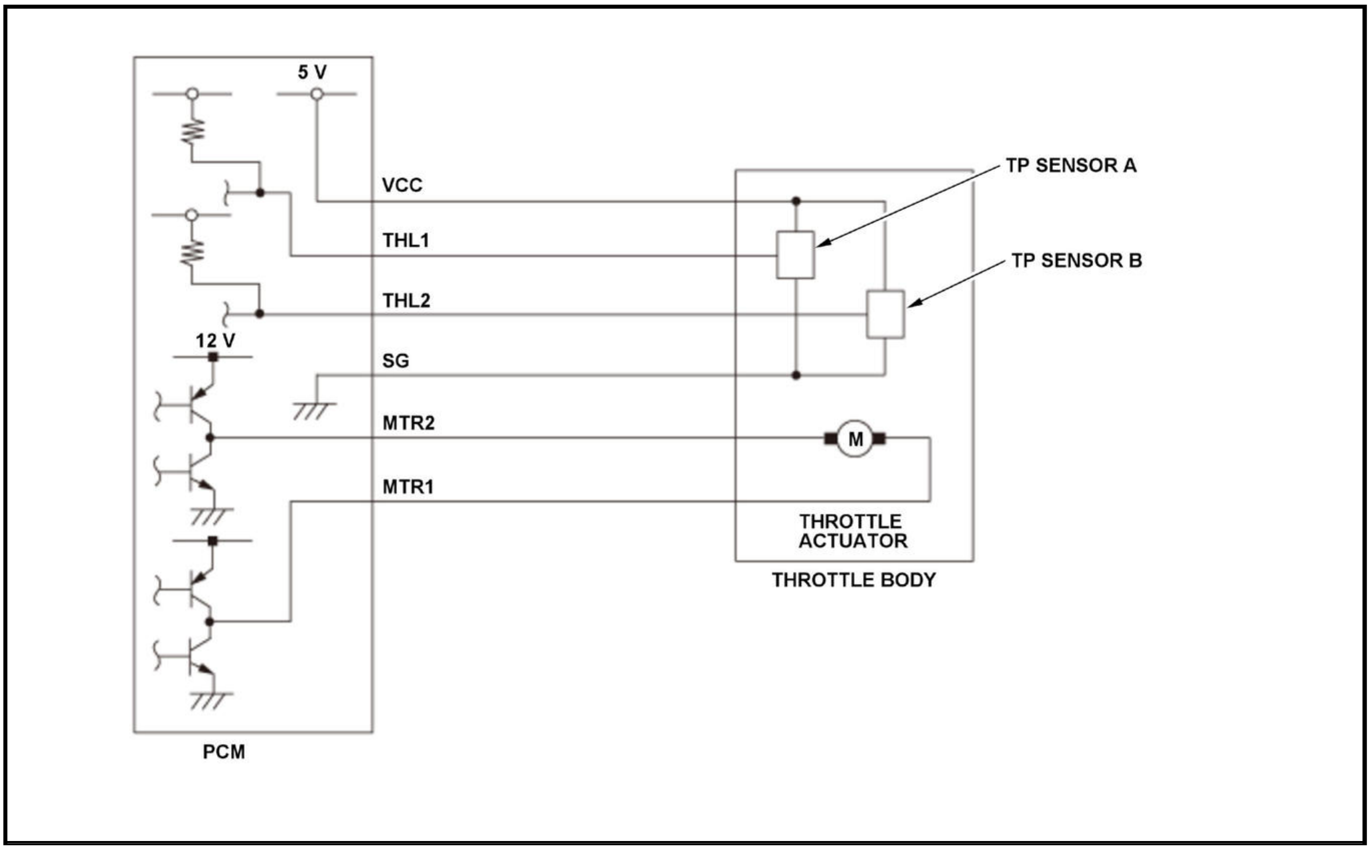
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P2101

DTC P2101: Electronic Throttle Control System (ETCS) Malfunction

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). The PCM compares the throttle valve target opening angle and the actual throttle valve opening angle from TP sensor A, and when the difference exceeds the specification, the PCM detects the malfunction of the electronic throttle control system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	250 milliseconds or more*500 milliseconds or more**
DTC Type	One drive cycle, MIL on

*: Throttle valve closed direction

6 deg.	5.4 deg. or more
10 deg.	5.7 deg. or more
15 deg.	6 deg. or more
90 deg.	6 deg. or more

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle actuator MTR1 line failure
- Throttle actuator MTR2 line failure
- Throttle actuator failure
- TP sensor A/B failure
- Throttle body failure
- PCM failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2108

DTC P2108: Throttle Actuator Control Module Performance

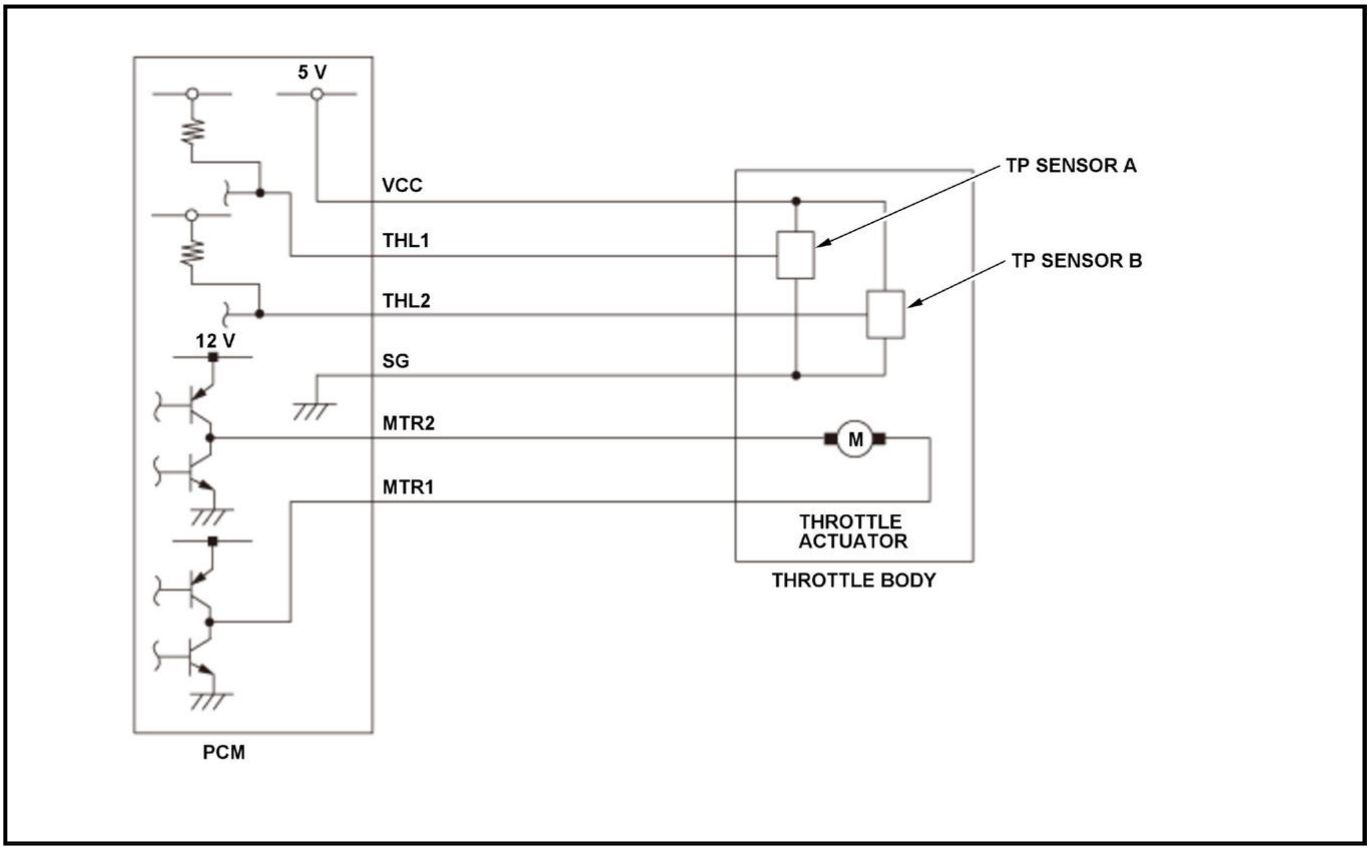
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the following DTC codes (P1658, P1659) are detected.

DTC P2118

DTC P2118: Throttle Actuator Current Range/Performance Problem

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). When the output current to the throttle valve actuator exceeds the specification for a set time, the PCM detects a malfunction of the electronic throttle control system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

The current flow to the throttle actuator is 9 A or more for at least 200 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle actuator MTR1 line short
- Throttle actuator MTR2 line short
- Throttle actuator internal circuit short
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2119

DTC P2119: Throttle Actuator Control Throttle Body Range/Performance

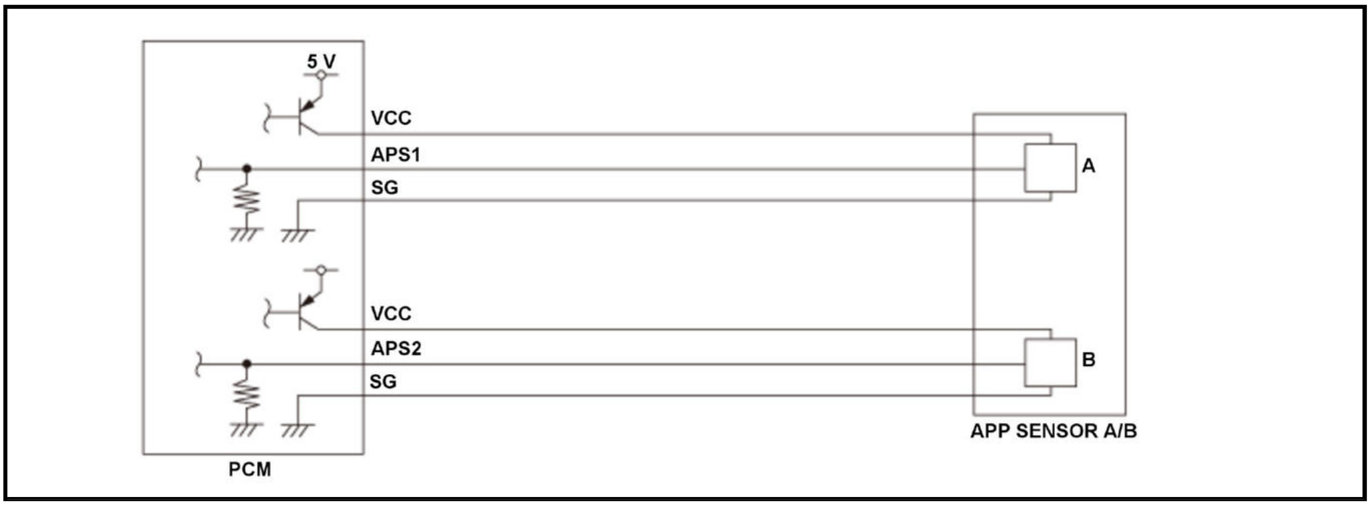
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the following DTC codes (P1683, P1684) are detected.

DTC P2121

DTC P2121: Accelerator Pedal Position (APP) Sensor A (Throttle Position (TP) Sensor D) Out of Range

General Description



Accelerator pedal position (APP) sensor A is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor A is a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The APP sensor A output voltage [APP Sensor A Voltage] is 0.69 V or less for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- APP sensor A failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

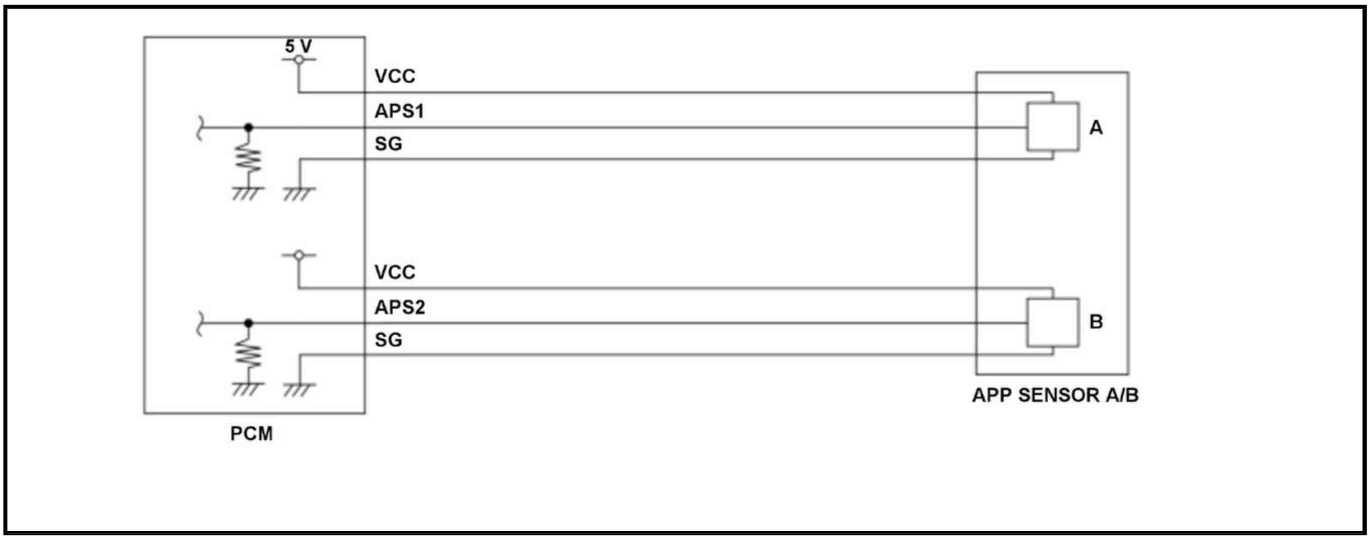
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2122, P2123

DTC P2122: Accelerator Pedal Position (APP) Sensor A (Throttle Position (TP) Sensor D) Circuit Low Voltage

DTC P2123: Accelerator Pedal Position (APP) Sensor A (Throttle Position (TP) Sensor D) Circuit High Voltage

General Description



Accelerator pedal position (APP) sensor A is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor A is a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P2122

The APP sensor A output voltage [APP Sensor A Voltage] is 0.2 V or less for at least 200 milliseconds.

DTC: P2123

The APP sensor A output voltage [APP Sensor A Voltage] is 4.9 V or more for at least 200 milliseconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P2122

- APP sensor A APS1 line open
- APP sensor A VCC line open
- APP sensor A APS1 line short to ground

DTC: P2123

- APP sensor A APS1 line short to APP sensor A VCC line
- APP sensor A SG line open

Common

- APP sensor A failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

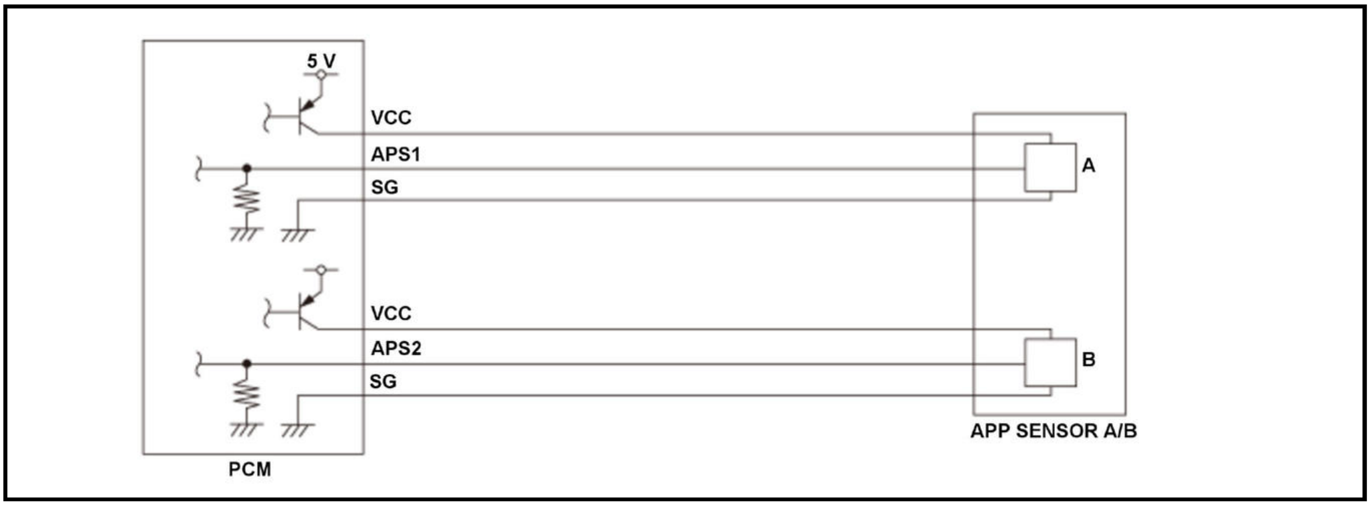
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2126

DTC P2126: Accelerator Pedal Position (APP) Sensor B (Throttle Position (TP) Sensor E) Out of Range

General Description



Accelerator pedal position (APP) sensor B is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor B is a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The APP sensor B output voltage [APP Sensor B Voltage] is 0.23 V or less, or 2.66 V or more for at least 6.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- APP sensor B failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

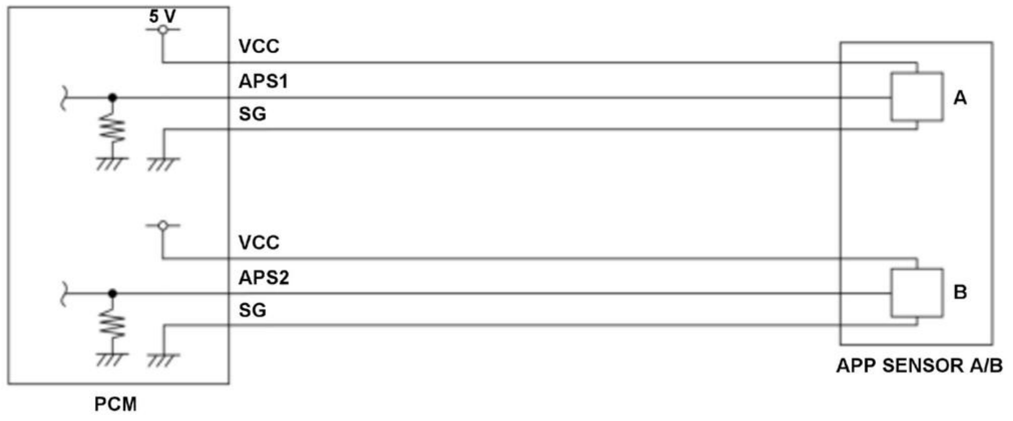
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2127, P2128

DTC P2127: Accelerator pedal position (APP) Sensor B (Throttle Position (TP) Sensor E) Circuit Low Voltage

DTC P2128: Accelerator pedal position (APP) Sensor B (Throttle Position (TP) Sensor E) Circuit High Voltage

General Description



Accelerator pedal position (APP) sensor B is a part of the electronic throttle control system. It is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor B is a set value, the PCM detects a malfunction and stores a DTC.

PCM

The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The PCM then operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A (installed in the throttle body). The PCM adds the TP sensor A and TP sensor B values, and compares the addition value with 5 V. If the deviation exceeds a certain value for a specified time, the PCM detects a malfunction in the relationship between TP sensor A and TP sensor B, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	200 milliseconds or more
DTC Type	One drive cycle, MIL on

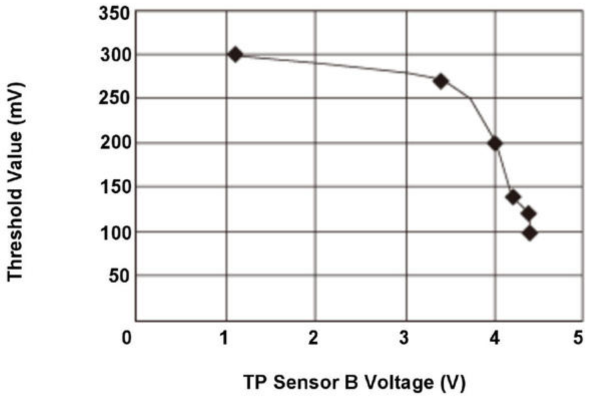
Enable Conditions

Condition	Minimum	Maximum
TP sensor B voltage[TP Sensor B]	1.1 V	4.4 V
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

The deviation between 5 V and addition value of TP sensor A and TP sensor B exceeds the threshold value which depends on TP sensor B voltage for at least 200 milliseconds as shown in the following graph.



Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TP sensor A THL1 line short to TP sensor B THL2 line
- TP sensor A failure
- TP sensor B failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

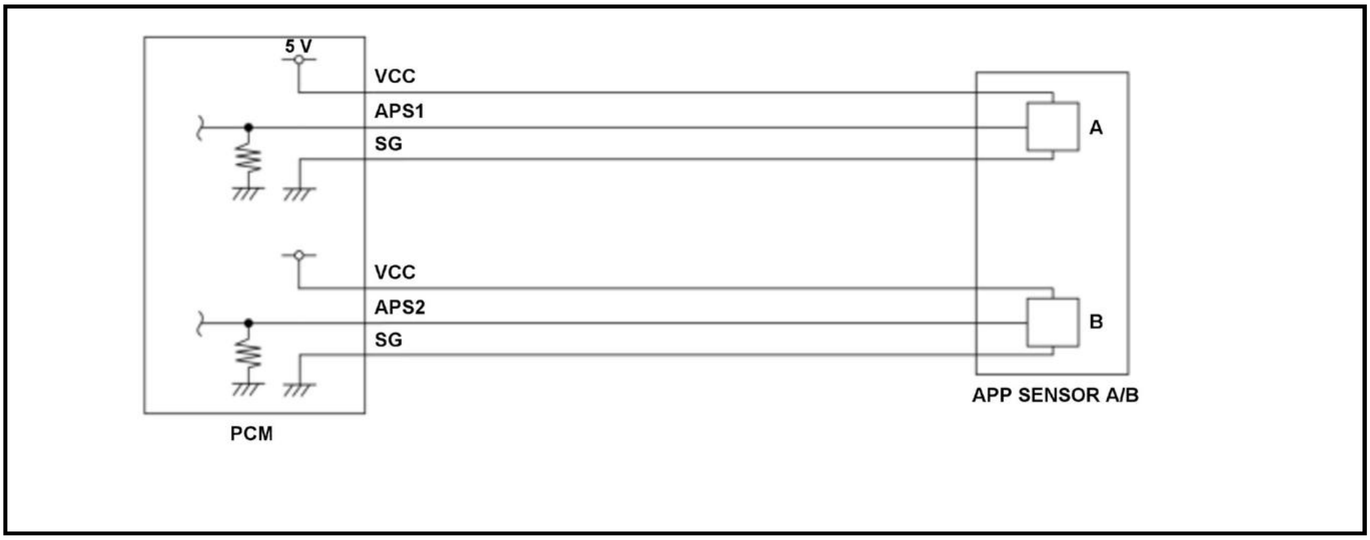
Conditions for clearing the DTC

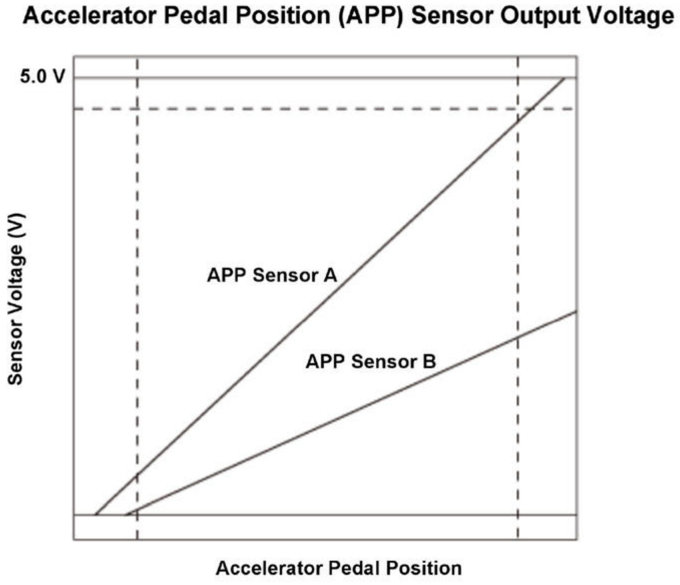
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2138

DTC P2138: Accelerator pedal position (APP) Sensor A/B (Throttle Position (TP) Sensor D/E) Incorrect Voltage Correlation

General Description





Accelerator pedal position (APP) sensor A and accelerator pedal position (APP) sensor B are potentiometers. They are installed on the accelerator pedal. When the accelerator pedal is pressed, APP sensors A and B detect the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in APP sensors A and B and transmitted to the powertrain control module (PCM) to compute the target position. APP sensor A is the primary control, and APP sensor B is a back-up of APP sensor A in case it malfunctions. Both sensors compare their output voltage to each other for malfunction detection. When the voltage difference of APP sensor B is out of a fixed range for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Duration	300 milliseconds or more
DTC Type	One drive cycle, MIL on

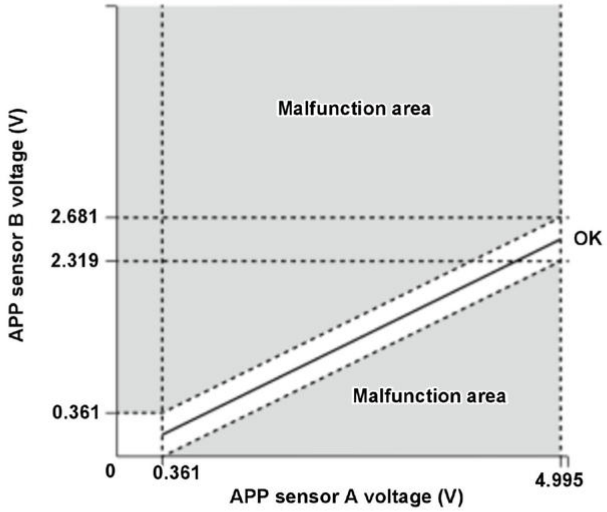
Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The APP sensor B voltage [APP Sensor B Voltage] is in the malfunction area based on the APP sensor A voltage [APP Sensor A Voltage] as shown in the figure below for at least 300 milliseconds.

[ ]: HDS Parameter



Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- APP sensor A APS1 line short to APP sensor B APS2 line
- APP sensor A/B failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

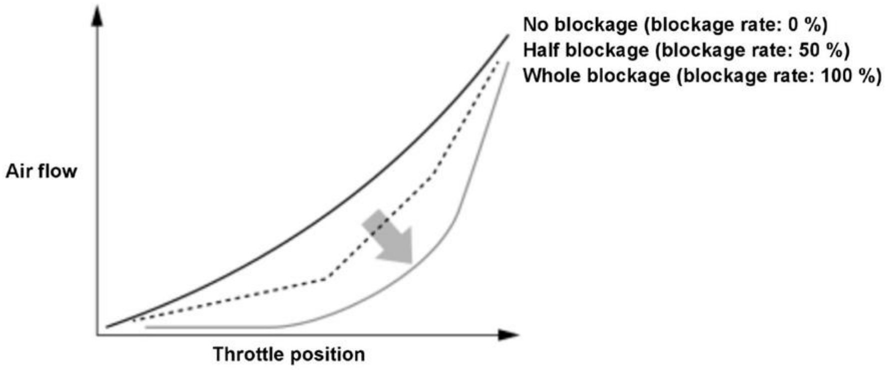
Conditions for clearing the DTC

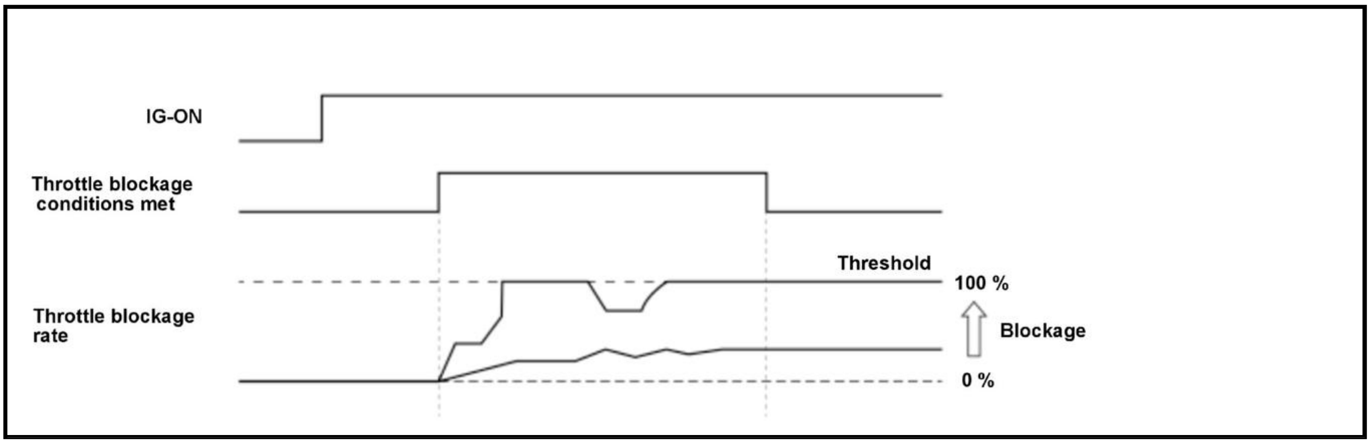
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2175 (2021)

DTC P2175: Throttle Actuator Control System Low Air Flow Detected

General Description





When a throttle body blockage occurs, air flow decreases compared to the normal condition at similar throttle position. From this characteristic, the powertrain control module (PCM) assumes a blockage of the throttle body. If the throttle body blockage rate reaches 100 % of the predetermined threshold, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	0.5 second or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Other	At idle

Malfunction Threshold

The throttle body blockage rate is 0.99 or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle body blockage
- Air cleaner blocked

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Turn the vehicle to the OFF (LOCK) mode.
- Enter the maintenance mode, then start the engine and let it idle for at least 1 minute.
- Repeat steps 2 through 3, 20 times.
- Enter the maintenance mode, then start the engine and let it idle for at least 10 minutes.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

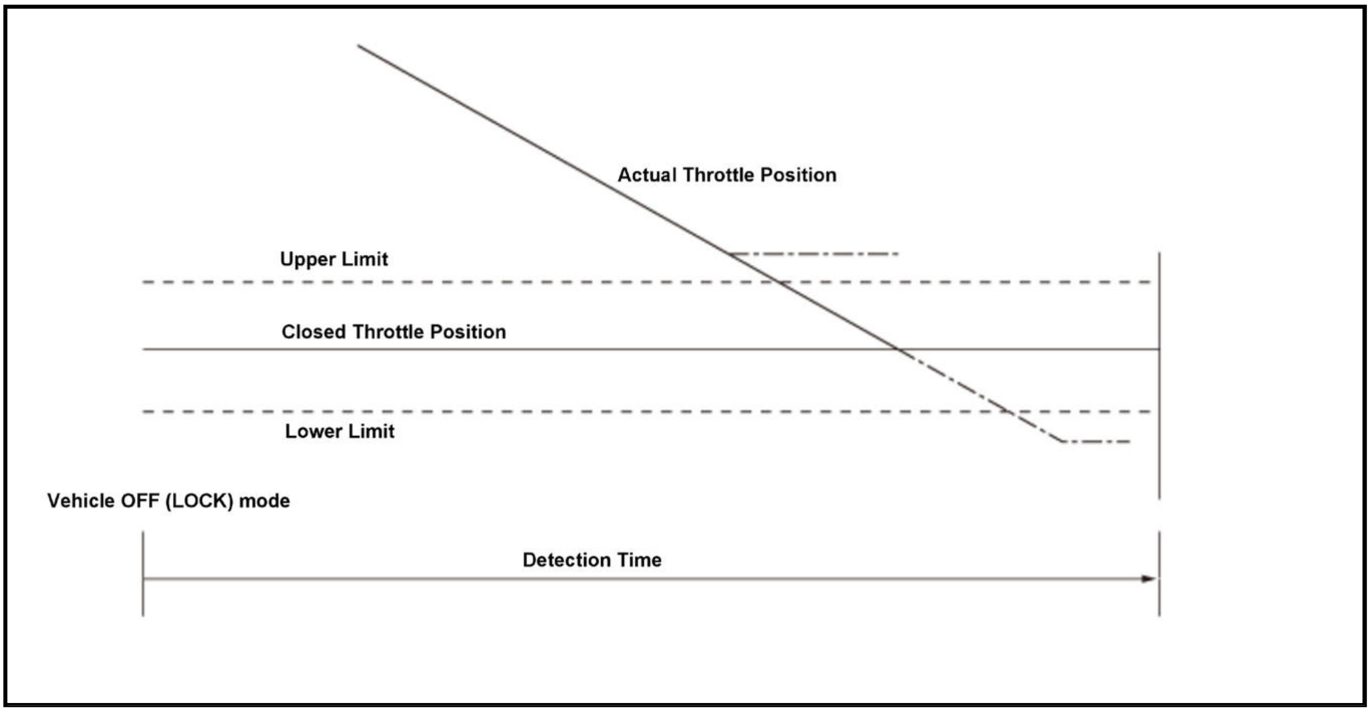
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2176

DTC P2176: Throttle Actuator Control System Idle Position Not Learned

General Description



The electronic throttle control system controls the throttle valve opening. The system includes the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the PGM-FI subrelay circuit, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM). When the accelerator pedal is pressed, the APP sensor detects the accelerator pedal opening value. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensors A and B (installed in the throttle body). The PCM transmits a signal to the throttle actuator and moves the throttle valve to the fully closed position to register the throttle valve fully closed position after the vehicle is turned to the OFF (LOCK) mode. When the registration of the throttle valve fully closed position is not completed within a predetermined time after the vehicle is turned to the OFF (LOCK) mode, also the registered value is out of predetermined range, the PCM detects a malfunction in the electronic throttle control system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	6.0 V	-
Vehicle	OFF (LOCK) mode	

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met, when the registration of the throttle valve fully closed position is not completed for at least 2.0 seconds after the vehicle condition is turned to the OFF (LOCK) mode:

- The registered value of the throttle valve fully closed position is more than 1.02 V, or less than 0.49 V.*
- The registered value of the throttle valve fully closed position is more than 4.51 V, or less than 3.98 V.**

*: TP sensor A [TP Sensor A]**: TP sensor B [TP Sensor B]

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Throttle actuator MTR1 line failure
- Throttle actuator MTR2 line failure
- Throttle actuator failure
- TP sensor A/B failure
- Throttle body failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

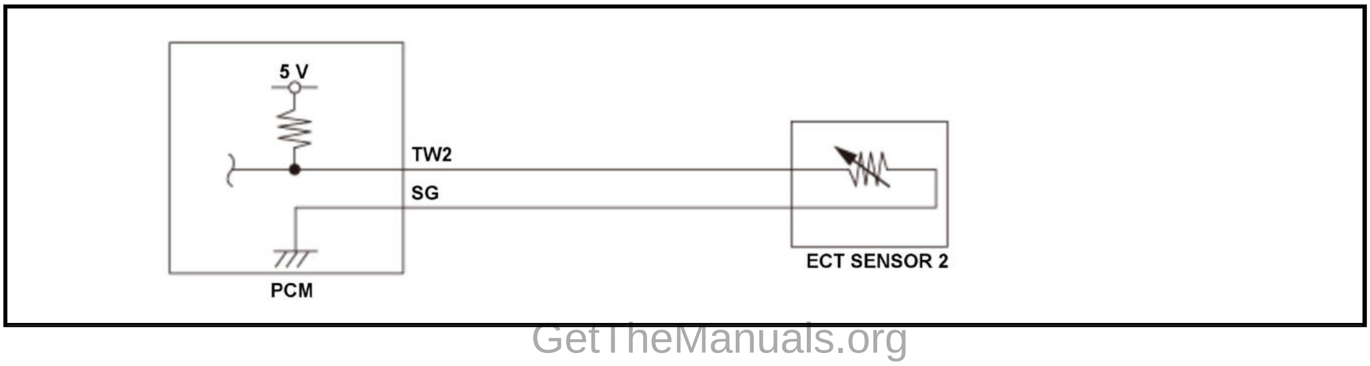
Conditions for clearing the DTC

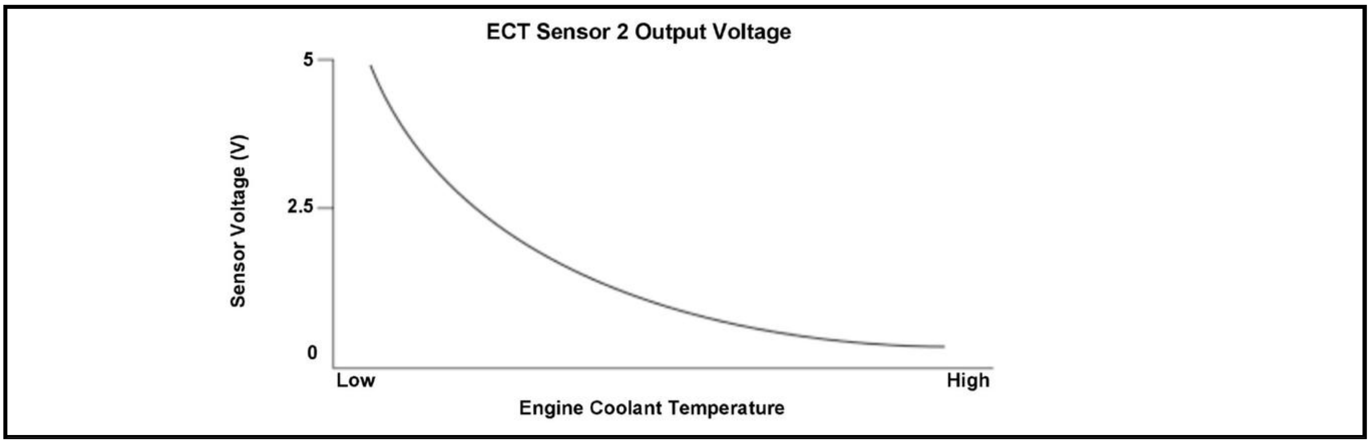
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2182

DTC P2182: Engine Coolant Temperature (ECT) Sensor 2 Out of Range

General Description





Engine coolant temperature (ECT) sensor 2 is a thermistor attached to the radiator. The powertrain control module (PCM) applies voltage (about 5 V) to the TW2 signal circuit through a pull-up resistor. As the engine coolant temperature cools, the ECT sensor 2 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 2 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 2 output voltage is a set value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The ECT sensor 2 output voltage [ECT Sensor 2 Voltage] is 0.14 V or less for at least 6 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 2 failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

The powertrain control module (PCM) is equipped with two engine coolant temperature (ECT) sensors and two intake air temperature (IAT) sensors in order to measure engine temperature. The ECT sensor 1/ECT sensor 2 and the IAT sensor 2 temperatures are nearly the same as the air temperature after sufficient time shut down to cool the system. Furthermore, the IAT sensor 1/IAT sensor 2 values agree after starting the engine since they are located in the same air intake path. When the system is started after the prescribed time has elapsed, the IAT sensor 2 detects malfunction comparing the ECT sensor 1 and ECT sensor 2. When the sensors are normal, the PCM detects a malfunction in the IAT sensor 1 and stores a DTC comparing temperatures of the IAT 1 sensor and IAT 2 sensor after starting the engine.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	1.0 second or more* 10 seconds or less**
DTC Type	Two drive cycles, MIL on

*: After the system is activated**: After the engine is started

Enable Conditions

Condition	Minimum	Maximum
Engine off time	6 hours	-

Malfunction Threshold

A malfunction is detected if the following conditions are present after the engine has stopped and the vehicle condition has been turned to the OFF (LOCK) mode for at least 6 hours before restarting the engine:

Temperature difference between each sensor values		Malfunction judgment		
ECT sensor 1 - ECT sensor 2	IAT sensor 2 - ECT sensor 2	ECT sensor 1	IAT sensor 2	ECT sensor 2
Higher than 57 deg.F (32 deg.C)	Higher than 57 deg.F (32 deg.C)	Normal	Normal	Failure
	From -43 deg.F (-24 deg.C) to 57 deg.F (32 deg.C)	Failure	Normal	Normal
	Lower than -43 deg.F (-24 deg.C)	Failure	Failure	Normal
From -43 deg.F (-24 deg.C) to 57 deg.F (32 deg.C)	Higher than 57 deg.F (32 deg.C)	Normal	Failure	Normal
	From -43 deg.F (-24 deg.C) to 57 deg.F (32 deg.C)	Normal	Normal	Normal
	Lower than -24 deg.C (-43 deg.F)	Normal	Failure	Normal
Lower than -43 deg.F (-24 deg.C)	Higher than 57 deg.F (32 deg.C)	Failure	Failure	Normal
	From -43 deg.F (-24 deg.C) to 57 deg.F (32 deg.C)	Failure	Normal	Normal
	Lower than -43 deg.F (-24 deg.C)	Normal	Normal	Failure

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- ECT sensor 2 failure
- IAT sensor 1 failure
- IAT sensor 2 failure
- Engine block heater attachment (besides a genuine part)

Confirmation Procedure

Operating Condition

- Turn the vehicle to the OFF (LOCK) mode, and wait at least 6 hours.
- Enter the maintenance mode, then start the engine, and let it idle for at least 10 seconds.

- Do not use an engine block heater because the engine coolant temperature will not stay equal during engine stop.
- When freeze data is stored, test the vehicle under an ambient temperature close to the intake air temperature in the freeze data.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the

freeze data are stored.

Conditions for clearing the DTC

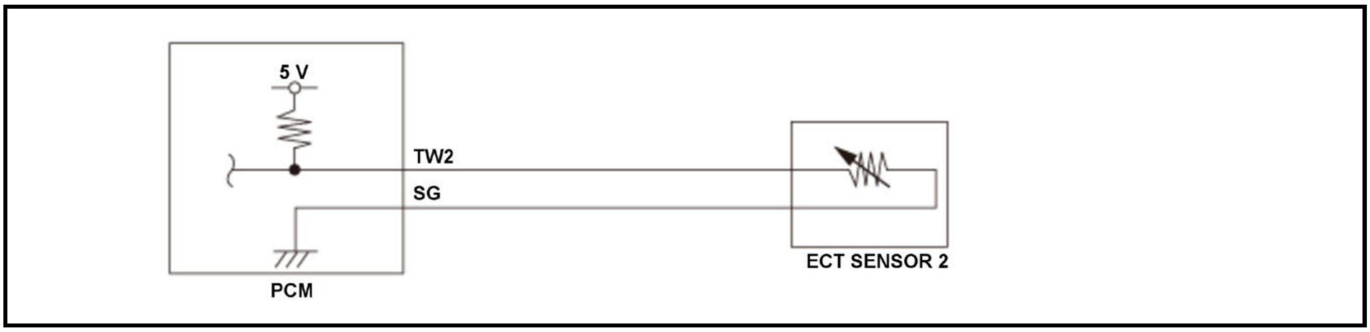
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

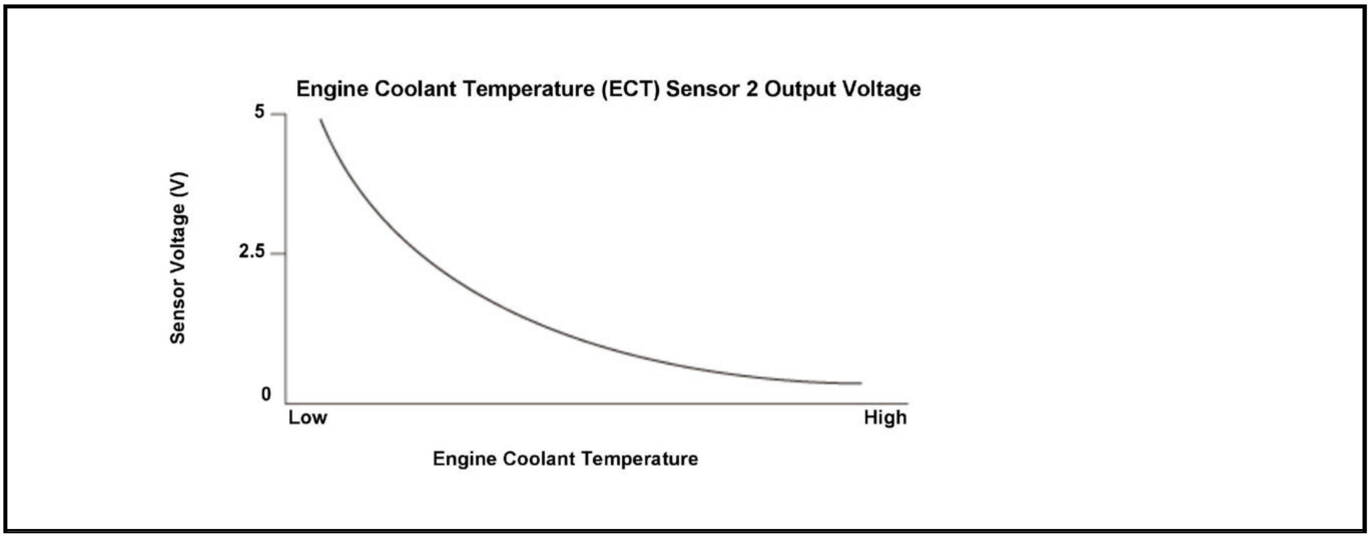
DTC P2184, P2185

DTC P2184: Engine Coolant Temperature (ECT) Sensor 2 Circuit Low Voltage

DTC P2185: Engine Coolant Temperature (ECT) Sensor 2 Circuit High Voltage

General Description





Engine coolant temperature (ECT) sensor 2 is a thermistor attached to the radiator. The powertrain control module (PCM) applies voltage (about 5 V) to the TW2 signal circuit through a pull-up resistor. As the engine coolant temperature cools, ECT sensor 2 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the sensor resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 2 output voltage is a set value when the engine coolant temperature is high or low, the PCM detects a malfunction and stores a DTC.

Failure

When the air/fuel ratio (A/F) sensor (sensor 1) is properly connected to the engine wire harness, but it is not installed in the exhaust pipe, the feedback is not done properly even if the A/F sensor (sensor 1) is active after starting the engine. Thus, the exhaust emissions increase. When the A/F sensor (sensor 1) output stays out of the normal range after the A/F sensor (sensor 1) becomes active, the powertrain control module (PCM) detects that the A/F sensor (sensor 1) is not properly installed and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	7.0 seconds or more
DTC Type	Two drive cycles, MIL on

	From -43 deg.F (-24 deg.C) to 57 deg.F (32 deg.C)	Failure	Normal	Normal
	Lower than -43 deg.F (-24 deg.C)	Normal	Normal	Failure

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- ECT sensor 1 failure
- ECT sensor 2 failure
- IAT sensor 1 failure
- IAT sensor 2 failure
- Engine block heater attachment (besides a genuine part)

Confirmation Procedure

Operating Condition

- Turn the vehicle to the OFF (LOCK) mode and leave the vehicle for at least 6 hours.
- Enter the maintenance mode, then start the engine, and let it idle for at least 10 seconds.

- Do not use an engine block heater because the engine coolant temperature will not stay equal during engine stop.
- When freeze data is stored, test the vehicle under an ambient temperature close to the intake air temperature in the freeze data.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P219C, P219D, P219E, P219F

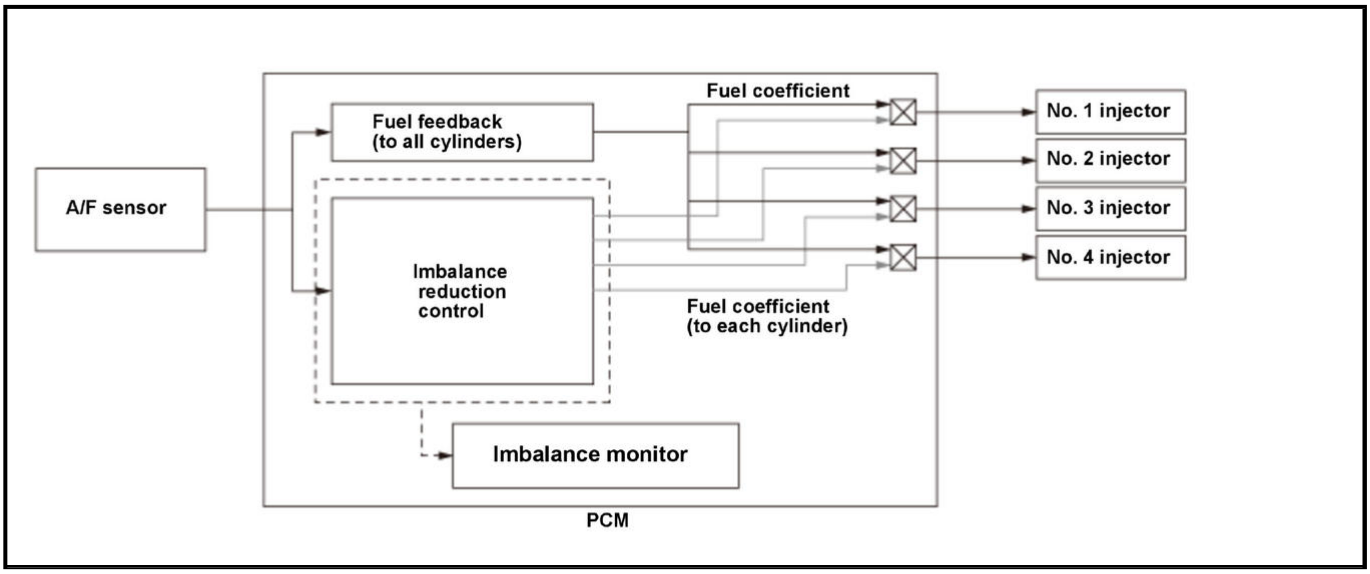
DTC P219C: No. 1 Cylinder Air-Fuel Ratio Variation

DTC P219D: No. 2 Cylinder Air-Fuel Ratio Variation

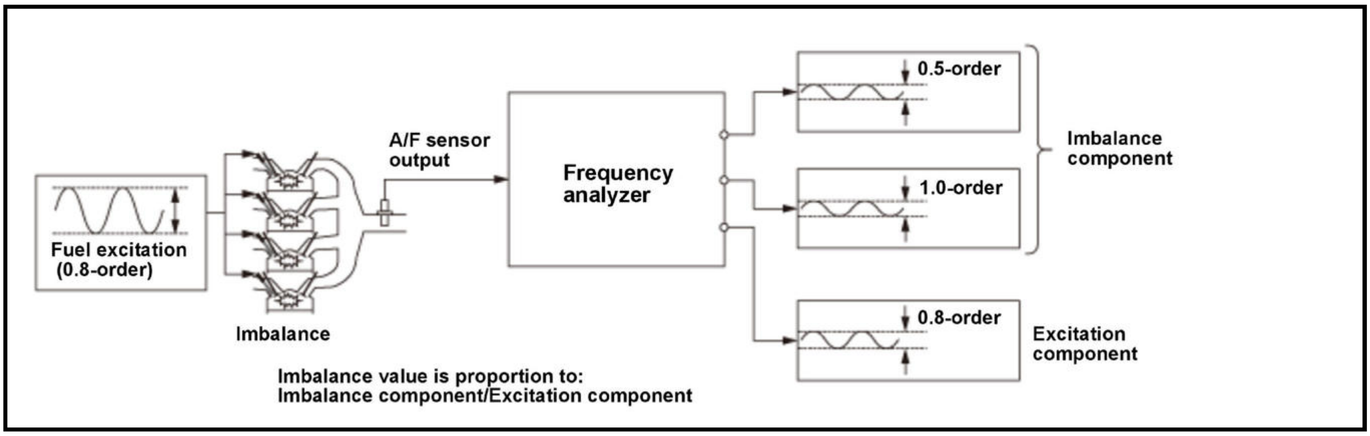
DTC P219E: No. 3 Cylinder Air-Fuel Ratio Variation

DTC P219F: No. 4 Cylinder Air-Fuel Ratio Variation

General Description



A/F sensor
Fuel feedback
(to all cylinders)
Imbalance
reduction
control
Fuel coefficient
Fuel coefficient
(to each cylinder)
No. 1 injector
No. 2 injector
No. 3 injector
No. 4 injector
Imbalance monitor
PCM



Fuel excitation
(0.8-order)
Imbalance
A/F sensor
output
Frequency
analyzer
0.5-order
1.0-order
0.8-order
Imbalance
component
Excitation
component
Imbalance value is proportion to:
Imbalance component/Excitation component

The powertrain control module (PCM) detects the imbalance amount from the sizes of the 0.5-order and 1.0-order components compared to 0.8-order excitation input by the fuel injection to determine the air/fuel ratio variation between the cylinder. The obtained components are used to learn the fuel coefficient of each cylinder and performs the imbalance reduction control. If it is not possible to suppress the variation even if the imbalance reduction control is performed; resulting the imbalance amount is large and the fuel coefficient is a specified value or more, the PCM detects as imbalance failure.

- When the imbalance amount is a specified value (about 10 %) or less:
-
  - -

    Fuel coefficient of each cylinder is higher than the threshold value: Failure on corresponding cylinder

-
  - -

    Fuel coefficient of each cylinder is lower than the threshold value: Pass

- When the imbalance amount is a specified value (about 10 %) or more:
-
  - -

    Performs imbalance reduction control and fuel coefficient is higher than the threshold value: failure on corresponding cylinder

-

- -

  Performs imbalance reduction control and fuel coefficient of each cylinder is lower than the threshold value: re-performs imbalance reduction control for a specified time and re-determines the failure by the fuel coefficient of each cylinder. If the imbalance amount is a specified value or less after imbalance reduction control is performed for a specified time, the determination is suspended. If the imbalance amount is a specified value or more after imbalance reduction control is performed for a specified time, the imbalance reduction control is performed again and if the fuel coefficient of each cylinder is higher than a specified value, the PCM detects the failure on corresponding cylinder.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	-
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	156 deg.F (69 deg.C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg.F (-25 deg.C)	-
Engine speed [Engine Speed]	1, 850 rpm	3, 400 rpm
Engine speed variation during 1 cycle	-	100 rpm
Fuel trim	0.69	1.47
Intake air amount variation	-	0.1 g (0.003 oz)
Fuel feedback	Closed loop at stoichiometric	
Monitoring priority	P0133, P0400, P0420	

[ ]: HDS Parameter

Malfunction Threshold

Fuel correction coefficient of each cylinder is 0.83 or less, or 1.15 or more.

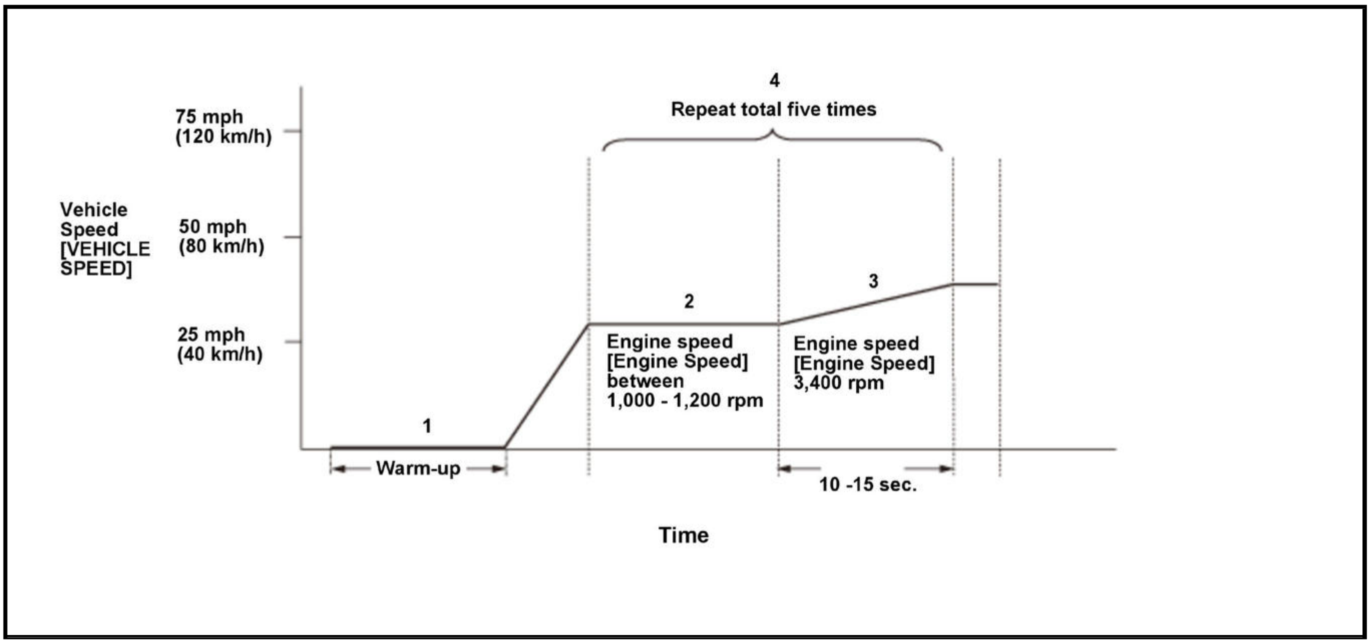
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Fuel injector failure
- Fuel rail clogged
- Intake manifold air leak/clogged
- Cam lift failure
- Ignition system failure
- Engine compression abnormal
- Valve clearance incorrect

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady engine speed [Engine Speed] 1, 000 - 1, 200 rpm.
- Take 10 - 15 seconds to accelerate up to engine speed [Engine Speed] 3, 400 rpm.
- When the diagnosis does not finish, repeat Driving Pattern steps 2 through 3, five times.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

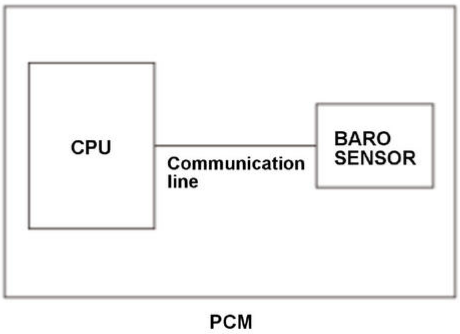
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2226

DTC P2226: Barometric Pressure (BARO) Sensor Circuit Malfunction

General Description



The barometric pressure (BARO) sensor is built into the powertrain control module (PCM), and it monitors atmospheric pressure. The BARO sensor output voltage is converted to A/D in the sensor inside, and transmitted to a CPU by serial communication. When the signal is not sent from the BARO sensor or when the signal sent from the BARO sensor is abnormal and this condition continues for a specified time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

One of these conditions is met at least 2.0 seconds:

- The PCM does not receive signals.
- The signal sent from the BARO sensor is abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

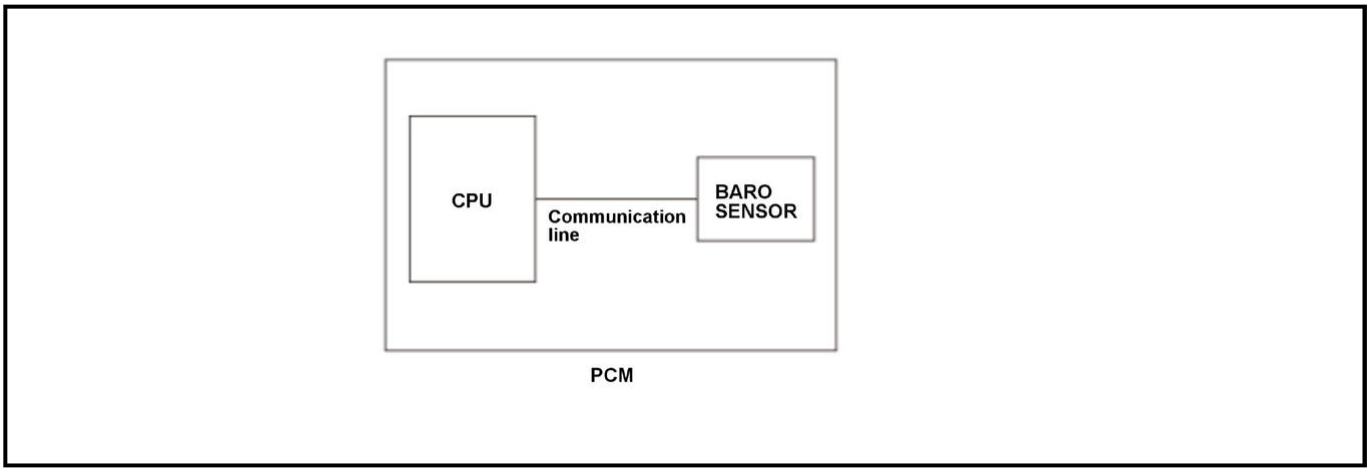
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2228, P2229

DTC P2228: Barometric Pressure (BARO) Sensor Circuit Low Voltage

DTC P2229: Barometric Pressure (BARO) Sensor Circuit High Voltage

General Description



The barometric pressure (BARO) sensor is built into the powertrain control module (PCM), and it monitors atmospheric pressure. The BARO sensor output voltage is converted to A/D in the sensor inside, and transmitted to a CPU by serial communication. If the atmospheric pressure value sent from the BARO sensor is abnormal, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P2228

The BARO sensor output value [Baro Sensor] is 49 kPa (371 mmHg, 14.4 inHg) or less for at least 6.0 seconds.

DTC: P2229

The BARO sensor output value [Baro Sensor] is 114 kPa (855 mmHg, 33.7 inHg) or more for at least 6.0 seconds.

[ ]: HDS Parameter

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

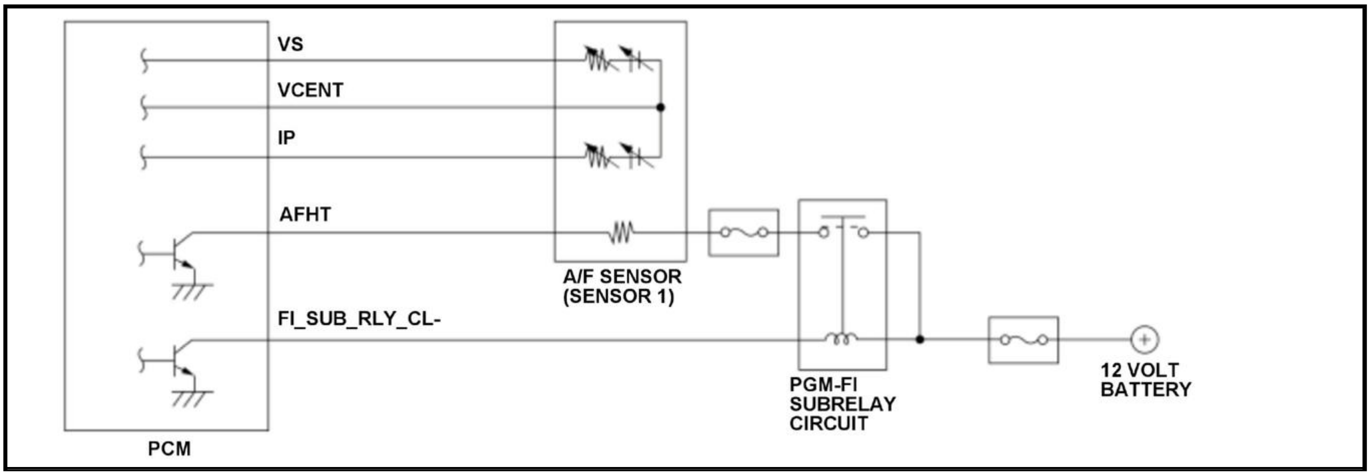
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2237

DTC P2237: Air/Fuel Ratio A/F Sensor (Sensor 1) IP Circuit High Voltage

General Description



The air/fuel ratio (A/F) sensor (sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The A/F sensor (sensor 1) transmits a signal to the powertrain control module (PCM), and the PCM controls fuel injection duration by comparing the target air/fuel ratio with the A/F sensor (sensor 1) signal. If the IP terminal voltage is within a specified range when the A/F sensor (sensor 1) pump cell voltage is excessively high, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	15 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	9.0 V	-

Condition	Minimum	Maximum
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

The IP terminal voltage is between 1.93 - 2.07 V for at least 15 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) IP line open
- A/F sensor (sensor 1) failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Enter the maintenance mode, start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

With the HDS

None.

Diagnosis Details

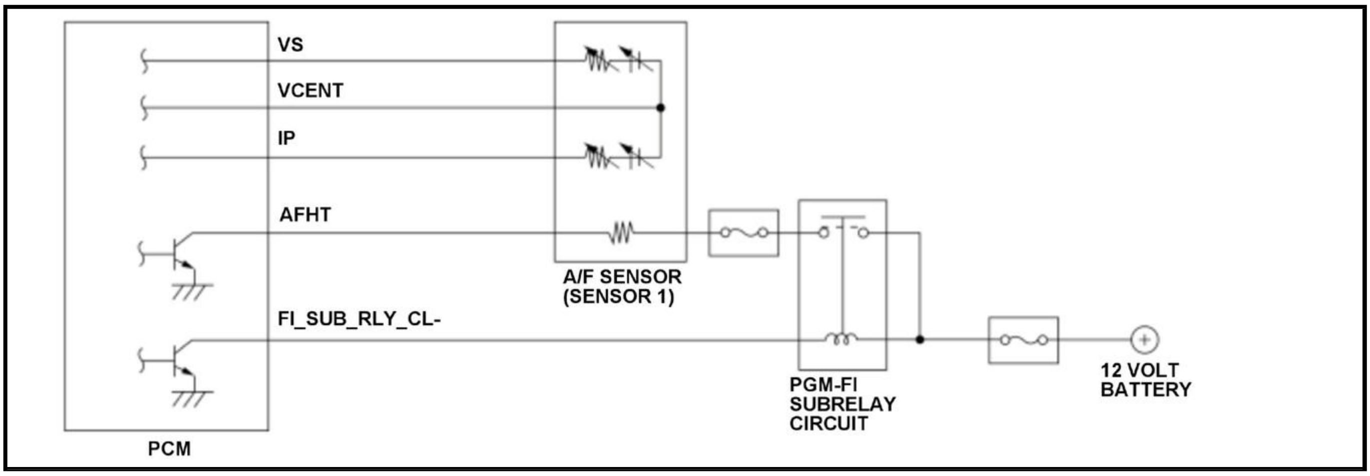
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2238

DTC P2238: Air/Fuel Ratio (A/F) Sensor (Sensor 1) IP Circuit Low Voltage

General Description



The air/fuel ratio (A/F) sensor (sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The A/F sensor (sensor 1) transmits a signal to the powertrain control module (PCM), and the PCM controls fuel injection duration by comparing the target air/fuel ratio with the A/F sensor (sensor 1) signal. If the IP terminal voltage is a specified voltage when the self-diagnosis function in the PCM detects an abnormal condition, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	9.0 V	-
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

One of these symptoms occurs:

- When the element temperature is low before the sensor becomes active:

  The IP terminal voltage is 2.0 V or less for at least 5 seconds after the self-diagnosis function in the PCM detects low voltage abnormal for 500 milliseconds.

- When the element temperature is high before the sensor becomes active:

  The IP terminal voltage is 2.0 V or less for at least 5 seconds after the self-diagnosis function in the PCM detects short circuit for three times and the heater is stopped for 5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) IP line short to ground
- A/F sensor (sensor 1) failure

- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Enter the maintenance mode, start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

With the HDS

None.

Malfunction Threshold

One of these symptoms occurs:

- The PCM detects VS line short to ground after the self-diagnosis function in the PCM judges as an occurrence of short circuit for at least 5 seconds.
- The VS terminal voltage is 2.6 V or less after a current is applied to the sensor pump cell for at least 500 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) VS line short to ground
- A/F sensor (sensor 1) failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Enter the maintenance mode, start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

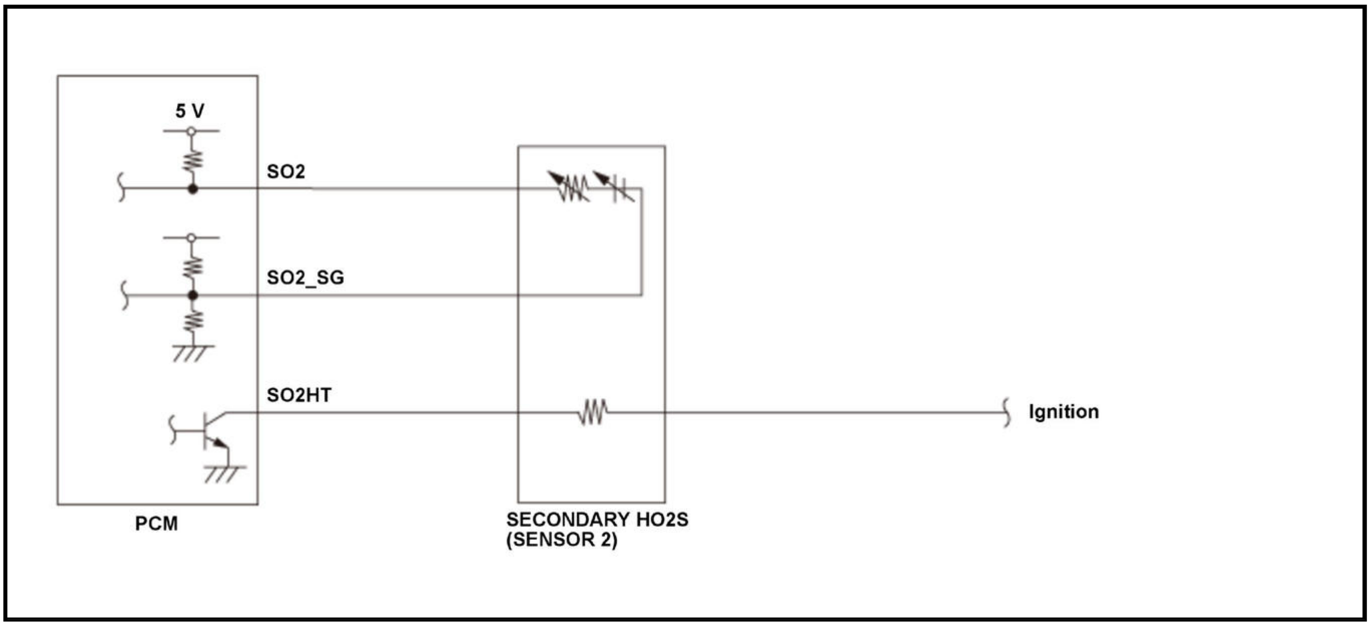
Conditions for clearing the DTC

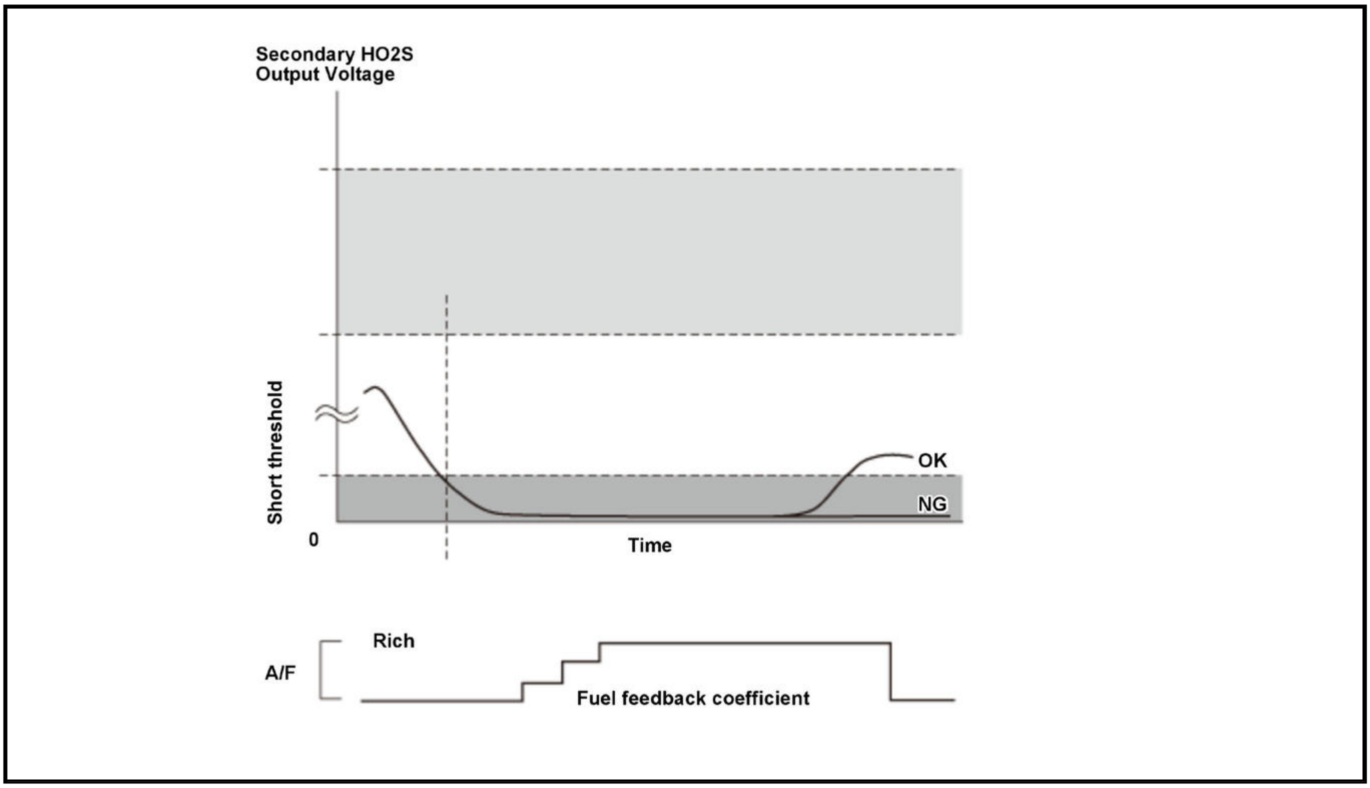
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2270

DTC P2270: Secondary Heated Oxygen Sensor (Secondary HO2S (Sensor 2)) Circuit Signal Stuck Lean

General Description





The secondary heated oxygen sensor (secondary HO2S (sensor 2)) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control. The powertrain control module (PCM) controls the air/fuel ratio from the air/fuel ratio (A/F) sensor (sensor 1) output voltage so that the TWC efficiency is optimized. When power is applied to the secondary HO2S (sensor 2) heater, if the secondary HO2S (sensor 2) output continues to be low (lean) during feedback control, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	18 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time that secondary HO2S activity is not monitored after starting the engine	15 seconds	-
Engine coolant temperature [ECT Sensor 1]	156 deg.F (69 deg.C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg.F (-25 deg.C)	-
Fuel trim	0.69	1.47
Fuel feedback	Closed loop	
Other	Cruise load or more	

[ ]: HDS Parameter

Malfunction Threshold

The secondary HO2S (sensor 2) output voltage [HO2S S2] is 0.05 V or less for at least 18 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) lean side stuck

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine, and let it idle until the radiator fan comes on.
- Drive immediately at a steady engine speed [Engine Speed] between 1, 500 - 3, 000 rpm for at least 18 seconds.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 2.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

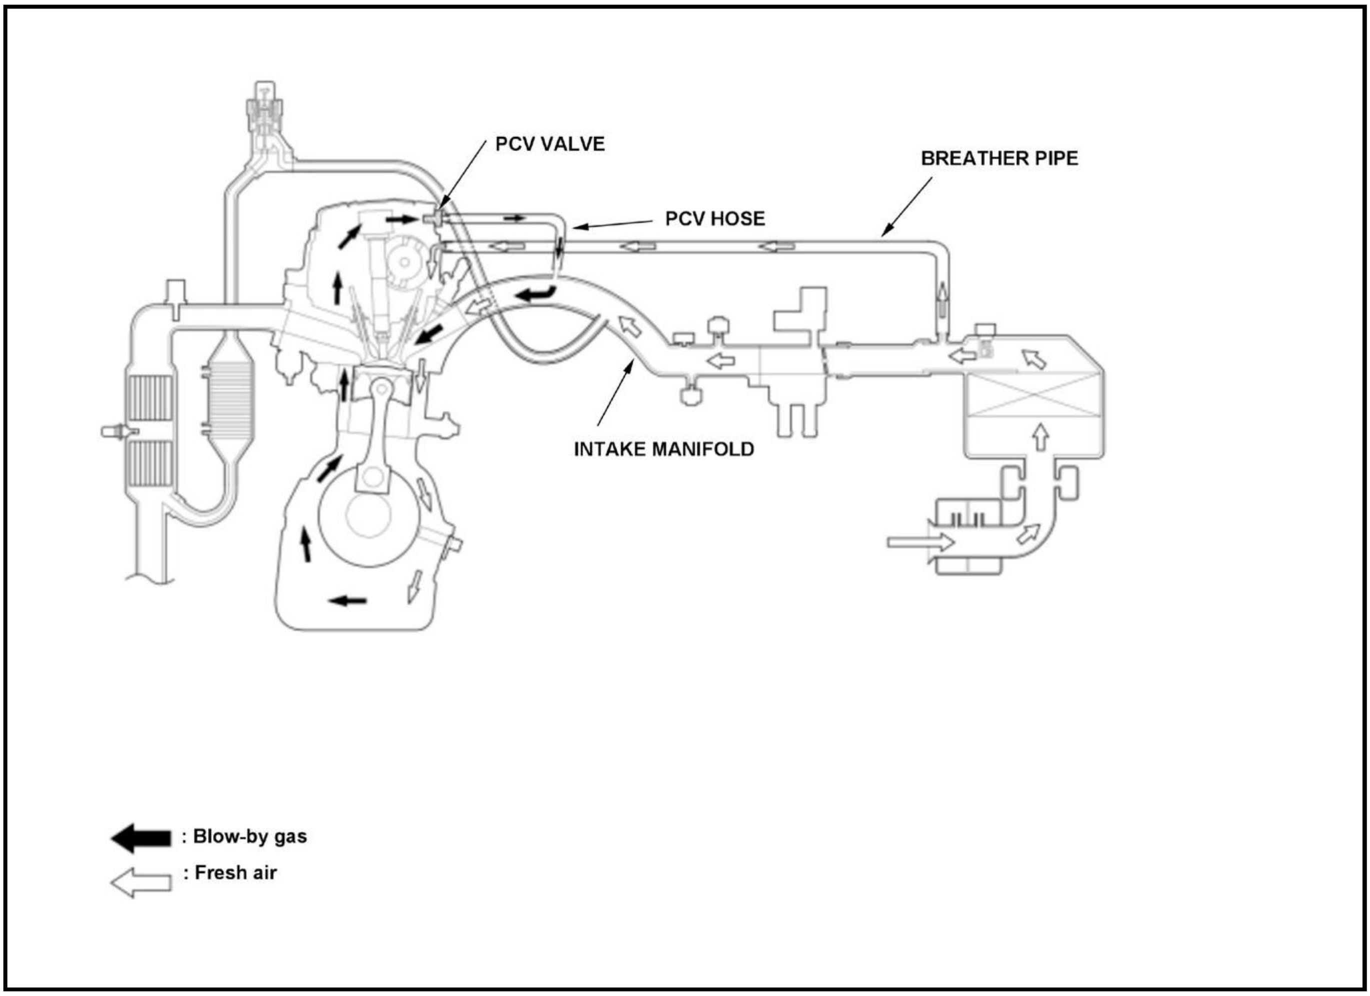
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

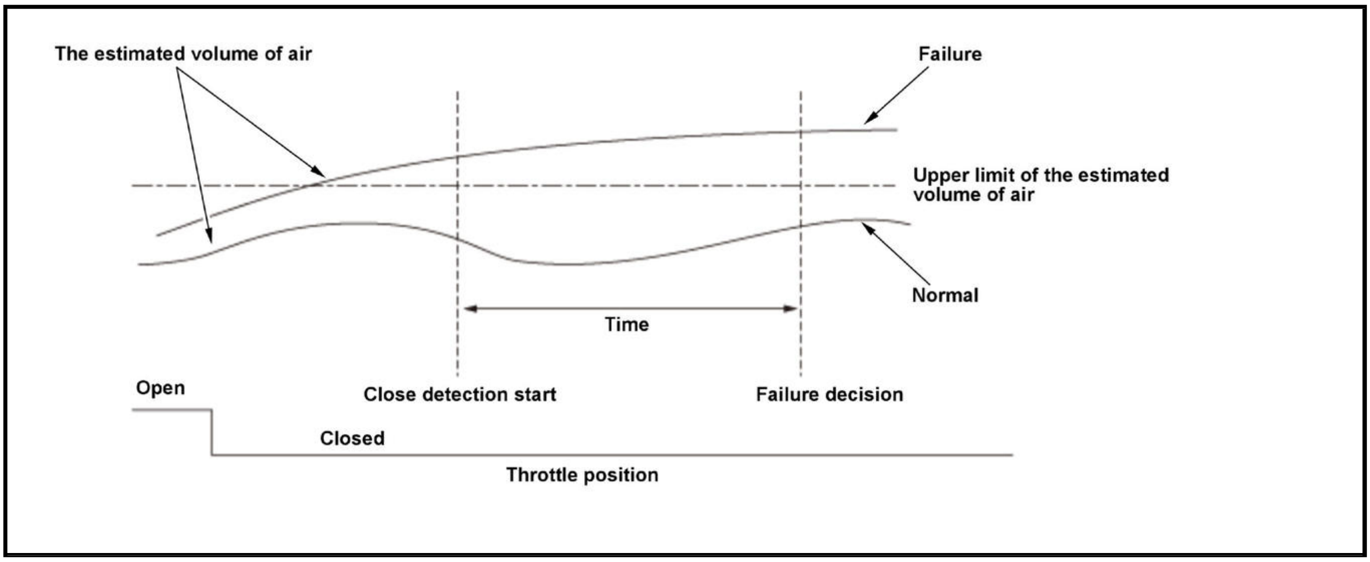
DTC P2279

DTC P2279: Intake Air System Leak

General Description



PCV VALVE
BREATHER PIPE
PCV HOSE
INTAKE MANIFOLD
⬅ : Blow-by gas
⇦ : Fresh air



The estimated volume of air
Failure
Upper limit of the estimated volume of air
Normal
Time
Open
Close detection start
Failure decision
Closed
Throttle position

The positive crankcase ventilation (PCV) system reduces hydrocarbon (HC) emissions. The PCV system recirculates unburned air/fuel mixture (blow-by gas) into the intake manifold so that it is drawn into the engine and burned, thus reducing HC. Estimate the amount of air inflowing from the PCV valve from the deviation between the inflow air amount of the intake manifold calculated from the manifold absolute pressure (MAP) sensor and the amount of air passing through throttle body measured using mass airflow (MAF) sensor. When the PCV hose is disengaged, the amount of air flowing from the PCV valve increases and the deviation also increases. The estimated air quantity of PCV is compared with the judgment value (upper limit value), and when it exceeds the more than the upper limit, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5.5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	15 seconds	-
Engine speed [Engine Speed]	1, 200 rpm	3, 000 rpm
Engine coolant temperature [ECT Sensor 1]	122 deg.F (50 deg.C)	-
Intake air temperature [IAT Sensor (1)]	18.4 deg.F (-7.6 deg.C)	-
12 volt battery voltage [Battery]	10.5 V	-
Fuel trim	0.69	1.47
Fuel feedback	Closed loop	

[ ]: HDS Parameter

Malfunction Threshold

The estimated volume of intake air is 180.0 L/min (190.2 US qt/min) - 220.0 L/min (232.5 US qt/min) or more*.

*: Depends on engine speed and load

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Vacuum hose fall
- Throttle body air leak
- Intake manifold air leak
- Evaporative emission (EVAP) canister purge valve failure
- Valve timing incorrect

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 5.5 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

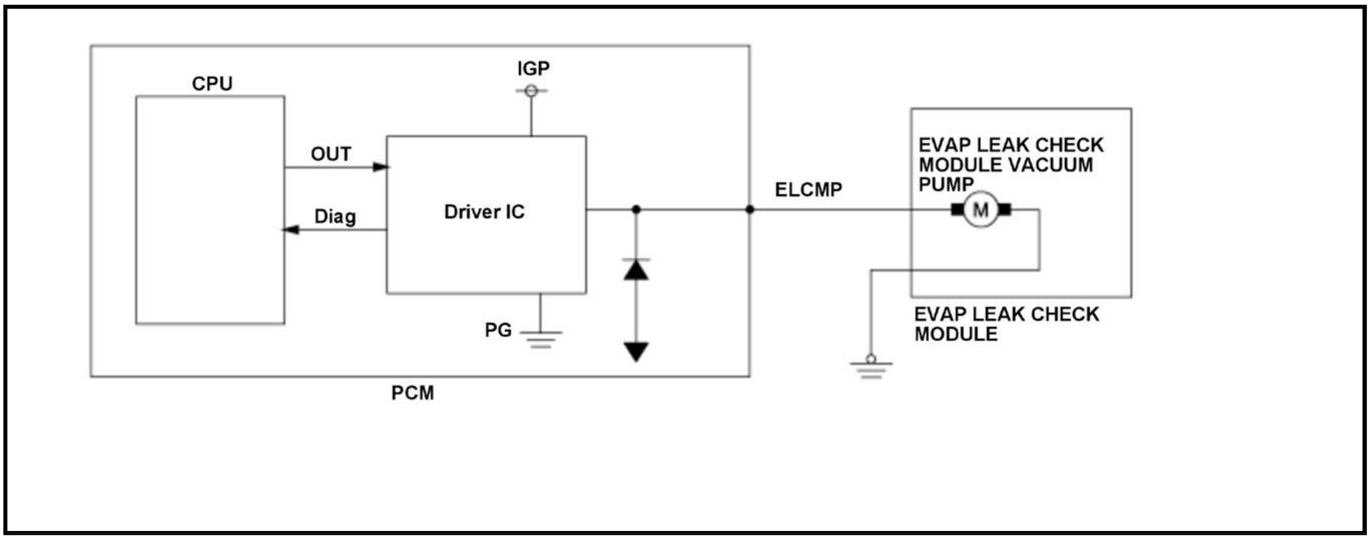
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P2401, P2402

DTC P2401: Evaporative Emission (EVAP) Leak Check Pump Control Circuit Low Voltage

DTC P2402: Evaporative Emission (EVAP) Leak Check Pump Control Circuit High Voltage

General Description



The evaporative emission (EVAP) leak check module vacuum pump is installed in the EVAP leak check module to create negative pressure in the EVAP passage when performing the EVAP leak check. The EVAP leak check module vacuum pump is normally non-energized and inactive. It is only activated when performing the EVAP leak check. The powertrain control module (PCM) detects a malfunction and stores a DTC when the diagnostic signal of the driver IC of the PCM internal circuit is low continuously for the prescribed time though operation signal is output to the EVAP leak check module vacuum pump.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10 V	-

[ ]: HDS Parameter

Malfunction Threshold

DTC: P2401

When the diagnostic signal of the driver IC of the PCM internal circuit is low continuously for 2.0 seconds or more while the operation signal is output to the EVAP leak check module vacuum pump.

DTC: P2402

When the diagnostic signal of the driver IC of the PCM internal circuit is high continuously for 2.0 seconds or more while the operation signal is output to the EVAP leak check module vacuum pump.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P2401

- EVAP leak check module ELCMP line short

DTC: P2402

- EVAP leak check module ELCMP line open
- EVAP leak check module ground line open
- EVAP leak check module ELCMP line short to power
- EVAP leak check module ground line short to power

Common

- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode.

With the HDS

Select the EVAP TEST in the INSPECTION MENU, then select the FUNCTION TEST with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

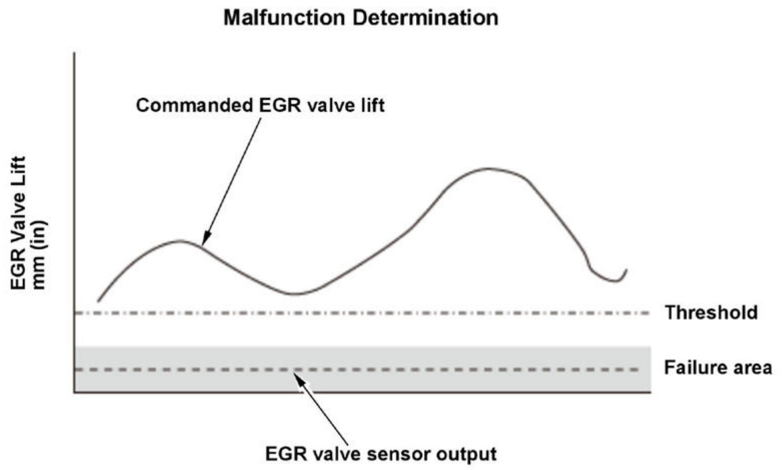
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2413

DTC P2413: Exhaust Gas Recirculation (EGR) System Malfunction

General Description



The exhaust gas recirculation (EGR) valve, which is controlled by the powertrain control module (PCM), is opened and the exhaust gas flows through the EGR valve, the intake manifold, and the EGR passage. The exhaust gas is circulated into the air/fuel mixture and the mixture is drawn into the combustion chamber to lower combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions. A sensor (lift sensor) is built into the EGR valve and detects the amount of valve lift. The command value for the target valve lift is stored in the PCM so that exhaust gas recirculation can be optimized according to driving conditions. Comparing this command value with the lift sensor output signal value, the PCM controls the EGR valve to make the amount of actual valve lift equal to the command value. If the valve sensor output is insufficient for the commanded valve lift, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	5.0 seconds or more

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	-	4, 500 rpm
Commanded EGR valve lift	0.0394 in (1.00 mm)	-
12 volt battery voltage [Battery]	10.5 V	-

[ ]: HDS Parameter

Malfunction Threshold

If the actual valve lift is 0.0059 in (0.15 mm) or less for at least 5.0 seconds, the valve is considered stuck closed.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EGR valve position sensor line open
- EGR valve position sensor line short
- EGR valve closed stuck
- EGR valve position sensor middle stuck
- EGR valve position sensor range/performance problem

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Select the EGR TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

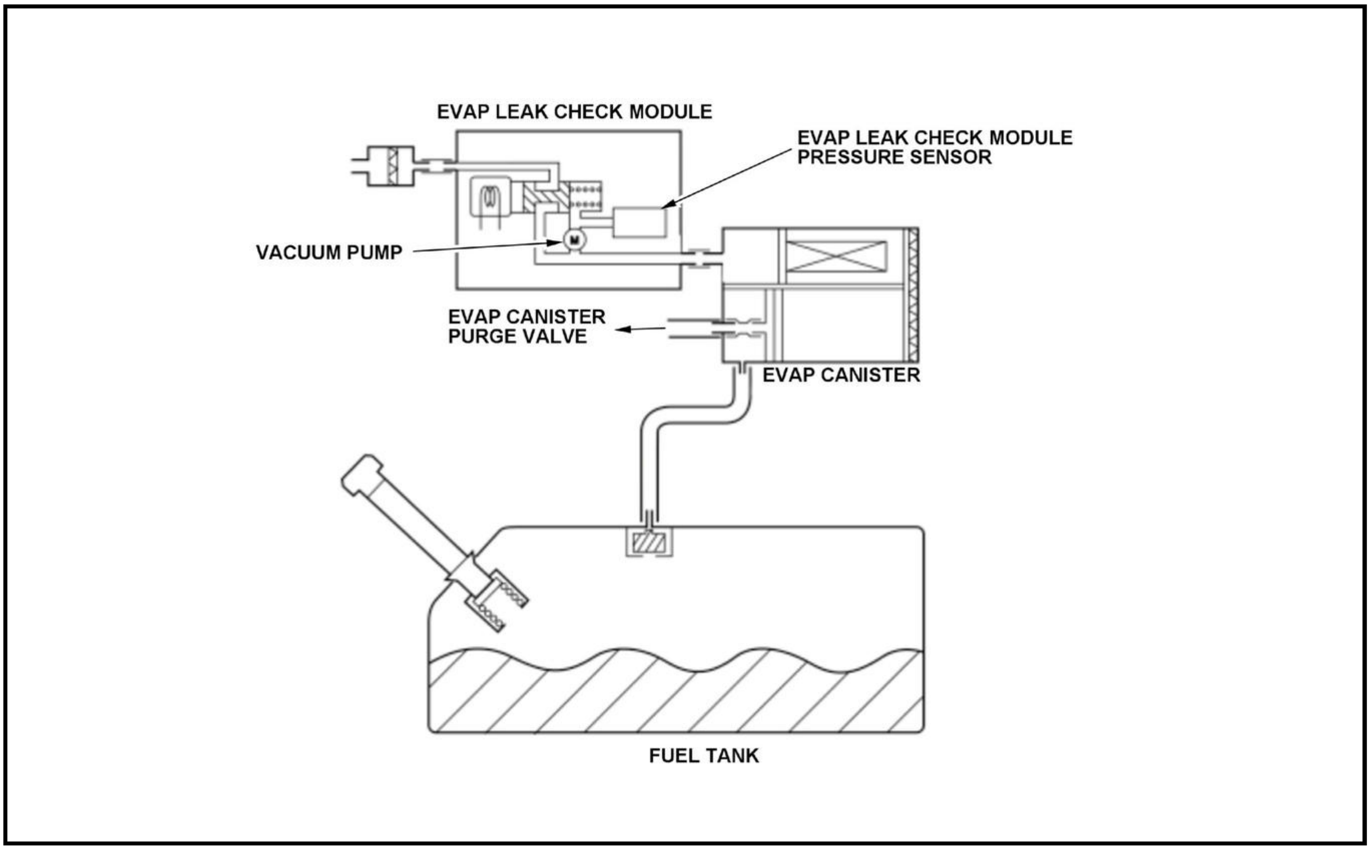
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

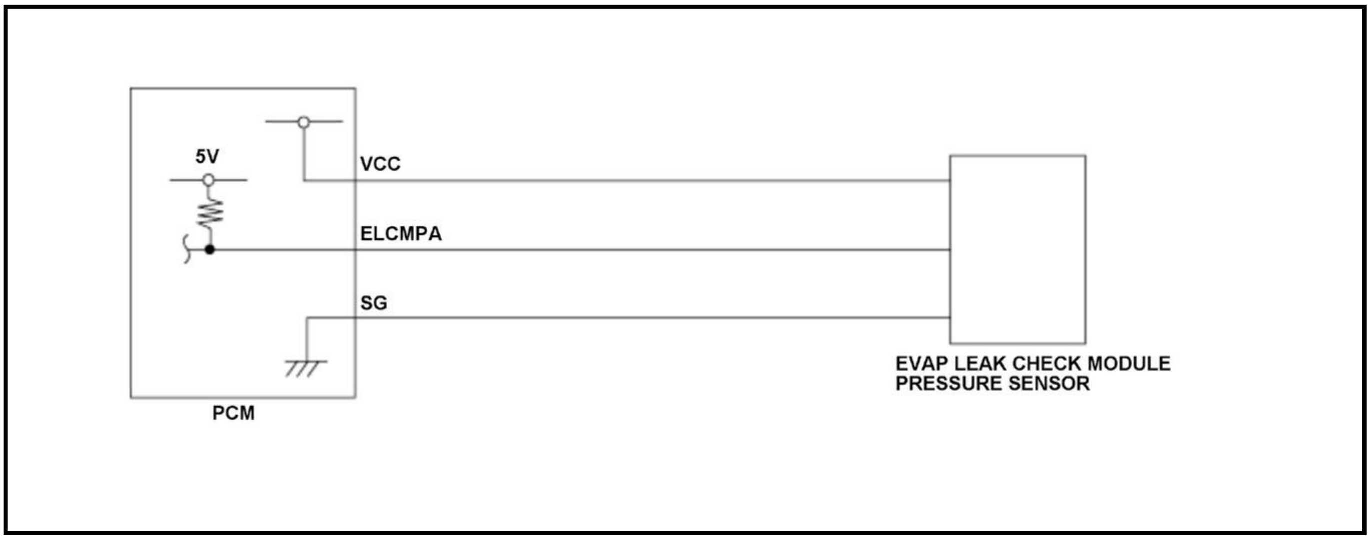
DTC P24B8

DTC P24B8: Evaporative Emission (EVAP) Leak Check Module Absolute Pressure Sensor Out of Range

General Description



EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
VACUUM PUMP
M
EVAP CANISTER PURGE VALVE
EVAP CANISTER
FUEL TANK



5V
VCC
ELCMPA
SG
PCM
EVAP LEAK CHECK MODULE PRESSURE SENSOR

The evaporative emission (EVAP) leak check module pressure sensor is a sensor used for leak detection of the fuel tank. The limit of the EVAP leak check module pressure sensor output is specified. If the output is exceed that limit, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None

Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The EVAP leak check module pressure sensor output level is 115 kPa (34 inHg, 857 mmHg) or more for at least 6 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP leak check module pressure sensor ELCMPA line open
- EVAP leak check module pressure sensor SG line open
- EVAP leak check module pressure sensor VCC line open
- EVAP leak check module pressure sensor ELCMPA line short to ground
- EVAP leak check module pressure sensor ELCMPA line short to power
- EVAP leak check module pressure sensor failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait for at least 6 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

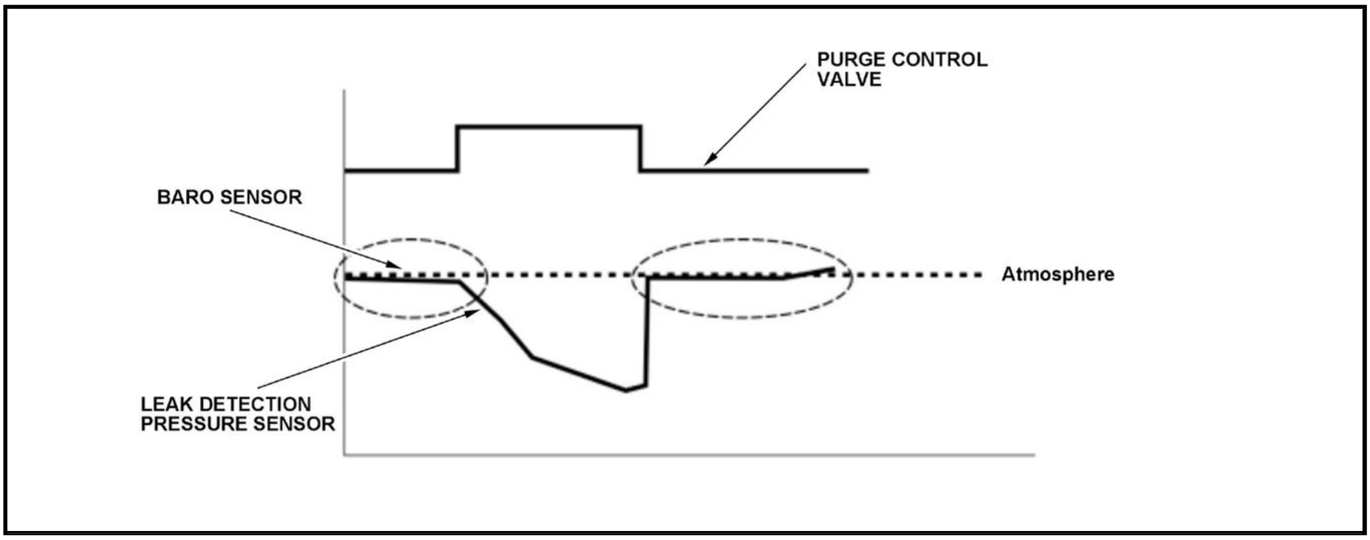
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P24B9

DTC P24B9: Evaporative Emission (EVAP) Leak Check Module Pressure Sensor Range/Performance Problem

General Description



The fuel vapor in the fuel tank is temporarily stored in the evaporative emission (EVAP) canister and drawn into the engine through the EVAP canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by varying the duty cycle of the EVAP canister purge valve according to the condition of the engine. While purge control is stopped, the EVAP leak check module pressure sensor output is a pressure equivalent to the atmospheric pressure. If the difference between the barometric pressure (BARO) sensor pressure and EVAP leak check module pressure sensor pressure exceeds the specified value for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	4 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	10 seconds	-
Other	Purge control stopped	

Malfunction Threshold

When a difference in pressure of the leak detection sensor and the BARO sensor became more than 17 kPa (125 mmHg, 4.9 inHg).

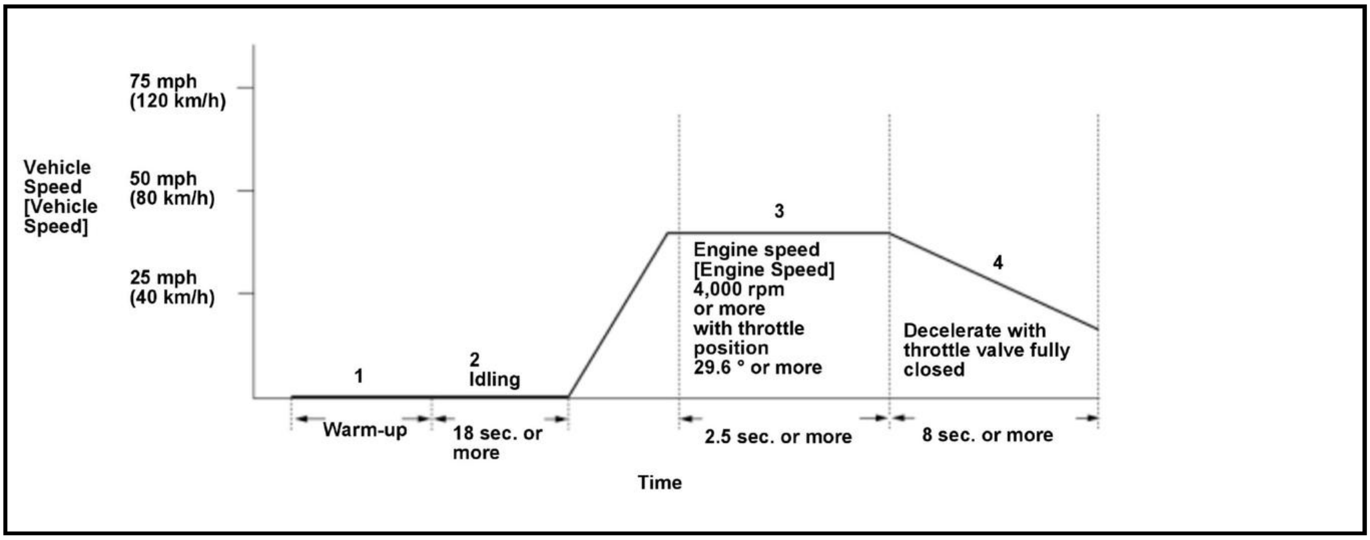
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- BARO sensor range/performance problem
- EVAP leak check module pressure sensor range/performance problem
- Manifold absolute pressure (MAP) sensor range/performance problem
- Purge control solenoid failure
- Air cleaner element clogged
- Valve timing incorrect
- Throttle body air leak
- Intake manifold air leak

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on.
- Let the engine idle for at least 18 seconds.
- Drive the vehicle at engine speed [Engine Speed] 4, 000 rpm or more with throttle position 29.6 deg. or more for at least 2.5 seconds.
- Decelerate with the throttle valve fully closed for at least 8 seconds.

- When freeze data is stored, drive the vehicle under those conditions instead of Driving Pattern step 4.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

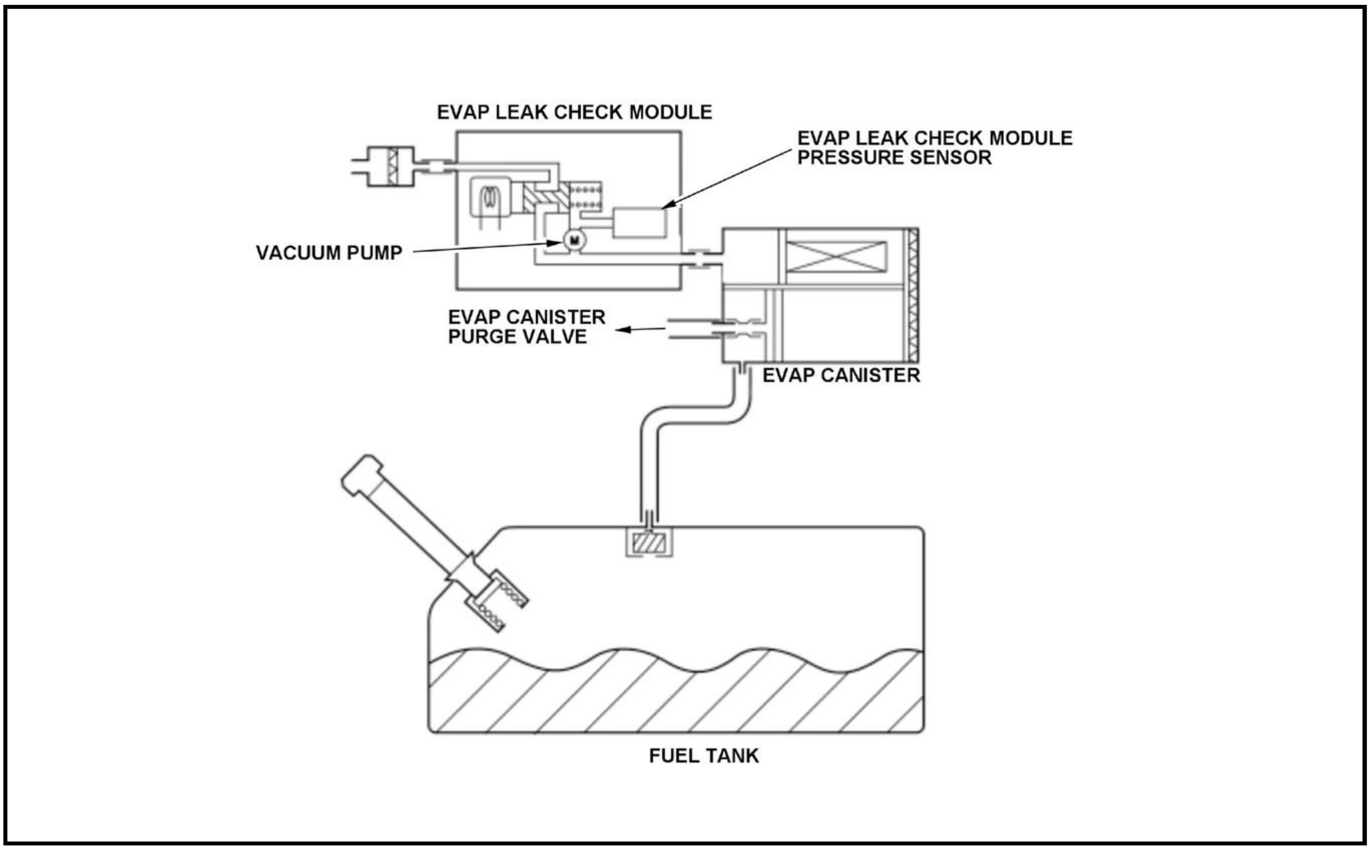
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P24BA, P24BB

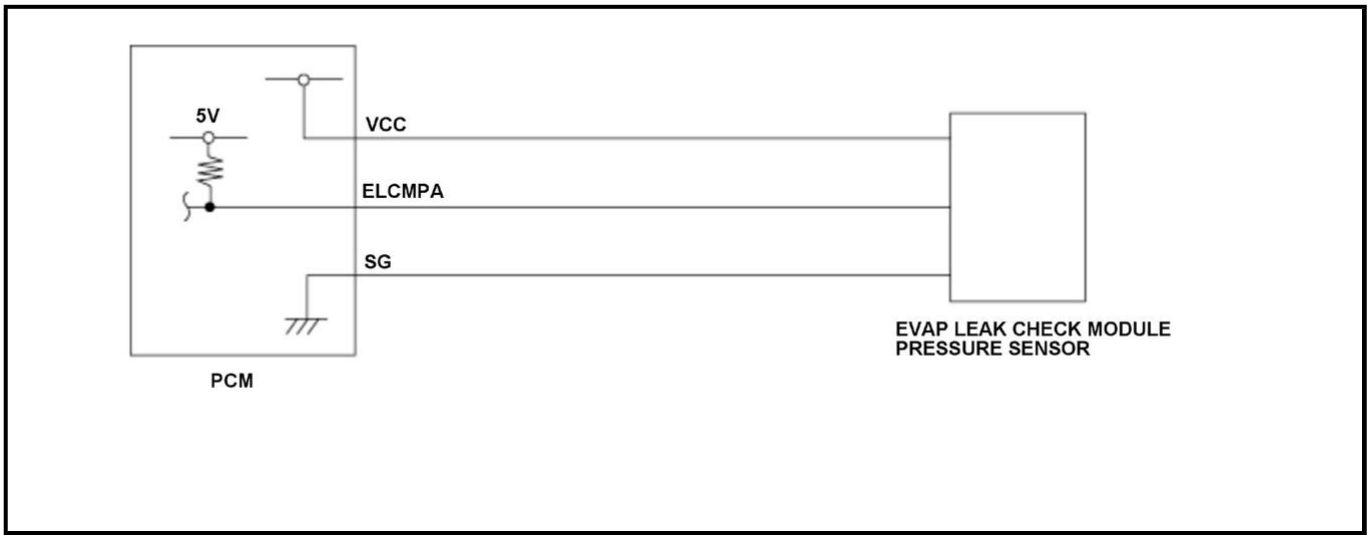
DTC P24BA: Evaporative Emission (EVAP) Leak Check Module Pressure Sensor Circuit Low Voltage

DTC P24BB: Evaporative Emission (EVAP) Leak Check Module Pressure Sensor Circuit High Voltage

General Description



EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
VACUUM PUMP
M
EVAP CANISTER PURGE VALVE
EVAP CANISTER
FUEL TANK



5V
VCC
ELCMPA
SG
PCM
EVAP LEAK CHECK MODULE PRESSURE SENSOR

The evaporative emission (EVAP) leak check module pressure sensor detects pressure in the fuel tank when the canister change over valve is open and detects barometric pressure when the canister change over valve is closed. If the EVAP leak check module pressure sensor output voltage is a set value for a set time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

DTC: P24BA

The EVAP leak check module pressure sensor [Absolute Pressure of ELCM Pressure Sensor] output level is 44 kPa (13 inHg, 331 mmHg) or less for at least 3 seconds.

DTC: P24BB

The EVAP leak check module pressure sensor [Absolute Pressure of ELCM Pressure Sensor] output level is 119 kPa (36 inHg, 893 mmHg) or more for at least 3 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P24BA

- EVAP leak check module pressure sensor ELCMPA line short to ground

DTC: P24BB

- EVAP leak check module pressure sensor ELCMPA line open
- EVAP leak check module pressure sensor ELCMPA line short to power
- EVAP leak check module pressure sensor VCC line open

Common

- EVAP leak check module pressure sensor failure
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

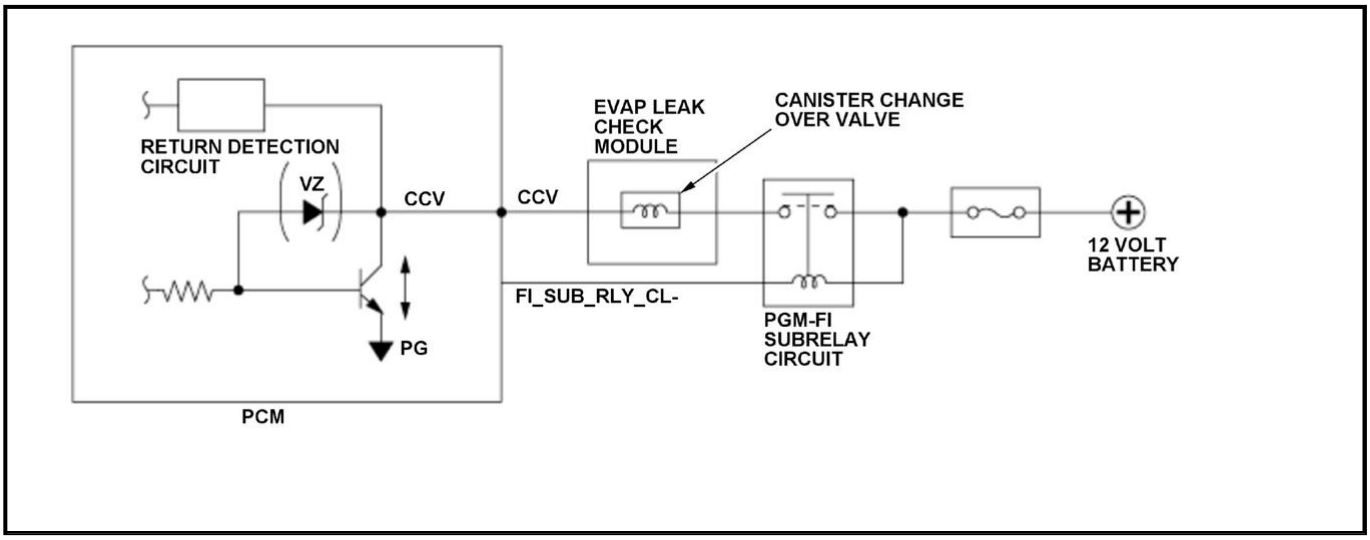
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P24BE

DTC P24BE: Canister Change Over Valve Control Circuit Low Voltage

General Description



The canister change over valve is installed in the evaporative emission (EVAP) leak check module and used to seal up the EVAP passage when performing the EVAP leak check. The canister change over valve is normally open (open to the atmosphere) and only closed (sealed) when performing the EVAP leak check. The powertrain control module (PCM) detects a malfunction and stores a DTC when the close signal is returned continuously for the prescribed time or more though close signal is not output to the canister change over valve.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 Volt Battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

When close signal is returned continuously for 2.0 seconds or more though close signal is not output to the canister change over valve.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP leak check module CCV line open
- EVAP leak check module power supply line open
- EVAP leak check module internal circuit open
- EVAP leak check module CCV line short
- EVAP leak check module power supply line short to ground
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

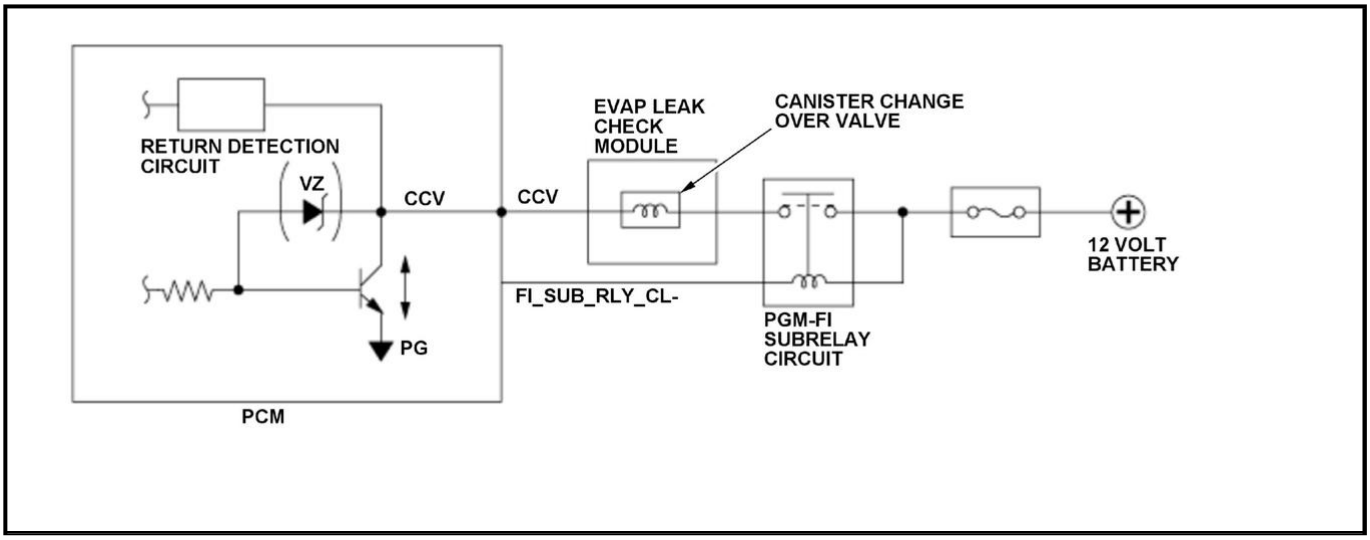
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P24BF

DTC P24BF: Canister Change Over Valve Control Circuit High Voltage

General Description



The canister change over valve is installed in the evaporative emission (EVAP) leak check module and used to seal up the EVAP passage when performing the EVAP leak check. The canister change over valve is normally open (open to the atmosphere) and only closed (sealed) when performing the EVAP leak check. The powertrain control module (PCM) detects a malfunction and stores a DTC when the close signal is returned continuously for the prescribed time or more though close signal is not output to the canister change over valve.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

When open signal is returned continuously for 2.0 seconds or more though close signal is output to the canister change over valve.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EVAP leak check module CCV line short to power
- EVAP leak check module change valve internal circuit leak
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

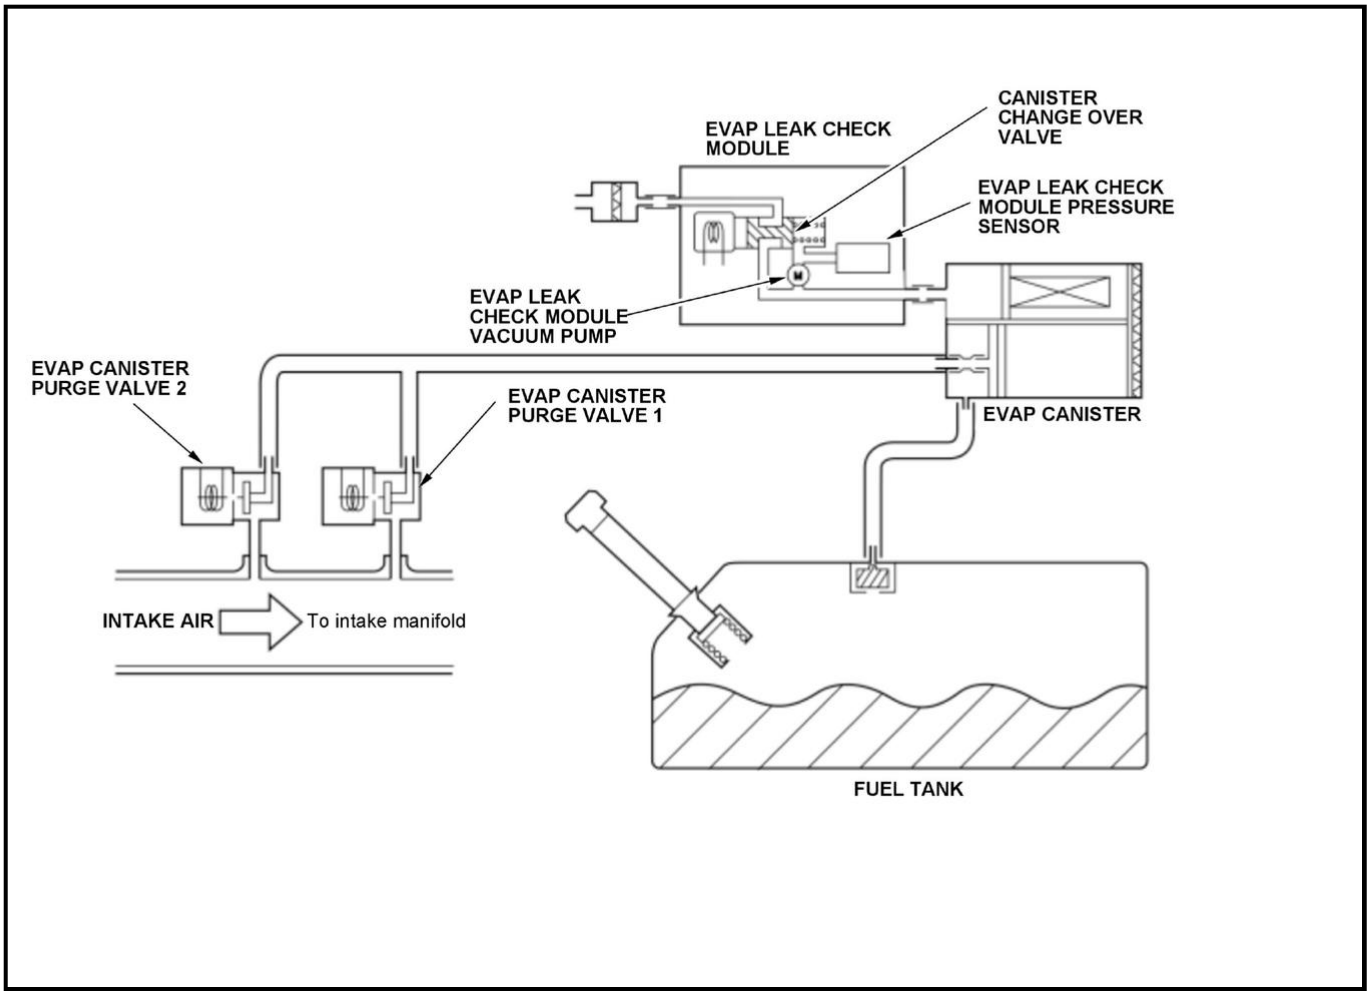
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P24C0

DTC P24C0: Canister Change Over Valve Close Malfunction

General Description



CANISTER CHANGE OVER VALVE
EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP LEAK CHECK MODULE VACUUM PUMP
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER PURGE VALVE 1
EVAP CANISTER
INTAKE AIR
To intake manifold
FUEL TANK

When the canister change over valve is functioning normally, the value of evaporative emission (EVAP) leak check module pressure sensor will not show an negative pressure during the purge since the passage for purge flow and depressurization are constantly secured unless during the EVAP leak check. However, if the purge control is activated while the canister change over valve is stuck closed or the passage, the dust filter, or the drain is clogged, a fuel tank buckling will occur due to excessive negative pressure. If a relative pressure calculated from the EVAP leak check module pressure sensor continuously shows an excessive negative pressure, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	1 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT SENSOR 1] before EVAP purge control starts	104 deg.F (40 deg.C)	-

[ ]: HDS Parameter

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	10.5 V	-
Fuel feedback	Closed loop	

[ ]: HDS Parameter

Malfunction Threshold

The relative pressure calculated from the EVAP leak check module pressure sensor value is less than -3.7 kPa (-28.2 mmHg, -1.1 inHg) for at least 1 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Canister change over valve stuck closed
- Dust filter clogged

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine, and let it idle until the radiator fan comes on.
- When the diagnosis does not finish at idle, drive at 30 - 75 mph (48 - 120 km/h) at EVAP canister purge valve duty [EVAP PC Duty] 20 % or more.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

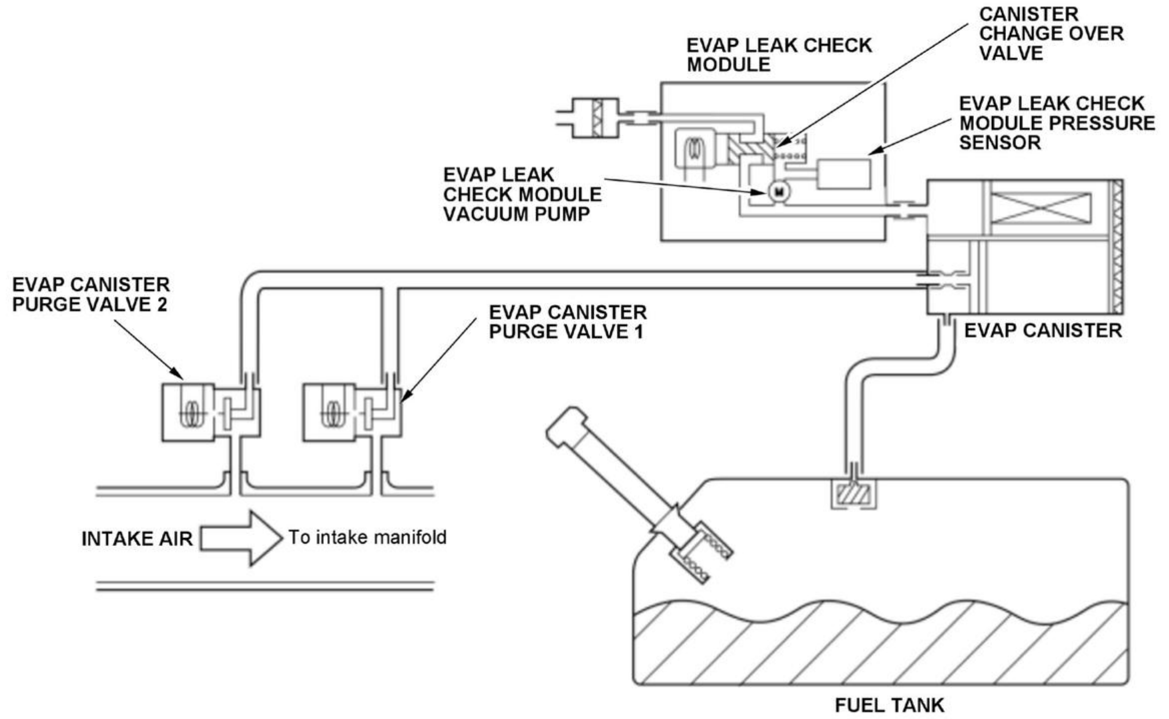
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

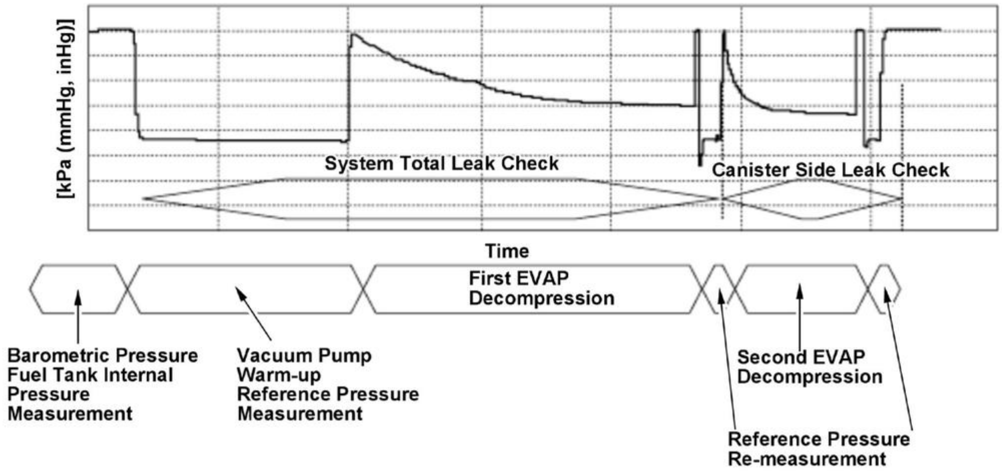
DTC P24C1

DTC P24C1: Canister Change Over Valve Stuck Close

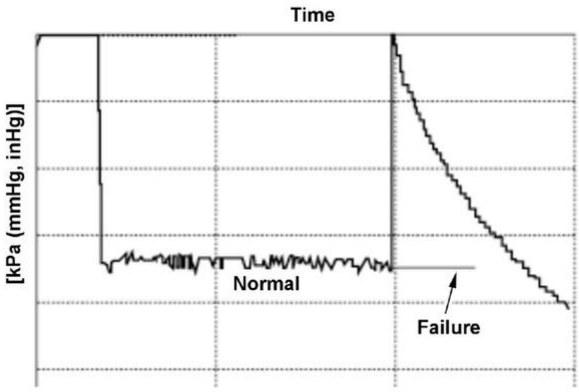
General Description



CANISTER CHANGE OVER VALVE
EVAP LEAK CHECK MODULE
EVAP LEAK CHECK MODULE PRESSURE SENSOR
EVAP LEAK CHECK MODULE VACUUM PUMP
EVAP CANISTER PURGE VALVE 2
EVAP CANISTER PURGE VALVE 1
EVAP CANISTER
INTAKE AIR
To intake manifold
FUEL TANK



[kPa (mmHg, inHg)]
System Total Leak Check
Canister Side Leak Check
Time
First EVAP Decompression
Barometric Pressure Fuel Tank Internal Pressure Measurement
Vacuum Pump Warm-up Reference Pressure Measurement
Second EVAP Decompression
Reference Pressure Re-measurement



The powertrain control module (PCM) starts the evaporative emission (EVAP) system diagnosis after the vehicle has been turned to the OFF (LOCK) mode, and has met all other enable conditions (initial engine coolant temperature [ECT Sensor 1] and off for at least 5 hours). The EVAP system diagnosis is performed by reducing pressure between the EVAP canister and the atmosphere.

A malfunction is detected and a DTC is stored when changes in the pressure is equal to or less than the prescribed value after the prescribed time of starting the system pressure reduction.

EVAP leak detection module operation flow

- Reference pressure measurement: Malfunction check in the EVAP leak check module and determination of early completion of pressure reduction when normal.
- System pressure reduction: Pressure in the EVAP system is reduced to measure the ultimate pressure.
- Reference pressure re-measurement: Leak is detected by comparing with the ultimate pressure of the system pressure reduction.
- Reference value is to be measured twice considering change in the characteristics of the EVAP leak check module vacuum pump during detection.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	At least 6 minutes 40 seconds but not more than 18 minutes 55 seconds
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the READY TO DRIVE mode	10 minutes	-
Elapsed time after the vehicle condition is turned to the OFF (LOCK) mode	5 hours	-
PCM wake up radiator coolant temperature [ECT Sensor 2]	40 deg.F (5 deg.C)	95 deg.F (35 deg.C)
Barometric pressure[BARO SENSOR]	76 kPa (569 mmHg, 22.5 inHg)	-
12 volt battery voltage [BATTERY]	10.5 V	-

Condition	Minimum	Maximum
Other	No refueling is required	

[ ]: HDS Parameter

Malfunction Threshold

When the change in the pressure 6 minutes 40 seconds after starting the system pressure reduction is 0.3 kPa (2.3 mmHg, 0.09 inHg) or less.

Possible Cause

- EVAP leak check module vacuum pump failure
- Canister change over valve failure
- Reference orifice flow quantity is excessive
- Reference orifice flow quantity is too few

Confirmation Procedure

Operating Condition

- With the engine coolant temperature [ECT Sensor 2] within the specified range, turn the vehicle to the READY TO DRIVE mode, and wait for at least 10 minutes.
- Turn the vehicle to the OFF (LOCK) mode, and wait for at least 5 hours.
- PCM wake up, and wait at least 18 minutes 55 seconds.

With the HDS

Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

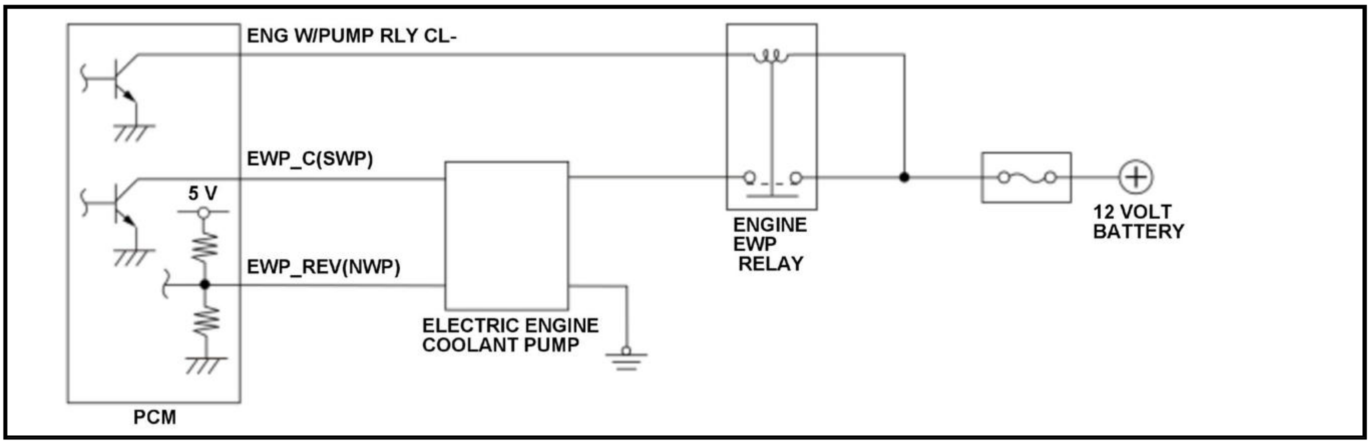
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

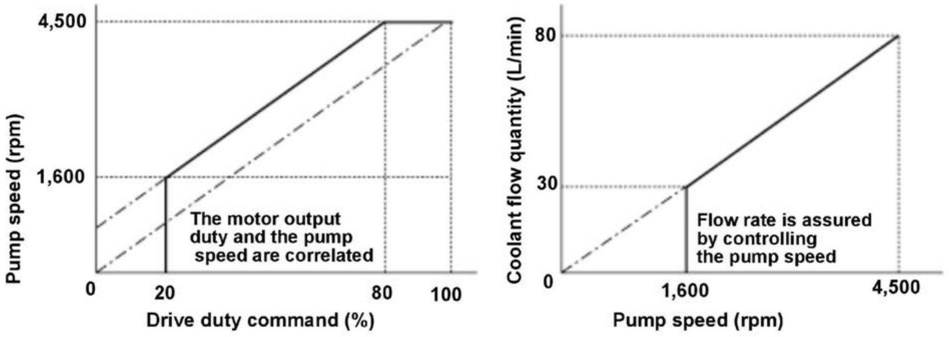
DTC P2601

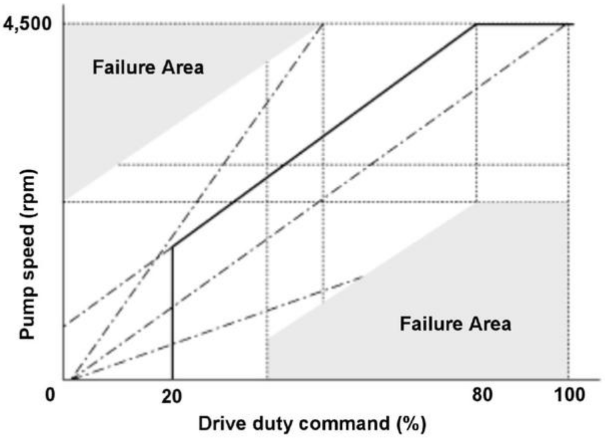
DTC P2601: Electric Engine Coolant Pump Range/Performance Problem

General Description



ENG W/PUMP RLY CL-
EWP_C(SWP)
5 V
EWP_REV(NWP)
PCM
ELECTRIC ENGINE COOLANT PUMP
ENGINE EWP RELAY
12 VOLT BATTERY





The electric engine coolant pump cools the engine. The pump motor speed is varied by a drive duty command and outputs pump speed to the powertrain control module (PCM). Malfunction detection is performed by comparing the drive duty command to the electric engine coolant pump and pump speed. If the pump speed is higher or lower than the drive duty command by the prescribed value, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	-13 deg.F (-25 deg.C)	-
12 volt battery voltage [Battery]	10.5 V	16.0 V

[ ]: HDS Parameter

Malfunction Threshold

Either one of the conditions is met for at least 10 seconds:

- When the pump speed is lower than the drive duty command.

Drive duty command	Pump speed
45 %	0 rpm
90 %	2, 000 rpm

- When the pump speed is higher than the drive duty command while the 12 volt battery voltage is 14 V.

Drive duty command	Pump speed
0 %	3, 000 rpm
45 %	5, 500 rpm

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric engine coolant pump lock
- Electric engine coolant pump impeller damage

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine.
- Hold the engine speed [Engine Speed] at 1, 000 rpm, and wait for at least 10 seconds.
- Hold the engine speed [Engine Speed] at 2, 000 rpm, and wait for at least 10 seconds.
- Hold the engine speed [Engine Speed] at 3, 000 rpm, and wait for at least 10 seconds.

With the HDS

Select the Electric Water Pump TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

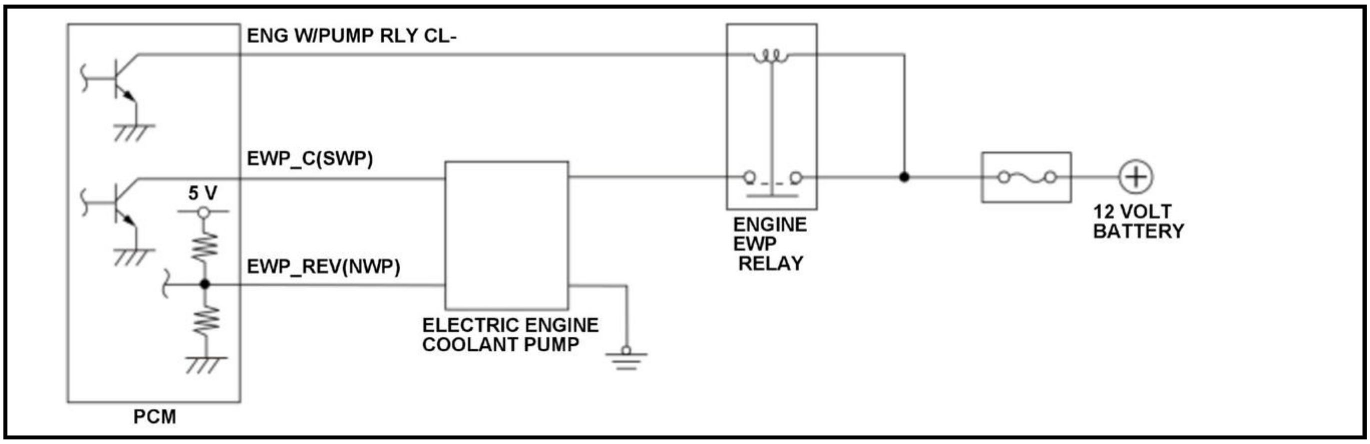
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2602

DTC P2602: Electric Engine Coolant Pump Circuit Low Voltage

General Description



The electric engine coolant pump varies the pump revolution speed according to the powertrain control module (PCM) outputs signal. The PCM outputs signal (EWP_C(SWP)) to the electric engine coolant pump and feeds back the revolution speed (EWP_REV(NWP)) from the electric engine coolant pump to control the revolution speed. Since the flow rate of the pump is in proportion to the revolution speed, the flow rate increases as the revolution speed is raised. If the electric engine coolant pump revolution speed is low continuously for the prescribed time when the PCM outputs signal to the electric engine coolant pump, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	-13 deg.F (-25 deg.C)	-
12 volt battery voltage [Battery]	10.5 V	16.0 V
Electric engine coolant pump drive duty	40 %	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

The electric engine coolant pump is 600 rpm or less for at least 5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric engine coolant pump power supply line open
- Electric engine coolant pump EWP_REV(NWP) line open
- Electric engine coolant pump ground line open
- Electric engine coolant pump EWP_C(SWP) line short to ground
- Electric engine coolant pump power supply line short to ground
- Electric engine coolant pump EWP_REV(NWP) line short to ground
- Electric engine coolant pump failure
- PCM failure

Confirmation Procedure

Operating Condition

None.

With the HDS

Select the Electric Water Pump TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

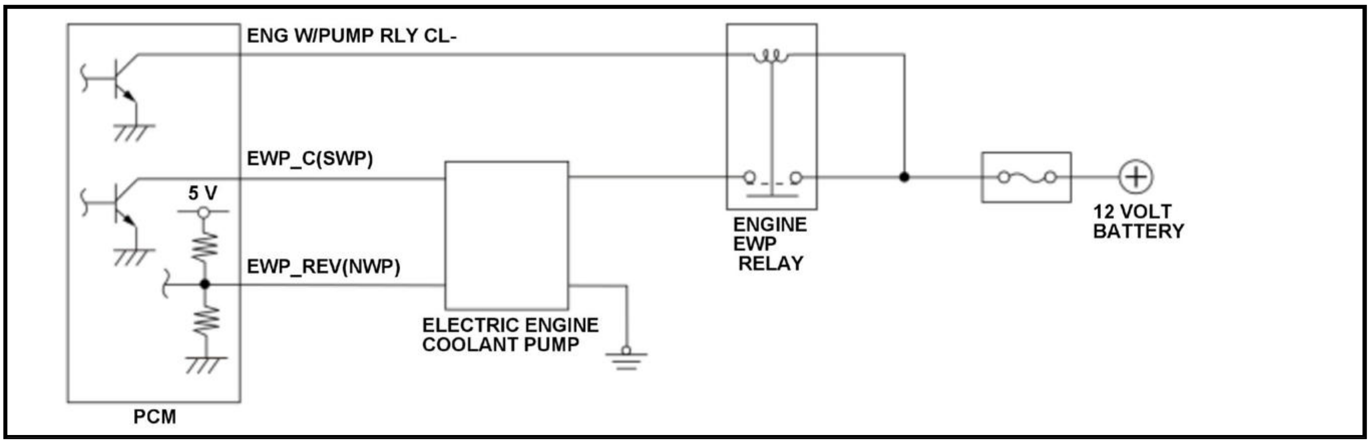
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2603

DTC P2603: Electric Engine Coolant Pump Circuit High Voltage

General Description



The electric engine coolant pump varies the pump revolution speed according to the powertrain control module (PCM) outputs signal. The PCM outputs signal (EWP_C(SWP)) to the electric engine coolant pump and feeds back the revolution speed (EWP_REV(NWP)) from the electric engine coolant pump to control the revolution speed. Since the flow rate of the pump is in proportion to the revolution speed, the flow rate increases as the revolution speed is raised. If the electric engine coolant pump revolution speed is more than a specified value continuously for the prescribed time when the PCM outputs stop signal to the electric engine coolant pump, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Electric engine coolant pump drive duty	-	8 %
Vehicle	ON mode	

Malfunction Threshold

The electric engine coolant pump is at 600 rpm or more for at least 6.0 seconds

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Electric engine coolant pump EWP_C(SWP) line open
- Electric engine coolant pump EWP_C(SWP) line short to power
- Electric engine coolant pump failure
- PCM failure

Confirmation Procedure

Operating Condition

None.

With the HDS

Select the Electric Water Pump TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

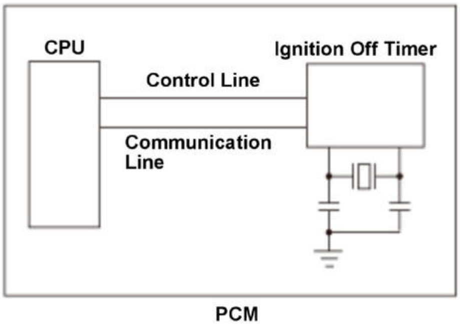
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2610

DTC P2610: Powertrain Control Module (PCM) Ignition Off Internal Timer Malfunction

General Description



The powertrain control module (PCM) has a built-in ignition off timer that measures the duration from ignition off to the next ignition on. The measured duration is used for evaporative emission (EVAP) leak detection and temperature assumption of the catalytic converter. The CPU in the PCM accesses the ignition off timer when reading the measured duration. If the access process fails, a malfunction is detected and a DTC is stored. When an abnormality is found in the read data, the PCM detects a malfunction and stores a DTC. Even if the access is normally performed, the PCM stores a DTC when the measured duration accuracy of the ignition off timer is out of normal range.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	B
Vehicle*	ON mode

*: Excludes after the 12 volt battery is reconnected.

Malfunction Threshold

One of these symptom occurs:

- The access process to the ignition off timer fails.
- The malfunction is found in the read data for at least 5 seconds.
- When the difference between the CPU and the ignition off timer measurement time is 2.0 % or more continuously for 5 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

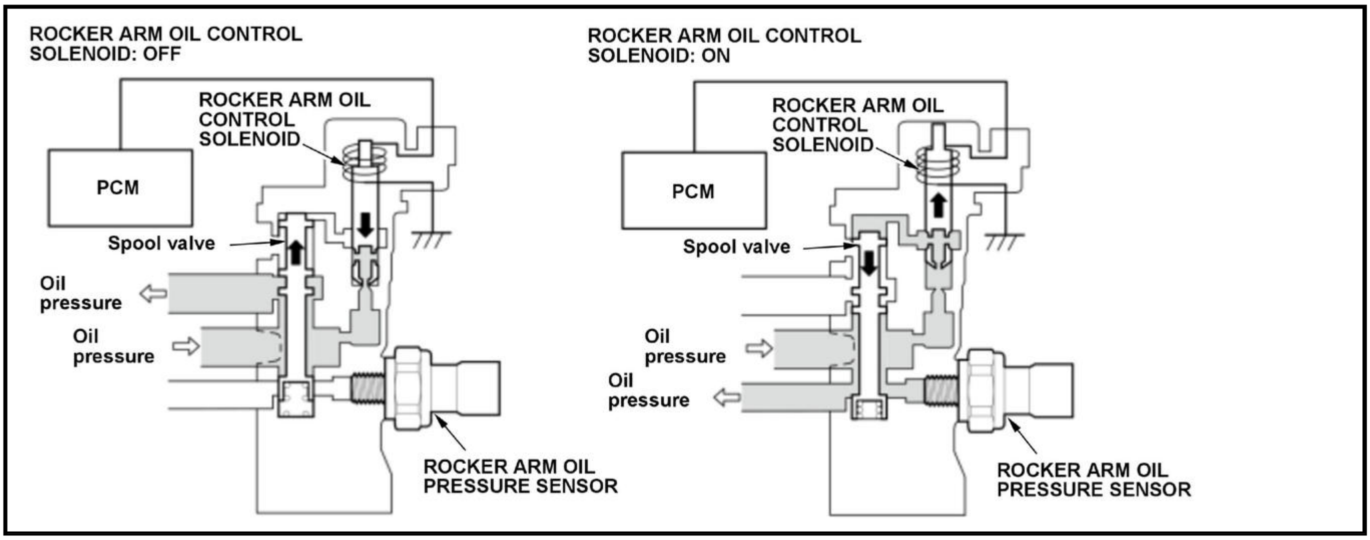
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2646

DTC P2646: Rocker Arm Oil Pressure System Stuck Off

General Description



ROCKER ARM OIL CONTROL SOLENOID: OFF
ROCKER ARM OIL CONTROL SOLENOID
PCM
Spool valve
Oil pressure
Oil pressure
ROCKER ARM OIL PRESSURE SENSOR
ROCKER ARM OIL CONTROL SOLENOID: ON
ROCKER ARM OIL CONTROL SOLENOID
PCM
Spool valve
Oil pressure
Oil pressure
ROCKER ARM OIL PRESSURE SENSOR

Logic Decision	Rocker Arm Oil Pressure Switch	
	'Lo'	**'Hi'**
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

The VTEC system activates the rocker arm oil control solenoid with a command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that delays valve timing. The PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure sensor downstream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit determined by the PCM command and the oil pressure condition determined by the status of the rocker arm oil pressure sensor, the system is considered faulty, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	7 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	50 deg.F (10 deg.C)	-
Engine speed [Engine Speed]*	990 rpm	-
Vehicle speed [Vehicle Speed]	0 mph (0 km/h)	-
12 volt battery voltage [Battery]	10.5 V	-
Other	Other than wide open throttle	

*: Variable that is depending on the engine load.

[ ]: HDS Parameter

Malfunction Threshold

When the rocker arm oil control solenoid is ON, the rocker arm oil pressure sensor output remains low (49 kPa (0.49 kgf/cm 2, 7.1 psi) or less).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Rocker arm oil control solenoid VTS line open
- Rocker arm oil control solenoid VTS line short
- Rocker arm oil pressure sensor output stuck
- Rocker arm oil control solenoid failure
- Oil passage clogged

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine, and let it idle until the radiator fan comes on.
- Drive the vehicle at an engine speed [ENGINE SPEED] 990 rpm or more for at least 7 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Select the VTEC TEST in the Function Test Menu with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

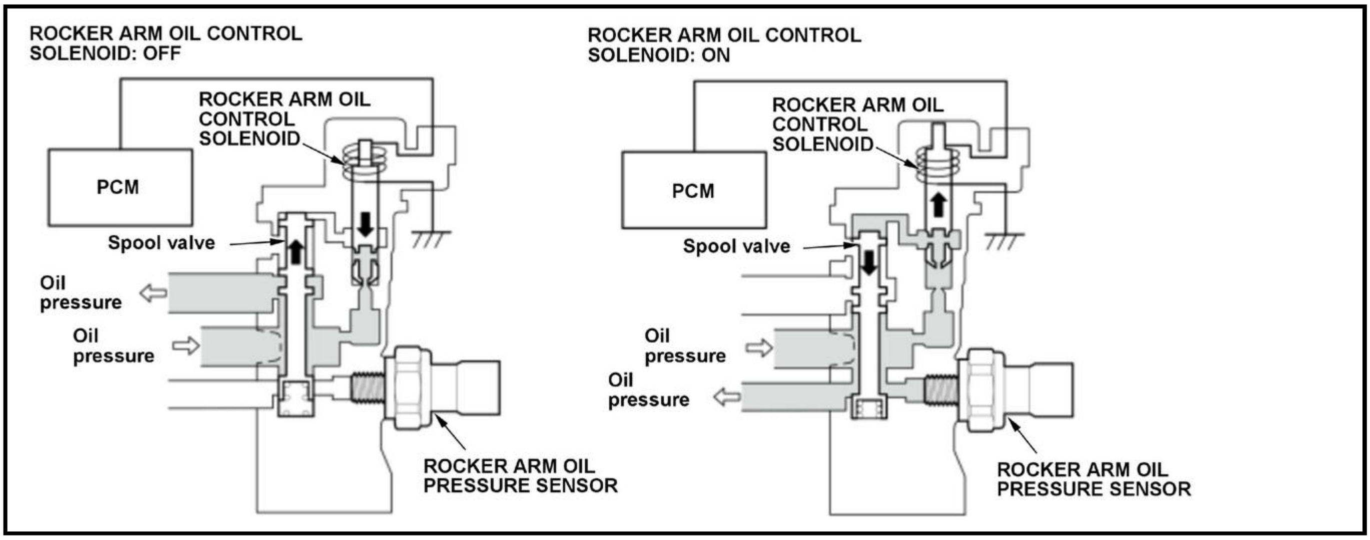
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P2647

DTC P2647: Rocker Arm Oil Pressure System Stuck On

General Description



ROCKER ARM OIL CONTROL SOLENOID: OFF
ROCKER ARM OIL CONTROL SOLENOID
PCM
Spool valve
Oil pressure
Oil pressure
ROCKER ARM OIL PRESSURE SENSOR
ROCKER ARM OIL CONTROL SOLENOID: ON
ROCKER ARM OIL CONTROL SOLENOID
PCM
Spool valve
Oil pressure
Oil pressure
ROCKER ARM OIL PRESSURE SENSOR

Logic Decision	Rocker Arm Oil Pressure Sensor	
	'Lo'	'Hi'
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

The VTEC system activates the rocker arm oil control solenoid with a command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that delays valve timing. The PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure sensor downstream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit determined by the PCM command and the oil pressure condition determined by the status of the rocker arm oil pressure sensor, the system is considered faulty, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	7 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.5 V	-
Other	At idle	

[ ]: HDS Parameter

Malfunction Threshold

When the rocker arm oil control solenoid is OFF, the rocker arm oil pressure sensor output remains high (49 kPa (0.50 kgf/cm 2, 7.1 psi) or more).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Rocker arm oil control solenoid VTS line open
- Rocker arm oil control solenoid VTS line short
- Rocker arm oil pressure sensor output stuck
- Rocker arm oil control solenoid failure
- Oil passage clogged

Confirmation Procedure

Operating Condition

Enter the maintenance mode, then start the engine, and let it idle for at least 7 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

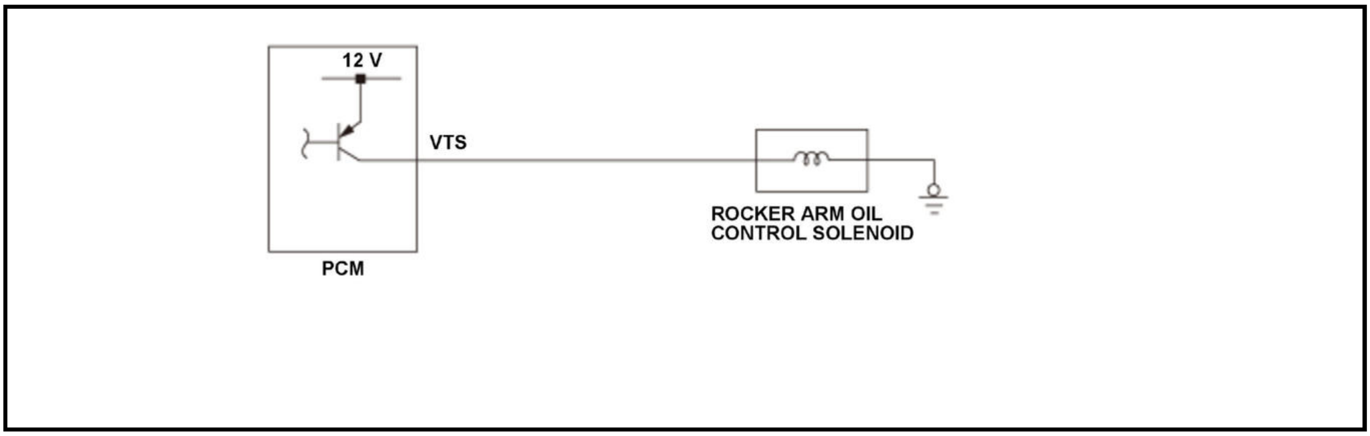
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P2648, P2649

DTC P2648: Rocker Arm Oil Control Solenoid Circuit Low Voltage

DTC P2649: Rocker Arm Oil Control Solenoid Circuit High Voltage

General Description



The VTEC system activates the rocker arm oil control solenoid by a command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is OFF (low) when the PCM outputs the ON (high) signal to the rocker arm oil control solenoid, or the return signal is ON (high) when the PCM outputs the OFF (low) signal to the rocker arm oil control solenoid, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

DTC: P2648

The return signal is OFF (low) for at least 2.0 seconds when the PCM outputs the ON (high) signal to the rocker arm oil control solenoid.

DTC: P2649

The return signal is ON (high) for at least 2.0 seconds when the PCM outputs the OFF (low) signal to the rocker arm oil control solenoid.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC: P2648

- Rocker arm oil control solenoid VTS line short to ground

DTC: P2649

- Rocker arm oil control solenoid VTS line open
- Rocker arm oil control solenoid ground line open

Common

- Rocker arm oil control solenoid failure
- PCM internal circuit failure

Confirmation Procedure

DTC: P2648

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady engine speed [Engine Speed] 990 rpm or more for at least 2 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

Select the VTEC TEST in the Function Test Menu with the HDS.

DTC: P2649

Operating Condition

Enter the maintenance mode, then start the engine, and let it idle for at least 2 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

CPU
SBW SHIFTER CONTROL MODULE

If input information from the input circuit is abnormal during shifting the R, N, or D switch, the powertrain control module (PCM) receives malfunction from the SBW shifter control module, and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	One drive cycle, MIL off, shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode or accelerating and decelerating

Malfunction Threshold

Either one of the condition is met:

- RSW1 or RSW3 is ON for at least 200 milliseconds when shifting the transmission to other than R position/mode.
- RSW2 is ON for at least 1 minute when shifting the transmission to other than R position/mode.
- Either RSW1, RSW2, or RSW3 is OFF for at least 10 times when shifting the transmission to R position/mode.
- NSW1 or NSW3 is ON for at least 200 milliseconds when shifting the transmission to other than N position/mode.
- NSW2 is ON for at least 1 minute when shifting the transmission to other than N position/mode.
- Either NSW1, NSW2, or NSW3 is OFF for at least 10 times when shifting the transmission to N position/mode.
- DSW1 or DSW3 is ON for at least 200 milliseconds when shifting the transmission to other than D position/mode.
- DSW2 is ON for at least 1 minute when shifting the transmission to other than D position/mode.
- Either DSW1, DSW2, or DSW3 is OFF for at least 10 times when shifting the transmission to D position/mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- SBW shifter assembly (SBW shifter control module) internal failure

Confirmation Procedure

Operating Condition

- Shift the transmission to other than R position/mode for at least 1 minute.
- Shift the transmission to R position/mode for at least 10 times.
- Shift the transmission to other than N position/mode for at least 1 minute.
- Shift the transmission to N position/mode for at least 10 times.
- Shift the transmission to other than D position/mode for at least 1 minute.
- Shift the transmission to D position/mode for at least 10 times.

[ ]: HDS Parameter

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

- Park pawl actuator relay stuck off
- Park pawl actuator driver unit internal failure

Confirmation Procedure

Operating Condition

Turn the vehicle to the ON mode, and wait at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

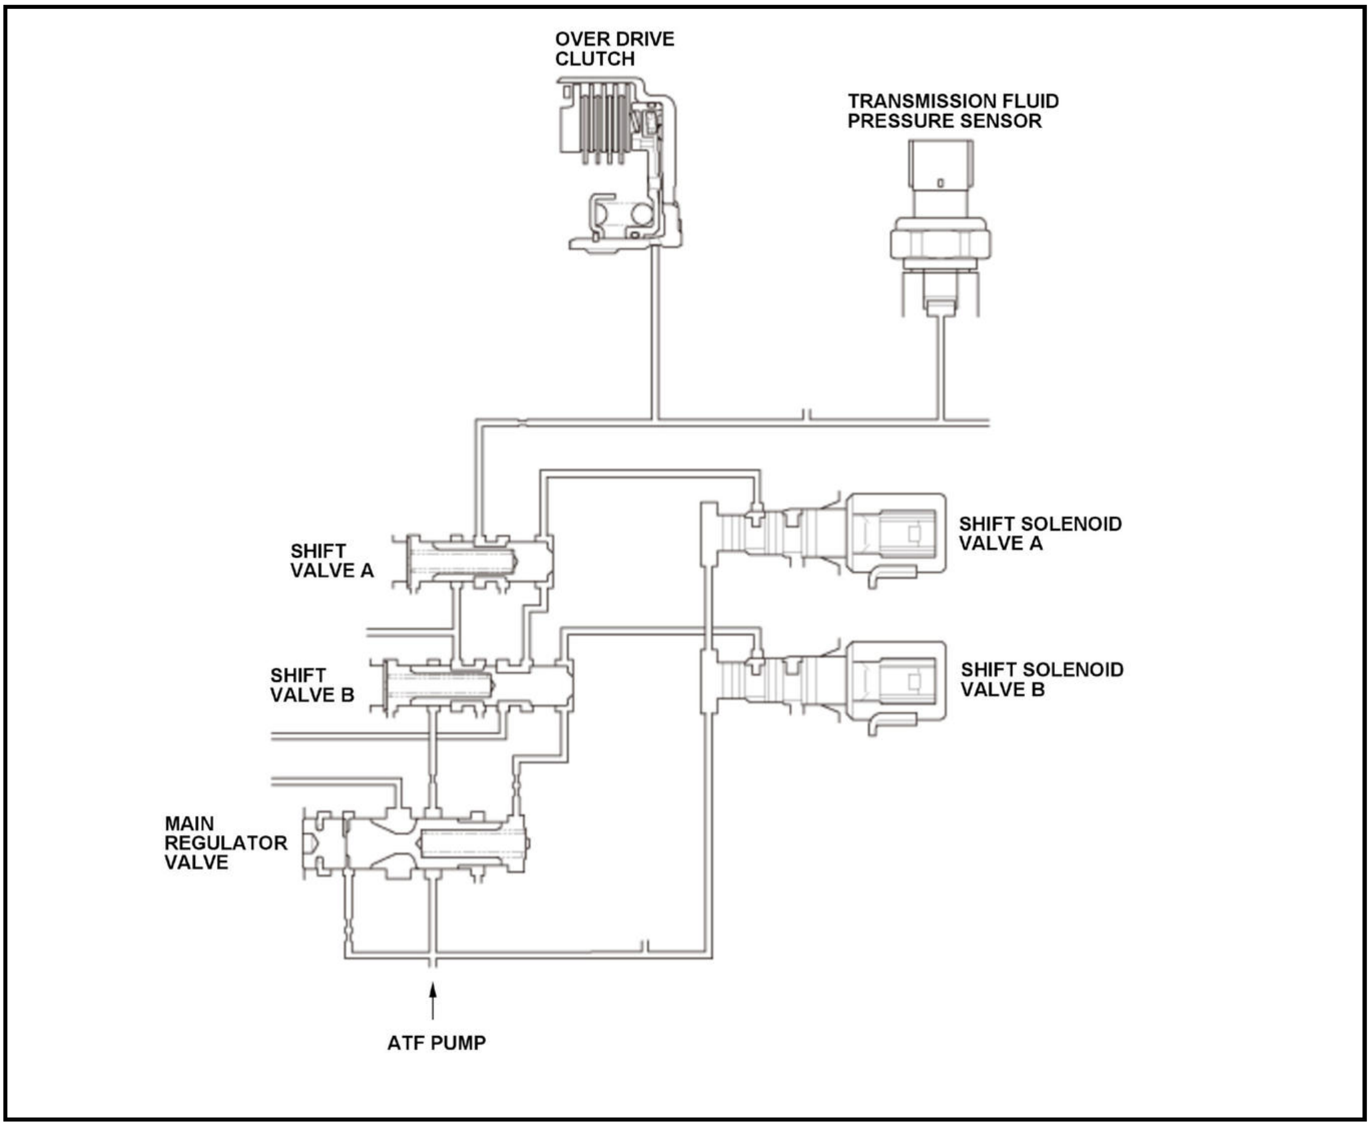
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2872 (2021)

DTC P2872: Over Drive Clutch Stuck Engaged

General Description



OVER DRIVE CLUTCH
TRANSMISSION FLUID PRESSURE SENSOR
SHIFT SOLENOID VALVE A
SHIFT VALVE A
SHIFT VALVE B
SHIFT SOLENOID VALVE B
MAIN REGULATOR VALVE
ATF PUMP

Capacity of Over Drive Clutch		Shift Solenoid Valve A	
		ON (12 V)	OFF (0 V)
Shift Solenoid Valve B	ON (12 V)	ON	OFF
	OFF (0 V)	OFF	OFF

Shift solenoid valve A is installed on the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply line pressure to shift valve A. The signal from the PCM is output so that the line pressure is supplied to the clutch piston under the condition that overdrive clutch engagement is requested while driving at 44 mph (70 km/h) or more. When the signal to shift solenoid valve A from the PCM is ON, and the line pressure is applied to shift valve A, it operates against the shift valve A spring. When the signal to shift solenoid valve A from the PCM is OFF, and the line pressure is discharged, shift valve A is inactive. The PCM monitors the transmission fluid pressure sensor, and detects a failure of the over drive clutch stuck engaged and stores a DTC when the transmission fluid pressure sensor is at specified value or more when both shift solenoid valve A and B are outputting an OFF signal in the over drive clutch disengagement process in response to a request for disengagement of the engaged over drive clutch.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.0 seconds or more
DTC Type	One drive cycle, MIL on, shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY VOLTAGE]	10 V	-
Over drive clutch	OFF	
State of the vehicle	Engine driving mode	

[ ]: HDS Parameter

Malfunction Threshold

The transmission fluid pressure sensor value is at a specified pressure for 0.8 seconds or more when both shift solenoid valve A and B are outputting an OFF signal in the over drive clutch disengagement process in response to a request for disengagement of the over drive clutch.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Both Shift solenoid valve A and Shift solenoid valve B stuck on
- Shift valve failure

Confirmation Procedure

Operating Condition

- Enter the maintenance mode, then start the engine. Hold the engine speed [ENGINE SPEED] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a steady speed of 44 mph (70 km / h) or more, turn off the APP sensor and turn off the overdrive clutch by decelerating the vehicle.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

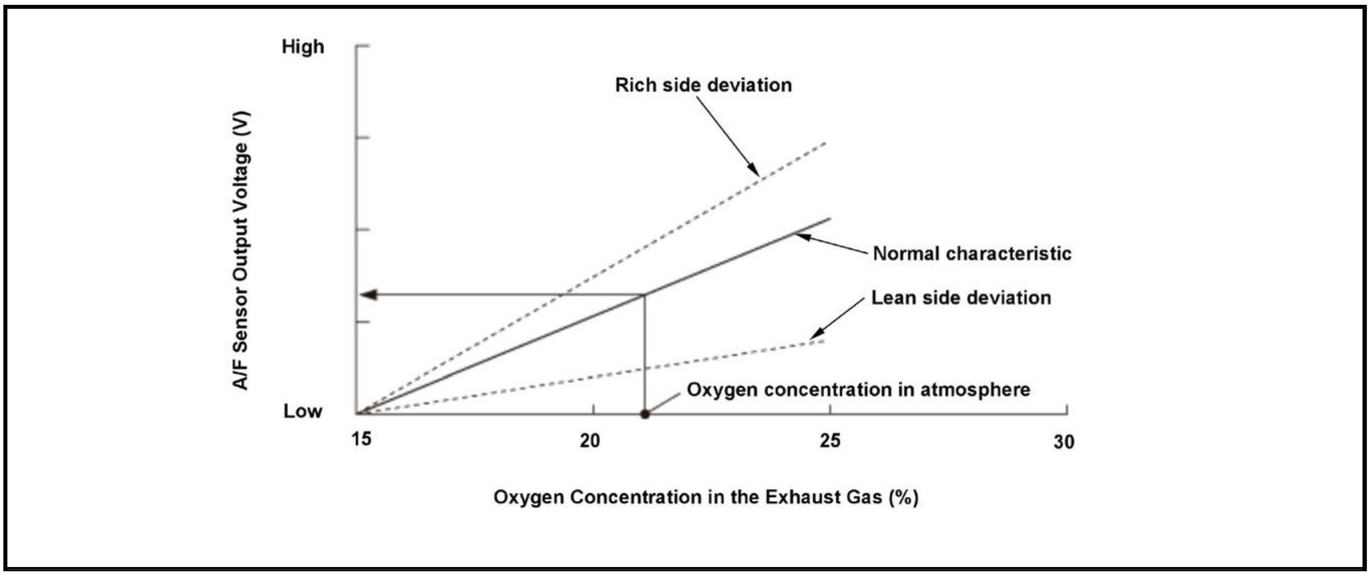
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2A00

DTC P2A00: Air/Fuel ratio A/F Sensor (Sensor 1) Circuit Range/Performance Problem

General Description



The air/fuel ratio (A/F) sensor (sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the A/F sensor (sensor 1) output voltage and uses fuel feedback control to improve exhaust emissions. The PCM monitors the A/F sensor (sensor 1) output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

NOTE: Output to the scan tool exhibits a relationship between the A/F sensor (sensor 1) output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage, as the stoichiometric ratio is 0.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	3.5 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after starting the engine	5 seconds	-
Engine coolant temperature [ECT Sensor 1]	156 deg.F (69 deg.C)	-
Intake air temperature [IAT Sensor (1)]	-13 deg.F (-25 deg.C)	-
Engine speed [Engine Speed]	500 rpm	4, 000 rpm
Vehicle speed [Vehicle Speed]	23 mph (37 km/h)	-
Fuel feedback	During deceleration with throttle fully closed	

[ ]: HDS Parameter

Malfunction Threshold

The A/F sensor (sensor 1) output voltage is 2.55 V or less, or 4.11 V or more.

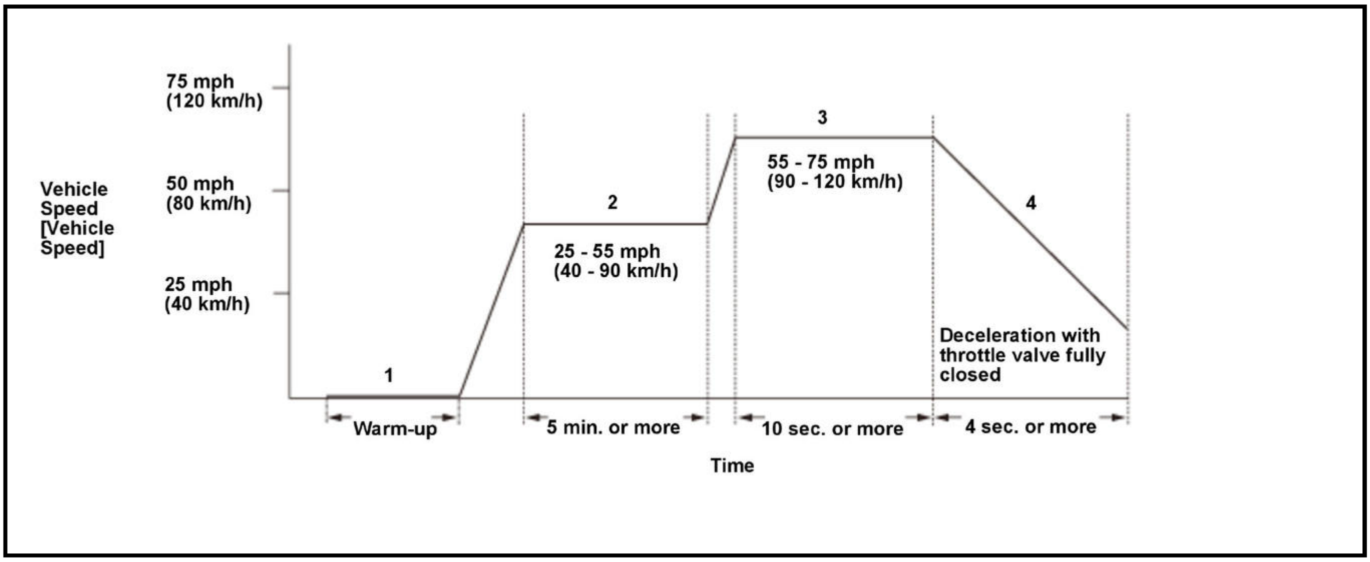
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- A/F sensor (sensor 1) deterioration

Confirmation Procedure

Operating Condition



- Enter the maintenance mode, then start the engine. Hold the engine speed [Engine Speed] at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.
- Drive the vehicle at a speed between 25 - 55 mph (40 - 90 km/h) for at least 5 minutes.
- Drive immediately at a steady speed between 55 - 75 mph (90 - 120 km/h) for at least 10 seconds.
- Decelerate with the throttle valve fully closed for at least 4 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

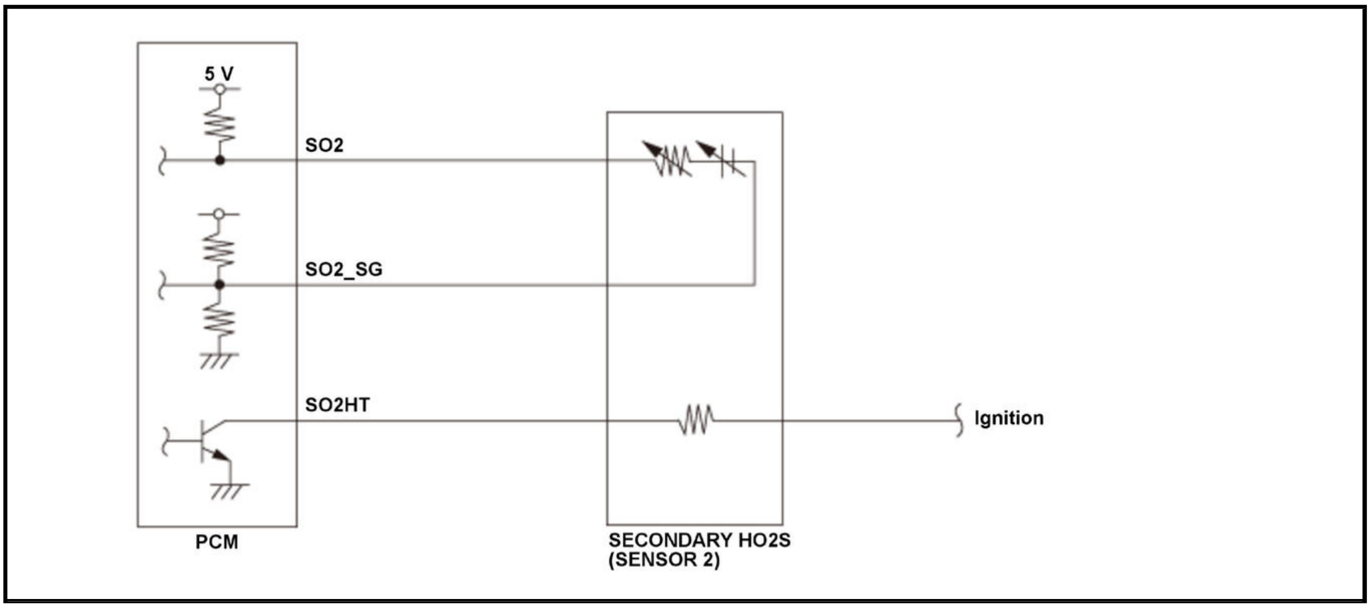
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool clear command or by disconnecting the 12 volt battery.

DTC P2A01

DTC P2A01: Secondary HO2S (Sensor 2) Circuit Range/Performance Problem

General Description



The secondary heated oxygen sensor (secondary HO2S (sensor 2)) detects the oxygen density in the exhaust gas and converts it into electrical signals. If the secondary HO2S (sensor 2) output voltage is a specified value for a set time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	6 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Secondary HO2S (sensor 2) output voltage [HO2S S2]	-	1.0 V
State of the engine	Running	

[ ]: HDS Parameter

Malfunction Threshold

The secondary HO2S (sensor 2) output voltage [HO2S S2] is 1.51 V or less for at least 6 seconds after the secondary HO2S (sensor 2) is judged that it is normally activated (1.0 V or less as a value).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Secondary HO2S (sensor 2) failure
- PCM internal circuit failure

Confirmation Procedure

Operating Condition

Enter the maintenance mode, then start the engine, and let it idle until the radiator fan comes on, then let it idle.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC, the freeze data, and the on-board snapshot are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, the freeze data, and the on-board snapshot can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

Failure

The cold start emission reduction process controls the air fuel ratio to lean when the engine is cold to lower emissions as the catalyst is not warmed up. If the actual air fuel ratio is too lean or too rich compared to the commanded air fuel ratio, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	7.0 seconds or more

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Throttle valve	Fully closed	
Accelerator pedal position	Released	
A/F sensor	Active	
Other	Vehicle stopped	

Malfunction Threshold

The ratio of the actual air fuel ratio to commanded air fuel ratio is 0.86 or less.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Intake air duct breakage
- Intake air duct misinstalled
- Air cleaner breakage
- Air cleaner damage
- Air cleaner clogged
- Throttle body clogged
- Intake air system clogged
- Mass airflow (MAF) sensor failure
- Intake air temperature (IAT) sensor failure
- Engine coolant temperature (ECT) sensor 1 failure
- Air fuel ratio too rich
- Air fuel ratio too lean
- Ignition system failure

Confirmation Procedure

Operating Condition

- Leave the vehicle to cool the engine.
- Enter the maintenance mode, then start the engine, and let it idle for at least 7.0 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

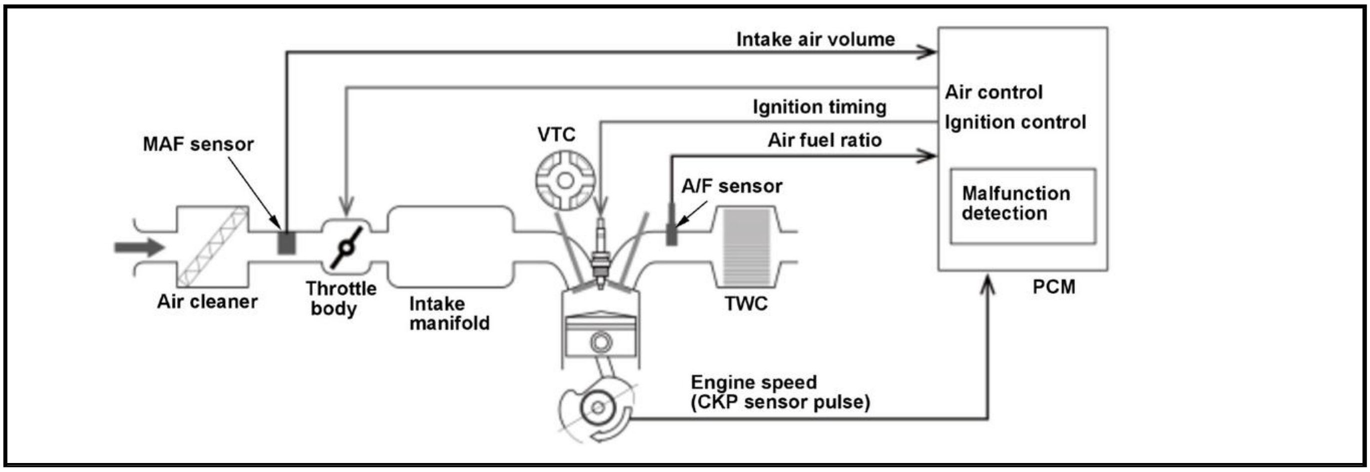
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

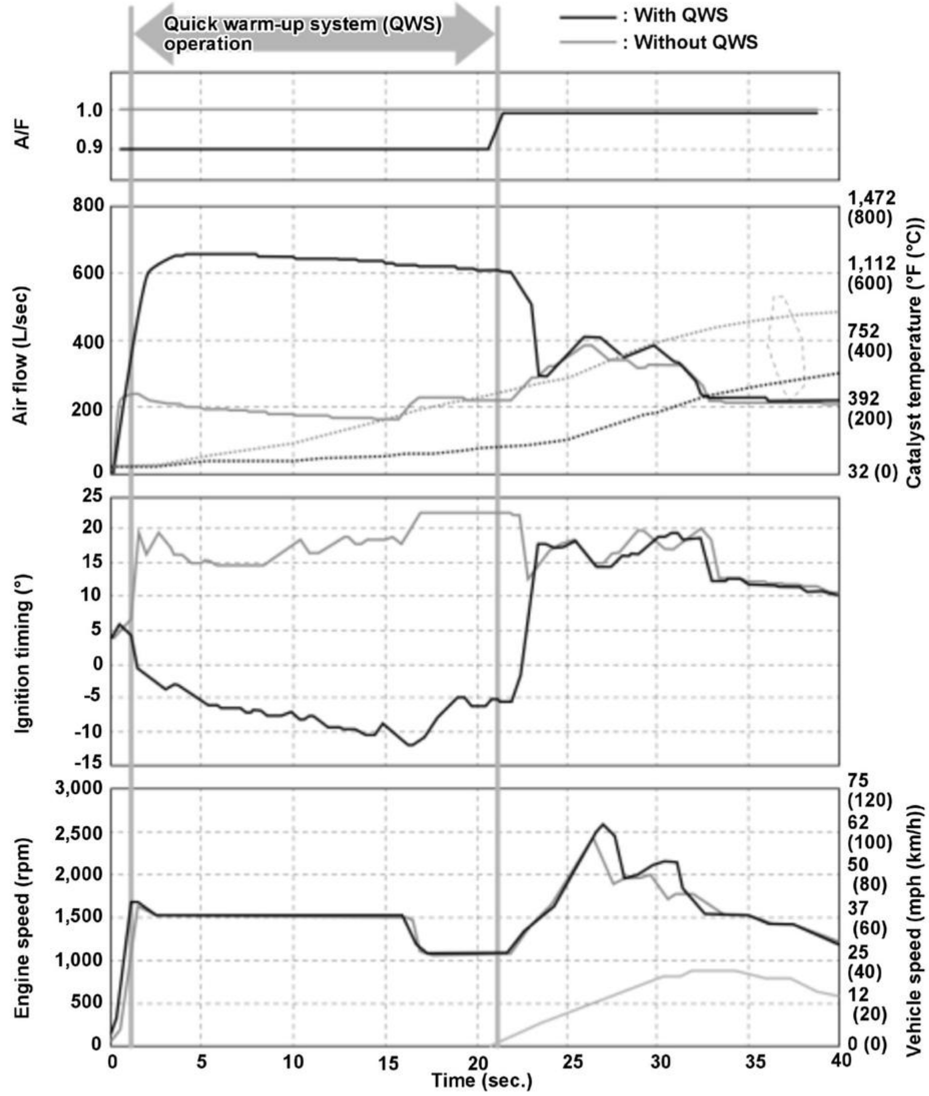
DTC P2DE1 (2021)

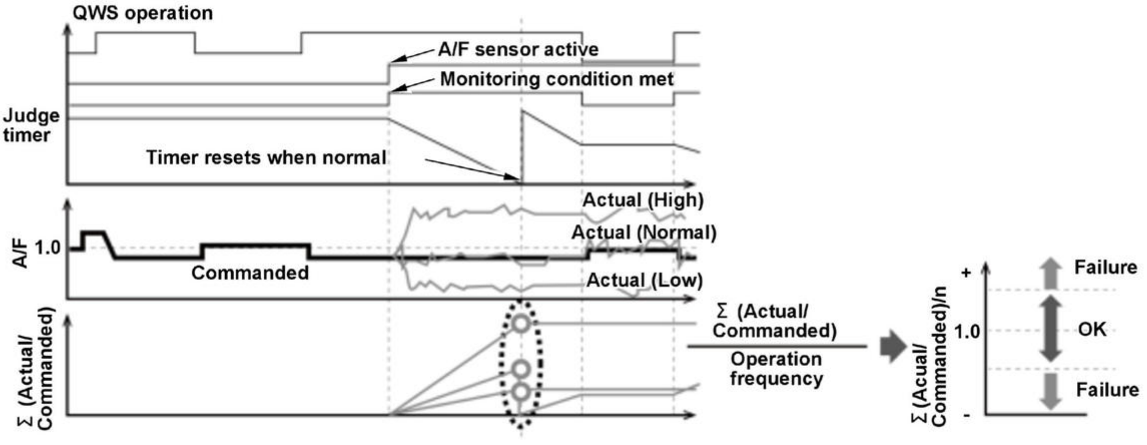
DTC P2DE1: Cold Start Air Fuel Ratio Control System Rich

General Description



Intake air volume
Air control
Ignition timing
Ignition control
Air fuel ratio
MAF sensor
VTC
A/F sensor
Malfunction detection
Air cleaner
Throttle body
Intake manifold
TWC
PCM
Engine speed (CKP sensor pulse)





QWS operation
A/F sensor active
Monitoring condition met
Judge timer
Timer resets when normal
Actual (High)
Actual (Normal)
Actual (Low)

1.0
Commanded
Σ (Actual/ Commanded)
Σ (Actual/ Commanded)
Operation frequency
Σ (Acual/ Commanded)/n
+
1.0
-
Failure
OK
Failure

The cold start emission reduction process controls the air fuel ratio to lean when the engine is cold to lower emissions as the catalyst is not warmed up. If the actual air fuel ratio is too lean or too rich compared to the commanded air fuel ratio, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	7.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Throttle valve	Fully closed	
Accelerator pedal position	Released	
A/F sensor	Active	
Other	Vehicle stopped	

Malfunction Threshold

The ratio of the actual air fuel ratio to commanded air fuel ratio is 1.14 or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Intake air duct breakage
- Intake air duct misinstalled
- Air cleaner breakage
- Air cleaner damage
- Air cleaner clogged
- Throttle body clogged
- Intake air system clogged
- Mass airflow (MAF) sensor failure
- Intake air temperature (IAT) sensor failure
- Engine coolant temperature (ECT) sensor 1 failure

- Air fuel ratio too rich
- Air fuel ratio too lean
- Ignition system failure

Confirmation Procedure

Operating Condition

- Leave the vehicle to cool the engine.
- Enter the maintenance mode, then start the engine, and let it idle for at least 7.0 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

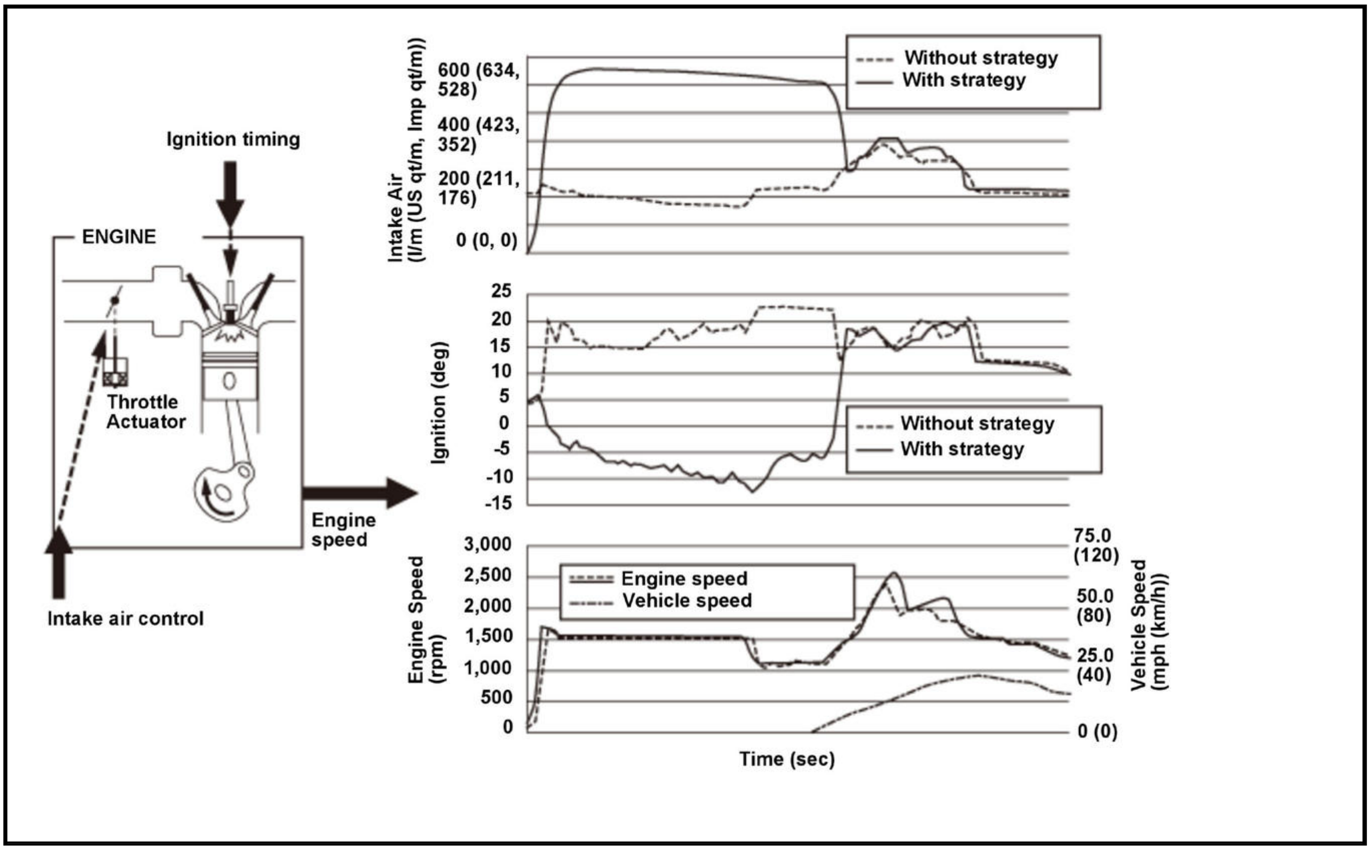
Conditions for clearing the DTC

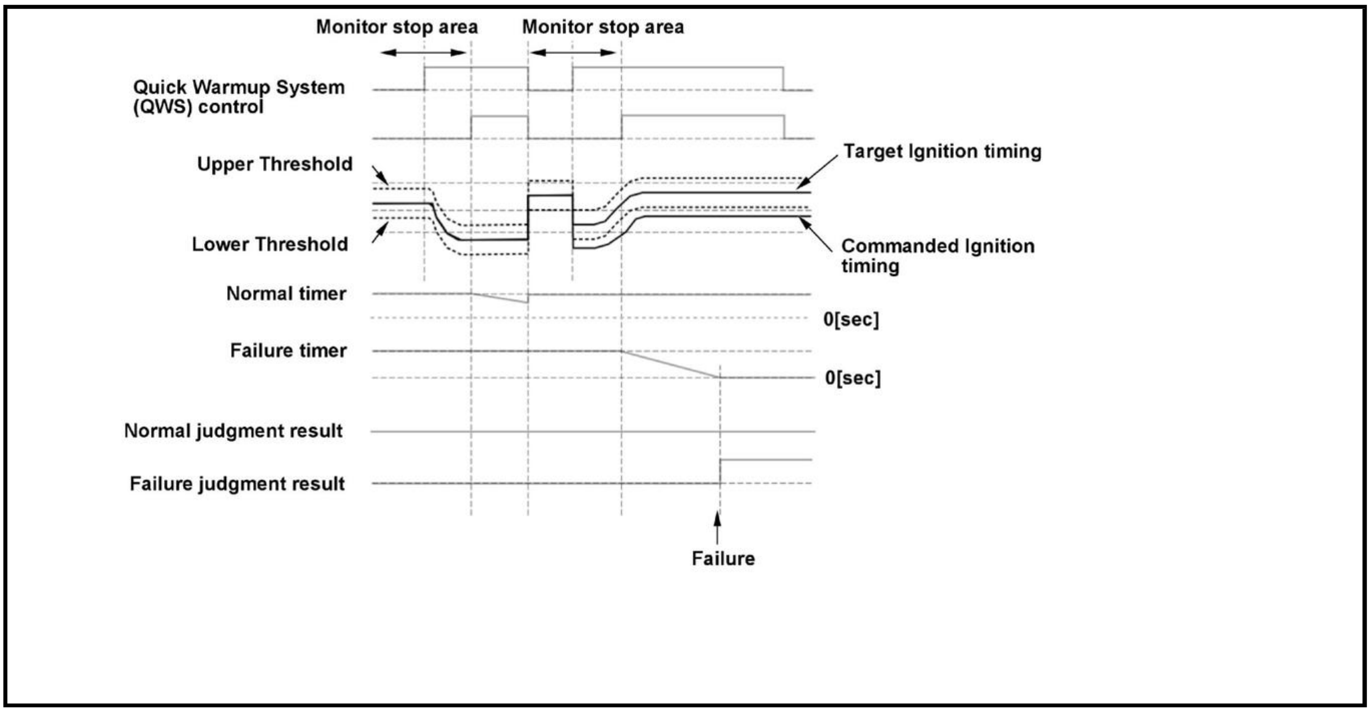
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2EA4 (2021)

DTC P2EA4: Cold Start Ignition Timing Problem

General Description





The cold start emission reduction process controls the air fuel ratio to lean when the engine is cold to lower emissions as the catalyst is not warmed up. If the ignition timing has not been retarded to the specified value for a specified time, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	10.0 seconds or more
DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
Engine coolant temperature [ECT Sensor 1]	14 deg.F (-10 deg.C)	176 deg.F (80 deg.C)
Quick warm-up system	Operation	
Accelerator pedal position	Released	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

The ignition timing deviation is 2 deg. or more for at least 10.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM internal circuit failure

Confirmation Procedure

Operating Condition

- Leave the vehicle until the engine coolant temperature [ECT Sensor 1] lowers to 122 deg.F (50 deg.C) or less.
- Enter the maintenance mode, then start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle with the engine coolant temperature and intake air temperature at engine start-up within the specified temperature range, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle with the engine coolant temperature and intake air temperature at engine start-up is within the specified temperature range, the MIL comes on and a Confirmed DTC and the freeze data are stored.

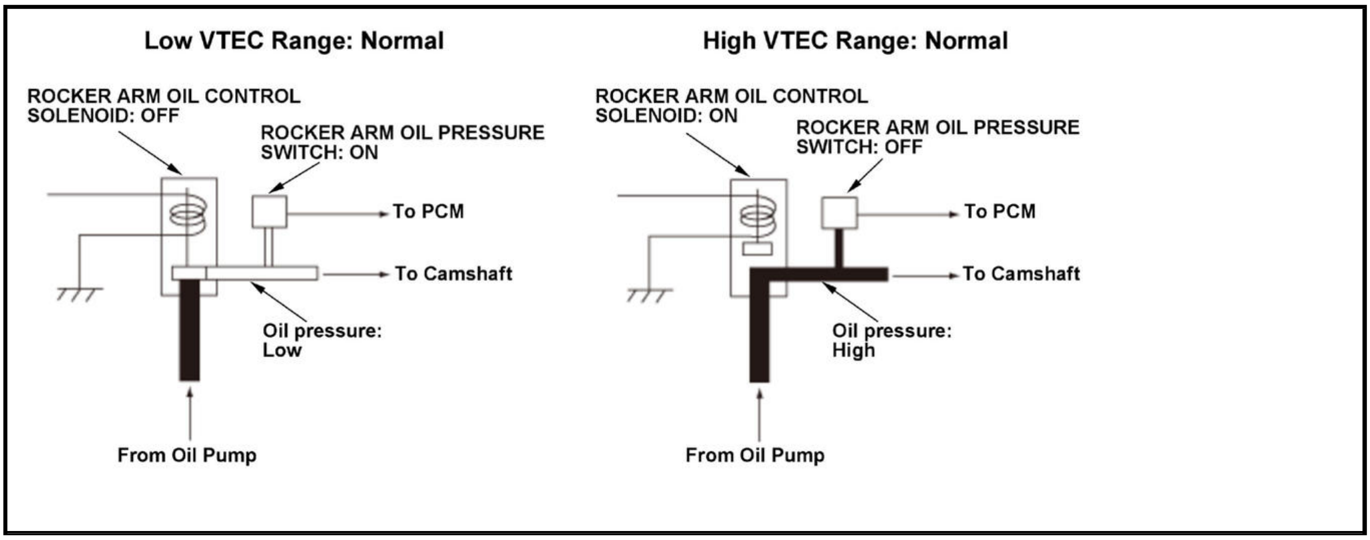
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC P2EC7 (2021)

DTC P2EC7: Cold Start Rocker Arm Oil Control System Problem

General Description



Low VTEC Range: Normal
ROCKER ARM OIL CONTROL SOLENOID: OFF
ROCKER ARM OIL PRESSURE SWITCH: ON
To PCM
To Camshaft
Oil pressure: Low
From Oil Pump
High VTEC Range: Normal
ROCKER ARM OIL CONTROL SOLENOID: ON
ROCKER ARM OIL PRESSURE SWITCH: OFF
To PCM
To Camshaft
Oil pressure: High
From Oil Pump

Logic Decision	Rocker Arm Oil Pressure Switch	
	'ON'	'OFF'
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

The cold start emission reduction process controls the air fuel ratio to lean when the engine is cold to lower emissions as the catalyst is not warmed up. If there is a difference between the oil pressure condition in the hydraulic circuit and the status of the rocker arm oil switch as determined by the power control module (PCM), the system is considered faulty, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	7 seconds or more

DTC Type	Two drive cycles, MIL on

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.5 V	-
Engine coolant temperature [ECT Sensor 1]	14 deg.F (-10 deg.C)	176 deg.F (80 deg.C)
High voltage battery capacity (SOC)	20 %	B
Quick warm-up system	Operation	
Accelerator pedal position	Released	
Other	Vehicle stopped	

[ ]: HDS Parameter

Malfunction Threshold

When the rocker arm oil control solenoid is OFF, the rocker arm oil pressure switch remains OFF.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Rocker arm oil control solenoid failure
- Rocker arm oil control solenoid VTS line open
- Rocker arm oil control solenoid VTS line short
- Rocker arm oil pressure switch failure
- Rocker arm oil pressure switch VTM line open
- Rocker arm oil pressure switch VTM line short
- Oil passage clogged

Confirmation Procedure

Operating Condition

- Leave the vehicle to cool the engine.
- Enter the maintenance mode, then start the engine, and let it idle for at least 7 seconds.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the PCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

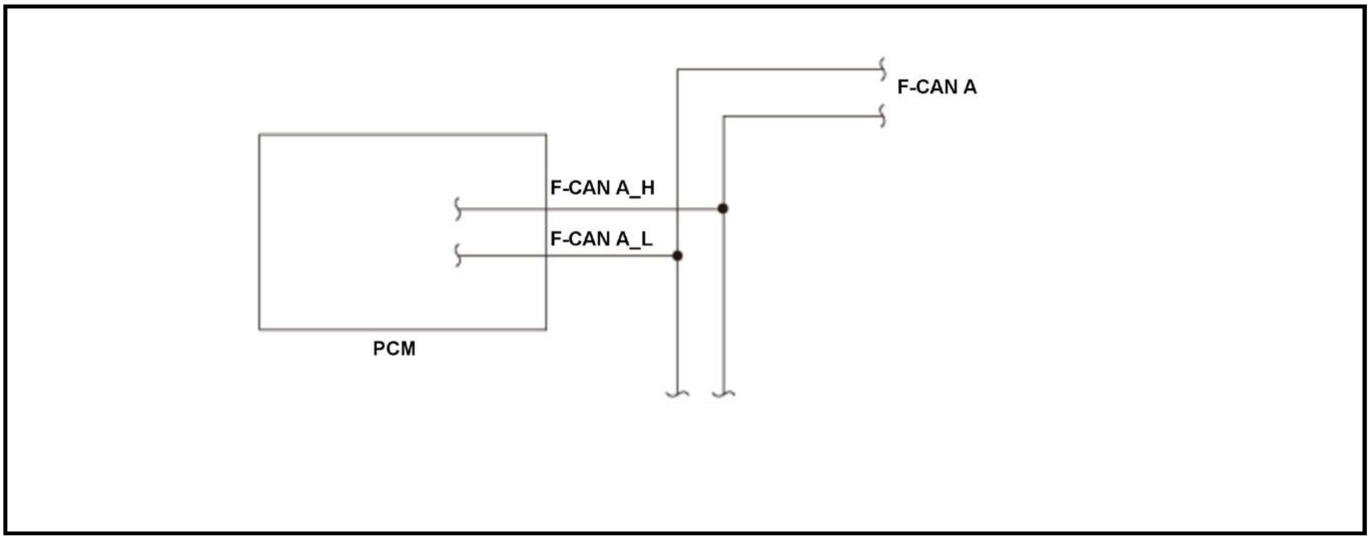
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0029 (PGM-FI SYSTEM)

DTC U0029: F-CAN Malfunction (BUS-OFF(Powertrain Control Module (PCM)))

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the powertrain control module (PCM) cannot send the signals via the F-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The PCM cannot send any signals via the F-CAN lines for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

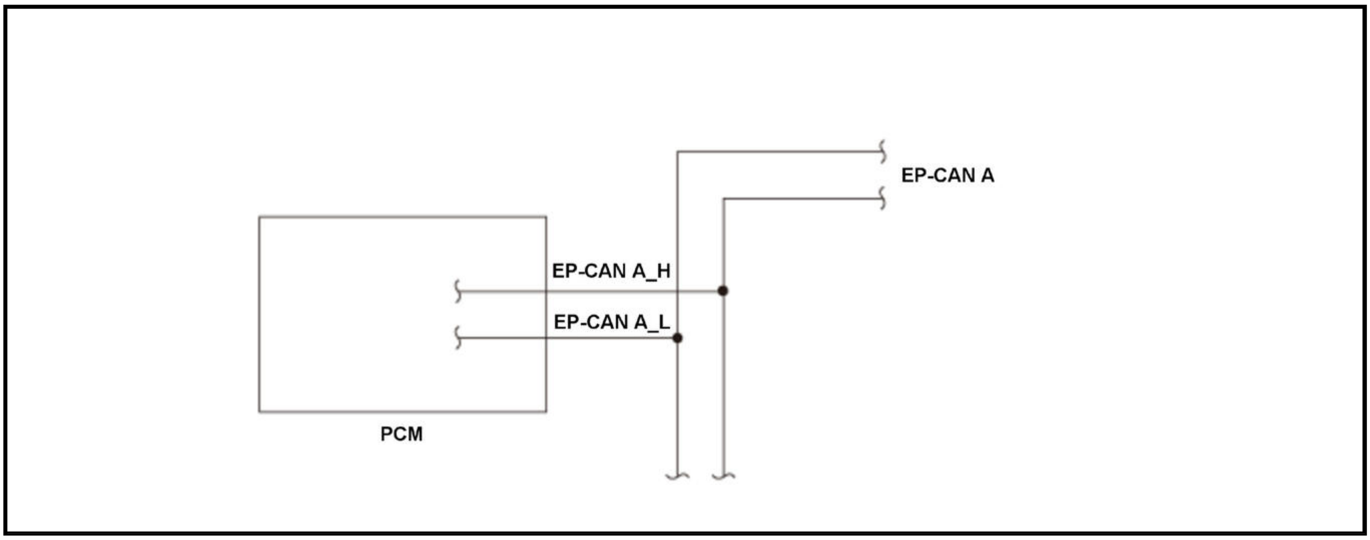
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0038 (PGM-FI SYSTEM)

DTC U0038: EP-CAN Malfunction (BUS-OFF(Powertrain Control Module (PCM))/PT-CAN Malfunction (TCM ECU BUS-OFF))

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the powertrain control module (PCM) cannot receive the signals via the EP-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The PCM cannot receive any signals via the EP-CAN lines for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- EP-CAN circuit EP-CAN A_H line open
- EP-CAN circuit EP-CAN A_L line open
- EP-CAN circuit EP-CAN A_H line short to ground
- EP-CAN circuit EP-CAN A_L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory.

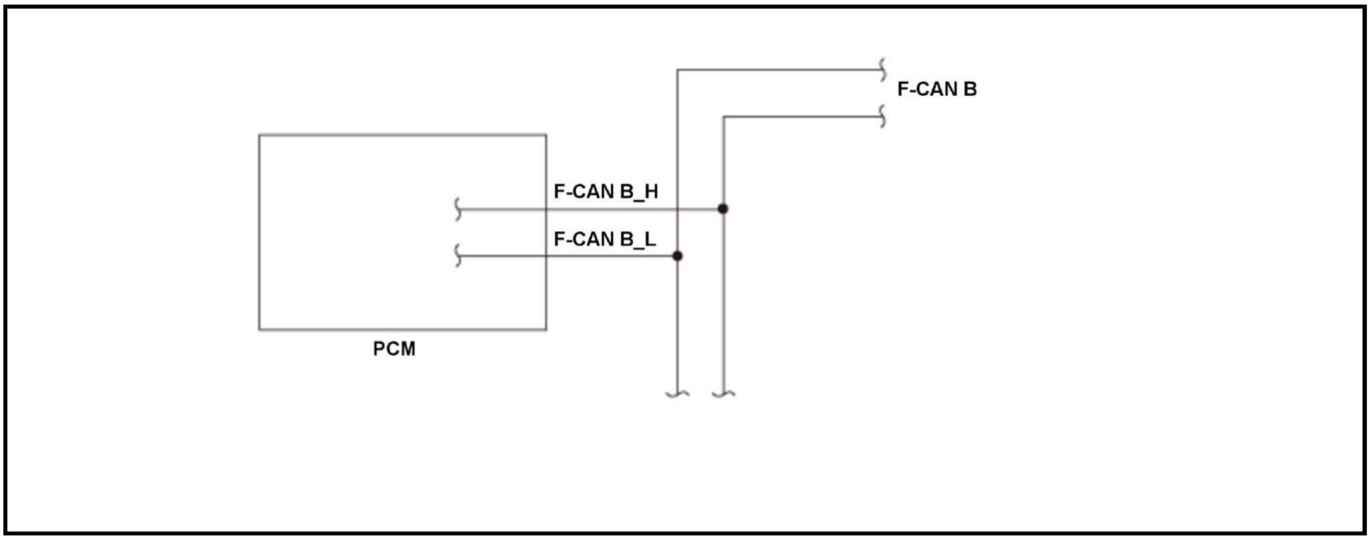
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0047 (PGM-FI SYSTEM)

DTC U0047: F-CAN Malfunction For The Second Channel (BUS-OFF (Powertrain Control Module (PCM)))

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the powertrain control module (PCM) cannot receive the signals via the F-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Duration	1 second or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The PCM cannot receive any signals via the F-CAN lines for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

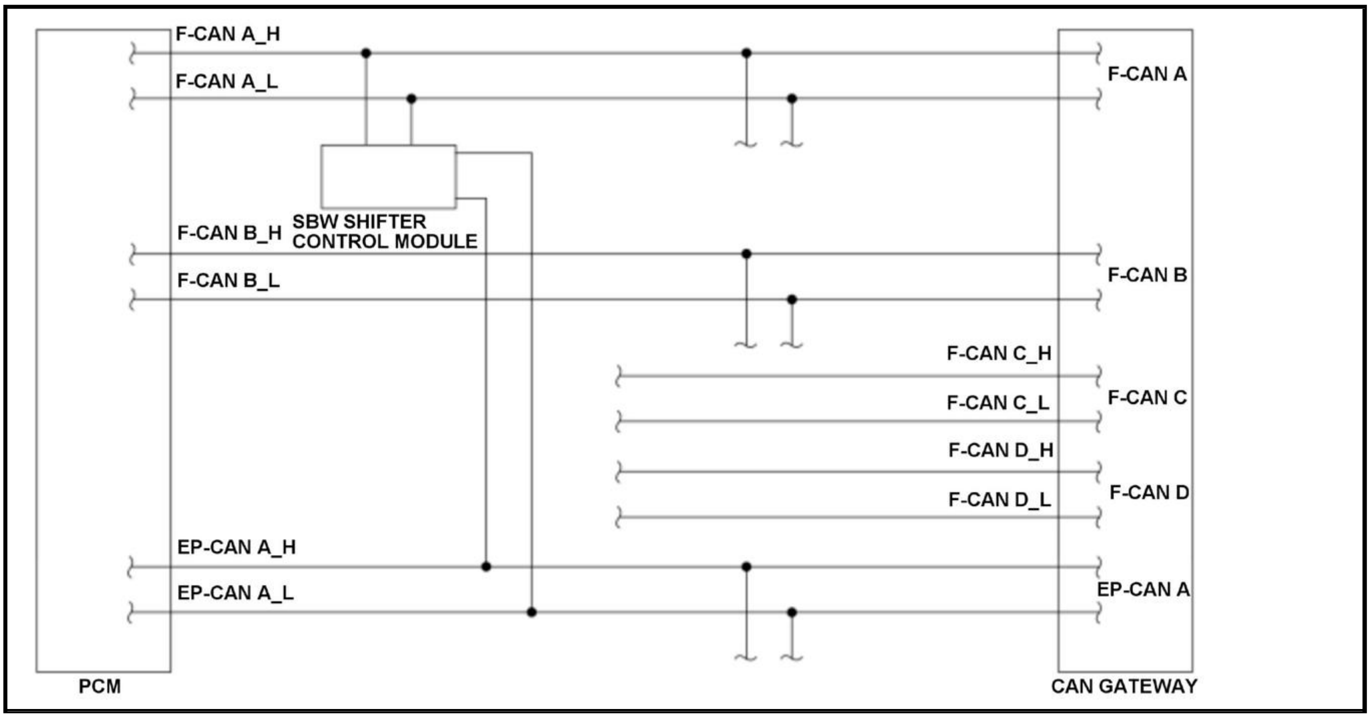
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0103 (PGM-FI SYSTEM)

DTC U0103: F-CAN Malfunction (Powertrain Control Module (PCM)-SBW Shifter)

General Description



F-CAN A_H
F-CAN A_L
F-CAN A
SBW SHIFTER CONTROL MODULE
F-CAN B_H
F-CAN B_L
F-CAN B
F-CAN C_H
F-CAN C_L
F-CAN C
F-CAN D_H
F-CAN D_L
F-CAN D
EP-CAN A_H
EP-CAN A_L
EP-CAN A
PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the powertrain control module (PCM) cannot receive the signals from the shift by wire (SBW) shifter control module via the F-CAN lines for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The PCM cannot receive any signals from the SBW shifter control module via the F-CAN lines for at least 1.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open

- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- SBW shifter control module failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

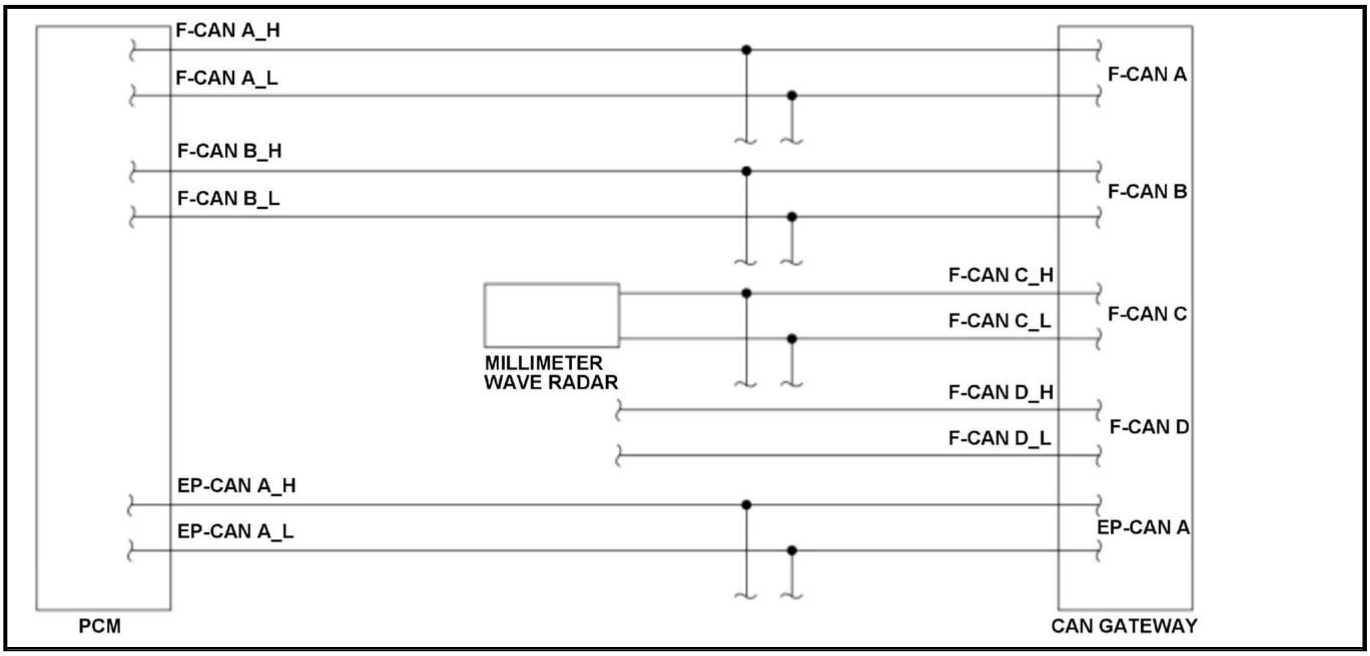
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0104 (PGM-FI SYSTEM)

DTC U0104: F-CAN Malfunction (Powertrain Control Module (PCM)-Driving Support System Control Unit)

General Description



The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the millimeter wave radar via the F-CAN lines and this condition continues for a specified time or when the information sent from the millimeter wave radar is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the millimeter wave radar via the F-CAN lines for at least 1.5 seconds.
- The information sent from the millimeter wave radar is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- F-CAN circuit F-CAN C_H line open
- F-CAN circuit F-CAN C_L line open
- F-CAN circuit F-CAN C_H line short to ground
- F-CAN circuit F-CAN C_L line short to ground
- Millimeter wave radar failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0110 (PGM-FI SYSTEM)

DTC U0110: EP-CAN Malfunction (Powertrain Control Module (PCM)-Motor Control Module)

General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the DTC code U1205 is detected.

DTC U0111 (PGM-FI SYSTEM)

DTC U0111: EP-CAN Malfunction (Powertrain Control Module (PCM)-Battery Condition Monitor Module)

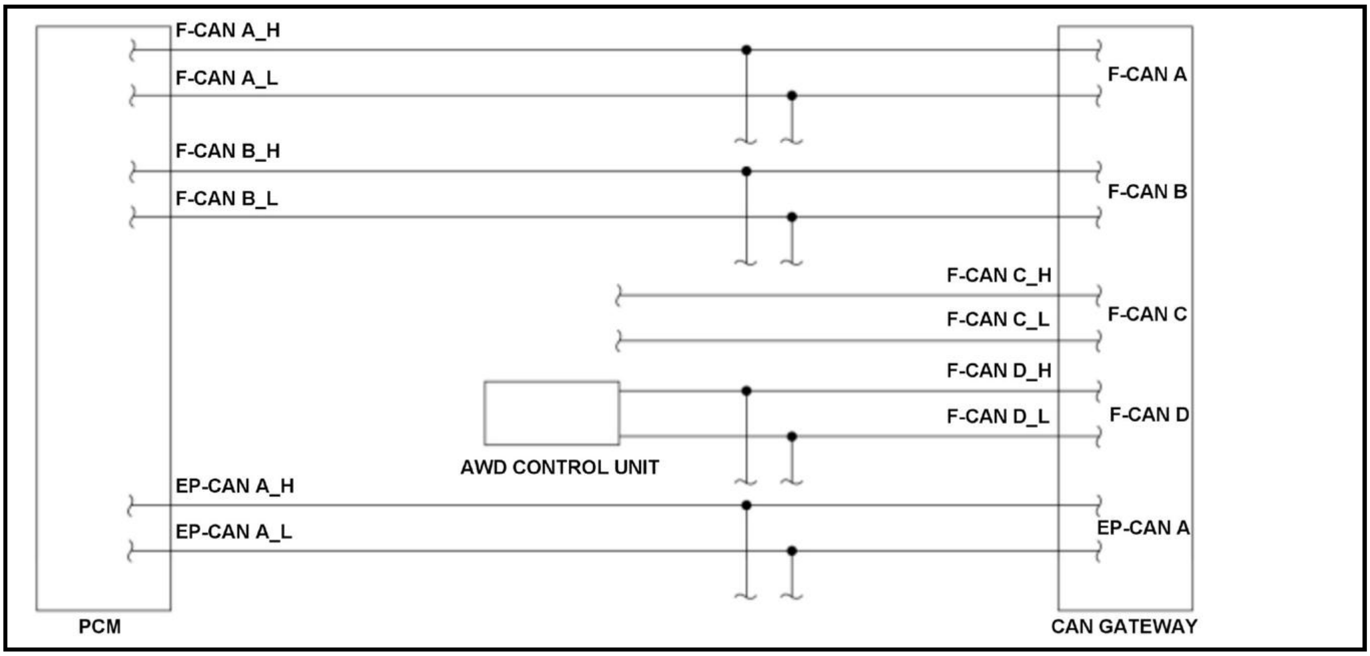
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the DTC code U1206 is detected.

DTC U0114 (PGM-FI SYSTEM)

DTC U0114: F-CAN Malfunction (Powertrain Control Module (PCM)-AWD Control Unit)

General Description



F-CAN A_H
F-CAN A_L
F-CAN A
F-CAN B_H
F-CAN B_L
F-CAN B
F-CAN C_H
F-CAN C_L
F-CAN C
F-CAN D_H
F-CAN D_L
F-CAN D
AWD CONTROL UNIT
EP-CAN A_H
EP-CAN A_L
EP-CAN A
PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the AWD control unit via the F-CAN lines and this condition continues for a specified time or when the information sent from the AWD control unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

Either of the condition is met:

- The PCM cannot receive any signals from the AWD control unit via the F-CAN lines for at least 1.5 seconds.
- The information sent from the AWD control unit is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- F-CAN circuit F-CAN D_H line open
- F-CAN circuit F-CAN D_L line open
- F-CAN circuit F-CAN D_H line short to ground
- F-CAN circuit F-CAN D_L line short to ground
- AWD control unit failure (include fuse blown)
- PCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the PCM memory. The MIL does not come on.

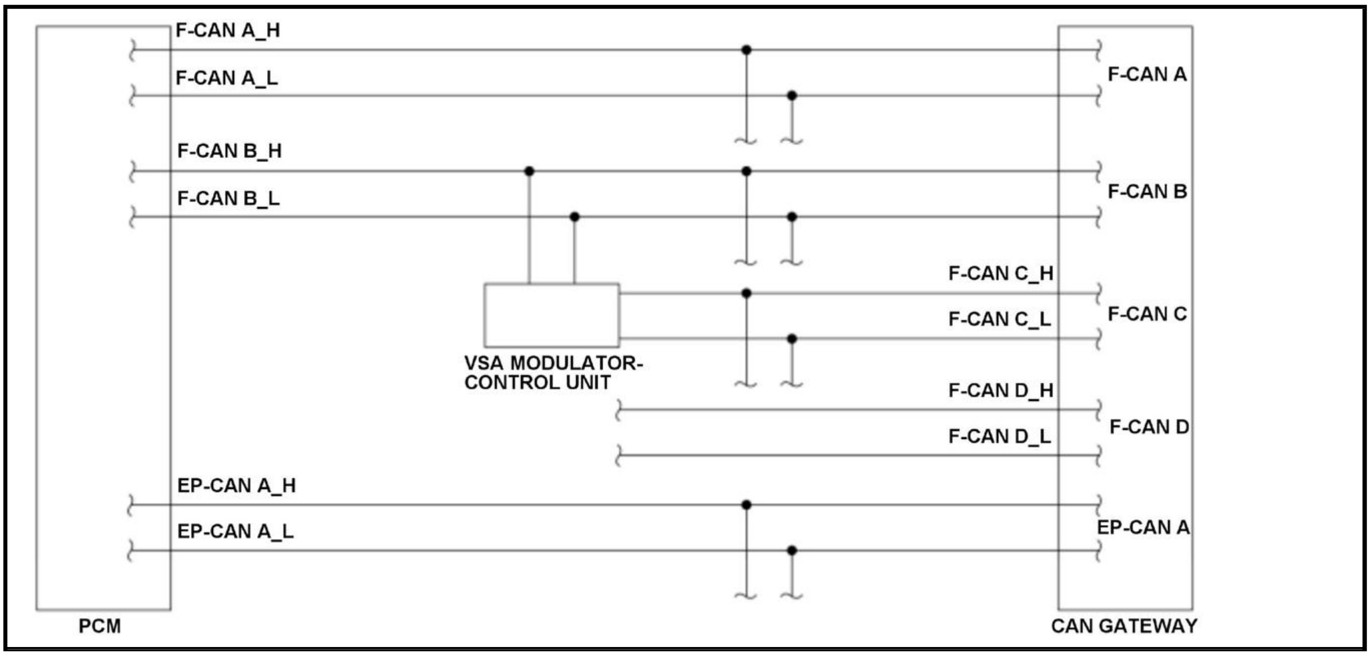
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command or by disconnecting the 12 volt battery.

DTC U0122 (PGM-FI SYSTEM)

DTC U0122: F-CAN Malfunction (Powertrain Control Module (PCM)-VSA Modulator-Control Unit)

General Description



F-CAN A_H
F-CAN A_L
F-CAN A
F-CAN B_H
F-CAN B_L
F-CAN B
F-CAN C_H
F-CAN C_L
F-CAN C
VSA MODULATOR-
CONTROL UNIT
F-CAN D_H
F-CAN D_L
F-CAN D
EP-CAN A_H
EP-CAN A_L
EP-CAN A
PCM
CAN GATEWAY

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (CAN H and CAN L). When the information is not sent from the VSA modulator-control unit via the F-CAN lines and this condition continues for a specified time or when the information sent from the VSA modulator-control unit is abnormal and this condition continues for a specified cycle, the powertrain control module (PCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL off

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [Battery]	10.0 V	-
